Congressional pay raises offer the most obvious and least controversial examples. Most members want pay raises but, because constituents disapprove, fear voting for them. In recent years, public opposition has increased in intensity, making a pro-vote seem that much more dangerous to reelection. In 1989, when the joint party leaderships agreed to try to pass a pay raise, they carefully packaged it with an overhaul and tightening of ethics standards. Then they brought the package to the floor under a closed rule. Considering this legislation under an open rule would have raised the quintessential collective action dilemma; while everyone would be better off if the bill remained intact, whoever defected first would benefit significantly at the expense of his colleagues and someone would surely have done so. That is, had amendments been allowed, some members would have succumbed to the temptation to make political points and confront their colleagues with killer amendments impossible to vote against. Most obviously, an amendment to delete the pay raise would surely have been offered and would have placed many members in a politically untenable position. The closed rule thus gave members who wanted the pay raise but feared its reelection consequences cover; they could explain and justify their vote for the pay raise as a vote for ethics reform.

In the spring of 1992, President Bush sent Congress 99 requests to rescind $5.662 billion in already approved budget authority. The Budget and Impoundment Control Act requires congressional approval for such rescissions to go into effect but also allows one-fifth of the House membership to force a vote on a rescission request. As part of his reelection campaign, Bush intended to force Democrats to cast a series of painful votes and to excoriate Congress for any spending cuts it failed to approve. With the House already under intense criticism for the bank scandal and other internal management problems, the party and Appropriations Committee leadership decided Democrats had to match Bush's spending cuts but that Congress not the president should decide where the cuts should come. The Appropriations Committee went to work and reported out a measure that slightly exceeded Bush's total in savings. Even though committee Republicans had participated fully in deciding where to

make the cuts, Republicans wanted to offer a floor amendment adding Bush's cuts to those the committee had made. Republicans hoped to force Democrats to choose between voting for cuts that they believed to be bad public policy (in part, undoubtedly, because some of them would be harmful to their districts) and casting a hard-to-explain vote. The committee and the leadership believed that, given the highly charged political atmosphere, their members' reelection fears would dictate a vote for the additional cuts. The leadership, therefore, structured the rule so that members would choose between the committee's package of cuts and the package recommended by Bush; a vote on adding cuts was not allowed. Republicans fought the rule but the previous question was ordered on a 257 to 160 vote and the rule approved on a 240 to 178 vote. Only one Democrat defected on the previous question vote and only 24 opposed the rule, a clear indication that the leadership had rightly judged its members' expectations.

Not long after the stock market crash in the fall of 1987, during a period of intense concern about the deficit, welfare reform legislation was ready for House floor consideration. The Ways and Means Committee, which had primary jurisdiction over the legislation, wanted a closed rule. Some Democrats, however, thought the bill too expensive and wanted to amend it on the floor. The leadership determined that a closed rule would not pass. Discussion centered on an amendment that Tom Carper, D-Del., wanted to offer. Letting him do so, the leadership determined, would doom the bill because enough Democrats would join all the Republicans to pass the amendment. Adoption of the amendment, which made draconian cuts in the program, would alienate most strong supporters of welfare reform, and they would join most Republicans to defeat the bill on final passage. The leadership decided to bar the Carper amendment but to allow an amendment by Mike Andrews, D-Texas, that also cut the program but not by enough to alienate the original bill's strong supporters. With this solution, those Democrats who needed to demonstrate their fiscal responsibility were given a vote to trim the program. The rule, Andrews's amendment, and the bill all passed with relative ease.

In this case, then, most Democrats -- enough to constitute a clear majority of the House -- favored passing a welfare reform bill; they believed it constituted good public policy. Many, however, believed that, for reelection reasons, they had to go on record as favoring a reduction in the program's costs. By allowing a vote on the moderate Andrews amendment but barring one on the draconian Carper amendment, the rule gave those members who needed it the opportunity to demonstrate fiscal responsibility and also assured that legislation most Democrats favored would be enacted.

The 1991 civil rights bill, the product of an excruciatingly difficult process of compromise aimed at building a coalition sufficiently large to override an expected veto, was brought to the floor under a rule that tightly limited amendments. The leadership's compromise, a Republican-Administration version, and a liberal-Black Caucus version were made in order as substitutes to the original bill. Women members were not allowed to offer an amendment to lift the cap on punitive damages to women who could prove their employer had intentionally discriminated, and Republicans were denied a motion to recommit with instructions, which provides another means of amending a bill. The amendment to lift the cap would have confronted many Democrats with an

extremely unpalatable choice: their strong supporters favored the amendment fervently, they themselves believed it just, but its adoption would extinguish the bill's chances of becoming law because it would drive away need Republican votes on passage. The strategic problem was structuring floor choices so that Democrats would not be confronted with a choice between having to explain a strategic vote to the bill's and their own strongest supporters and casting a sincere vote that would endanger the bill. The leadership barred this amendment but allowed the much stronger Black Caucus substitute, thus giving liberals who needed to show their purity on the issue the opportunity to do so but making the choice to oppose the alternative easier for most Democrats. Republicans were given a substitute but were denied a motion to recommit with instructions to prevent them having a "second bit of the apple," as senior staff expressed it. The leadership feared Republicans would come up with some alternative provision, possibly even the lifting of the cap, that would unravel the compromise. If Republicans could come up with something that an appreciable number of Democrats would have real difficulty voting against, they might sink the bill despite strong House support for it.

The rule for the civil rights bill specified that the substitutes were to be offered in a specific order under a king-of-the-hill procedure, whereby the last one which receives a majority prevails. The rule gave liberals a vote on their much stronger version but put that substitute first in line. Having cast a vote in favor of the tough bill civil rights activists favored, these members then could support the leadership compromise. The rule next gave House Republicans and the Administration a vote on their preferred version. It put the Democratic compromise last, which is clearly the advantaged position.

A final example involves the long running battle over aid to the contras fighting the Sandinista government in Nicaragua. In the spring of 1988, President Reagan's plan for more military aid for the contras was defeated by a very close vote. The Democratic leadership which had orchestrated the campaign against more lethal aid had promised its members a vote on a humanitarian aid package. A number of Democrats who had previously supported contra aid had come to believe Reagan's policy was delaying an end to the conflict; yet vocal pro-contra sentiment in their districts made them fear negative reelection repercussions from repeated votes against Reagan on the issue. Republicans wanted to offer Reagan's lethal aid package again. Under normal parliamentary procedure, the Reagan plan would be made in order as a substitute to the Democratic proposal. The Reagan plan would be voted on first and, only if it was defeated, would there be a vote on the Democratic proposal. Those Democrats -- mostly moderate southerners -- who had proved the leadership's margin of victory opposed the normal procedure; they objected to having to vote against Reagan's plan again, arguing that doing so would hurt them with their constituents. They had voted it down once; couldn't the leadership make it possible for them to vote <u>for</u> the Democratic plan without having to vote against the president? The leadership did so; the rule designated the Reagan plan as the base bill and made the Democratic proposal in order as a substitute, thus reversing the order of the votes.

Why would a majority of House members vote for rules such as these which constrain, often severely, their opportunity to offer amendments on the floor?

Explaining majority support for many highly restrictive rules tends to be difficult within a single goal perspective, especially if the goal posited is the single minded pursuit of reelection. Why, for example, would moderate southern Democrats vote for the contra aid rule, especially when Reagan and House Republicans were violently denouncing not just the Democratic package but the rule itself?

House majorities now routinely approve restrictive rules; the rules analyzed earlier were all ones that the House adopted. Few rules are defeated (or altered) on the House floor; the mean per congress from 1981 through 1992 was less than 2.5. And, as the frequency of restrictive rules has increased, defeats have not become more common. Not a single rule was lost during the 102nd Congress. Yet rule roll calls are by no means purely pro forma. House members can and do defeat rules; some of the defeats have occurred on highly visible and consequential legislation. (For an example, see Sinclair 1983, 202-221)

Democrats overwhelmingly support rules on floor votes and their level of support varies little with the restrictiveness of the rule at issue. In the 100th and 101st Congresses, there were roll calls on 52 rules for major legislation as defined earlier.[9] The mean Democratic vote in favor on passage or on ordering the previous question (which ever was closer) was 93 percent. Open rules were supported by 98 percent of Democrats on average; modified open rules by 90 percent; modified closed rules by 93 percent and closed rules by 96 percent.

Republicans are increasingly voting against restrictive rules, especially against modified open and modified closed rules which, with their complex provisions, are most likely to be used strategically. Of rules for major legislation in the 100th and 101st Congresses, 56 percent of the open rules and 44 percent of the closed rules were approved by voice vote on the floor but only 16 percent of the modified open and modified closed rules were. Conversely, modified open rules and particularly modified closed rules were much more likely than either open or closed rules to see a majority of Democrats voting in support and a majority of Republicans opposed (See Table 7). In fact, on the average only 14 percent of House Republicans voted for the modified closed rules that elicited floor role calls.

The simplest explanation of why big majorities of Democrats support restrictive rules is that, on balance, they gain more than they loose by doing so. And, in the cases presented here and many others, what they gain, I would argue, is being able to vote their policy preferences rather than their reelection fears. No matter how cleverly structured, a rule is not likely to induce a member to cast a vote she perceives as truly against her constituents' interests (nor would the party leadership ask this of a member). Rules can sometimes protect members from facing votes that are very difficult to explain to constituents and, therefore, easy for an opponent to exploit--and so free them to vote on other grounds.

Conclusion

My purpose here is certainly not to argue for rejecting the distributive and informational theories. Rule choice, while important, is only one piece of the institutional design puzzle and, in any case, my analysis here is obviously not comprehensive. As any close observer of Congress would attest, both theories get at something important. Krehbiel's theory, by challenging the one dimensional view of Congress that was becomming increasingly prevalent, has enriched the debate and had a major beneficial effect on legislative scholarship. Neither theory, however, offers a complete answer and, taken as if they did--which presumably none of the authors intend--they paint a distorted picture of Congress.

Clearly a theoretical synthesis is called for. The incorporation of parties has been begun by Cox, Kiewiet and McCubbins, but harder tasks lie ahead. A good theory must be able to handle change convincingly and, I believe, must be based on the assumption of multiple goals.

Endnotes

1.Wolfensberger's categorization differs slightly from Bach and Smith's for the congresses both have studied. Wolfensberger's percent open tends to be slightly larger than Bach and Smith's.

2.The decrease in the number of rules over time evident in Table 1 seems to be a result of the increased use of omnibus legislative vehicles where previously several separate bills would have been used and of a large increase in the use of the suspension procedure. In the 95th Congress (1977-1978), 38% of all measures passed were considered under suspension; in the 102nd Congress (1991-92), 52% of all bills passed were considered under suspension.

3.In the 1980s, appropriations bills were increasingly brought to the floor under rules so, for purposes of comparability, an appropriations bill that makes the list of major legislation that is brought to the floor without a rule is coded as having been considered under a simple open rule.

4.What follows is my version and should not be attributed to (i.e. blamed on) CKM or interpreted as an exposition of their theory. My apologies to CKM for not dealing with their approach in any detail but space considerations preclude doing so.

5.The categorization of rules was done by the author by examining the text of the rule and, where necessary, the debate in the Congressional Record. In close calls, I relied upon Wolfensberger's judgment and my categorization is very close to his.

6.Two measures of leadership involvement on each of the major measures identified earlier were constructed for the congresses listed in Table 2 (for more detail, see Sinclair, 1992A). The first measure, intended to distinguish some leadership involvement from no involvement, is based upon answers to the following questions: (1) Was the bill a part of the leadership's agenda? (2) Did the Speaker or the Majority Leader advocate passage during floor debate? (3) Did Congressional Quarterly's account report the leadership as being involved? If any one of the answers is "yes," the leadership is considered as having been involved. A second more refined measure--and the one used in all analyses reported in this essay-- distinguishes major from minor involvement on the basis of the mode or modes of involvement reported by Congressional Quarterly. Four modes are distinguished: (a) the leadership uses its control over scheduling, the Rules Committee, or other procedure to advantage the legislation; (b) the leadership is involved in a floor vote mobilization effort; (c) the leadership is centrally involved in some other aspect of legislative strategy; or (d) the leadership participates in shaping the content of the legislation by talking or negotiating with or among the committee(s) or with the Senate or with the President. Major leadership involvement is defined as engaging in shaping legislation (e.g. d) or in any two of the other activities (e.g., 1, 2, a, b, c.).

7.Although I do not have the data to make the test, these results suggest that Krehbiel's specialization hypothesis might well fare better were all rules during these congresses analyzed. When, as here, only major measures are considered, other considerations appear to dominate.

8.A number of hybrid equations with all of the variables and various subsets were estimated but none were as good as this party model; none of the Krehbiel variables were significant and of the correct sign in these hybrid equations.

9. This includes four defeats--all of which were rectified. In all cases, the second rule that passed fell into the same category of restrictiveness as the first.

Identity Politics and the Imagined Community

Karen Slawner

University of Notre Dame

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

The term "identity politics" has become a convenient buzzword in academic as well as mainstream writings, used to describe changes in the curriculum, a type of intellectual inquiry, a particular variant of political practice, and the downfall of American civilization. The term is used both favorably and as a criticism. It is necessary to interrogate what is meant by the term "identity" and the term "politics." This can be achieved only by considering an issue that is inextricably bound up with identity politics, that of community. Identity is usually ascribed to or claimed by a particular community: of race, of gender, of nationality, or of sexual orientation. Even those critical of identity politics generally base their objections on a notion of community that is supposed to transcend other identities, and thus posit an identity of their own. Communities of all sizes and types predicate an identity that distinguishes between members and non-members. Communitarian identity is therefore unavoidably political, and identity, community, and politics must be thought together.

Identity Politics

Let me begin by listing a few recent definitions of identity politics. Hank Bromley associates identity politics with the combination of the post-structuralist critique of subjectivity and Marxist activism.[1] Todd Gitlin, in *Dissent*, calls it a "long overdue opening of political initiative to minorities, women and gays," but one that has led to "its own methods of silencing."[2] Michael Geyer distinguishes between multiculturalism, "a set of ideas that explores the diversity and difference of cultural articulations," and identity politics, "an ambivalent project that vacillates between essentialism and constructivism."[3] Cornel West celebrates the "new cultural politics of difference" that "trash[es] the monolithic and homogenous in the name of diversity."[4] David Rieff, in the August issue of *Harper's* magazine, declares that academics are deluded in thinking that their adoption of multiculturalism has political effects, because we have apparently been left in the dust by the business community, which realizes that true multicultural change is not occurring in the classroom, but in the "newly globalized consumer economy, stupid."[5]

Let us assume from the outset that we who are interested in something called identity politics or multiculturalism are not stupid, and that it is not necessary for academics to join the corporate world in order to be relevant. We first must attend to the fact that "identity politics," "multiculturalism" and "politics of difference" are often used interchangeably to describe similar phenomena, but that the more astute commentators postulate a difference between identity politics and the other two terms. The distinction is drawn between modes of theory and practice that realize that identity is socially constructed and contingent, and those that are essentialist in nature. The term "identity politics" is usually reserved for the latter, essentialist, epistemology. It is the critiques of essentialism

that I would like to explore through a discussion of two recent critiques of identity politics, because it is the charge of essentialism that brings to the fore the question of community.

Gitlin understands that identity politics represents a quest for security, comfort and community in an often hostile world, although he bemoans the separatism to which, according to him, it so often leads (Gitlin, 172). Gitlin explains the rise of identity politics as a consequence of the demise of the New Left. The early activists rooted in the civil rights movement, feminism, labour studies and other emancipatory movements demanded that the academy and the public space open themselves to alternative and previously marginalized voices, but the generation which succeeded that with the experience of struggle in the sixties has come to glorify difference and separatism rather than common humanity and inclusion (Gitlin, 173). Gitlin claims that "identity politics leads to a turning inward, a grim and hermetic bravado celebrating victimization and stylized marginality" (Gitlin, 173). This is not limited to the university but has permeated the public space and has, according to him, become the only type of politics practiced by minority or marginalized groups.

While I think that Gitlin is probably overstating the case somewhat, especially in his description of academic discourse, his analysis if the causes of the development of identity politics is interesting. He notes that part of the explanation lies in the difficulty of having spent twelve years fighting the right and the declining economy, both of which led to a hardening of positions. However the more important cause was the fracturing of the Left after the Vietnam War. Gitlin exhibits a nostalgia for the early days of the New Left, when radicals rooted their dreams in a "story of universal human emancipation" (Gitlin, 174). He acknowledges, however, that this dream was destined to failure "because the center could not hold" (Gitlin, 174). Blacks and feminists first, then other groups, demanded the recognition of their difference from the universalist project and activist groups proliferated. The people who entered the academy in the seventies had never participated in the universalist activism of the sixties and were familiar only with identity politics, which became more entrenched and antagonistic in the eighties.

Gitlin's sadness over the fragmentation of the Left operates on two levels. In part, he believes that a unified left would be more successful in achieving political goals. There is some legitimacy to that argument, although it is curious that he does not refer to more contemporary attempts to find unity within difference, such as Jesse Jackson's Rainbow Coalition. This is because he does not seem to recognize that there is a difference between the essentialist practitioners of identity politics and the multiculturalists, a frequently made mistake. He, like many others, lumps all the fragments of the old New Left into the same category. There is undoubtedly a need for oppositional groups to

seek commonalities of purpose. However, Gitlin's nostalgia for the "universal subject," which I view as the second level of Gitlin's sadness, is problematic. This nostalgia is also a philosophical tristesse. He claims to recognize that the center could not possibly hold, but does not realize that the universal subject was always constructed precisely through the elimination of difference, thus his nostalgia is misplaced. Gitlin longs for a "common America" and a "unitary Left," which are for him the "two great legacies of the Enlightenment" (Gitlin, 177). His critique of identity politics would be seen not as contribution to a dialogue between people with similar goals, but as the metaphysical pronouncement of an unreconstructed Marxist. He also yearns for a unitary, determinate community albeit on a larger scale.

Geyer situates his discussion of multiculturalism and identity politics within a history of the American university and its construction of an American identity. Until recently, general education was designed to indoctrinate students in a notion of a "common culture," common, that is, to the Atlantic world. Geyer names this phenomenon monoculture. Curiously, for Geyer, American students were taught European culture, rather than American history and culture (Geyer, 508). This served to engineer and legitimate American political hegemony after World War II (Geyer, 509). If the United States was to lead Europe, it had to position itself within the trajectory of European culture, this despite the incredible diversity of American culture and its difference from European culture.

The hegemony of monoculturalism was disrupted by the civil rights movement, as well as, ironically, the importation of another European cultural artifact, post-structuralism (Geyer, 513). The two combined to permit a "recovery of submerged knowledges" and have "molded the basic issues of a contemporary politics of representation that is at the core of the debate on multiculturalism" (Geyer, 513). At its best, multiculturalism acted to include within the rubric of "general education" histories and perspectives that had previously been considered marginal. Post-structuralist concepts of counter-memory and *differance* facilitated the deconstruction of the metaphysical narratives integral to monoculturalism, and the civil rights movement lent multiculturalism its political activism. However, as Geyer observes, it is in its incarnation as identity politics that multiculturalism has gained its notoriety (Geyer, 521). In that form, multiculturalism

> stands accused of upholding unequivocal identities grounded in naturalized histories that hark back to uniqueness of climate, territory, or biology, or, more commonly, mythical images of a glorious and heroic origin. In whichever way the case is argued, identity politics crucially insists not

> simply on "self-representation" but on the sufficiency (and occasionally the exclusivity) of the self's representation to the self. (Geyer, 521)

According to Geyer this type of thinking has led to a separatist nationalism, grounded in a search for recognition and rights, at home and internationally. He cites the cases of Eastern Europe and Palestine, among others, but his examples of academics exhibiting this sort of thinking include Cornel West and bell hooks. Both these scholars are careful to criticize essentialism and nationalism, both in the Black community's relations with non-Blacks, and within the community itself. They recognize the danger and the inefficacy of the nationalism exhibited by people like Leonard Jeffries, and are critical of attempts to homogenize the Black community, as if differences of gender, class and sexual orientation do not exist. Furthermore, both recognize that identity is culturally constructed. Their outlook is clear in the text Geyer cites, *Breaking Bread*, which is a dialogue between the two of them.[6]

Geyer's misinterpretation of hooks and West and Gitlin's criticism of the shards of the New Left demonstrate a recurring problem in the analysis of identity politics and multiculturalism. Even when the critic welcomes diversity and claims to be condemning only the "essentialists," authors who would never consider themselves as such appear on the list. Blacks who welcome white progressives into their struggle are labelled separatists, feminists who explore the construction of gender are accused of believing anatomy is destiny, and post-colonialists who condemn Third World demagoguery are described as nationalists. What is missing in these accusatory debates is an adequate exploration of the notion of community. Blacks who are concerned about racism, feminists who oppose sex discrimination and post-colonialists interrogating the effects of imperialism must all posit communities: of persons with certain skin colours, of women and men, of citizens or inhabitants of particular countries or territories. We must explore how it is possible to think about community, to consider ourselves to be members of one or more communities, perhaps to be proud of such membership, and yet not subscribe to essentialism, with all its admittedly negative consequences.

Rethinking community

As we witness the carnage in the former Yugoslavia and in many of the republics of the former Soviet Union, it is understandable that we are hesitant to embrace a rigid or reified concept of community. The invocation of community is frequently accompanied by the recitation of centuries-old disputes and nostalgia for a by-gone time. The history of oppression is supposed to justify current practices.

Yet community is a hypostasized construct, a metaphysical creation. Communities are imagined. While in some cases there

exist similar phenotypes, similar skin color or anatomy do not guarantee commonality. The group must be constructed. The act of creating the community is a joint project; in part it is a result of definitions projected by non-members, in part by the voluntary assertion of identity by members.[7] For example, it was the white majority that decided that persons with any amount of "black blood" were to be considered black, but today children of so-called mixed marriages debate with which culture they will identify themselves (although racists will have no problem making that decision).

The contingent character of community is what produces its often violent or discriminatory attempts to ground itself. The creation of sovereign self-identity is usually accomplished through the elimination of difference. However, in recognizing the historicality of community lies the potential for re-imagining community, one not based on exclusion but on justice. In the first part of this section I will explore the ways Jean-Luc Nancy, Benedict Anderson and Homi Bhabha expose the contingency of community. Anderson and Bhabha are primarily concerned with the state-level community, however their analysis is pertinent to any group attempting to found an identity. I will then discuss how Nancy and Giorgio Agamben deconstruct community, thereby opening up possibilities for its re-articulation.

Jean-Luc Nancy shows that in tandem with the modern belief in progress[8] there has always existed a belief in a lost or broken community. Nancy mentions the natural family, the polis, the Roman republic and early Christian community, among others,

> always it is a matter of a lost age in which community was woven of tight, harmonious, and infrangible bonds and in which above all it played back to itself, through its institutions, its rituals and its symbols, the representation, indeed the living offering, of its own immanent unity, intimacy, and autonomy. (Nancy, 9)

But community has never existed. The loss of community is merely a nostalgic dream, "so that community, far from being what society has crushed or lost, is *what happens to us* - question, waiting event, imperative - *in the wake of* society" (Nancy, 1991a, 11). Nonetheless, millions of lives have been lost, or rather given up, in the name of this community, in the desperate hope for immanence, the desire for a foundation that would transcend time. The myth of community is strong enough to solicit the willing participation of society in war and destruction. But death does not engender salvation or immanence, it is only the death of one person, perhaps multiplied by thousands or millions, but even in great quantities death is not sublated into a community. Community can never be grounded.

The impossibility of immanence does not prevent the attempts to create it through myth. In Nancy's view, myths tell the story of our origins, our mission in the world and our relationship to one another. Yet the function of myth is equally mythical, invented during the Romantic period in a conscious effort to revive the purported power of myth, which in fact created it (Nancy, 1991a, 45). This too is an aspect of modernity, the nostalgia for an originary "mything humanity" and the desire to "regenerate" European culture by re-enacting its myths (Nancy, 1991a, 46).

Myth is, in essence, communitarian. Myth communicates the being-in-common: "There is no myth that does not at least presuppose (when it does not in fact state) the myth of the communitarian (or popular) revelation of myths" (51). But we also know that myth is a myth. We know that the founding myths are myths. Our foundations are fictions, but no less powerful for all that. They create what Benedict Anderson called "imagined communities."

Anderson explores the construction of the nation-state and the creation of the phenomenon of nationalism. Both, he argues, are cultural artifacts of the eighteenth century, made possible only by historical changes of that period that allowed nations to be "imagined." He defines nation as an "imagined political community - and imagined as both inherently limited and sovereign."[9] Nationalism invents nations. In an effort complementary to Nancy's philosophical and literary investigations of the myth of the myth, Anderson explains the social and politico-historical preconditions of nationalism.

The growth of nationalism must be seen in the context of the changes in culture which preceded it. First was the decline of Latin as both a sacred and administrative language in the seventeenth century. It had served to unify Europe, as the language of worship and as the language that the literate classes used to communicate with one another. Its decline contributed to the division of that greater community (Anderson, 21-25). Secondly, at the same time the absolutist state within contiguous territory came to replace the medieval dynasties with their geographically disparate territory. No longer was the king of England also the sovereign over parts of France and other areas we now call states (Anderson, 27).[10]

Anderson's account of these historical transformations is unproblematic as he provides concrete examples of particular events. His next assertion is more abstract. He claims that the change from the medieval period to the modern was accompanied by an alteration in the concept of time, from "simultaneous" to "empty, homogeneous time" (Anderson, 30). The change in the understanding of time was essential for the creation of the nation. Nationalism requires the capability to conceive of one's compatriots as being contemporaneous with oneself: "The idea of a sociological organism moving calendrically through homogeneous,

empty time is a precise analogue of the idea of the nation, which is also conceived as a solid community moving steadily down (or up) history" (Anderson, 31). This is akin to women around the world asserting a common history of repression despite drastic differences of geography and social position, or the pan-Africanist and pan-Arabist movements.

Homi Bhabha, in the concluding essay of an anthology inspired by Anderson's work, writes that the nation as a narrative strategy is "the measure of the liminality of cultural modernity."[11] Bhabha explores the cultural construction of the "nation" or "people" through emphasizing the *temporal* dimension of the textual strategies which create the construct rather than the *historical*. This emphasis serves to denaturalize the concept of the nation and displace the modernistic view of the state.

Bhabha cites from Gellner's *Nation and Nationalism*, and it is a citation worth reciting:

> Nationalism is not what it seems, and above all not what it seems to itself...The cultural shred and patches used by nationalism are often arbitrary historical inventions. Any old shred would have served as well. But in no way does it follow that the principle of nationalism ...is itself in the least contingent and accidental.[12]

Nations must be narrated. The process of writing the nation requires a double action. On the one hand, the people are "the historical 'objects' of nationalist pedagogy, giving the discourse an authority that is based on the pregiven or constituted historical origin or event" (Bhabha, 297). On the other hand, the people are also "'subjects' of a process of signification that must erase any prior or originary presence of the nation-people to demonstrate the prodigious, living principle of the people as that continual process by which the national life is redeemed and signified as a repeating and reproductive process" (Bhabha, 297). Bhabha is a literary theorist, therefore he recognizes that nations are narrated in novels, but this narration takes place also in schools, in the discourse of political campaigns, even in advertising, everywhere that the myth of the people is constructed.

Nationalism requires an originary myth, but the construction of that myth necessitates a forgetting of its creation; the narrated nation continually appropriates Gellner's "shreds," but seeks to obscure the stitches that bind the quilt together: the myth of Plymouth Rock hides the genocide of the native peoples and the myth of the Founding Fathers covers over the history of the persons not deemed to have been created equal.

Most of Bhabha's analysis attempts to demonstrate how that quilt pulls itself apart, how the nation disseminates itself, as he invokes Derrida's terminology. The performative aspect of the narrative undermines the pedagogical:

> The boundary that marks the nation's selfhood interrupts the self-generating time of national production with a space of representation that threatens binary division with its difference. The barred Nation *It/Self*, alienated from its eternal self-generation, becomes a limited form of social representation, a space that is *internally* marked by cultural difference and the heterogeneous histories of contending people, antagonistic authorities, and tense cultural locations. (Bhabha, 299)

Bhabha understands dissemination and the narrative status of the nation as modes of entry into the hegemonic discourse of Western culture. He believes that his deconstructive analysis reveals the "traces of all those diverse disciplinary discourses and institutions of knowledge that constitute the condition and context of culture" (Bhabha, 313). It is an analysis that does not simply invert the hierarchy of study, from the metropole to the colony, but changes the "scenario of articulation" altogether.

I am afraid that Bhabha moves too quickly. He passes over the material history of the actual strife of the "contending peoples," the antagonism of the "antagonistic authorities," and the tension of the "tense cultural locations." He does not take the time to consider real violence.

The first essay in Bhabha's anthology is Ernest Renan's "What is a nation?" Bhabha cites Renan as saying, "yet every French citizen has to have forgotten Saint Bartholomew's Night's Massacre, or the massacres that took place in the Midi in the thirteenth century" (Bhabha, 310). Bhabha elides the violence that is at the foundation of states which Renan emphasizes and argues is a prerequisite for unity. Bhabha, in his own performance, forgets that the performative aspect of narrating the nation requires the forgetting not only the myth of violent foundation, but can also include the willful blindness to the evidence of current oppression.

In order to stabilize their contingent, imagined, "disseminated" identities, nations and other sub-national communities reify themselves through the construction of boundaries between themselves and others: inside/outside, self/other, rational/irrational, native/European, black/white, men/women, liberal/communist, us/them. Through myths of origin, awareness of oppression past and present, tales of essential identities passed on through blood, and bigotry and fear, those

boundaries are drawn tightly and seemingly impermeably.[13] Within those borders people feel themselves safe and comfortable and outsiders are enemies.

But must we abandon the term community to reactionary forces? Or, perhaps an equally undesirable alternative, must we embrace the liberal project with its assimilated, atomized individuals? Or can the recognition that communal identities are mythological, imagined, narrated and disseminated, open up possibilities for new myths, new stories? As we simultaneously search for ways to welcome diversity into the academic curriculum by including the accomplishments of other cultures and watch the horrors of ethnic cleansing on network television, it seems to me to be imperative to start the process of imagination.

I would like to return to Nancy's discussion of the "unworked community." As I wrote above, Nancy suggests that community has always been based on a myth of a lost or broken community situated in the past. According to Nancy, nationalism and war, and I would add, discrimination of all kinds, are the result of the attempt to immanentize community. Nancy's project is to rethink community in light of its perpetual slippage, the death of individual members that constantly precludes its immanence. Nancy offers an ontological interpretation of community, one that surpasses the defunct notion of immanentistic communism yet which does not reinstate the individualistic subject of the humanist project. At the same time he recognizes that "one cannot make a world with simple atoms" (Nancy, 1991a, 3). His ontological interpretation is an attempt to think individuals in their togetherness.

Nancy proceeds through a re-articulation of Heidegger's notion of *Mitsein*. For Heidegger, *Mitsein* (Being-with) is an answer to the question of the "who" of Dasein. The structure of Being-with is equiprimordial with Dasein's Being-in-the-world.[14] Heidegger rejects the Cartesian subject of modernity which assumes that Dasein is the Self:

> The assertion that it is I who in each case Dasein is, is ontically obvious; but this must not mislead us into supposing that the route for an ontological Interpretation of what is 'given' in this way has this been unmistakably prescribed. Indeed it remains questionable whether even the more ontical content of the above assertion does proper justice to the stock of phenomena belonging to everyday Dasein. It could be that the "who" of everyday Dasein just is *not* the "I myself." (Heidegger, 150)

If Dasein is in the world, it impossible that it is an isolated self without others (Heidegger, 152). Heidegger answers

the question of the "who" of Dasein by "analysing the kind of Being in which Dasein maintains itself proximally and for the most part" (Heidegger, 153). He has already explained that Dasein's being-in-the-world is revealed through its encounter with things. He now explains that this was a simplification for heuristic purposes; those things are now revealed as being connected with other Daseins. Our being-in-the-world is always with other Daseins: "The world of Dasein is a *with-world* [*Mitwelt*]. Being-in is *Being-with* Others. Their Being-in-themselves within-the-world is *Dasein-with* [*Mitdasein*]" (Heidegger, 155). We are always already with others.

Nancy argues that in 1933, at the time of his Rectoral Address, Heidegger failed to think the radical implications of the being-toward-death of Dasein along with its being-in-the-world with Others (Nancy, 1991a, 14). If he had, he would have realized that immanent community is impossible because of the mortality of its members. Community is "the presentation to its members of its mortal truth" (Nancy, 1991a, 15). As each member dies and another is born, the finitude of the community is revealed. Just as no interpretation can totally capture being within its grasp because of the finitude of individual Dasein, that same mortality precludes the possibility of any community representing a truth for eternity. No community can claim that it has embodied a transcendent truth-claim.

We are neither atomistic Cartesian subjects nor members of an immanentized community. According to Nancy, we are singular beings whose finitude is expressed ontologically through our "co-appearance" or "compearance" (*com-paraitre*) (28). We are born into this world which is already occupied by others and we are who we are only because others preceded our appearance, and we will die after structuring the world so as to influence those who will succeed us. Our finitude "always presents itself in being-in-common and as this being itself" (Nancy, 1991a, 28). This being-in-common, Nancy cautions, is not a social contract imposed over previously existing subjects. Being-in-common is the between itself. He writes this as "you shares me." Compearance is originary sharing and communication. For Nancy, being-in-common is understood ontologically: "existence is only in being partitioned and shared."[15] Community is the modalization of being. From this perspective, communism (Marxism), is "an ontological proposition, not a political option."[16]

Yet Nancy recognizes that ontology has political consequences. He is critical of totalitarianism, and he believes that even liberal democracies are a sort of soft totalitarianism, because they have extended the realm of the political to all aspects of life. This has resulted in the retreat of the political because there is no distinct place for the exercise of politics.[17] Politics must be reconceived in light of the recognition that our being is being-in-common. He writes:

> It thus can no longer be a question of better or worse regulation of the exercise of power - of political economy - by focusing on a "right" that is constantly menaced and rectified. The necessity of such "right" cannot hide the fact that it does not touch the "essence" of the "common." (Nancy:1992, 390)

Nancy has been accused of being a liberal quietist by Nancy Fraser and of being apolitical by Simon Critchley. Fraser claims that Nancy is afraid of getting his hands dirty in the rough and tumble world of politics.[18] Critchley argues that Nancy's apoliticism is a result of his Heideggerianism.[19] In his work published as part of the proceedings of the Centre for Philosophical Research on the Political (which he co-founded with Philippe Lacoue-Labarthe), Nancy broaches the question of how we can today investigate the "essence of the political." Nancy accepts the assertion that "everything is political," and that contemporaneity is consequently totalitarian. He therefore recommends dispensing with an analysis of "politics," understood as the mundane activity of elections and other activities commonly described as politics, in favour of an exploration of "the political," understood as the ontological realm in which politics takes place. Critchley argues that "the thesis of the domination of politics is assimilable to Heidegger's analysis of the contemporary world in terms of the total domination of technology, while the distinction between *le politique* and *la politique* is assimilable to Heidegger's distinction between the essence of technology ('which is nothing technological') and technology itself" (Critchley, 204). Restricting himself to reflection on "the political" is intended to avoid the pitfalls of metaphysics. Like Fraser, Critchley interprets Nancy's refusal to consider "politics" to mean the "rejection of the very genre of political debate, of dispute and dissension, persuasion and the battle over *doxa*" (Critchley, 215). Terry Eagleton criticizes non-Marxist theorists generally by stating that the "truth that neither liberal nor post-structuralist seems able to countenance is that there are certain key political struggles that someone is going to have to win and someone will have to lose."[20]

It is clear, at least in his later article *La Comparution*, that Nancy is not so apolitical as not to be concerned with injustice. In fact he demonstrates anger about the "stripping away" of community that has resulted in poverty, homelessness, racism, hunger, torture and other social evils (Nancy:1992, 375, 392). He recognizes that communities have historically been founded through the unjust process of excluding the "other". He tells us that this other is nothing but the "in" of the in-common (Nancy:1992, 392). According to him, we do not know yet what a politics would like look like that at once embraced community yet did not exclude the other. But it is precisely the absence of pre-determined knowledge that opens up the space for thinking (Nancy:1992, 393). Nancy has a fairly ethereal idea of what

politics would be like if it were consistent with his concept of community as the in-between:

> Even its [the in-between] presentation is multiple and expansive: art, thought, love, glory (to remain with only a few examples, of which the very names perhaps no longer apply). "Politics" would be the fragments whose particular property would be to diffract the "in" as such, or the compearance, without attribution or properties. (Nancy:1992, 390)

Giorgio Agamben, in his book *The Coming Community*, takes up Nancy's theme of dispersion and fragmentation and explores its medieval archive.[21] Agamben predicts that the coming community will express "whatever" being, being that partakes in both the common and the singular and is "reclaimed not for another class nor for the simple generic absence of any belonging, but for its being-*such*, for belonging itself" (Agamben, I). He interprets the medieval philosophers and Spinoza as having solved the problem of the universal and particular by asserting an *inessential* commonality, so that singularities are dispersed in existence rather than being united in essence. Whatever being exists in "an infinite series of modal oscillations" between commonality and singularity. (Agamben, V). It is impossible to fix a particular being either in its singularity or its commonality as it constantly fluctuates between both, and more importantly, it is precisely that fluctuation that characterizes its existence. Moreover, it is that characteristic that makes whatever being lovable:

> Love is never directed toward this or that property of the loved one (being blond, being small, being tender, being lame), but neither does it neglect the properties in favor of an insipid generality (universal love): The lover wants the loved one *with all of its predicates*, its being such as it is. (Agamben, I)

Agamben believes that the politics of the coming community is exemplified by the events of Tiananmen Square. According to him, the students demands of democracy and freedom were empty of content (!). What was threatening to the Chinese leaders was that the students denied the state the sole right to claim an essential identity for its inhabitants. Agamben argues that the students rejected the notion of belonging to a fixed category (Agamben, XIX). Whatever being threatens the State itself because it denies pure universality and pure singularity in favour of its own belonging-together. Agamben's interpretation of the demonstrations and subsequent massacre at Tiananmen Square

is debatable, at best. What is important about his interpretation of politics in the coming community is that it rejects essentialism in the name of love for beings as such.

Despite Nancy's vagueness and Agamben's political naivete, I would like to think their interpretations of community together and explore the possibility of articulating a non-essential community in light of their analyses. First, we must recognize that we are always already in community. Community is being-in-common and the sharing of life on this world between individuals who are always already inter-connected and sharing. Second, being exists in the oscillation between the universal and the particular, therefore it is impossible for any one person to belong to only one, essentialized community. I have plural identities: woman, Jew, political theorist (among others). Third, injustice takes the form of the excluded other, and justice must consist in trying to include it. Ethnic communities, for example, must realize that their members comprise women and men, gays and straights, rich and poor, just as feminist or gay communities must recognize the diversity of their memberships.

If identity is understood as plural, shifting, and contingent, then traditional modes and definitions of politics are called into question. I would like to offer Cornelius Castoriadis' definition:

> Politics is not a matter of municipal elections, nor even presidential ones. Politics, in the true sense of the term, puts into question the actual institution of society; it is the activity that tries to aim clearly at the social as such.[22]

This means that politics cannot be founded on any determinate collective state. It is inextricably related to the social interaction of human beings. Political activity "does not have a referent external to itself" (Castoriadis, 127). It consists in a constant questioning of who we are and how we are to organize our society (thought broadly). Many of the groups practicing what has been called identity politics, African-Americans, feminists and gays, among others, are resisting the reified communities which had excluded them, communities based on the suppression of difference and the metaphysics of presence. However, they also invoke the term community. Linda Singer explains:

> But ironically, the term that is supposed to supersede the disruptive effects of difference can also be appropriated for discourses of differentiation. When gays, blacks, and feminists, for example, appeal to

> the notion of community as part of a movement rhetoric or on their own behalf, that appeal takes the form of a demand, a demand for the recognition of differences and the systematic asymmetries they produce. For a member of a marginalized group, the invocation of community marks an existentially and politically vital site of affiliation, and refusal of false enclosure or erasure.[23]

Many of these groups, although not all, are willing to join with others to achieve common goals. For example, so-called minority groups and the poor have realized that environmental degradation disproportionately affects their neighbourhoods and have made common cause with environmentalists, who are learning to view ecology as a civil rights issue. This does not mean that African-Americans will abandon their greater political agenda in order to concentrate on pollution, nor will the green movement be absorbed by the NAACP. It means only that both groups recognize their being-in-common and have come to exercise what Chantal Mouffe calls radical democratic citizenship. Her view of citizenship "rejects the idea of an abstract universalist definition of the public" and suggests instead that citizenship "consists in identifying with the ethic-political principles of modern democracy and that there can be as many forms of citizenship as there are interpretations of those principles."[24] The ethical principles of the modern project she wishes to retain are liberty and equality:

> In the case of a radical democratic citizen, such an approach allows us to envision how a concern with equality and liberty should inform one's actions in all areas of social life. No sphere is immune from these concerns, and relations of domination can be challenged everywhere. Nevertheless, we are not dealing with a purposive kind of community affirming one single goal for all its members, and the freedom of the individual is preserved. (Mouffe, 81)

To the extend that the multi-culturalists, the proponents of identity politics and the cultural politics of difference, and other progressive social movements are attempting to enact these principles, they contribute to arrival of the coming community.

Conclusion

Inevitably, we must consider whether it is possible to convince others of a non-essentialist concept of community. The answer, unfortunately, is that it is not. We cannot tell the Serbs that they are in the grip of an out-dated metanarrative,

that their identity is imagined and can be re-imagined to include the Bosnians and Croatians. However, we can interrogate how the communities to which we belong are responding to this and other tragedies, whether we are doing are best to oppose domination and discrimination and hasten the arrival of the coming community.

The Impact of Comprehensiveness on Quality: The Case of Public Schools

Stephanie A. Slocum

The American University

Abstract

While it is clear that the quality of secondary education in the United States is poor, the debate over the potential causes and remedies for the situation continues. Critics have recently claimed that the structure of the comprehensive public high school is a major contributor to today's educational malaise - first on the basis of the predictions of bureaucracy theory that comprehensiveness leads to loss of competition and near-bureaucratic monopoly, and second on the basis of the argument that in the rush for inclusiveness and diversity, the aim of excellence has been obscured in comprehensive schools. This paper attempts to determine whether the theoretical critique is consistent with the actual performance of public schools by testing the hypothesis that as comprehensiveness increases, quality indicators such as drop-out rates and achievement scores are adversely affected. The results are not consistent with the theoretical critique but indicate that comprehensiveness serves to increase achievement in American public high schools.

> Why do we seek to know the condition of education? In the answer to this question will be found the reason for the elaborate statistical record which forms a feature of all official school reports. We take account of education so that we may know whether it is sufficient in amount and good in quality.
>
> Henry Barnard
> First Commissioner of Education

It was during the 1960's and 70's, that a multitude of researchers (Becker, 1975; Schultz, 1971; Hanoch, 1967; Hansen, 1963) empirically validated what most everybody already suspected - that a high school education is extremely important to the future success of young adults in the United States of America. In particular, it was found that the rates of return on a high school education were high and were increasing, and that these rates even outpaced those for a college education (Becker, 1975). While it has thus been long known that a high school education is extremely important for the individual, there is no question among scholars and practioners alike that the condition of public education in the United States is dismal.

The evidence of the failure of the American educational system is everywhere, and the nation has slowly come to realize the extent of the problem. One major turning point came in 1983, when the National Commission on Excellence in Education published a study called "A Nation at Risk". That study shook the very foundations of the educational system with its depressing descriptions of poor quality and its gloomy predictions for the future. Since then, the bad news has continued to mount. The National Educational Longitudinal study of 1988, for example, indicated that the composite drop-out rate for the nation rose every year from 1968 to 1986. And more recent work suggests that America's educational system fails about one in four students: twenty-five percent of all high school students drop out before graduating. In large cities, that rate nears 50 percent (Toby & Armor, 1992; Chubb & Moe, 1990).

The difficulties go beyond drop-out rates however. Standardized test scores also have declined consistently (National Center for Education Statistics, 1990). For example, one study found that Standardized Achievement Test (SAT) scores fell from an average of 978 points to 890 points in less than two decades (Boaz, 1991), and others have found the same level of decline in scores on other standardized tests (Niskanen, 1991). While it has been argued that this decline might have been caused by the democratization of the pool of college-bound students, the most recent work indicates that it is, rather, a result of the mediocritazation of the college track in America's high schools (Toby & Armor, 1992; Murray & Hernstein, 1992). Furthermore, the test scores of American students in international competitions are abysmal (Glazer, 1992; Niskanen, 1991).

The problems of the educational system are further compounded when one considers the performance of minority students. It is clear that the crisis in education is nowhere more severe than in the case of America's minority students (Murphy, 1991; Boaz, 1991; Coleman, 1990; Sowell, 1986). All of these indicators demonstrate that the quality of education in America has steadily declined, particularly in the inner cities, and all the while spending in this area has soared. Conservative estimates put the increase at about 40 percent per decade (Niskanen, 1991).

These reports about the crisis in American education have prompted an outpouring of public concern. Parent groups, political candidates, and presidents have all joined in the chorus of voices demanding reform. What is the cause of this low educational quality? What can we do to fix it? These are the questions that require immediate answers. Most recently, reformers have been looking at the comprehensive high school as the cause of our educational woes, and their solution is to have those schools dismantled.

The Role of Reform and the Comprehensive High School

This outpouring of concern is not new to the American educational system, and proposals and implementations of reform have been common. One of the first and most important waves of reform, for example, brought major institutional change during the progressive era. It revolutionized American education over the first half of the 20th century by creating a true system of public schools in response to a society that was becoming increasingly urban and industrialized (Tyack, 1974). The system was designed to ensure that education would be taken out of the arena of politics and placed in the hands of 'impartial experts' devoted to the public interest. This was thought to be the "one best system" (Chubb and Moe, 1990; Tyack, 1974). The winners in this revolution (the experts) and their institutions became deeply entrenched. At the heart of their system is the familiar school district and its institutions of democratic control: the school board, the superintendent, and the district office. All of these institutions gain their authority from the state government, and all of them still remain in control today.

There have been other proposals of educational reform ever since that 'one best system' was born, but one of the largest and most successful reforms originated in the 1960's with Harvard University President James B. Conant. In 1959, he published a report entitled The American High School Today that changed the face of education in the United States. He convinced the nation that public secondary schools should be large and "comprehensive". Such schools, he argued, could offer students a sufficiently broad curriculum through economies of scale. And by tending to the educational needs of all students under one roof, they would be an important source of democratic spirit in public education.

Proponents of the comprehensive public school have since argued that it provides a solid educational experience for all of its students, not just the students who do particularly well academically. Thus the comprehensive high school provides a place for all students, even students who want vocational training. The proponents argue that it is important to keep the mission of the public high school in mind: to provide a quality education for all of America's children and to encourage unity, cohesiveness, and a common core of values among citizens (Levin, 1987; Sullivan, 1979; Butts, 1978; Beales, 1967).

Furthermore, the comprehensive high school offers the value of a widely diverse student body and faculty, and this characteristic ensures a well-rounded experience for students who attend such schools. Many parents value highly the opportunity for their children to have that kind of educational experience, and the proponents of comprehensive public school claim that most school professionals, students, and parents are convinced that program variety is one of the best features of high school (Powell et al., 1985). Thus the comprehensive public high school is seen as central to the formation of understanding, educated, and effective participants in a representative democracy.

Conant believed that large, comprehensive public schools could provide both quality and efficiency through educational economies of scale, and his suggestions profoundly changed the face of education in the United States. In many areas, the comprehensive public high school now dominates. In fact, research has verified that consolidation and enlargement of existing jurisdictions has been taking place in response to Conant: in the period between 1950 and 1980, there has been a sharp decline in the number of school districts (Kenny & Schmidt, 1991).

The Critique of the Comprehensive High School

America embraced the concept of the comprehensive high school, and its structure and organization have come to be very familiar in the landscape of public education. However, critics have recently called for an end to Conant's model for two different reasons. First, some argue that the call to comprehensive schools, and the resulting consolidation of school districts, has had disastrous consequences for the quality and efficiency of educational services. Consolidation, they argue, leads to reduced competition among schools. This argument is based upon both Tiebout's theory (1956) and the theory of bureaucratic discretion: budget maximization by bureaucrats can be more effectively pursued the larger the size of the jurisdiction in which they operate. The higher the cost of mobility to citizens, ceteris paribus, the less optimal the allocation of resources (Tiebout, 1956). This is the reason, they say, for the abysmal quality of education in the United States.

Several scholars have provided empirical support for this argument by demonstrating that whenever local government competition is decreased through annexation, consolidation, or centralization, the result is poor service provision (Nellor, 1984; Sjoquist, 1982; West, 1981; Staaf, 1977; Cook, 1975; Stigler, 1972). It is also believed that the established bureaucracy will organize itself to obstruct all threats to its monopoly (Everhart, 1982). Thus, any of the benefit derived from consolidation due to economies of scale (Kenny, 1982; Riew, 1966) is absorbed by bureaucrats through monopoly power (Martin & McKenzie, 1975), resulting in no economies of scale or diseconomies of scale (Burnell, 1991; Hirsch, 1970). The fact that a recent study indicates that private schools produce higher quality education than public schools because their organization allows them to have far greater autonomy from external, bureaucratic control (Chubb & Moe, 1990) only lends credence to this argument.

The second critique of the Conant model focuses more closely on the comprehensive schools themselves. These critics claim that the consolidation of school districts and the challenges of an increasingly diversified student body force schools to provide something for everyone in order to stay in business. Comprehensive schools have thus had to expand almost limitlessly the variety of experiences considered educationally valid (Sizer, 1987; Hampel, 1986; Powell, Farrar & Cohen, 1985; Sizer 1984; Sizer, 1983). The problem, according to these scholars, is that in the rush for inclusiveness and diversity, the aim of excellence has been obscured.

These scholars contend that the size and organization of comprehensive schools create anonymity, making it very difficult to achieve the kind of one-on-one engagement that good learning requires, and guaranteeing mediocrity in the process (Sizer, 1987). The comprehensive public high school is too large, cold, and impersonal (Toch, 1991). In urban schools particularly, students are just numbers in a computer and the principal is only a voice heard over the public address system. Such a bleak environment, maintain the critics, contributes to the drop-out problem and deepens the sense of alienation and purposelessness that already plagues America's high school students. They claim that it has led many students to seek refuge in part-time jobs of up to 40 hours a week, and in many schools truancy is so bad that officials have resorted to what can only be described as bribing students to come to school (Toby & Armor, 1992; Toch, 1991).

Many scholars contend, on the basis of these two arguments, that Conant's model should be abandoned and that comprehensive public high schools should be divided-up into small units. They point to the demonstrated superiority of smaller, specialized private schools. Research has shown those private schools to consistently produce a higher level of educational quality while spending less money (although it is very difficult to control for self-selection in such cases) (Niskanen, 1991; Chubb & Moe, 1990; Coleman, 1990; Chubb & Moe, 1988; Coleman & Hoffer, 1987; Coleman, Hoffer & Kilgore, 1982).

Model Specification

While the critics have called loudly for the abandonment of the comprehensive school system, the hypothesis that a comprehensive school structure results in lower overall educational quality has never been empirically tested. The purpose of this paper, therefore, is to test just such a hypothesis. Of primary interest is the effect of comprehensiveness on such quality indicators as standardized test scores and drop-out rates. However, other issues are also of concern in examining the relationship between comprehensiveness and quality. For example, the question of whether or not comprehensive schools do tend to be large in size is of importance in empirically exploring the critiques that have been made of comprehensive schools. Furthermore, several supporting hypotheses must also be considered. In particular, it will be useful to know if comprehensiveness is related to increased truancy and if comprehensiveness encourages students to seek refuge in outside employment, as the critics have suggested.

With regards to the primary hypothesis, there are several other factors that must be controlled for in order to isolate the effect of comprehensiveness on quality. These factors are related to socioeconomic status, race, and urbanization. The primary hypothesis to be tested can thus be represented in conceptual terms in the following reduced form equation:

$$QUALITY = f(COMP, SES, MIN, URBAN)$$

All of the variables used to operationalize the above equation are based on data from the *High School and Beyond* longitudinal study, and they are drawn from the base year survey, which was conducted in the Spring of 1980. The study design provided for a highly stratified national probability sample of over 30,000 sophomores and 28,000 seniors enrolled in 1,015 public and private high schools across the country. With the exception of certain special strata which were oversampled, schools were selected with probabilities proportional to their estimated enrollment in the 10th and 12th grades. All variables are defined at the school level of aggregation and in terms of public schools only.

The QUALITY variable is used to measure the quality of educational output. From the critiques presented of Conant's comprehensive schools and from the evidence used to conclude that current educational quality is low, it is clear that both drop-out rates and standardized test scores must be used to measure quality. The operational measure of drop-out rates is the percentage of students who entered tenth grade but dropped-out before graduation. This measure does not include transfers. The measure of standardized achievement scores is drawn from the study's composite test scores, which were calculated from tests administered by the survey team. Using these scores ensures comparability across schools. The composite test score was computed as an average of

the non-missing scores among one quantitative, two vocabulary, and two mathematical tests.

The variable included to measure comprehensiveness is the number of special programs offered by each school (COMP). A large number of programs provided by a school should result in reductions in school quality according to the primary hypothesis. The program index was constructed by increasing the index by a value of one for each additional "special" program provided by a school. Potential programs included bilingual programs, consumer and homemaking vocational programs, cooperative vocational education programs, work-study programs, advanced science and mathematics programs, as well as art and drafting programs. There were 32 potential programs in all.

The SES variable measures the average socioeconomic status of students attending each school. This variable was calculated on the basis of several components: parent's education and occupation, family income, and material possessions in the household. Many studies have concluded that family background measures such as socioeconomic status are key in determining a student's performance in secondary school (Coleman, 1990; Chubb & Moe, 1990; Coleman & Hoffer, 1987; Coleman, Hoffer & Kilgore, 1982), and therefore socioeconomic status must be included as a control variable. If socioeconomic status is significant at this level of aggregation, then high SES is expected to increase test scores and decrease drop-out rates.

Race has also been shown to have a profound influence on both achievement and the tendency to drop out of school (Boaz, 1991; Coleman, 1990; Sowell, 1986), and so the MIN variable has been included to measure the percentage of students in each school who are racial minorities. This variable was computed by adding together the reported percentages of hispanic and black students attending each school. It is expected that this variable will have a negative coefficient with respect to test scores and a positive coefficient with respect to drop-out rates.

The URBAN variable is included in the equation in order to control for the impact of urbanization on educational quality. It is clear from previous research that inner city schools have the worst track record with regard to quality (Boaz, 1991; Coleman, 1990; Sowell, 1986). This variable is presented as a dummy variable, with urban and suburban schools coded as one or zero as appropriate, and with rural schools as the reference group. it is expected that urban schools will show lower levels of educational quality.

Finally, in exploring the veracity of the expectation that comprehensive schools are particularly large institutions, size is measured as the number of students enrolled in each school. In terms of the supporting hypotheses, truancy is measured as the mean number of days students reported being absent from school but not ill, and part-time work takes on the operational definition of the mean number of hours students from each school work per week in their current job. It is expected that comprehensiveness will be positively correlated with both variables.

Empirical Results

It is interesting to note before proceeding directly to the test of the primary hypothesis that many schools in the study resemble the comprehensive public school. Figure 1 demonstrates that many schools do offer a wide range of educational choices. No public school offers less than nine special programs, and more than 75 percent of schools offer 20 or more programs out of a possible total of 32. These results indicate that there is a general tendency of public high schools to resemble Conant's comprehensive school.

Figure 1: Frequency Distribution for Comprehensiveness

Number of Programs	Percentage of Schools with those Programs	Cumulative Percent
9	0.1	0.1
10	0.2	0.2
11	0.3	0.5
12	0.3	0.9
13	0.5	1.4
14	1.6	3.0
15	2.6	5.6
16	2.6	8.2
17	4.3	12.4
18	5.5	17.9
19	6.5	24.4
20	8.5	32.9
21	9.7	42.6
22	13.1	55.7
23	9.9	65.6
24	7.0	72.6
25	8.3	81.0
26	9.1	90.1
27	4.6	94.7
28	3.1	97.8
29	1.7	99.5
30	0.4	99.8
31	0.2	100.0

According to the critics of Conant's model, there should also be evidence that comprehensive high schools are 'large, cold, and impersonal'. However, a simple Pearson's correlation indicates that although enrollment size and comprehensiveness are significantly correlated ($p<0.0001$), the relationship is extremely weak at $r=0.231$ ($n=4100$). These findings call into question some

of the claims of the critics about the environment that students experience in the comprehensive public school system.

However, the fact that comprehensiveness does not necessarily mean large enrollment size is only one small piece of the puzzle. Two direct tests of the primary hypothesis give a more substantial, and perhaps more surprising, view of the performance of our comprehensive schools. The empirical results from the estimation of the ordinary least squares regression equations for drop-out rates (Model 1) and for achievement scores (Model 2) are presented in Figure 2.

The explanatory power of the equations is not particularly high. However, high R-squares were not expected in this case since the purpose of these tests was neither to predict drop-out rates and achievement scores, nor to describe each variable that might influence them, but merely to see the impact of comprehensiveness on quality while controlling for a few relevant variables. It may be suggested that such control variables as the degree of truancy, the number of hours worked outside the school, enrollment size, and the degree of disciplinary problems should have been included in the model. While the addition of such variables would have undoubtedly raised the explanatory power of the equations, it would have simultaneously ensured that the proposed tendency of comprehensive schools to foster such problems would go untested, thus biasing the equations in favor of finding little negative impact on quality by comprehensiveness. For this reason, several potential explanatory variables were not included in the model.

Figure 2: Regression Results for Comprehensiveness Equations

Variable	Model 1	Model 2
COMP	0.097*	0.120***
	(2.75)	(6.54)
SES	-0.000	0.004***
	(0.53)	(15.05)
MIN	0.047***	-0.082***
	(8.83)	(26.75)
SUBURB	-0.725*	0.193
	(2.74)	(1.37)
URBAN	3.597***	1.116***
	(9.77)	(5.70)
R-SQUARE	0.106***	0.298***

t-values are in parentheses
* significant at p<0.01; *** significant at p<0.0001

The socioeconomic status variable is significant and has the expected positive coefficient in Model 2, although its impact on test scores is negligible. The SES variable also has the expected negative coefficient with respect to drop-out rates (Model 1), but it is not significant. This suggests that at the school level of aggregation, and with the inclusion of the minority and urbanization control variables, socioeconomic status does not have a significantly strong impact on educational quality. It may be argued that alternative measures for the influence of family background, such as parent interest in the student and their educational experience, must then be included in the model. However, it should be noted that such variables do not make much theoretical sense at the school level of aggregation.

The MIN variable, representing the percentage of minority students attending each school, is highly significant and has the expected sign in both models. The SUBURB variable also performs as expected for both models: it has a significant negative impact on drop-out rates, indicating that schools in a suburban setting tend to have a lower percentage of drop-outs than rural schools, and it has a positive impact on test scores, although it is not significant.

On the other side of the SUBURB dummy variable, the URBAN variable is highly significant for both models. The large, positive impact that it has on drop-out rates (Model 1) is not a surprise. However, the URBAN variable has a positive coefficient with regards to test scores (Model 2), contrary to expectations. This indicates that schools in urban areas tend to have higher levels of student achievement than schools in rural areas. One possible explanation for this result is that suburban schools and urban schools both outperform schools in rural areas on measures of achievement, while urban schools are still plagued with the particular problem of high drop-out rates. The results presented here thus generally reaffirm the findings of previous research which suggests that race and urbanization have an impact on educational quality.

The primary variable of interest here is COMP, which is intended to measure the degree of comprehensiveness of each high school. As Figure 2 indicates, the coefficient of this variable is positive and significant for both equations. However, this result is not consistent with the theoretical critique of Conant's comprehensive public high schools. With regards to Model 1, the COMP variable performs as is expected: comprehensiveness does have a significant and positive influence on drop-out rates, but its actual impact is small. This result suggests that comprehensiveness alone cannot be the only factor, nor even an important factor, in the continuing problem of high drop-out rates. Furthermore, the COMP variable has a surprisingly positive and highly significant impact on test scores, indicating that increasing the comprehensiveness of a school leads to increases rather than decreases in performance on standardized tests. This finding is completely contrary to the expectations raised by the critique of the Conant model.

The positive impact of comprehensiveness on quality in the case of both drop-out rates and test scores has several possible implications. First, it may suggest that comprehensiveness has a different impact on different types of students. These results may indicate, for example, that students who are self-directed or who receive guidance at home really thrive in the comprehensive school environment. In such an environment, there is much to choose from, and these students can take advantage of the array of choices and thus excel to high standards of achievement. Of equal concern, however, are the students who are not sure what they want out of their high school education. Such students may find an environment of comprehensiveness to be overwhelming; they may not get enough encouragement or guidance in that environment. Such students may then be more likely to give up on high school all together.

It may also be more generally that comprehensive schools are not fulfilling their mission of inclusiveness. If greater comprehensiveness leads even a few more students to give up on school, then the comprehensive public high school cannot be doing such a great job of serving its consumer. It may be that the loss of competition among schools predicted by bureaucracy theory to be the outcome of comprehensiveness and jurisdiction consolidation, does indeed lead to complacency on the part of those schools in terms of satisfying the customer. It was suggested by the theoretical critique of Conant's comprehensive schools that the environment in these schools is so bleak for some students that they avoid coming to school at costs, even to the point of seeking refuge in a part-time job. The empirical data suggests otherwise, however. A Pearson's correlation of comprehensiveness with truancy rates shows an insignificant ($p=0.141$) and negative relationship ($r= -0.023$) between the two, contrary to the claims of the critics. Furthermore, the relationship between comprehensiveness and the number of hours worked per week outside of school is also negative ($r= -0.007$) and insignificant ($p=0.643$).

The empirical results presented here do not provide support for the theoretical critique of the comprehensive public school. Although there is some support for the critique in the positive impact of COMP on drop-out rates, that impact is slight. Furthermore, the correlation between comprehensiveness and size is so weak that comprehensive schools cannot be the 'large, cold, impersonal' places that the critics claim them to be, and there is no apparent relationship between comprehensiveness and either truancy or the number of hours worked outside of school. Finally, the impact of COMP on test scores demonstrates that Conant's comprehensive high schools may produce higher achievement than non-comprehensive schools, a finding that is completely contrary to the theoretical predictions of the critique.

Implications and Conclusion

The purpose of this paper was to analyze the relationship between comprehensiveness and educational quality. Specifically,

it was an attempt to determine whether or not empirical evidence supports the theoretical critique of the comprehensive public high school and the calls for its destruction. The empirical results do not support the predictions of poor quality on the part of comprehensive schools. When other factors - socioeconomic status, race, and urbanization - are held constant, it appears that comprehensiveness has little impact on quality in terms of drop-out rates, and a positive impact on quality with regards to achievement. Thus, the claim that the comprehensive schools' goals of inclusiveness and diversity have meant the death of excellence is certainly not supported by the empirical evidence presented here.

These results may have some important consequences for our public education system. The contention that Conant's reforms of the 1960's were a miserable failure and a major contributor to today's educational malaise, and the claim that all such schools need to be either dissected or destroyed, is at best overblown. While concerns about the quality of comprehensive schools may thus be alleviated by these findings, the question raised by bureaucracy theory about the efficiency of consolidating schools and school districts is still a valid concern. This issue is certainly deserving of additional research.

In the meanwhile, scholars, practioners, and politicians all must continue the search for the sources and remedies of today's crisis in education. While we have less to worry about in the performance of our comprehensive public schools, the field is open to a myriad of other factors that affect educational quality. It is not enough to know that race, urbanization, and family background all have an impact on the quality of educational outputs. We must also know what to do about them, and questions about privatization and the role of choice certainly remain open. However, the study of the comprehensive high school reminds us that in the rush for academic excellence and high performance, we must not lose sight of one of public education's principle missions: preparing <u>all</u> youngsters for life in the adult world.

Alliance Formation and War.

by Alastair Smith.

Department of Political Science,
Harkness Hall,
University of Rochester,
Rochester NY 14627.

This paper was prepared for presentation at the American Political Science Association meeting 1993. I would like to thank David Austen-Smith, Jeff Banks, Bruce Bueno de Mesquita, Daniel Diermeier, Fiona McGillivray, T. Clifton Morgan and James Morrow for their help and advice. I remain liable for all errors.

Abstract.

This paper integrates alliance formation, alliance reliability and the effects of alliances on the occurrence of conflict into a simple game theoretic model. A simple model of conflict is presented (the conflict subgame) in which three nations compete over land. How non-binding but costly alliances affect the behaviour of nations in the conflict subgame is demonstrated. Given the effects of different alliances on conflict, those alliances that nations actually want to form in any particular situation can be calculated. When the formation of alliances is endogenous to the behavior within a complete information game of warfare, then the alliances that form are all reliable. Offensive alliances are seen to occur only rarely. Defensive alliances are shown to be able to both stabilize or destabilize the system. However, in equilibrium defensive alliances can not decrease the security of their members.

Introduction.

The study of alliances has been broken up into three lines of research: the relationship between alliances formation and the occurrence of war, the motivations for the formation of alliances and the reliability of alliances. In this paper I argue that these three processes are interconnected and any attempt to theorize about the role of alliances in international relations must consider how these factors interact. Specifically, I maintain that reliability and security issues must be endogenous to any explanation of alliance formation and that empirical works relating alliances to wars that don not consider this are flawed.

The Correlates of War project (COW) has produced a data set containing war and alliance data since 1815. Using these data, Singer and Small [1968] were among the first to establish an empirical link between alliances and war. Vasquez [1987] provides a comprehensive summary of the extensive empirical work on the alliance-war relationship. He summaries the two major findings of this work as:

"First, alliances do not prevent war or promote peace; instead

> they are associated with war, although they are probably not a cause of war. Second, the major consequence of alliances is to expand war once it has started; in the war alliances are important in accounting for the magnitude and severity of war." [Vasquez 1987, p119].

Attempts to establish what is driving the links between war and alliances has lead to the inclusion of intervening variables such as system polarization [Wallace 1973 and Bueno de Mesquita 1978]. However, this inductive method of analysis has not brought us any closer to understanding the underlying relationship between alliances and war because the empirical evidence is often contradictory and generically inconclusive [for example see Ostrom and Hoole 1978]. Similarly, findings about the reliability of alliances are also mixed [Sabrosky 1980, Siverson and King 1980, Altfeld and Bueno de Mesquita 1979].

Levy provides a summary of the different hypotheses purported to explain how alliances effect the occurrence of conflict [1984, p582-584]. However, as Levy notes, little systematic evidence can be presented to back these hypotheses.

> "There are clearly a variety of plausible theoretical linkages between alliances and war (or peace). Recent empirical studies have yet to demonstrate conclusively, however, which of these complex linkages is the most important, in conjunction with which other factors, and under which conditions" [Levy, 1984 p.584]

I maintain that the lack of conclusive support for any particular set of hypotheses reflects the lack of theoretical understanding about how alliance formation, alliance reliability and allied conflict interact. In order to fully explain the role of alliances in the international system all three theoretical relationships must be considered simultaneously.

Some efforts have been made to endogenise alliance formation

into models of war, for example Niou and Ordeshook [1992] and Morrow [1986], but these models have assumed that alliances are reliable. In this paper I allow nations a choice about whether to honour their alliance commitments.

It is my intention to present a simple extensive form game, which I call the conflict subgame, where nations can use military might in order to obtain resources. Given this model of warfare, I ask can non binding alliances alter outcomes? In order to answer this I ask supposing there were an alliance how would this affect the behaviour of nations in the conflict subgame? Finally, given how the presence of alliances affects outcomes in the conflict subgame, I ask which alliances can nations form, thereby moving towards a theory of endogenous alliance formation.

Nations are assumed to be in competition over a transferable resource. The concept of a transferable resource is fairly general, but for the purposes of this paper I consider a single resource, land. More generally these resources can be any good, tangible or not, that nations care about.[1] Although nations want to maximize the expected size of their territories, they are assumed to be sensitive to domestic constraints which impose costs on leaders who indulge in violent acts and alliance politics. If a nation enters a war, then the leader of the nation faces both real and domestic costs due to the real cost of equipping the military and the destruction caused, as well as civilian reaction to lower domestic consumption and the casualties caused. Leaders also face costs to bullying other nations and to giving in to violence.[2]

Before proceeding any further it is worth asking what is an alliance? I define an alliance as an agreement between two nations, entered into voluntarily, that represents a non-binding commitment to help each other in event of armed conflict. This contrasts with a coalition, which is a set of nations that fight

together in a war, whether or not they had any prior agreement to do so. Alliances are assumed to be non-binding. Given the anarchic nature of international relations and the evidence that alliances are not always honoured, there are both theoretical and empirical justifications behind this assumption [Sabrosky 1980, Altfeld and Bueno de Mesquita 1979 and Siverson and King 1980].

Given the characterization of alliances above, we should ask why nations sign alliances given that they are non-binding and that nations can always fight together even if they do have an alliance. Arguments have been made that the alliances signal the strength of commitment that nations have towards each other and so inform possible aggressors [Morrow 1993]. While informational aspects can not be ignored, it is my intention to consider complete information situations. Specifically, I suppose that there are costs associated with alliance formation and alliance failure and ask how these costs affect nations' actions.

Traditional realist arguments, such as those by Snyder and Diesing [1977], state that alliances are honoured in order to maintain reputations, which allow nations to form alliances in the future. Alt, Calvert and Humes [1988] have formalized these reputational costs to show that in order to maintain a reputation nations will sometimes choose myopically suboptimal actions. In other models of alliance formation, alliance have been associated with other costs, such as loss of autonomy [Altfeld 1988] or trade externalities [Gowa 1989]. Recent empirical studies have shown that leaders face domestic costs associated with their foreign policy decisions [Bueno de Mesquita, Siverson and Woller 1992]. This provides evidence that leaders are sensitive to domestic costs.

Given the above considerations I assert that costs exist to making and breaking alliances. Since this model does not explicitly consider the domestic arrangements in each country, the

costs considered here are generated exogenously. What is important about these domestic costs is that the difference in expected utility between fighting in a coalition and not fighting changes if a nation is a member of an alliance. The specific domestic costs considered are summarized in the table below for a generic alliance between nations j and k:

Domestic cost	Interpretation	cost/ benefit
$f(jk)_j$	Domestic value that nation j associates with forming an alliance with nation k if the alliance results in peace.	either
$e(jk)_j$	Domestic cost nation j associates with attacking its ally nation k.	cost
$h(jk)_j$	Domestic cost nation j associates with failing to honour its alliance to nation k.	cost
$i(jk)_j$	Domestic cost nation j associates with being attacked by its ally nation k.	cost
$g(jk)_j$	Domestic cost for nation j if its ally fails to help it during a war.	cost

Failing to honour an alliance is defined as follows: If nations j and k have an alliance, and j becomes involved in a war and k fails to form a coalition with j then the alliance is said to have failed. If k forms a coalition with j then the alliance is honoured.

THE MODEL.

The conflict subgame will now be presented. Following this the effect of various exogenously generated alliances will be considered. Formally, there are three nations, {A, B, C}. These nations have military capabilities, arms= (w_a, w_b, w_c). There is a

distribution of land amongst the three nations, $d \in \{(d_a, d_b, d_c): d_i \geq 0$ for $i=a,b,c$ and $d_a+d_b+d_c=1\}$. There is a set of possible alliances AL = {(AB), (AC), (BC), (ø)}, where (ø) represents no alliance being present, (AB) represents an alliance between A and B, etc.[3] Each alliance has associated costs which were detailed above.

The game tree is shown in figure 1. Without loss of generality assume that nation A has the opportunity to attack. Nation A can attack nation B and if attacked B must decide whether to retaliate or acquiesce. If a war occurs then C must decide whether to join the conflict and if so on which side. The terminal nodes are labelled #1-#5.

At each non-terminal node $n \in N=\{1,2,3\}$ let the action sets be $\alpha=\{ø,B\}$, $\beta=\{r,ø\}$ and $\gamma=\{ø,B,A\}$, respectively. A's set of actions is either to remain peaceful or attack B, B's set of actions is to retaliate or acquiesce and C's set of actions is to remain neutral, attack B or attack A.

A strategy is a mapping from arms, distribution of territory and alliances into actions. A strategy profile is a triple $s=(s_a,s_b,s_c)$ where $s_a \in \alpha$, $s_b \in \beta$ and $s_c \in \gamma$.[4] To simplify the notation, strategies are expressed as a function of the alliance state only. Let θ be the mapping from strategy profiles, $S=\{s:s=(s_A,s_B,s_C)\}$ into outcomes as described by the game tree, $\theta:S \rightarrow \{\#1,\ldots,\#5\}$. Thus if the alliance state is (AB) and the strategy profile is $s^*(AB)$ then the outcome of conflict subgame is $\theta(s^*(AB))$.

At the end of the game each nation is rewarded according to the outcome. If a nation acquiesces to an attack then all of its lands are transferred to the aggressor. If a war occurs then the distribution of territory at the end of the game is determined probabilistically. Specifically if a coalition of B and C fight nation A then the probability that the coalition wins is $(w_b+w_c)/(w_a+w_b+w_c)$. This function, often known as the capabilities aggregation model, captures the monotonic relationship between armaments and the probability of victory.

The losing coalition loses sovereignty over its lands, which are transferred to the victorious coalition.[5] If there are two members in a victorious coalition then they will divide the resources of the vanquished between them according to relative size of the forces that they contributed. For example if B and C defeat A and $w_b=2w_c$, then B gets two thirds of d_a.

Since violent actions are costly, any nation i involved in a war pays a cost, war_i. Unreciprocated violent acts are also costly to both the aggressor and the victim, I let this cost be z_i and assume that $war_a \geq z_a$.

The solution concept is subgame perfect Nash equilibrium. At any information set, $n \in N$, define Γ^n to be all the nodes/information sets that follow n sequentially in the game tree (Γ^n is a sub-game). s_j is a best response to s_{-j} in some subgame Γ^n if and only if $U_j(\theta(s_j,s_{-j})) \geq U_j(\theta(s_j',s_{-j}))\ \forall s_j'$. If (s_A^*, s_B^*, s_C^*) is a subgame perfect Nash equilibrium (SPE) then s_A^*, s_B^* and s_C^* are mutually best responses in Γ^n, $\forall n \epsilon N$.

RESULTS

Firstly, the conflict subgame is considered in isolation from alliance effects. For simplicity during the proofs it is assumed that no alliance exists although it is simple to show that the first four results do not depend on the alliance structure. A full characterization of subgame perfect equilibria on which these results are based is included in the appendix. It should be noted that these propositions do not contain a full description of the equilibria but instead focus on those elements that are relevant to the substantive questions.

The main substantive results are propositions 9, 10 and 11. The earlier results provide context for these propositions. In particular propositions 1-4 just outline the behaviour of the nations in the conflict subgame and are not essential to the argument for endogenous alliance formation.

Proposition 1.

The probability that nation C will enter a war between A and B is non-decreasing as w_c increases, d_c decreases and war_c decreases.

Proof. If C remains neutral then it can guarantee a payoff of $U_c(\#2) = d_c$. If C decides to join the war then it receives either $U_c(\#3)=((w_a+w_c)/(w_a+w_b+w_c))*(d_c+(w_c/w_a+w_c)*d_b)-war_c$ or $U_c(\#4)=((w_b+w_c)/(w_a+w_b+w_c))*(d_c+(wc/(w_b+w_c))*d_a)-war_c$. In general if C fights with j against k then $U_c(s=(B,r,k))=$ $((w_j+w_c)/(w_a+w_b+w_c))*[d_c+((w_c/(w_c+w_j))*d_k)]-war_c$. Given the definition of subgame perfection the probability of C attacking k is zero if $U_c(\theta(B,r,k)) * \max\{U_c(\#2),U_c(\#3),U_c(\#4)\}$. Therefore the probability of C attacking k is a non decreasing monotone of $U_c(\theta(B,r,k))-U_c(\theta(B,r,\varnothing))$. Since $\partial(U_c(\theta(B,r,k))-U_c(\theta(B,r,\varnothing)))/\partial w_c > 0$, $\partial(U_c(\theta(B,r,k))-U_c(\theta(B,r,\varnothing)))/\partial d_c < 0$, and $\partial(U_c(\theta(B,r,k))-U_c(\theta(B,r,\varnothing)))/\partial war_c = -1$ C does not become less likely attack k as w_c increases, d_c decreases and war_c decreases.

Proposition 1 states that as C becomes more powerful, has less

land to lose and faces lower costs to warfare then C is more likely to enter an ongoing conflict. Proposition 2 will look at how C decides who to fight having joined the war.

Proposition 2.

Given that nation C will enter a conflict between A and B, the likelihood of C attacking B is non decreasing as the ratio (w_b/w_a) increases and the ratio (d_b/d_a) decreases.

Proof. Subgame perfection implies that if C attacks nation A instead of nation B then $U_c(\theta(B,r,A))-U_c(\theta(B,r,B)) \geq 0$. Define diff $=U_c(\theta(B,r,A))-U_c(\theta(B,r,B))$. Diff$=(w_a+w_b+w_c)^{-1}*(w_ad_c+w_cd_b-w_bd_c-w_cd_a)$ and $\partial diff/\partial w_a=(w_i+w_j+w_k)^{-2}*d_c \geq 0$, $\partial diff/\partial w_b=-(w_i+w_j+w_k)^{2}*d_c \leq 0$, $\partial diff/\partial d_a=-w_c/(w_i+w_j+w_k)^2 \leq 0$, and $\partial diff/\partial d_b= w_c/(w_i+w_j+w_k)^2 \leq 0$.

Therefore, cetebus paribus, a neutral nation entering a war will attack the militarily weak but land rich nation. Although we might suspect that high amounts of land are associated with large militaries empirically this is not always true. For example vietnam and Israel both have large armies but only small amounts of land while Zaire is very large but does not possess a large military.

Proposition 3.

Given s_c, the probability of B fighting back if attacked by A is non decreasing as w_b increase, w_a decreases, d_a increases, d_b increases, war_j decreases and z_j increases.

Proof. By SPE if B retaliates then the expected utility from retaliating must not be less than that associated with acquiescing. Define $\pi_i=U_b(\theta(s_a,s_b=r,{}^is_c))-U_b(\theta(s_a,s_b=\varnothing,{}^is_c)$, where $s_a=B$, ${}^1s_c=\varnothing$, ${}^2s_c=B$ and ${}^3s_c=A$. Then $\partial\pi_i/w_b >0$, $\partial\pi_i/\partial w_a<0$, $\partial\pi_i/\partial d_b \geq 0$, $\partial\pi_i/\partial d_a\geq 0$, $\partial\pi_i/\partial war_b <0$ and $\partial\pi_i/\partial v_b >0$ for i = 1,2,3.

Proposition 4.

The likelihood that A will undertake a violent action depends only

on z_a and d_b if nation B will acquiesce to violence, weakly decreasing in z_a and weakly increasing in d_b. If B retaliates to aggression then given s_c, the likelihood of A attacking is weakly increasing as war_a decreases, w_a increases, w_b decreases, d_b increases and d_a decreases.

Proof: If $s_b^*=\varnothing$ then by SPE if $s_a^*=B$ then $U_a((\varnothing),\theta(B,\varnothing,s_c^*)) - U_a((\varnothing),\theta(\varnothing,\varnothing,s_c^*)) \geq 0$. $\partial[U_a((\varnothing),\theta(B,\varnothing,s_c^*))-U_a((\varnothing),\theta(\varnothing,\varnothing,s_c^*))]/\partial z_a < 0$ and $\partial[U_a((\varnothing),\theta(B,\varnothing,s_c^*))-U_a((\varnothing),\theta(\varnothing,\varnothing,s_c^*))]/\partial d_b > 0$ but this expression is independent of all other parameters. If $s_b^*=r$ then by SPE if $s_a^*=B$ then $U_a((\varnothing),\theta(B,r,s_c^*)) - U_a((\varnothing),\theta(\varnothing,r,s_c^*)) \geq 0$. Redefine $\pi_i = [U_a((\varnothing),\theta(B,\varnothing,{}^is_c^*))-U_a((\varnothing),\theta(\varnothing,\varnothing,{}^is_c^*))]$, for ${}^is_c = \varnothing,B,A$. $\partial\pi_i/\partial war_a < 0$, $\partial\pi_i/\partial w_a > 0$, $\partial\pi_i/\partial w_b < 0$, $\partial\pi_i/\partial d_a < 0$ and $\partial\pi_i/\partial d_a < 0$.

Given these propositions the following empirically falsifiable hypotheses can be generated. Firstly, those nations that are militarily strong relative to the amount of land they risk losing and face low costs to fighting are most likely to intervene in a conflict. If they do intervene they are most likely to attack militarily weak, land rich states.

Any nation that is attacked will base its decision to retaliate upon its military strength relative to the aggressor, the resources that are at stake (the size of both the aggressors and its own land), the cost to fighting relative to domestic costs of surrendering (war_i-z_i) and the strategy of any third party. States that are militarily weak and facing high costs to fighting are the most likely to surrender. These weak states will only be prepared to fight when the stakes are very high. A very powerful state would be likely to fight back even when the stakes are very low since it has a high probability of winning. How a nation's decision whether to retaliate is effected by the strategy of the

third party depends on the arms level and resources of all nations. Specifically, if a third party fights forms a coalition with B against A then B faces an increased chance of being in the winning coalition but the gains from winning are reduced since they must be shared. If C fights against B then B has a lower probability of winning but the size of the potential gains increase.

Nation A bases its decision about whether to attack B on the strategies of B and C. Generally, if A behaves violently the best outcome it can expect to obtain is for B to surrender[6], which gives A all of B's lands and avoids the cost of fighting for A. If B does retaliate then A wants B to be land rich but militarily poor. Thus, as the cost, war_b rises and w_b falls B becomes a more attractive target to A. As the resources of B increases then the value of attacking B increases provided that B does not alter its strategy. Providing B continues to surrender then an increase in d_b increases the incentive for A to attack, but once d_b becomes suitably large that B will retaliate and A will start to base his decision on the military strength of B.

<u>How do exogenous alliances effect the occurrence of war?</u>

Next I consider how alliances effect the outcomes in the conflict subgame by assuming that alliances have been exogenously formed.

Proposition 5.

The likelihood of nation i honouring an alliance is weakly increasing in $h_i(\bullet)$ and $e_i(\bullet)$.

Proof. The choice to attack an ally or honour an alliance can be made at nodes 1 and 3. At n=1 if there is an (AB) alliance then A has the opportunity to attack its ally. If s_a =B then $U_a(\theta(\bullet))$ is a function of $e_a(AB)$, specifically $\partial U_a(\theta(s_a,\bullet,\bullet))/\partial e_a(AB) < 0$. If

$s_a=\emptyset$ then $U_a(\theta(s_a,\bullet,\bullet))$ is not a function of $e_a(AB)$. If (s_a^*,s_b^*,s_c^*) is an equilibrium then $U_a(s_a^*,s_b^*,s_c^*) \in \max U_a(s_a,s_b^*,s_c^*)$. As $e_a(AB)$ increases A can not be more likely to attack it alliance partner B. At n=3 if (s_a^*,s_b^*,s_c^*) is a SPE then $s_c^* \in \text{argmax}_{\#2,\#3,\#4} U_c(\theta(\bullet))$. If there is a (BC) alliance then $U_c(\#2)=d_c-h_c(BC)$, $U_c(\#3)=(w_a+w_c/(w_a+w_b+w_c))*(d_c+(w_c/(w_a+w_c))d_a)-war_c-e_c(BC)$ and $U_c(\#4)=((w_b+w_c)/(w_a+w_b+w_c))(d_c+(w_c/(w_b+w_c))d_a)-war_c$. Thus $\partial U_c(\#2)/\partial h_c(BC)<0$, $\partial U_c(\#3)/\partial e_c(BC)$ but all other relevant partials are equal to zero. As $h_c(BC)$ increases $U_c(\#2)$ falls and as $e_c(BC)$ increase $U_c(\#3)$ falls, so the probability that $\theta(s^*)=\#4$ is non decreasing. A similar argument exists for the alliance (AC).

Proposition 5 states that if the cost of attacking an ally increases then nations are less likely to attack allies and if the cost associated with failing to honour an alliance increases then nations are more likely to honour alliances. If we assume that the higher the class of alliance [Singer and Small 1966] the larger the cost of breaking it then this proposition is consistent with the empirical results, [Siverson and King 1980, Altfeld and Bueno de Mesquita 1979]. Although reassuring, these results can not be a test for proposition 5 because as shown later there is a sample bias induced because not all alliances will be formed.

Proposition 6

If A attacks B, the likelihood of B surrendering is;

(i) weakly increasing in $i_b(BC)$ and $g_b(BC)$,

(ii) weakly increasing with increases in $h_c(BC)$ and $h_c(AC)$ if $U_b((al),\#2) \geq \max\{U_b((al),\#3), U_b((al),\#4)\}$ for al = BC, AC,

(iii) Weakly increasing with increases in $e_c(BC)$ if $U_b((BC),\#3) > \max\{U_b((BC),\#2),U_b((BC),\#4)\}$ and weakly increasing with increases in $e_c(AC)$ if $U_b((AC),\#4)>\max\{U_b((AC),\#2), U_b((AC),\#3)\}$, and

(iv) independent of all (AB) alliance costs.

Proof: Suppose not (i). Then for some {arms, d} the probability that $s_b^*=r$ increases as $i_b(BC)$ increases or $g_b(BC)$ increases. Note that s_c^* is independent if $i_b(BC)$ and $g_b(BC)$. Case 1, $s_c^*= \varnothing$. By SPE $s_b^*=r$ only if $U_b((BC),\#2) \geq U_b((BC),\#5)$. Since $\partial(U_b((BC),\#2)/\partial g_b(BC) < 0$, $\partial(U_b((BC),\#5)/\partial g_b(BC)=0$, $\partial(U_b((BC),\#2)/\partial i_b(BC) =0$ and $\partial(U_b((BC),\#5)/\partial i_b(BC)=0$ then increase in $g_b(BC)$ and $i_b(BC)$ can not increase the probability of $s_b^*=r$ with increases in $g_b(BC)$ and $i_b(BC)$. Case 2, $s_c^*=B$. By SPE $s_b^*=r$ only if $U_b((BC),\#3) \geq U_b((BC),\#5)$. Since $\partial(U_b((BC),\#3)/\partial g_b(BC) = 0$ and $\partial(U_b((BC),\#3)/\partial i_b(BC) < 0$ then increase in $g_b(BC)$ and $i_b(BC)$ can not increase the probability of $s_b^*=r$ with increases in $g_b(BC)$ and $i_b(BC)$. Case 3, $s_c^*=A$. By SPE $s_b^*=r$ only if $U_b((BC),\#4) \geq U_b((BC),\#5)$. Since $\partial(U_b((BC),\#4)/\partial g_b(BC) = 0$ and $\partial(U_b((BC),\#4)/\partial i_b(BC) = 0$ then increase in $g_b(BC)$ and $i_b(BC)$ can not increase the probability of $s_b^*=r$ with increases in $g_b(BC)$ and $i_b(BC)$. Hence contradiction. (ii) At the subgame starting at n=3 by SPE as $h_c(BC)$ increases then the probability weight on outcome #2 is non increasing since $U_c((BC),\#2)$ decreases while $U_c((BC),\#3)$ and $U_c((BC),\#4)$ are unchanged. Since outcome $U_b((BC),\#2) \in \max_{i=\#2,\#3,\#4} U_b((BC),i)$ then the expected utility B gets from retaliating to an attack is weakly reduced by an increase in $h_c(BC)$. As $U_b((BC),\#5)$ is unchanged then increases in $h_c(BC)$ may cause B to switch strategies and surrender. The arguments for $h_c(BC)$ and (iii) are similar. (iv) Since all attainable payoffs by B at n=2 are equally effected by changes in $i_a(AB)$ then s_b^* is independent of (AB) alliance effects.

Proposition 6 states that if B, a member of an unreliable defensive alliance, is attacked then B is weakly more likely to surrender the larger the costs associated with alliance failure. Since B pays a cost associated with alliance failure, if C will not honour alliance commitments then B has an incentive to avoid these costs by surrendering. However, B's decision about whether to retaliate is not a function of alliance commitments with A because once attacked B can not avoid these costs.

If the costs of breaking a defensive alliance increase then proposition 5 states that the alliance is more likely to work which may provide B with increased security. Unfortunately, if the alliance is still unreliable the increase in domestic costs makes the nations more likely to surrender to aggression. As the

earlier quote from Vasquez showed the relationship between alliances and war is not always in the same direction. Clearly, whether an alliance is honoured and whether a nation will retaliate to violence will influence A's decision about whether to attack or not. It is this relationship that I explore next.

Proposition 7. (AB) alliance.

Nation A will not behave more aggressively as a member of an (AB) alliance than it would do if it were non allied.

Proof: By earlier proposition s_c^* and s_b^* are unaffected by (AB) alliance costs. If A undertakes a violent act then $U_a((AB),\theta(B,s_b^*,s_c^*)) \geq U_a((AB),\theta(\emptyset,s_b^*,s_c^*))$ but since $U_a((AB),\theta(B,s_b^*,s_c^*)) = U_a((\emptyset),\theta(B,s_b^*,s_c^*)) - e_a(AB)$ this implies that $U_a((\emptyset),\theta(B,s_b^*,s_c^*)) > U_a((\emptyset),\theta(\emptyset,s_b^*,s_c^*))$ so if A had remained unallied it would also have behaved violently.

Figure 2 is a numerical example of the conflict subgame. The diagram shows that when an (AB) alliance is present then distributions of lands, which in a non-allied state would have resulted in violence, remain peaceful (#1).

Proposition 8. (AC) alliance.

Comparing the behaviour of nation A in an (AC) alliance to that of a non-allied situation, A will only behave more aggressively in the allied situation if the presence of the alliance causes a change in nation C's behaviour and A prefers the outcome of allied aggression to that of non allied aggression.

Proof: Suppose that A does not prefer the allied outcome of aggression to that of non allied aggression then $U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset))) \geq U_a((AC),\theta(B,s_b^*(AC),s_c^*(AC)))$, $s_a^*(AC)=B$ and $s_a^*(\emptyset)=\emptyset$. SPE $\rightarrow$ if $s_a^*(AC)=B$ then $U_a((AC),\theta(B,s_b^*(AC),s_c^*(AC))) \geq U_a((AC),\theta(\emptyset,s_b^*(AC),s_c^*(AC))) = U_a((\emptyset),\theta(\emptyset,s_b^*(\emptyset),s_c^*(\emptyset)))=d_a$. Since $U_a((\emptyset),\theta(\emptyset,s_b^*(\emptyset),s_c^*(\emptyset))) < U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset)))$ SPE $\rightarrow s_a(\emptyset)=B$ which is a contradiction. Now show that C must change action upon the formation of an alliance if A behaves more aggressively.

Suppose not then $s_c^*(\emptyset)=s_c^*(AC)$. Consider the subgame at n=2. $U_b((\emptyset),\theta(\emptyset,r,s_c^*(\emptyset)))= U_b((AC),\theta(\emptyset,r,s_c^*(AC)))$ and $U_b((\emptyset),\theta(\emptyset,\emptyset,s_c^*(\emptyset)))= U_b((AC),\theta(\emptyset,\emptyset,s_c^*(AC)))$ so generically $s_b^*(AC)= s_b^*(\emptyset)$. Since $U_a((\emptyset),i)\geq U_a((AC),i)$ for i=#2,...,#5 then $s_a^*(AC)=B \rightarrow s_a^*(\emptyset)=B$ which is a contradiction.

Propositions 7 and 8 state that the formation of an offensive alliance will often reduce the tendency for A to behave aggressively. The only time that A will behave more aggressively upon the formation of an offensive alliance is when A will benefit from allied help and the alliance is required to ensure the participation of a reluctant coalition partner. As figure 2 shows the regions where violence will occur are smaller if offensive alliances are formed.

Proposition 9. (BC) alliance.

The likelihood of A behaving more aggressively when facing a defensive (BC) alliance compared to a non allied situation depends on whether the alliance is reliable. If the alliance is reliable then its formation will only alter the outcome of the conflict subgame if $s_c^*(BC) \neq s_c^*(\emptyset)$. Specifically if A behaves more aggressively then either (i) $s_b^*(BC) =\emptyset$ and $s_b^*(\emptyset)=B$, or (ii) $s_b(BC) =r$ and $U_a((\bullet),\#4) > u_a((\bullet),\theta(B,s_b^*(BC),s_c^*(BC)) \in \{U_a((\bullet),\#2),U_a((\bullet),\#3)\}$

For an unreliable (BC) alliance the probability that A is aggressive is non decreasing (non increasing) if (iii) B acquiesce to violence, (iv) $w_aw_c \geq (<) w_bw_cd_a$, $\theta(B,s_b^*(\emptyset),s_c^*(\emptyset)) =\#3$ and $\theta(B,s_b^*(BC),s_c^*(BC)) =\#2$, and (v) $w_aw_c \leq (>) w_bw_cd_a$, $\theta(B,s_b^*(\emptyset),s_c^*(\emptyset)) =\#2$ and $\theta(B,s_b^*(BC),s_c^*(BC)) =\#3$.

Proof: Suppose the outcome of the conflict subgame is altered by the formation of the (BC) alliance but $s_c(\emptyset)=s_c(BC)=A$.

Since $U_i((\emptyset),\#4) = u_i((BC),\#4)$ and $U_i((\emptyset),\#5) = u_i((BC),\#5)$ for i= A, B then generically $s_b^*(\emptyset)=s_b^*(BC)$, which in turn implies that $s_a^*(\emptyset)=s_a(BC)$. This contradicts $\theta(s^*(\emptyset))\neq\theta(s^*(BC))$. If the probability that A attacks B increases upon the formation of the alliance then $[U_a((BC),\theta(B,s_b^*(BC),s_c^*(BC))-U_a((BC),\theta(\emptyset,\bullet,\bullet))] > [U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset))-U_a((\emptyset),\theta(\emptyset,\bullet,\bullet))]$ which implies that $U_a((BC),\theta(B,s_b^*(BC),s_c^*(BC)) > U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset))$. By the first result $\theta(B,s_b^*(BC),s_c^*(BC))\neq\theta(B,s_b^*(\theta),s_c^*(\emptyset))$ this implies that $\theta(B,s_b^*(BC),s_c^*(BC)) \in \{\#4,\#5\}$ and $\theta(B,s_b^*(\theta),s_c^*(\emptyset)) \in \{\#2,\#3,\#5\}$. Suppose $s_b^*(BC)=\emptyset$ then $\theta(B,s_b^*(BC),s_c^*(BC)) =\#5$. Since $U_a((\bullet),\#5) > \max\{U_a((\bullet),\#2), U_a((\bullet),\#3)\}$ then $U_a((BC),\theta(B,s_b^*(BC),s_c^*(BC))) > U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset)))$. Suppose $s_b^*(BC)=r$. If $\theta(B,s_b^*(BC),s_c^*(BC)) =\#2$ then $U_a((\bullet),\#4) > (\leq) U_a((\bullet),\#2)$ implies $U_a((BC),\theta(B,s_b^*(BC),s_c^*(BC)) > (\leq) U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset))$.
If $\theta(B,s_b^*(BC),s_c^*(BC)) =\#3$ then $U_a((\bullet),\#4) > (\leq) U_a((\bullet),\#3)$ implies $U_a((BC),\theta(B,s_b^*(BC),s_c^*(BC)) > (\leq) U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset))$.
Unreliable alliance. From P5 $\theta(B,s_b^*(BC),s_c^*(BC)) \neq \#4 \rightarrow \theta(B,s_b^*(\emptyset),s_c^*(\emptyset)) \neq\#4$ which implies that $\theta(B,s_b^*(BC),s_c^*(BC))) \in \{\#2, \#3, \#5\}$. Since $U_a((\bullet),\#5) > \max\{U_a((\bullet),\#2), U_a((\bullet),\#3)\}$ if $s_b(BC)=\emptyset$ then $U_a((BC),\theta(B,s_b^*(BC),s_c(BC))) \geq U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset)))$, since $U_a((BC),\theta(\emptyset,\bullet,\bullet))=U_a((\emptyset),\theta(\emptyset,\bullet,\bullet))$ this implies that probability of A attacking if B will acquiesce upon the formation of a (BC) alliance is non decreasing. (iv) $w_aw_c \geq w_bw_cd_a$ implies that $U_a((\bullet),\#2) \geq U_a((\bullet),\#3)$. Suppose $\theta(B,s_b^*(\emptyset),s_c^*(\emptyset)) =\#3$ and $\theta(B,s_b^*(BC),s_c^*(BC)) =\#2$ then $u_a((BC),\theta(B,s_b^*(BC),s_c^*(BC))) \geq U_a((\emptyset),\theta(B,s_b^*(\emptyset),s_c^*(\emptyset)))$. Hence the probability of A attacking B is non decreasing. The other proofs follow similarly.

The presence of a defensive alliance can alter the behaviour of A. Under some circumstances the alliance can succeed in deterring A from aggression while in other circumstances the alliance can encourage A to attack. Wu [1990] makes a similar observation. In the numerical example, shown in figure 2, both these types of behaviour are observed. Firstly the size of region where #2 is the outcome is reduced as A is deterred from attacking. However, the size of region where #5 is the outcome is increased, such that a (BC) alliance encourages A to attack.

Alliance formation game.

A formal model of alliance formation will now be presented.

Having had the opportunity to form alliances, nations then play the conflict subgame. In this model I consider immediate deterrence so I assume the potential aggressor, namely A, is common knowledge. There are four possible alliance states, AL = {(AB), (AC), (BC), (ø)}. Each nation is allowed to sign one alliance agreement, subject to being a member of that alliance. Formally, the strategies for each nation are: $\sigma_A \in \{ø, AB, AC\}$, $\sigma_B \in \{ø, AB, BC\}$, and $\sigma_C \in \{ø, AC, BC\}$.

If the two parties to an alliance both sign the alliance it is assumed that the alliance is formed. The payoffs from the alliance formation game are those payoffs that a nation would receive in the conflict subgame given the particular alliance state. Thus, when nations decide to form alliances they do so knowing how those alliances are going to effect behaviour with respect to possible aggression by A. $U_A((AB),\theta(s^*(AB)))$ is A's expected payoff if an (AB) alliance is formed. Since nations generically have strict preferences over strategies, then the outcome of the conflict subgame, $\theta(s^*(AB))$ is generically unique. The normal form representation of the game is given in the appendix.

The solution concept used is strong equilibrium since this eliminates the possibility of a nation forming one alliance when there is another alliance that is better for it and its new potential alliance partner. The Nash equilibrium conditions for this game constitute necessary conditions for alliance formation.

A strategy profile $(\sigma_A,\sigma_B,\sigma_C)$ is a strong equilibrium if for all subsets, $k \in K$ of nations, $(K=2^{(A, B, C)})$, $U_j(\sigma_A,\sigma_B,\sigma_C) \geq U_j(\sigma_k',\sigma_{-k})$,

$\forall \sigma_k'$ and $\forall j \in k$.

According to the definition of a strong equilibrium multilateral deviations must also be considered. The conditions required for the various alliances to be strong equilibria are given in the appendix.

Results of the alliance formation game.

Given the definition of a strong equilibrium a necessary condition for nations to want to form an alliance is that the alliance does not make them worse off.

Proposition 9.

Necessary conditions for an offensive (AB) alliance to form are:

i) $\theta(s^*(AB))=\#1$,

ii) $f_a(AB)\geq 0$, and

iii) $f_b(AB)\geq U_b((\emptyset),\#1)-U_b((\emptyset),\theta(s^*(\emptyset)))$.

Proof: Given earlier results s_b^* and s_c^* are independent of (AB) alliance costs. Suppose $\theta(s^*(AB))\neq\#1$ then $U_a((AB),\theta(s^*(AB))) = U_a((\emptyset),\theta(s^*(AB))-e_a(AB)$, but this contradicts $U_a((AB),\theta(s^*(AB))) \geq U_a((\emptyset),\theta(s^*(\emptyset)))$. (ii) Suppose $f_a(AB)<0$ then $U_a((AB),\#1)<U_a((\emptyset),\#1)$, but this contradicts $U_a((AB),\theta(s^*(AB))) \geq U_a((\emptyset),\theta(s^*(\emptyset)))$. (iii) The proof follows directly from $U_b((AB),\theta(s^*(AB)))\geq U_b((\emptyset),\theta(s^*(\emptyset)))$.

An (AB) offensive alliance can only be formed if the outcome to the corresponding conflict subgame is peaceful. Additionally A will never form any (AB) alliance if it is costly for A to do so. However, nation B maybe prepared to endure considerable costs in forming an (AB) alliance if this ensures B that it will not be attacked. We can think of B being prepared to pay off nation A to avoid being attacked. Figure 3 shows these conditions under which

an (AB) alliance can be formed. Since A receives a payoff of 0.05 if peace follows alliance formation, A will form an alliance up to the point where this 0.05 compensates him for the difference in expected utility between using violence and not.

Proposition 10.

Necessary conditions for the formation of an offensive (AC) alliance are:

i) $\theta(s^*(AC)) \in \{\#1,\#3,\#5\}$,

ii) if $\theta(s^*(AC))=\#3$ then $\theta(s^*(\emptyset))=\#3$, and

iii) if $\theta(s^*(AC))=\#1$ then $f_a(AC)\geq 0$ and $f_c(AC)\geq 0$ if $\theta(s^*(\emptyset)) \in \{\#1,\#2,\#5\}$.

Proof: Suppose not (i). Suppose $\theta(s^*(AC))=\#2$ if $\theta(s^*(\emptyset))\in\{\#1,\#2,\#5\}$ then $U_c((\emptyset),\theta(s^*(\emptyset))) = d_c > d_c - h_c(AC) = U_c((AC),\#2)$, if $\theta(s^*(\emptyset))=\#3$ then generically $U_c((\emptyset),\#3) > U_c((\emptyset),\#2)$, $U_c((AC),\#2) > U_c((AC),\#3)$, but $U_c((\emptyset),\#3)=U_c((AC),\#3)$ implies $U_c((\emptyset),\#2)>U_c((AC),\#2)$. If $\theta(s^*(\emptyset))=\#4$ then $U_c((\emptyset),\theta(s^*(\emptyset))) = (((w_b+w_c)d_c+w_c d_a)/(w_a+w_b+w_c)) - war_c > d_c = U_c((\emptyset),\#2) > U_c((AC),\#2)$. Hence $\theta(s^*(AC))\neq\#2$. Suppose $\theta(s^*(AC))=\#4$. If $\theta(s^*(\emptyset))\in\{\#1,\#2,\#5\}$ then $U_c((\emptyset),\theta(s^*(\emptyset)))=d_c \geq U_c((\emptyset),\#4) > U_c((AC),\#4)$. If $\theta(s^*(\emptyset))=\#3$ then $U_c((\emptyset),\#3)\geq U_c((\emptyset),\#4) > U_c((AC),\theta(s^*(AC))$. If $\theta(s^*(\emptyset))=\#4$ then $U_c((\emptyset),\#4)>U_c((AC),\#4)$. Hence $\theta(s^*(AC))\neq\#4$. (ii) Suppose not. If $\theta(s^*(\emptyset))\in\{\#1,\#2,\#4,\#5\}$ then generically $U_c((\emptyset),\theta(s^*(\emptyset))) > U_c((\emptyset),\#3) = U_c((AC),\#3)$, but this $U_c((AC),\theta(s^*(AC)) \geq U_c((\emptyset),\theta(s^*(\emptyset)))$. (iii) $U_a((AC),\theta(s^*(AC))) \geq U_a((\emptyset),\theta(s^*(\emptyset))) \rightarrow$ [if $s_a^*(\emptyset)=\emptyset$ then $f_a(AC)\geq 0$ and if $s_a^*(\emptyset)\neq\emptyset$ then $U_a((\emptyset),\theta(s^*(\emptyset)))\geq U_a((\emptyset),\#1)$] which implies $f_a(AC)\geq 0$. If $\theta(s^*(AC))=\#1$ then $U_c((AC),\theta(s^*(AC)))\geq U_c((\emptyset),\theta(s^*(\emptyset))) \rightarrow$[if $\theta(s^*(\emptyset))\in\{\#1,\#2,\#5\}$ then $f_c(AC)\geq 0$, if $\theta(s^*(\emptyset))=\#3$ then $f_c(AC) \geq (w_c d_b - w_b d_c)/(w_a+w_b+w_c) - war_c$ and if $\theta(s^*(\emptyset))=\#4$ then $f_c(AC) \geq w_c d_a - w_a d_c)/(w_a+w_b+w_c) - war_c$].

An offensive (AC) alliance can only form if it is reliable. Therefore the outcome can be peace, B surrendering or A and C forming a coalition against B. The war can only occur if the same war would have occurred without the presence of the alliance. If the outcome in the corresponding conflict subgame is peaceful then

alliance formation can not be costly for A and can only be costly for C if the alliance avoids C having to fight. This is demonstrated by the numerical example in figure 3.

Generalizing for both offensive alliance types, (AB) and (AC), form only when they are reliable. Additionally offensive alliance formation never increases the occurrence of violence. Walt [1987 and 1988] classified an alliance as offensive only if it actually behaved aggressively. Given that this paper proposes that the formation of an (AB) or (AC) alliance can only reduce the occurrence of violence, Walt's empirical evidence that offensive alliance were rare supports these propositions.

Proposition 11. (BC) alliance.

Necessary conditions for the formation of a defensive (BC) alliance are:

i) $\theta(s^*(BC)) \in \{\#1,\#4,\#5\}$.

ii) Generically, if $\theta(s^*(BC))=\#4$ then $\theta(s^*(\emptyset))=\#4$.

iii) Generically, if $\theta(s^*(BC))=\#5$ then $\theta(s^*(\emptyset))=\#5$.

Proof: Suppose not (i). Suppose $\theta(s^*(BC))=\#2$ then $U_c((BC),\#2)=d_c-g_c(BC)$. If $\theta(s^*(\emptyset))\in\{\#1,\#2,\#5\}$ then $U_c((\emptyset),\theta(s^*(\emptyset)))=d_c > d_c-g_c(BC)$, if $\theta(s^*(\emptyset))\in\{\#3,\#4\}$ then $U_c((\emptyset),\theta(s^*(\emptyset))) \geq U_c((\emptyset),\#2) > U_c((AC),\#2)$, hence $\theta(s^*(BC))\neq\#2$. Suppose $\theta(s^*(BC))=\#3$. If $\theta(s^*(BC))\in\{\#1,\#2,\#5\}$ then $U_c(\emptyset),\theta(s^*(\emptyset)))= d_c \geq U_c((\emptyset),\#3) > U_c((BC),\#3)$, if $\theta(s^*(\emptyset))=\#3$ then $U_c((\emptyset),\#3) > U_c((AC),\#3) = U_c((AC),\#3) - e_c(BC)$, and if $\theta(s^*(\emptyset))=\#4$ then $U_c((\emptyset),\#4) > U_c((\emptyset),\#3) > U_c((AC),\#3)$. Hence $\theta(s^*(BC))\neq\#3$. Suppose not (ii). Generically $\theta(s^*(BC))\neq\#4 \Rightarrow U_c((\emptyset),\theta(s^*(\emptyset))) > U_c((\emptyset),\#4) = U_c((AC),\#4)$. Which contradicts $U_c((BC),\theta(s^*(BC))) \geq U_c((\emptyset),\theta(s^*(\emptyset)))$. The proof to (iii) is similar.

Those defensive (BC) alliances that form in equilibrium must be reliable. With complete information no unreliable alliances should be formed. In addition I predict that those alliances

formed should either deter A from attacking or not alter the outcome of the conflict subgame. Given that alliances are reliable then these possible outcomes are #1 and #4 and #5, respectively. If the alliance has the ability to deter nation A from attacking then B and C can form alliances even when this is costly to do. Thus in the face of a threat even nations that are traditional enemies may form an alliance if it will successfully deter an aggressor.

Figure 3 show that a (BC) alliance can not be formed where the corresponding conflict subgame ends in alliance failure (#2 and #3). The alliance can not form when it destabilizes B's position and encourages it to surrender when unallied it would not have done so (#5). Even if f_b(BC) had been slightly negative a (BC) alliance could have been formed in the region where the presence of the alliance deters A. This instance may be thought of as B making side payments to C in order to ensure its support.

Conclusions and Discussion.

In this paper I have presented a simple model of warfare between three countries. Having analyzed the occurrence of conflict with respect to structural parameters such as the distribution of armaments and resources I considered how alliances affect outcomes in the conflict subgame. Given the outcomes that occur for different alliance states I was able to identify which alliances can form for a given set of structural parameters.

The primary result is that when alliance formation is endogenous in a model of war with complete information there are no

cases of alliance failure. Although reliability is common to all, alliances can serve different purposes. Firstly there are alliances that do not affect the occurrence of war or the coalitions that form. These alliances might be thought of as just coordinating the actions of potential coalition partners. Alliances can preserve peace. If a potential aggressor benefits sufficiently from the non-security externalities associated with alliance formation, then nations can form alliances with the aggressor, buying him off. Having formed an alliance I observed that potential aggressors are inhibited by the costs of alliance failure.

Alliances can alter the occurrence of conflict, making potential aggressors more prone to attack. However, these alliances only occur if the threatened nation is not prepared to resist the aggressor. These offensive alliances can better be thought of as diplomatic coalitions that pressure a nation into giving way. Since the formation of the alliance undermines the victim's will to resist, these alliances will rarely end in conflict. Finally, there are defensive alliances that genuinely deter aggressors from violence. By showing a consolidated front, through alliance formation, nations are able to prevent wars.

The formation of alliances occurs for different reasons under different circumstances. The inability of empirical studies to isolate the causes behind the formation of an alliance means that it is difficult to test individual hypotheses regarding the properties of alliances. Without knowing which of these possible

purposes an alliance serves, it is impossible to see if the alliance has fulfilled its purposes.

The model assumes complete information. Unfortunately, leaders do not have this luxury when making decisions. Leaders are also forced to deal with the prospect of change. Leaders can only make alliances based on their ex-ante expectations about the changes that may occur. Unfortunately, ex-post, leaders may make mistakes. Regime changes and incomplete information are important in the formation of alliances that in the long run may not fulfill the purposes for which they were created.

Given these considerations we should not be surprised that alliance failures do occur. If, ex-post, nations have formed the "wrong" alliances we might ask how this affect the behaviour of potential aggressors? Proposition 8 tells us that when unreliable alliances are formed there are a wide number of situations where a potential aggressor becomes likely to attack. The empirical results of Siverson and King [1980] indicate that alliances are unreliable (only 67 alliances are honoured out of 290 possible situation to honour alliances). The results of the model reveal that there may be sample biases as potential aggressors are more likely to attack an unreliable alliance than a reliable one.

Despite these difficulties in studying alliances there are empirical results that support the propositions here. Over time, structural and alliance parameters can vary. An alliance that was reliable several years ago may be unreliable now due to structural change during that time. In addition, regime changes may have

significant effects on whether an alliance will remain reliable. Empirically this is supported by Siverson and King's result that alliance reliability declines over the lifetime of an alliance. The model also predicts that offensive alliances should rarely be formed and this agrees with the empirical evidence observed by Walt.

Both theoretical and empirical studies could benefit from a fuller understanding of how alliances impose costs upon nations. This paper treats these costs are purely exogenous which is an unsatisfactory explanation. A complete theory of alliances needs to explain how the costs that compel nations within alliances are generated, whether they are reputationally generated within the international system or domestically generated by reselection struggles within a nation.

In conclusion, this paper demonstrates that alliance formation is endogenous to conflict. The reliability and the desires of nations to form alliances are functions of the possible conflicts that can occur. Theoretic and empirical explanations of the role of alliances in international relations that do not simultaneously consider alliance reliability, alliance formation and the role of alliances in the initiation and expansion of conflict will produce biased results.

Appendix.

The subgame perfect equilibrium that characterizes the behaviour of nations in a non allied situation and is used to support propositions 1-4. Since nation are not generically indifferent between actions then mixed strategies have been ignored. Throughout the whole paper it is assumed that if indifferent nations move towards the lower indexed terminal nodes.

$s_a(\varnothing)$= B if $[d_b > z_a]$ or $[w_a d_b > w_b d_a + (w_a+w_b)war_a,\ w_b(d_a+d_b) - (w_a+w_b)(war_b - z_b) \geq 0,\ war_c > w_c d_b - w_b d_c/(w_a+w_b+w_c)$ and $war_c > w_c d_a - w_a d_c/(w_a+w_b+w_c)]$ or $[w_a d_b > w_b d_a + w_a + w_b + w_c)(war_a),\ w_b \geq (w_a+w_b+w_c)(war_b - z_b),\ (w_a - w_b)d_c + w_c(d_b - d_a) \geq 0$ and $(w_c d_b - w_b d_c)/(w_a+w_b+w_c) \geq war_c]$ or $[w_a > (d_a + war_a)(w_a+w_b+w_c),\ (w_b+w_c)d_b + w_b d_a - (w_a+w_b+w_c)(war_b - z_b) \geq 0,\ (w_a - w_b)d_c + w_c(d_b - d_a) < 0$ and $w_c d_a - w_a d_c/(w_a+w_b+w_c) \geq war_c]$

= ø else.

$s_b(\varnothing)$= r if $[w_b(d_a+d_b) - (w_a+w_b)(war_b - z_b) \geq 0,\ war_c > w_c d_b - w_b d_c/(w_a+w_b+w_c)$ and $war_c > w_c d_a - w_a d_c/(w_a+w_b+w_c)]$ or $[w_b \geq (w_a+w_b+w_c)(war_b - z_b),\ (w_a - w_b)d_c + w_c(d_b - d_a) \geq 0$ and $(w_c d_b - w_b d_c)/(w_a+w_b+w_c) \geq war_c]$ or $[(w_b+w_c)d_b + w_b d_a - (w_a+w_b+w_c)(war_b - z_b) \geq 0,\ (w_a - w_b)d_c + w_c(d_b - d_a) < 0$ and $w_c d_a - w_a d_c/(w_a+w_b+w_c) \geq war_c]$

= ø else.

$S_c(\varnothing)$= ø if $war_c > w_c d_b - w_b d_c/(w_a+w_b+w_c)$ and $war_c > w_c d_a - w_a d_c/(w_a+w_b+w_c)$,
B if $(w_a - w_b)d_c + w_c(d_b - d_a) \geq 0$ and $(w_c d_b - w_b d_c)/(w_a+w_b+w_c) \geq war_c$,
A if $(w_a - w_b)d_c + w_c(d_b - d_a) < 0$ and $w_c d_a - w_a d_c/(w_a+w_b+w_c) \geq war_c$.

Normal form representation of the alliance formation game.

σ_A=ø	ø	σ_C AC	BC

ø	ø	AC	ø
σ_B AB	ø	AC	ø
BC	ø	AC	BC

The conditions required for various alliance formations to be strong equilibria.
(AB) alliance, $U_A((AB),\theta(s^*(AB))) \geq U_A((\varnothing),\theta(s^*(\varnothing)))$, $U_B((AB),\theta(s^*(AB))) \geq U_B((\varnothing),\theta(s^*(\varnothing)))$, $[U_A((AB),\theta(s^*(AB))) \geq U_A((AC),\theta(s^*(AC)))$ or $U_C((AB),\theta(s^*(AB))) \geq U_C((AC),\theta(s^*(AC)))]$ and $[U_B((AB),\theta(s^*(AB))) \geq U_B((BC),\theta(s^*(BC)))$ or $U_C((AB),\theta(s^*(AB))) \geq U_C((BC),\theta(s^*(BC)))]$. **(AC) alliance**, $U_A((AC),\theta(s^*(AC))) \geq U_A((\varnothing)),\theta(s^*(\varnothing))$, $U_C((AC),\theta(s^*(AC))) \geq U_C((\varnothing)),\theta(s^*(\varnothing))$, $[U_A((AC),\theta(s^*(AC))) \geq U_A((AB),\theta(s^*(AB)))$ or $U_B((AB),\theta(s^*(AB))) \geq U_B((AB),\theta(s^*(AB)))]$ and $[U_B((AC),\theta(s^*(AC))) \geq U_B((BC),\theta(s^*(BC)))$ or $U_C((AC),\theta(s^*(AC))) \geq U_C((BC),\theta(s^*(BC)))]$. **(BC) alliance**, $U_B((BC),\theta(s^*(BC))) \geq U_B((\varnothing)),\theta(s^*(\varnothing))$, $U_C((BC),\theta(s^*(BC))) \geq U_C((\varnothing)),\theta(s^*(\varnothing))$, $[U_A((BC),\theta(s^*(BC))) \geq U_A((AB),\theta(s^*(AB)))$ or $U_B((BC),\theta(s^*(BC))) \geq U_B((AB),\theta(s^*(AB)))]$ and $[U_A((BC),\theta(s^*(BC))) \geq U_A((AC),\theta(s^*(AC)))$ or $U_C((BC),\theta(s^*(BC))) \geq U_C((AC),\theta(s^*(AC)))]$.

1. Generally, the tangible goods could be land, capital, access to limited resources or the ocean. The concept need not be limited to tangible goods. For example, these resources maybe relative position in the hierarchy in power transition theories [Organski and Kugler 1980], or advantageous trade positions.

2. Bueno de Mesquita and Lalman use a similar set of costs associated with violence in their international interactions game [1992 p.40-46]. I refer those interested in a more detailed explanation to their discussion.

3. I have assumed that the alliance of the whole, (ABC) is equivalent to an alliance of no-one. Since alliances are created that are opposed to at least one nation then in a three nation model there are only bilateral alliances.

4. Nations will generically have induced strict preference over actions and therefore mixed strategies have not been considered. Given this we assume that if nations are indifferent between actions they move towards the lower indexed terminal nodes. Thus we assume that the SPE described is unique which is generically true.

5. Although this modelling style appears to predict that coalitions win everything or lose everything we do not insist that this is the case. War can result in numerous distributions of resources. What is important is that the expected utility summed over all the possible resource distributions equals the expected utility of either winning all or losing all.

6. The only exception to this is when s_c=A and $U_a((\bullet),\#4) \geq U_a((\bullet),\#5)$.

PROLEGAMENA TO A POST-MODERN ENVIRONMENTAL ETHIC

Gregory Bruce Smith
The American University

- I -

Non imperium in imperio asserted Spinoza. But modernity substantially ignored that sentiment and set about carving out a human kingdom within the natural whole--indeed a human kingdom that was increasingly conceptualized as opposed to Nature as its "Other." We late moderns are left with the ramifications of that decision. At the heart of those ramifications are the issues that we address under the rough and ready rubric "environmentalism." But the central and unavoidable questions are philosophical. For example: "What should be the relation between man and the rest of the natural whole"? Only under the hegemony of a decidedly post-Kantian manifestation of modernity could it be thought irrelevant to link that question with its inevitable adjunct: "What is the relation between the human world and the rest of the natural whole"? But these are difficult questions for us to pose with clarity let alone answer. I will not presume to do so here as I have set myself a more modest propaedeutic task.

The possibility of clarity is even further complicated by the fact that almost all core philosophical questions have in the late modern world become almost hopelessly politicized. This very modern phenomenon is related to the issues we try to confront under the rubric "environmentalism." We have arrived at a point where it is fashionable to assert that the distinction between philosophy and politics, thought and action, is a meaningless one. The upshot is that we are encouraged to pick sides and join the fray: a choice which cannot avoid becoming a primarily aesthetic one--i.e., am I more "comfortable" with the crowd on the "right" or the "left." I will argue that the politicization of "envi-

ronmentalism" has had a significant effect in making the questions and issues that need to be addressed incapable of being clearly stated let alone "solved," should there turn out to be a "problem(s)." The real issues are ultimately philosophical. They involve questions like the relation between Identity and Difference, the difference between the human and the non-human, the relation between the human and the non-human, and even such seemingly pedestrian questions as what is a "fact" or a "thing," to say nothing of a "value." The pedestrian veneer peels away immediately as soon as we are determined to think rather than merely assert.

It is necessary to begin by stating the obvious: "Environmentalism" is a thoroughly modern phenomenon of recent origin. Furthermore, if one looks at the center of gravity of the present phenomenon "environmentalism," it is a phenomenon of the modern left. But this advances our understanding very little as terms like "right" and "left" have become increasingly meaningless in our time. How could it be otherwise for terms born during the fight for and against throne and alter and then deflected for use in the increasingly anachronistic confrontation between bourgeoisie and proletariat. We are left with the confusing spectacle of a "right" (a.k.a. conservatives) which at times mindlessly commits itself to the benignity of various "invisible hands"--a maneuver intellectually indistinguishable from the environmentalist faith in things like a "balance of nature" in the non-human arena. This abdication on the part of reason can eventuate in nothing but a growing autonomy for the juggernaut born of the convergence of commerce and modern technology, which in turn can lead to nothing but a constant revolutionizing of existence in a way that makes talk about "conserving" utterly meaningless whether we are talking about human traditions or that conceptual nightmare, an "ecosystem."

Opposed to this we have a "left" (a.k.a. liberals) which simultaneously advances the preservation of non-human ecosystems free from intrusion (frequently under the banner of defending natural "Difference," a.k.a. "biodiversity"), which simultaneously pursues the total destruction of all human customs and traditions as hopelessly sullied by this-centrism and that-phobia. This undertaking is almost always conjoined with an intrusion into the human ecosystems of birth and death, war and peace, plenty and famine, intellect and folly, joy and sorrow, striving and rest, and so on, that is

without any regard for natural limits or natural differences among individuals. Instead of such respect, we are encouraged to a pursue the actualization of a formless, contentless, universal self. The opposite side of this coin is the wish that "humans" recover the simple, ahistorical, unselfconscious existence of the animals--a.k.a. "deep ecology"[1]--on the assumption we will then be kinder and gentler to the environment. And all of this usually in the service of an enforced egalitarianism that can have no other outcome than the reduction of humanity to a suffocating, soporific, painless, passionless "Identity."

In what follows we cannot hope to resolve the issue of the increasing politicization of all human activity in the late modern world any more than we will bring final clarity to the fundamental question of the proper relation between humanity and the rest of the natural whole of which we are a part. But those are the kind of root questions that we would need clarity about before we could begin to seriously grapple with the issues posed by "environmentalism." Before that will be possible we require a step back and reflection upon all manner of prior issues. It is such a propaedeutic that I wish to offer. In so doing, I will argue that the "problem of environmentalism" is a fundamentally modern problem, and it cannot be confronted let alone solved by the application of modern ideas.

In what follows I will simply assert that the "problem of environmentalism" is identical to the problem of modernity; its solution lies beyond modernity. I will argue that that "beyond" is to be found in postmodernity not pre modernity in any of its manifestations. But I will differentiate what I mean by postmodernity from what is customarily discussed under the rubric postmodernism which is primarily a late, all too modern, phenomenon. Finally, I will assert that at the deepest level the problem of modernity is a philosophical problem. Hence one must try to grasp what is at the philosophical heart and soul of modernity--a much discussed and greatly vexed question.

I have used the ambiguous term "environmentalism" a number of times, as well as the phrase "the problem of environmentalism." I cannot here try to clarify the multiple uses of the term environmentalism.[2] Nor can I pause to show how simultaneously ambiguous and all-encompassing it frequently is in contemporary usage. I have italicized environmentalism to point to its multiplicity of meanings. For my purposes, environmentalism stands for an ensemble of ideas--not to be confused

with conservationism--which while manifesting some at least surface diversity, nevertheless--with certain exceptions--show a surprising underlying uniformity. For my purposes "environmentalism" also stands for a series of concrete policy issues that confront late modern humanity; some global, some local; some profoundly thought-provoking, many the product of a consciously constructed canard on the part of various self-appointed prophets who desire others to help them mount various ideological wish-horses--the rest of us are the horses they wish to saddle and ride.

As regards the concrete issues, the list has become familiar: It includes everything from overpopulation, possible and actual extinction of species, dwindling natural resources, destruction of wilderness areas necessary for everything from the production of oxygen to being the incubators of genetic diversity, pollution, growing problems with waste disposal to global warming and ozone depletion. I by no means wish to downplay or summarily dismiss these issues, but they will not be the focus of my remarks in what follows. I would argue that some are more substantial and intractable than others; several the product of a hyperbolic mode of speech that uses them as entering wedges for a primarily moral and political agenda. This distinction is clear to most observers. Since my point is that clarity on these issues requires that we step out of the modern perspective in which we presently confront them, I will step back from the important concrete discussion(s) to consider prior theoretical issues.

Environmentalism understood as a constellation of ideas is what will occupy my attention in what follows although it is not my intention to offer anything resembling a typology of the intellectual landscape. I will at present leave matters at looking at environmentalism as an ensemble of ideas. Again, it should not be controversial to note that environmentalism as a contemporary ensemble of ideas--focusing where there seems to be the most contemporary heat and energy--is a phenomenon of the political and moral left. As such it is altogether modern and shares a variety of modern premises. We may leave contemporary conservatives out of the present discussion as they have paradoxically yielded the field to their rivals. The fact that "environmentalism" has fallen to one side of the contemporary spectrum has, I believe, had a lot to do with why it has had less success than it might have and occasioned knee-jerk opposition where it need not have.

Finally, while various conservationist movements have roots going back at least into the last century, "environmentalism" as I am using the term is a phenomenon that can be traced back no further than the 1960's. It owes a great deal to the intellectual constellation of ideas known as the New Left, as can be seen from its almost universal commitment to egalitarianism (of a particular, modern, metaphysical variety), faith in the local and praise of participation, critique of modern liberal culture, belief in social and political experimentation and faith in the efficacy of transcending almost all manifestations of Tradition and natural difference. Needless to say, contemporary environmentalism has gone beyond its beginnings. Its instincts, however, remain clear in its repeated attempts to harness for use everything from Critical Theory to Marxism, Neomarxism, Socialism, Feminism, Anarchism, etc. But these are all modern phenomenon, and with these tools environmentalism will never escape the confining grip of the modern.

- II -

This leaves us to deal with the much vexed question of the meaning of modernity. At present I am not interested in the question of what modernity owes to pre-modernity nor whether or not it is "legitimate."[3] I am prepared to admit that modernity did not arise in a vacuum and it did not create the questions on which it "cut its teeth" ex nihilo. But modernity does represent a novel set of sentiments and a novel way of approaching the issue of the human good and of the relation between the human and the non-human. I believe that novelty can be articulated in a fairly clear fashion. While it will not be possible to go beyond a few general observations, that will suffice for present purposes.[4]

I accept the conventional wisdom that modern philosophy begins with Descartes and modern political philosophy begins with Machiavelli. They share the central philosophical instincts that are distinctively modern. They, and other proto-modern authors, share the self-understanding that they are making a conscious break with past thought and reality and that this is required to actualize the human good.[5] In every case, the archimedean point for this rejection of the past is a self-legislating, self-grounding conception of Reason. In Machiavelli's thought this is deployed in the service of the "Conquest of Chance."

According to Machiavelli, humanity remains in the clutches of Chance whenever it is not

ruled by consciously constructed "modes and orders." Hence the traditional world of the past must be replaced by a consciously projected world. It is necessary to quit the relatively small, homogeneous communities ruled by custom which Aristotle had praised and which Machiavelli admits are "natural."[6] One can become master in a consciously constructed kingdom--consciously constructed by "theorists" like Machiavelli who manipulate "new" princes, and eventual see to it that they become obsolete.

What one sees in Machiavelli is the beginning of modernity's distinctive anti-nature animus. The natural condition, here understood as Chance, is at odds with human well being. Through a conscious application of Reason one constructs an artificial arena that is allegedly superior in producing human well-being. Reason is also transformed into a manifestation of Will, no longer to be confused with pre-modern contemplation. And hence in Machiavelli we already see the first manifestation of the altogether modern dichotomy Reason (conceived as Will)/Nature(here conceived as Chance, later as Necessity). Reason is a tool used to stand outside the rest of nature.[7] The natural world is presented as if it is something that can be conceptualized as a whole despite the expulsion of one of its parts; i.e., man. Finally, with Machiavelli we see the emergence modern relation to temporality. The past is delegitimized. The present is put in the service of a transition to the future. From the very beginning, modern humanity has been "on the way." And hence from the beginning modern man has been expelled from the present. I will argue that only by again learning to live in the present will we be able to confront the problem(s) posed by environmentalism.

While Machiavelli's transition to a transformed and better human future required primarily a political program, Descartes sounds one of the first overt notes of the modern longing for the sublimation, indeed extirpation, of the political.[8] For Descartes, political competition is primarily conditioned by natural scarcity and human fear of death. Transcend those natural limitations and what passes for the political might no longer be needed. What is required is a new science not a new political science. To ultimately transcend natural limits one must first engage in the famous Cartesian suspension of belief in tradition, common sense, the data of the senses. In short, one must bracket everything which in the past passed for knowledge. Once again the past is delegitimized. But this

time the entire world as it appears for us in everyday life is delegitimized as well. Modernity never accomplishes a rapproachment with the world as it appears; indeed, as time passes it radicalizes the rift between the world of appearance and the one that is posited as the "real" world.

The empty, unencumbered self-consciousness of the abstract Cartesean ego becomes the abode of Reason; a Reason whose end is the manipulation and domination of Nature for the sake of overcoming natural limits so that we may become "masters and possessors of nature." The ahistorical, traditionless, worldless self dictates what will count as Being--via the projection of "clear and distinct" ideas as the ultimate substratum. Reality becomes a creation of the mind understood as self-projecting, self-legislating, self-grounding Will. Reality is posited by a great legislator, just as the new modes and orders would come to rest on Machiavellian "advisors" to new princes. As with Machiavelli, one sees in Descartes the elitism of the master theorist--the existence of subaltern theorists should not divert the gaze from the grand paradigm setter. Once again, one sees the modern instinct that conceives of Nature as it appears in itself as is an arena hostile to human well-being. Only an autonomous, disencumbered Reason can be the ground of human well-being. In Descartes's thought we see modernity's anti-nature animus and transformation of Reason into Will conjoined with the roots of the very modern longing for the abolition of the political--eventually consummated in the "withering away of the state."

The same fundamental principles resurface in the poetry of the State of Nature theorists who bring proto-modernity to its culmination. Again the natural state is seen as inimical to human well-being. Reason discovers laws that allow us to quit that state. In Hobbes's version, Reason is a trained capacity (presupposing primarily a shared method) for deducing what follows from definitions or names. Reason rests, therefore, on the legislative efforts of the name-giver or definition positor like Hobbes. Armed with laws of Reason so derived, we leave the natural state behind and launch a progressive transition toward the creation of a human world outside the larger natural whole. Once again, Reason is Nature's Other, the tool for the great escape from Nature.

With Hobbes we also see modernity's egalitarian bias emerge with singular clarity. In Hobbes's case, this egalitarianism is purchased through an assault on natural difference. Various types of

human beings must simply be suppressed. For example, the laws of Reason tell us that the natural love of honor--a manifestation of which, we are told, occurs even in laughter--must be sublimated if the human good--understood as involving the universal search for peace, comfort, considerable material consumption, and a relatively predictable existence--are to be ensured. Once again, to accomplish this an historically and naturally unencumbered Reason constructs its point of departure; obviously the point of departure carries with it the final destination. The whole enterprise is circular from the very beginning. Modern egalitarianism is purchased at the price of a radically disencumbered, abstract self completely alienated from Nature and natural Difference. Put another way, deep within the interstices of modernity is what Nietzsche would later call the "Spirit of Revenge," a subject to which I will return below. The Spirit of Revenge is at the very heart of the "problem of environmentalism."

With Hobbes we see with full clarity the hypothetical nature of the modern deployment of Reason. For example, Hobbes makes clear that his definitions or names do not correspond necessarily with anything in the natural world, i.e., the realm of appearance as it presents itself. True and false are related to speeches not things; they are as artificial as Hobbes's polity. Further, the possibility of the greatest good--peace, predictability and material progress--requires that Reason impose the same artificial whole everywhere--and that means universally. Hobbes purchases the human good, as he sees it, at the price of a dogmatic universalism--only one morality and one set of political arrangements are desirable everywhere and always. This dogmatic universalism rules throughout all later modern thought until Nietzsche.

Locke transforms, but in no way transcends, the proto-modern sentiment. In a way Locke radicalizes modernity's anti-Nature animus. For Locke, Nature is fundamentally valueless. Human transforming labor is the source of all value. We must produce our existence; Nature does not bestow well-being, or even survival, as a birthright. Nature is the valueless arena of harshness and scarcity. We must carve out a human arena with our labor. Nature has no independent dignity, it is for the support of man, an understanding shared completely by Marx. Marx merely added that as the "objectivizing," "outering" process of labor proceeds, alienation occurs--although Marx's version of

alienation requires a twist derived from Kant; it is "self"-alienation that is the primary problem, not alienation from "external" Nature which for Marx is all to the good. For both Locke and Marx, the production of the human good becomes primarily a technical problem, not a phenomenon of healthy praxis in the traditional sense or appropriate moral perfection. Both Locke and Marx presuppose the unleashing of an unlimited transforming technology.

With Locke, the proto-modern understanding reaches completion. The human good requires the escape from Nature. Nature is neither "balanced" in a way fruitful to man nor the basis of "value." Nature is not an ordered whole which supports the human good hence it must be transcended by Reason. Reason qua Will imposes its laws on Nature and thereby launches an endless pursuit of material progress, and an ongoing expulsion from the present which rejects the past and the present as they appear for all.

Proto-modernity was deflected by thinkers like Rousseau and Kant onto a different but still altogether consistently modern path. For example, while Rousseau rejected the bourgeoisification of modern man by proto-modernity, his critique of proto-modernity continues to use altogether modern tools in a thoroughly modern way. The path onto which proto-modernity is deflected by Rousseau is in the direction of "metaphysical freedom," an idea which in one permutation or another underlies almost all contemporary thought, including most environmentalist thought.

For Rousseau, man is metaphysically free because he is the one animal with almost no instinctive Nature. What man is is what he has become by imitation as well as at the hands of various historical accidents--and according to Rousseau all of prior history is an accident. Rousseau's insight was that if man can change over time, that process of change can be consciously shaped and hence all past accidents can give way to an artifact that is entirely the product of human Will--the Will, of course, of individuals like Rousseau. Rousseau is explicit that one of the ways to do that is to try to induce new forms of behavior and belief on the basis of hypothetically constructed histories--or as is now more fashionable, "narratives" (albeit contemporaries know we must eschew the dreaded "metanarrative"). As Nietzsche would observe, all of life becomes a fable, or more to the point, a competition of fables.

The altogether modern insight of the theorists of metaphysical freedom is that the truly human is not to be found in natural difference, but is based on self-legislating self-consciousness. The truly human is to be found only in that arena in which we give laws to ourselves. The natural realm is the realm of Necessity; the human realm is the realm of Freedom where we give laws to ourselves. This is our metaphysical freedom; to be able to stand outside Nature in self-consciousness and give laws to ourselves. Once again, the venue of the "outside" is the empty self-consciousness of a Reason that has been transformed into Will. The modern Reason/Nature split and transformation of reason into Will is given a novel twist in Rousseau such that the genuinely "human" good rests on moral and political progress rather that primarily technical progress. Nonetheless, it is clear that Rousseau in no way dismissed the discoveries of modern philosophy, he simply wanted them to remain the domain of a few rather that be publicly disseminated.

The idea of metaphysical freedom ran the risk of devolving into nihilism from the very beginning. Rousseau makes it clear that the primary Will at stake in proving our freedom was that of the theorist and "legislator" like Rousseau who posits the hypothetical history that would be instrumental in reshaping humanity and founding new nations. What lurks here is a potential battle of theorist titans to recreate humanity in their own image. Who is to say which titan is correct? The only limits to the potential free for all that Rousseau offers is the "General will." Subordination to a shared, national Volkgeist is the limit Rousseau offers for the seemingly unlimited tool he has unleashed. What simultaneously supports and limits Reason qua Will is public myth.

This was clearly unsatisfactory, as well as too politically demanding for most. Metaphysical freedom had to be made more palatable to the increasingly bourgeois tastes, egalitarian, hedonist sentiments and universalistic tendencies latent in modernity. In that light, Kant's work was a tour de force (albeit Kant himself would have desired a sterner morality than was his ultimate effect). Reason's self-grounding self-legislating status now becomes completely clear. Reason qua Will dictates what will be Nature for us. We simultaneously eschew the attempt to know the "thing-in-itself." We simply accept that we cannot grasp the world of Nature except qua Necessity, but that does not prove that Nature is in reality in the grips of Necessity rather than constant Becoming, or simple

Chance and indeterminacy. We will allow ourselves to "view" Nature in only one way; but thereby we may act as-if we were free beings because we cannot prove anything about the ineffable thing-in-itself. However, we can prove to ourselves that an act is free only if we can show that it is not a response to natural inclination. The only way to do that is will universal moral laws, universally applicable without regard to natural determinations based on the place we inhabit, climate, human diversity, etc. The realm of Freedom is in principal the negation of the realm of Necessity. We lay down the law to ourselves and Nature. The price paid for this maneuver is that both the natural realm of appearance and the human realm of values lose ontological foundations. They are both posited by Reason qua Will. And once again, we are delivered over to a dogmatic universalism.

If we are successful in deploying Reason in this fashion we will come to live in a human realm outside the natural whole. The concrete ramifications for which we may then hope are, perpetual peace consummated on a bed of universal, cosmopolitan, egalitarian, commercial republicanism made possible by modern science and technology, i.e., the modern longing in a nutshell.

Kant was not the end of modernity to date, but nothing simultaneously novel and thoroughly modern have announced themselves since. Hegel tried to give ontological credibility to the transforming march of Will through History. Marx tried to rethink the means to metaphysical freedom for all. Nietzsche stripped the Will of the need to will the universal. Now one could openly and with a good conscience create of man and the world anything one wanted in an unlimited exercise of the creative Will-to-Power. In the process, History ceased for Nietzsche to be progressive or meaningful, and human existence was delivered back to the contingency Machiavelli and Descartes set out to master. Heidegger stripped the Will of the possibility of self-consciousness and left us with the reign of a contingency and fate we could no longer master at all. In the process the way was paved for the anti-foundationalism and praise of blind "difference" of postmodernism. Modernity seems to have circled back on itself; it is unclear that there are any more modern moves to play in this game. Inadequate as this sketch is, we can stop here and consider the picture complete for our purposes.

- III -

Having delineated modernity in the fashion that I have, what would deserve to be called

genuinely postmodern? The genuinely postmodern alternative would have to be beyond metaphysical freedom. It would have to position itself beyond modernity's anti-nature animus. It would have to be beyond the glorification of rationality as autonomous, unencumbered self-legislating Will qua Nature's Other. Postmodernity would have to open itself to accepting the present which, I will argue shortly, will require emancipation from what Nietzsche called the Spirit of Revenge against "time and its 'it was.'" In short, postmodernity would have to quit the priority of the future which holds throughout modernity and which leaves us always in transition and thereby without a present. Postmodernity would have to open itself to the spontaneous occurring of natural difference in all its manifestations--although this need not imply a blind immersion in or total acceptance of all efficient causality. And it would have to find for itself a place to stand other than the gravity-defying mid-air tightrope of modern, self-legislating Reason. Finally, it would have to find a way to grasp the whole as a whole of which humanity is a part, although that whole need not be a completely ordered whole.

I will try to flesh out these intimations shortly, but it should be noted that the characteristics of the genuinely postmodern to which I have pointed have little in common with what customarily asserts itself under the rubric postmodernism. My understanding implies a distinction between postmodern and postmodernism.[9]

Postmodernism as it is associated with such names as Rorty, Derrida, Foucault, Vattimo, Lyotard, et al, and as used in conjunction with discussions in architecture, the social sciences, art, cultural criticism, etc is a decidedly post-Enlightenment, late- modern phenomenon. It rejects the possibility of the self-conscious, self-grounding, self-legislating self of modern thought. Hence given that there is no self-conscious ego--and no static Other either--it is impossible to posit the possibility of a linear, unidirectional motion for human History. Therefore, the central modern idea of Progress must be jettisoned as a chimerical idea as well as a policy goal.

Throughout postmodernism we hear the assertion (on postmodernist grounds what could count as a "proof"?) that reality is not fixed or static; it is asserted that it is evanescent, constantly changing, unknowable. This is true of both knower and know, "subject" and "object." As with metaphysical freedom, postmodernist reject the notion that man has a "nature," Nature itself does not

have a "nature." Reality, human and non-human, are constituted by our attempts to use, describe and understand what is. Indeed the traditional concept of Nature--that which is self-presenting rather than dependent on man--is jettisoned. In Derrida's version of the argument, all of reality is a text, constantly rewritten in the very act of reading. Consequently nothing in reality is entirely present--as with texts as conventionally understood, what is in the "margins" and between the lines carries meaning as much as the words. And a web of words is all that is ever present for us no matter how frequently we delude ourselves on this topic. All we are ever confronted with is "traces" of an absent source or foundation. Those traces continually reconstitute themselves.

Since reality is not fixed, it is a mistake to believe we can consciously or "rationally" control it. The modern dream of control slips away. With it any worries about closure or the "End of History" can be dismissed without being confronted. Life exists primarily on a surface that constantly reconstructs itself in unpredictable ways. There is no source or foundation, presence is determined by absence. When anything begins to rigidify in reality it is the duty of the deconstructionist to step forward and take it apart so that it can no longer be an object of attachment. Such attachment is allegedly the cause of all manner of evils. For the postmodernist this deconstructing must be constant, hence it never points toward reconstruction. What is needed is an urbane appreciation of "Difference" even though all difference is entirely contingent. Nonetheless, the flux of contingency is seen as central to the human good. How one knows this is unclear.

All of reality dissolves into an endless, arbitrary, contingent play of differences that occupy a surface beneath which there is nothing. It is entirely predictable that this understanding be conjoined with an attitude of irony; it is hard to see how it could possibly produce anything but an ironic relation to life. But with that irony usually comes cynicism as well. We bide our time, jaded and indifferent, the perfect citizens of the post-historical age in which we know that nothing is worthy of passion or commitment. It is not clear to me how one could construct a useful environmental ethic from this stance (except by sneaking in back door altogether modern commitments to which postmodernists are not entitled, as happens all too often in this literature).

Postmodern<u>ism</u> is an altogether consistent extension of modernity. It is the kind of under-

standing that presupposes that natural limits have been pushed back and that natural scarcity is not accepted as an inevitable given. Such an understanding presupposes a world where human labor has been successful in supplanting the natural realm of appearance. It also presupposes that human labor has been stripped of any rhyme or reason other than ongoing transformation. The entire ensemble of postmodern commitments from antifoundationalism to an-archic pluralism not only presuppose the liberal bourgeois world but represent the coming together of Marx's longed for "withering away of the state" and Nietzsche's understanding that all of life is interpretation (which is nothing but an extension of the modern understanding that we can know only what we make). The modern anti-nature animus is carried to a new peak--there is no "natural" foundation or source. There is nothing genuinely postmodern here. It is only the shortest of steps from proto-modernity's faith in the malleability and manipulability of nature, and metaphysical freedom's positing the non-existence or moral irrelevance of nature in man, to the evanesce of a world of traces.

The genuinely postmodern must construct a new relation to Nature that sees it as substantial, self-presenting, self-subsisting. This need not be a picture that is static, but it must take the realm of appearance seriously. And confronting the legitimate problems that come under the rubric environmentalism requires not that we continually deconstruct everything that presents itself but that we step back and allow something to congeal that will provide the basis of cross-generational perseverance.

- IV -

Where may we look to find the first notes out of which we might fashion a genuinely postmodern overture? To my mind the most promising elements are to be found in the work of Nietzsche and Heidegger. I would be the first to admit that both thinkers remain primarily within the orbit of modern thinking. For example, the priority Nietzsche puts on the Will-to-Will is modernity carried to a logical if frightening conclusion. But each author also articulates elements that introduce genuinely postmodern possibilities. I will focus on those elements, knowing the danger involved in abstracting them form the whole.

The postmodern elements in Nietzsche's thought are found in the central doctrine of the

"eternal recurrence of the same" and its linkage with the analysis of the Spirit of Revenge. The Heideggerian addition to and emendation of this analysis is to be found in the discussion of Being as physis, the discussion of "The Age of the World View," the discussions of the poetic revelation of reality, and the discussion of Gelassenheit.

Nietzsche presents us with the problem that on one level he simply carries the modern longing to its most extreme manifestation. In Nietzsche's thought the modern transformation of Reason into Will is raised to such a power that all of Being becomes Will-to-Power and man is justified in imposing his unlimited will on the rest of the world--human and non-human. Further, Nietzsche merely wills the inversion of the modern priority of the "human" over the instinctive animal in us, self-consciousness over consciousness, the realm of appearance over the true or ideal realm, and so on. But in the doctrine of the "eternal recurrence," which he asserted was his central and highest thought Nietzsche provides an opening to the postmodern

The doctrine of the eternal recurrence has been ignored by many scholars, or reduced to the banality of the understanding that as a fact of reality everything repeats. But Nietzsche intended it as a metaphor for a new relation to reality. The eternal recurrence is not presented as a metaphysical given, it has to be willed. Nietzsche's Zarathustra says of the eternal recurrence that it should be seen as our "last will." By that he did not mean our last will and testament, but that we should will the cessation of willing; that we should cease to operate in the realm of and under the hegemony of the Will. What this pointed to for Nietzsche was the "reintegration of man into nature."[10]

For Nietzsche, in perfectly Rousseauian fashion, all of past human history had been an accident. Nietzsche asserts that this becomes the ground of great distress--something eludes the Will. Since the present is a product of the past, man rebels against the present as well. He will not accept anything that is not the product of the human Will. The greatest affront to the will is "time and its 'it was'": i.e. that over which the Will can have no control. There is only solution to the problem, will that the past transpired precisely as we would have willed it. Then the past will cease to be the object of our anger and resentment. To prove that the past is just as we would have willed it, we must will that the future be a repetition of the past. In more concrete terms, we must will the return of the

hegemony of Nature qua instinct over the direction of the self-conscious ego. We must will that the abode of truth come to reside in the realm of appearance and not in some "real" or "ideal" realm that is "beyond" or "meta." We must will the overcoming of metaphysical man, and that means will the overcoming of the Realm of Freedom in favor of the hegemony of the Realm of Necessity. In Nietzsche's mind this implies the unleashing of a dialectic of the strong and the weak, of master and slave, of male and female; of nation and nation; in short, the unleashing of natural difference and an acceptance of the spontaneous outcomes that unimpeded interactions will imply. Needless to say, the implications could be harsh, and Nietzsche was by no means squeamish in this regard. Like a good Machiavellian, Nietzsche thought that foundings were always harsh. But upon a harsh foundation a new culture could be erected. That new culture would help humanity avoid the impasse characterized as the victory of the "last man": i.e. the End of History.

Nietzsche also characterized the refusal of the Will to accept time and its it was, as a manifestation of the Spirit of Revenge. For Nietzsche, all of past History, especially as it is conditioned by Christianity and Socratic rationalism, had been sullied by a revengeful relation to reality. Never yet have we been willing to accept reality as it presents itself; to accept that the whole is and must be constructed out of a balance of competing contradictory parts. Hence we have throughout time exacted our revenge against reality. We have been determined to transform the world as it presents itself and bring it in line with the wishes of our Will. In the process we have made life not only ugly, but threatened its cessation.

For Nietzsche, life grows out of a great cosmic clash of opposites. Willfully and revengefully destroying all manner of natural oppositions, clashes and confrontations, we have threatened to destroy life. According to Nietzsche, it is a mere prejudice to believe that the good is caused only by the good, that the beautiful is caused only by the beautiful, and so on. For example, using Nietzsche's understanding of Art, the most magnificent artistic creations are responses to the ugly, the threatening, the frightening. The higher is always born out of a confrontation with the low. Remove the low and you lose the high, the noble, the beautiful. Human greatness is born of facing challenges, overcoming hardships, confronting the base, the low and the frightening. If we revengefully remove all

obstacles humanity is not enhanced--as Hobbes would have it--but diminished to sub-humanity and banality.

To truly affirm life and be freed from the Spirit of Revenge it is necessary to affirm all of life in all of its mysterious, unfathomable diversity. And for Nietzsche that meant that one must affirm life in all its sorrow and joy, beauty and ugliness, strength and weakness, sickness and health, tyranny and magnanimity, and so on. To affirm all of life in a revenge-free fashion is to affirm the eternality of what is and to Will that one would want it no other way, for all of time. Hence one must be freed from the desire for a future that is different from all of the past, a future that rests on a progressive change and transformation of reality that culminates in what Nietzsche designated the "sabbath of all sabbaths." One must eschew the faith in History and Progress and affirm life in its infinite, mysterious, unfathomable circling and recurrence.

To say yes to life, to affirm it in all of its diversity--both the high and the low--is the human equivalent of affirming and nurturing bio-diversity. To be freed from the Spirit of Revenge requires emancipation from the desire to transform the world; and that would include the desire to transform the natural world for the sake of transcending all of the human limitations we refuse to accept. It means transcending the attitude that that the products of our Will are superior to the outcomes that come from the interaction of human diversity. A postmodern environmental ethic will have to be beyond the Spirit of Revenge. But it cannot selectively transcend that spirit. It cannot will that we cease our revengeful assaults on the non-human while we continue it with intensified force against the human.

It is my contention that Heidegger broadens and deepens Nietzsche's analysis of the Spirit of Revenge.[11] But our approach to Heidegger is made difficult by the obfuscations and cant that pass for Heidegger scholarship. Needless to say one must confront Heidegger's flirtation with Nazism.[12] But the real source of obfuscation surrounding Heidegger's thought emanates from the attempt to deflect Heidegger's teaching back onto the modern path--e.g. qua a pluralistic, anti-foundationalist, an-arche-ism in the service of further advancing the revengeful, comfortable self-preservation that sees death as the greatest evil and its avoidance at any cost as the greatest good. Heidegger himself

resolutely opposed the modern in all its manifestations--theoretical, moral and political.

Even when on the surface he overtly parted company with Nietzsche's rhetoric, Heidegger pursued an end similar to Nietzsche's. Heidegger pursued a rapproachment with a world that is self-presenting which we should affirm in all its diversity. It is the postmodern elements in Heidegger's thought--which I believe are substantially shared with Nietzsche--that I will stress. Central to Heidegger's teaching, from "early" to "late," is the discussion of Being. A central ontological intuition reigns throughout Heidegger's thought--Being is conceived as physis. Being is that which sends forth out of concealment into unconcealment while simultaneously holding back something in concealment. In more customary parlance, Being and the realm of appearance are intimately connected. What appears for us is the outer face of Being. But Being never completely reveals itself, and it reveals itself in a succession of different ways that are beyond our control. Heidegger--in a way that deepens the Nietzschean inversion of the real and the apparent--gives ontological grounding to what appears for us, and grounds it on something other than the human, positing Will. For Heidegger, Being is self-presenting and we must open ourselves to it. Unlike the modern understanding where what counts as Being is determined by a projection of our Will, for Heidegger, Being presents itself if we will open ourselves to it; albeit it does not present itself in a static fashion, and it is incapable of being grasped by us in its entirety. Given that Being always retains a concealed and mysterious element, it cannot be controlled and manipulated by us; it must be affirmed in all its mysteriousness.

According to Heidegger, the nihilism that engulfs us is--at least in one permutation of his argument--due to the fact that we have turned away from openness to that which presents itself. We live in the "Age of the World Picture." We impose our view on the world, and as a result we live in a time of competing world views. The world is no longer seen by us as self-presenting. The world has become our picture. Hence it has lost the dignity it has when it is imbued with Being. As a result, both Nature and man have become fundamentally inert and valueless for modern humanity. Man is transformed into a loborer and Nature is transformed into inert matter to be transformed at will and kept "standing by." Hence we feel no qualms about imposing various projects for transformation, manipulation and domination. The Age of the World View as Heidegger presents it, is the ultimate

manifestation of what Nietzsche called the Spirit of Revenge.

Any postmodern environmental ethic must stand beyond the belief that the world presents itself only after we impose our view upon it. We must open ourselves to that which presents itself, while remaining alive to the mystery at the core of all existence that we can never master. If that occurred we would open ourselves to the world as it appears and not try to transform it into what our Will wishes. As Heidegger puts the matter in the "late" discussion Gelassenheit, we must affirm "openness to the mystery," and "openness to things." This is identical to opening ourselves to the diversity that presents itself, while refraining from the revengeful imposition of our Will. And the diversity of Being for Heidegger presents itself in the midst of the same opposition and contradiction that Nietzsche depicts with greater poetic force.

But according to Heidegger, emancipating ourselves from the Age of the World View will be very difficult. In principle this cannot be accomplished by an act of the Will for that simply reproduces the problem. Herein lies Heidegger's deepest criticism of Nietzsche. One cannot transcend the hegemony of the revengeful, positing human Will by an act of Will. Further, we are so determined by the spirit of the revengeful technological world that it is a myth to believe that we can stand beyond or outside it. Everything that surrounds us, including ourselves, is revealed in the modern, revengeful technological fashion. All we can do is step back from willfulness, step back from projecting and positing world views. We must step back from the Will and await a new dispensation of Being, a new revelation of the realm of appearance. The prelude to that possibility requires a step back from willfulness; but we cannot predict when a new dispensation of Being will be forthcoming.

I am perfectly aware that these remarks are schematic, and at best inadequate from a hermeneutic point of view. But they are adequate for the present purpose of sketching the outlines of what I believe would be needed for a genuinely postmodern approach to the issues raised by environmentalism. First, we will have to stand beyond the Spirit of Revenge, beyond the desire to willfully impose our view on the world. Second, we will have to attain an openness to a world that presents itself, in all its diversity both human and non-human. I will close this section with one caveat: What I am discussing need not be confused with a blind and callous attitude that casts us adrift, to be swayed

by every vagrant accident, tyrannized by bullies and solicitous toward ignorance. What is implied is the emancipation of practical wisdom--a self-presenting phenomenon--from the willfulness and hubris of modern, abstract, theoretical Reason.

- V -

Where do these intimations take us in reflecting on environmentalism? They will certainly not take us in the direction of programs for immediate adoption; in fact no policy prescriptions necessarily follow in any fashion. In a significant way, the explosion of policy alternatives--and the general faith that enough clarity already exists to move immediately to projecting more or less grand, consciously constructed transformations of reality, is at the heart of the problem. The belief that we can and should, through an act of Will, impose our world view on reality is the faith the must be reconsidered. What is needed first is a new way of looking at things not a laundry list of prescriptions littered freely with our wish lists. We must accept that reality (qua physis) presents itself and does not demand the prior imposition of our view before we can approach it. Again, this represents a new stance toward reality, but it does not imply that we simply accept every vagrant outcome tossed up by Chance. But we must accept that appearance has solidity and is the abode of truth, ceasing thereby to continually transport truth to some other realm--whether that be some presumed "real" or human statements.

We must get ourselves beyond the attitude that it is not only legitimate but incumbent upon us to impose our Will. This spirit of revenge when directed against the non-human part of the natural whole is what leads to the concrete problem(s) of environmentalism in the first place. As man is part of the natural whole--and not as modernity would have it, a kingdom within a kingdom--this modern Spirit of Revenge cannot help but extend itself to man as well. It is beyond the theoretical hubris of competing revengeful views that an answer lies. With some exceptions, "environmentalism" as we have seen it up to now, is but another manifestation of the Spirit of Revenge which simultaneously argues for forcing man to step back from non-human Nature and allow it an unfettered arena to operate--for example in its "wilderness" manifestation--while projecting all manner of transformative manipulations upon man. First, it is inappropriate--although entirely modern--to view man as

something external to the natural whole. Second, this attitude sketched here almost always stands on a view of nature that is too static, and which fails to appreciate that what man is and does is as important to the ever chaning "balance" of the whole as the actions of a whale or snail darter.

It is almost impossible to find a manifestation of "environmentalism" that does not go hand in hand with a longing for a transformation of modern culture. But this longing for transformation remains altogether consistent with the modern longing. We must come to realize that a culture, in any meaningful, comprehensive sense, is a background phenomenon that loses its function precisely when we disinter it and bring it to the foreground. That is why modern man does not really have a culture, he merely lives eclectically--in the mode of postmodern pastiches and collages--off the cultural capital of the past. Cultures grow out of an indigenous experience of life, shared by a distinct group of people in a distinct place with a distinct history. Having a culture presupposes the exact opposite of being a disencumbered self. The cultural capital which comes to us from the past, while ennobling and invigorating to inspect, cannot be expected to be a living experience for individuals immersed in a present that is entirely different than the ones in which that cultural capital was generated. The ultimate modern longing for the hegemony of the cosmopolitan and the abstract universal destroys the rootedness that makes the "growth" of cultures possible. It is mindless to believe that we can will cultures to suit our tastes or presumed needs and impose them from the top down. They must be lived from the bottom up. It is precisely this possibility that is denied to us at present, and impeded by that modern willfulness that most contemporary environmentalism shares.

We must eschew faith in the totalitarian temptation and the belief that it would be efficacious to <u>impose</u> a new culture, one which, according to our theoretical lights, is more in line with the prospering of the non-human part of Nature. If we are to have a new culture which is not, for example, primarily a consumer culture, we must step back from the willful modern attempts that have transformed humanity into an increasingly uniform herd of laborer-consumers. That outcome is a modern phenomenon and rests on a distinctively modern attempt to suppress and ultimately transform the natural diversity of types of human beings that present themselves when we step back from revengeful attempts at their suppression.

It should be clear that this longed for modern transformation of humanity is the basis upon which we have presumed to be able to actualize the distinctive modern form of egalitarianism based on the abstract universal self. And it is only that self that can presume to engaged in "self-realization" in the modern mode of self-creation rather than self-discovery. We will have to reconsider these ideas--which does not mean we have to jettison all of the concrete outcomes we frequently wish to foster using such concepts as our means. We will also have to reconsider our modern prejudice against Tradition. The Enlightenment prejudice against traditions qua traditions rested on the belief that they are intrinsically bad because they limit self-realization qua self-creation ex nihilo--which rests on the modern longing to denaturalize man in favor of actualizing self-legislating Reason qua Will. But Tradition correctly understood is not reducible to the dead weight of blind oppressive past accidents. It is more closely linked with the distinctive way of doing things of a group in a certain place who have shared experiences over an extended period of trial and error. It is traditions so understood that make possible cross-generational perseverance and a more general concern for the future. It is traditions so understood that makes culture possible.

This argument is not a round about way of legitimizing past traditions, many of which emerged in the premodern world, and which are from an American perspective, on entirely different continents. What is required is that we step back from the modern universalist, dogmatic faith that there is only one correct and just way to do things everywhere. We need to step back and create the conditions under which the kind of positive and frequent interactions among individuals occur that allow such traditions to emerge and take root--e.g., we need to step back from bureaucratic planning. Finally, being beyond past traditions, new postmodern traditions would rest on a shared ethos that binds together old ethnic and racial groups into a new community. The politics of race and ethnicity, when it is dependent on old linkages, is atavistic.

My argument is that we will have to have the courage to step back from the modern longing to will outcomes to allow a postmodern alternative to present itself as it will, free from our revengeful projecting. If we are to unleash the natural from the revengeful theoretical transformations of modernity we cannot do it selectively according to our various priorities and agendas. While precise-

ly what is required is to allow something to emerge and present itself, I think this would occur within certain relatively predictable parameters which I will discuss shortly.

Under the rubric "The Tragedy of the Commons," it has been argued that individualism in an environment of consumerism leads to ruin. Hence it is concluded that individualism must be limited by elite cadres. By this argument, popular sovereignty must likewise be limited, if not jettisoned. The mechanics of these limitations are never made entirely clear, but the specter of self-selected and self-appointed elites is never far from the surface. This specter becomes even more menacing when it is asserted that the primary problems confronting us are global and hence will require global administration beyond the sovereignty of the nation state--again by self-appointed elites (In this regard, the name of Greenpeace in often repeated with almost religious reverence).[13] The prospect of global tyranny conducted in the name of a "Nature" from which man has been expelled should, in my view, cause a synthesis of anger, revulsion and disgust. This is the most dangerous specter of the modern instinct for control which is at the heart of the problems we need to confront.

The need for radical, imposed transformations is assumed to be not only logical and inevitable, but the only available option given that present manifestations of individualism and popular sovereignty will lead to mass universal consumerism, which will in turn make accelerated demands for economic growth, which it is assumed will require the transformation and using up of ever increasing quantums of limited natural resources. It is argued that there is no other way out of the vicious cycle that leads to inevitable ruin than through imposed limitations on freedom and consumption. But there is another, far easier way out, which is consistent with individualism and popular sovereignty which environmentalism never considers because of its modern myopia. Further, the anti-growth bias of environmentalism overlooks possibilities that can quite plausibly allow for economic growth without environmental ruin. And we need not turn to the frequently mentioned palliative of enforced equality of possessions (again implying greater centralized bureaucratic oversight and administration).

If overconsumption is the primary problem, then it is far more plausible to argue that what is needed is to give people something else to love other than consumption, not to forceable constrain

and administer their patterns of consumption. This never dawns on "environmentalism" because it is such a thoroughly modern phenomenon. Modernity was founded on the premise that material progress toward peace and comfortable self-preservation--as the only legitimate ends--together with political progress toward greater equality could only be had if various human inclinations and potentialities were suppressed and morally delegitimized. This is but one manifestation of modernity's reductionist, dogmatic, universalistic tendency. If consumerism is the problem, it is because of the victory of this unitary vision. What is needed is to relegitimize other ends beyond the pursuit of comfortable self-preservation. For example, to wealth could be added, honor, piety, excellence (and there is an entire pantheon of excellences with correspond with the various human capacities and potentialities--e.g., courage, artistic excellence, the pursuit of knowledge, spirited competition, etc.), to name but a few.

Modernity rests on an increasingly more powerful, revengeful attack on natural, human diversity and an attempt to reduce humanity to one universal whole. What we need to do is unleash human diversity. This is not tantamount to accepting a free for all, or a back door entree for neo-Social Darwinism. Human diversity may be balanced by practical wisdom in a variety of ways--but tortured, sublimated and transformed is an entirely different matter. Human diversity is part of biodiversity. Any balance of Nature implies the functioning of all the parts--the human included. Why, for example, is the spirited, honor-loving human being any less important to the whole than the spirited bald eagle? A postmodern environmental ethic would have to wean itself of its inclination to impose a unitary view of the human good in the name of the alleged well-being of the non-human half of the natural whole.

As I mentioned above, a postmodern environmental ethic must also wean itself of seeing the problem of Nature as being a problem regarding the well-being of everything that is not man and not man made. Why is an anthill natural (it is a product of labor not of biological reproduction) while a human temple is not? Why is a fishpond a mini-ecosystem while a human community authentically rooted in a specific indigenous place is not (reflect on the cliff-dwellers of the American Southwest in this regard). Why does the "balance of nature" require one and not the other. More to the point,

why do we begin by considering them different? Because we are still operating under the sway of modern prejudices--most specifically the modern Reason\Nature and Human\Nature dichotomies.

Take as another example of this point, the debate within environmentalism over whether one should adopt an ecocentric or anthropocentric view or orientation toward operative concrete issues and philosophic questions. Never mind for the moment that the issue is frequently adjudicated on the philosophically irrelevant basis of deciding which will be tactically more useful in winning political victories. The primary point is that it makes no sense to choose for the human or for the natural unless they are somehow two. However, there is no choice that needs to be made if they are part of the same whole. This is a false problem that flows through from a modern dichotomy. If Nature is not Nature until the last part is added--the human--then this issue never arises. As yet another example, take the approach known as deep ecology. Seeing the need to integrate man back into nature as a less self-conscious, willful animal with closer ties to natural rhythms once again implies that man is already outside Nature. Why is not man part of Nature precisely by being what he is--a rational, historical, cultural, political animal?

Finally, the issue of stepping back and allowing Nature to reassert its own alleged rhythms makes all manner of assumptions which are also flow throughs from modern conceptualizations. If we assume that if man is constrained to be integrated into Nature as an unselfconscious, ahistorical being like other animal species, it is assumed that a primordial state can reassert itself. This assumes an entirely too static understanding of Nature to fit the facts. Nature is ever changing, ever rebalancing. Why assume that there is some primary or primordial nature to return to, rather than an ever reconstituting whole of which man the historical, cultural being is a far better microcosm than any other species. We should rid ourselves of the modern, fundamentally Romanticist, longing for Arcadia. Were we to do that the poeticizing of the wilderness as a wonderful, refreshing, static, place that never changes and provides the eternal equivalent of a get-away weekend would sanguinely fade away. And the daydream that Nature in its simple wilderness manifestation is unmitigatedly supportive of human existence--without any cultivation--will slip away as well; and good riddence. These are nothing but extensions of altogether modern fables; more to the point, they are born of reactions

to modern conceptualizations at a time of increasing industrialization and urbanization. Nature is Nature only because man is part of it; man is man only because he is a historical, cultural, political being; man can be an historical, cultural being only if we step back from the modern revengeful assault on human diversity that attempts to reduce man to universal laborer-consumer qua abstractly identical citizen of a global polis.

If one opens oneself up to human diversity, beyond the modern Spirit of Revenge, the only meaningful basis of that diversity is the pursuit of a diversity of ends.[14] Among that diversity of ends will have to be excellence of one kind or another as an end in itself. Likewise, we will have to be open to the distributions of honors for excellence rather than for utility alone. That approach is in principle aristocratic, understood resolutely as implying a relation to arete. Put another way, if we open ourselves to ends other than utility, then we will inevitably open ourselves to pursuit of what Aristotle called the basis of the noble and aristocratic--i.e., the pursuit of the beautiful and the useless, that which is desired as an end in itself. Surely there is enough wealth and technical skill already available to make this pursuit possible, and for more than a small few--if they should freely choose it, and the society rewards it with honors. Without the later all pursuit of honor will have to be deflected onto the plane of utility by anyone with an even rudimentary acquaintance with reality and any self-love.

In a more aristocratic environment, the stark dichotomy between economic growth and environmental well-being could cease to exist. For example, if we become attached to products of high quality and potential longevity, and order our consumption toward quality rather than quantity, the transformation of far fewer natural resources is implied. In fact, recycling could be adequate to meet our needs. But this is ultimately dependent on the cultivation of an aristocratic taste. For example, a multiplicity of homes built quickly to house only two people, which have a planned obsolescence requiring destruction in 30-40 years requires far more lumber than larger homes built to stand the test of time that might house the postmodern version of the extended family. Consider the following possibility: a man and wife who have no children, one spouse's father, the other spouse's mother, an unmarried sister and her children, a gay brother of the other spouse who loves tending children, etc.

Such a family would not only fit in with coming economic realities, but would need a larger house rather than four, five or six dwellings. Houses built for such families could be built to stand the test of time and still be economically feasible. Take another example, what if we bought cars intended to last twenty years. Or, what if we bought clothes that were intended to last 15 years and not go out of fashion. In short, what if our tastes changed and quantity of consumption and mindless faddishness were eschewed. What if we quit that kind of individualism that is indistinguishable from an asocial atomism? I am not encouraging any specific changes, and certainly not arguing that they should be imposed. I am simply observing that if our tastes and ends change all manner of different forms of economic and social interaction are plausible. None of them require imposition from the top down. But as far as I can see they do require the legitimizing of an aristocratic taste. But that will take care of itself if we step back from the modern revengeful assault on human diversity. There is no reason that the problem of the environment has to be solved by giving in to the totalitarian temptation unless we are determined to continue to impose a modern all too modern view upon reality.

It seems to me that the kind of thing I am describing under the admittedly broad rubric aristocratic is what would also make possible the stability under which indigenous postmodern traditions could emerge and cross-generational perseverance become possible. It is the most logical way to assure a concern for the future and for the well-being of future generations. Only by giving people a present they can accept rather than revengefully attack, can they have a past they revere and a future for which they are concerned. That relation to temporality is fundamentally aristocratic.

Further, the implication of this series of thoughts is that the primary locus of our activities would become praxis rather than techne. In other words, we would again become genuinely political beings. A genuinely political situation is one where different individuals with different ends interact. The dynamic of that interaction can work itself out in a great variety of ways as any unbiased look at human history will show. When we simply compete over distributional issues we prove we all pursue the same end. Such interaction is economic not political in any serious sense. Economic interaction points toward mindless consumption conjoined with bureaucratic administration. Political interaction points toward face to face participation at some indigenous level capable of sustaining such

interaction.

The outcome of any genuinely political interaction cannot be judged in advance. It must grow out of the distinctive interaction itself. That is why it lends itself to the emergence of a variety of distinctive traditions rather than a dogmatic universalism. When the primary locus within which we play out our existence enlarges the political and contracts the economic, technical and utilitarian, we have a locus for human existence that is potentially far less devastating to the environment.

Genuine political interaction freed from the Spirit of Revenge will not eventuate in the kind of abstract egalitarianism that modernity has pursued, which most environmentalism is still determined to impose in the name of Nature. But this does not mean that we are forced to give up the belief--correct I believe--that the concepts justice and equality are inextricably linked in complicated ways. The issue of equality need only be disentangled form the desire to impose Identity. It needs to be made truly consistent with genuine diversity.

I do not doubt that the very word aristocratic will in and of itself raise hackles. This is partly because we are inclined to make the mistake of collapsing the terms aristocratic and oligarchic. Strictly speaking the one implies love of excellence the other love of wealth. Second, our modern world was carved out is conscious opposition to a manifestation of a decaying oligarchy that called itself an aristocracy. But the aristocratic need not align itself with the oligarchic, nor need it become inextricably linked with economic class divisions. We must recognize that the world that is coming will be increasingly classless by any historical standards. That does not mean it cannot have an aristocratic component.

Environmentalism offers a powerful new opening for political philosophy precisely because it forces us to reopen the question of Nature which modernity was intent upon closing; and which contemporary movements of thought from feminism to deconstructionism continue to assert out of existence as one of their opening premises. A postmodern environmental ethic must recover the question of Nature. Where exactly this will lead and what will follow I do not know; that is precisely the point. But the logic of the argument seems to me to point to an accentuation of the local over the global and the cosmopolitan.[15] It will have an aristocratic component--it would reward something

other than utility. It will open itself to the interaction of genuine human diversity. It will allow new traditions to emerge--the only plausible, non-totalitarian way to create concern for the future that is not the stale kind that is imposed from the top down. And it will be political in the full, architectonic sense rather than administrative and bureaucratic. Openness to the political points toward the local where more face to face participation is possible.[16] What is needed is to emancipate the love of ends other than utility, consumption and a quiet, predictable existence. Only then could we quit the modern manipulative stance, still shared by environmentalism, that believes we must will a cultural change from the top down, pursue enforced redistribution, willfully transform existing power relations (which still, in modern Newtonian fashion, forces us to conceive relations as power relations), etc. etc. Only beyond that modern mentality is there a hope for the health and well-being of the natural whole.

ENDNOTES

[1]Those interested in the philosophical antecedents of such ideas might start with Nietzsche's metaphor about "innocence and forgetting" in "Three Metamorphoses," Thus Spoke Zarathustra, Part I.

[11]For a more complete analysis of Nietsche and Heidegger see my Between Eternities. For an elaboration of Heidegger's thought see Part Three.

[12]For a discussion of this subject see my "Heidegger's Post-modern Politics?", Polity (Fall 1991).

[13]See for example William E. Connolly, Identity\Difference: Democratic Negotiations of Political Paradoxes, (Ithaca: Cornell University Press, 1991).

[14]If one assembles a group of ten people, of various melanin levels and dominant chromosomes, and they all pursue the same end--utility, consumption, wealth, manipulation and domination of nature--one has hardly accomplished diversity in any interesting sense.

[15]It is surprising how many postmodernists speak in favor of the local only to move immediately to will the universal and the cosmolitan. What is needed is to allow significant, novel, new local traditions to emerge, not use the local as the latest venue for the modern imposition of the universal.

[16]I hope my presentation will be spared the lame indictment of being "neo-conservative." Everyone from Habermas to Ferry and Renaut to environmentalists seem to fall back on this charge when confronted with a position that tries to be postmodern. It seems to be the last refuge of late-moderns. Every manifestation of this charge that I have seen rests on the modern prejudice--unannounced--that History moves in only one direction and can arrive at only one just outcome. This charge always assumes that there is nothing beyond modernity, and hence anything that challenges the modern understanding must be a reactionary sortie into the past. Armed with this piece of self-validating wisdom--and never admitting the End of History bias it implies--we then see the thoughtless maneuver that divides all possibilities into mine and everything else. Students of the Platonic dialogues will know that Plato long ago put the lie to this kind of maneuver when he lampooned such division by halves by showing how it could be used to show that man is essentially a "featherless biped"--i.e. a subsection of the class that includes chickens.

PRESIDENTIAL SACRIFICE CAMPAIGNS:

WHY FOLLOW OUR LEADER

Presidential Sacrifice Campaigns:

Why Follow Our Leader?

Kathy B. Smith

Wake Forest University

Individuals and nations periodically forego immediate need gratifications to attain a future goal. Millions of people trim their daily expenses to buy new homes, students postpone their entrance into the work force to achieve long-term professional and personal growth, and nations call on their citizens to sacrifice their personal interests for the greater good of the state.

Who "we" are as a community is determined partially by our conceptions of citizenship. The individual's relation to the state is the subject of a continuing debate in political philosophy. Individualists (Dworkin, 1977; Rawls, 1971) contend that the individual defines "self" and acts in rational ways, sometimes as part of a community. But because it is the individual's perspective that counts, it is rational for individuals to use the public arena to satisfy their personal needs and even to ignore the community's needs when they fail to address the individual's needs.

Communalists (Sandel, 1982; Taylor, 1973) respond that the individuals are defined by their relation to the state, and that community membership may be the essence of moral behavior. Communalist, David Miller (1992) argues that citizenship,

> is not just a matter of possessing rights, even if those are broadly interpreted . . . [One] must act as a citizen, that is as a member of a collectivity who is committed to advancing its common good. . . . [M]oreover, he [sic] cannot regard politics merely as an arena in which to pursue his [sic] private interests. (p. 96)

The individualist and communalist camps both offer strong arguments, which is why the debate continues. Each is an academic community united by its own interactions and shared disbeliefs. Moreover, each group needs the other because neither position makes

sense without the other: it is the rhetorical tension of the dialectic that sustains, verifies, and energizes them. So it is for society.

Each of us has individual needs, each of us has a sense of the shared needs of the various interpretive communities (individuals united by shared language, logic and values) to which we belong, and each of us has a grudging respect for the reasonable needs of others. So it is that we carry on the individualist-communalist debate in our own minds. We think in arguments: sometimes we know the philosophical bases, but usually not; sometimes our symbolization of the issues is well differentiated, articulated, and integrated, but more often it is anecdotal and clumsy.

There are times when the broader needs of the state take precedence over the individual needs of the citizen. The state has a right, even a moral obligation at such times, to promote actions for the good of the community that cause individual discomfort and sacrifice. But the terms and specifics are always arguable, and it is the interplay of arguments that influences social change. Sacrificing entails the giving up or foregoing of something valued for the sake of something greater. Individuals ultimately determine for themselves when a sacrifice is appropriate. But they reach that decision after communicating with others and after rehearsing and sorting in private the arguments they have learned.

Who speaks for the whole nation when a societal sacrifice is required? Rejecting Divine right and the rule of the jungle leaves a limited number of options. Religious leaders speak to their interpretive communities with various appeals for behavioral change and personal denial. But without an established religion we have no established clerics to speak for the nation. But there is the American civil religion with its "Bully pulpit" of the presidency (Bellah, 1967; Fairbanks, 1981). Our democratic creed teaches us to use votes to link the governors and the governed. Federalism has created a system of regionally based constituencies, but only the president and vice-president have a national constituency.

The President of the United States has the symbolic function of representing all Americans. As the sole elected official with a national constituency, he is able to articulate the dominant interpretation of the public interest and, sometimes, to establish an emerging interest as dominant. Additionally, the expanding nature of the modern presidency and the proliferation of interpretive communities has increasingly led Americans to look to the president for direction and priority setting. Indeed, that is the essence of the rhetorical presidency.

Constitutionally, president has substantial power to direct the executive branch. But to be a national leader the president must also encourage cooperation: from the rest of government, from non-governmental institutions, and from the people. Thus, when a national sacrifice is necessary, it is the president who is responsible for persuading citizens to act in the "public good."

This presidential responsibility occurs during peace and war. As the nation has moved from an era of gratifying abundance into a time of limited growth, some adjustments in life-style have become necessary. Government directed alterations in individual behavior are never easy to induce, but the promotion of a nationally oriented sacrifice program is particularly difficult when people are accustomed to self-interest and advancement.

Investigations of governmental attempts to modify mass consumption patterns can help us to identify the components of successful sacrifice campaigns. Specifically, President Truman's famine emergency plan and President Carter's energy plan will be considered as attempts to persuade Americans to sacrifice with respect to their consumption of scarce commodities.

STRATEGIES FOR INDUCING SACRIFICE

Mobilizing is persuasion. The mobilizer must attract, unite, organize, and orient people toward the attainment of a goal. The president as mobilizer must find the arguments or appeals to which the appropriate individuals will respond. Presidents can try to mobilize whole interpretive communities into coalitions or they can attempt to personally rally individuals. In either case, presidents and their surrogates create a cafeteria of rhetorical appeals from which citizens can find something to satisfy their individual and community needs.

The president as mobilizer cannot settle for ordinary political acquiescence. Instead, the mobilizing president must spur individual and collective action. They can induce these actions with either compulsory or voluntary strategies, but voluntary compliance is generally to be preferred. If millions of people are to voluntarily prefer concerted action to passivity, the new action will have to fulfill one or more of their personal needs. In other words, the rhetoric of mobilization must perform an array of psychological functions for citizens so that they will perform mobilization functions for the president.

Coercion, or pressuring strategies (Olsen, 1978). Such strategies involve a structural approach to change. They use laws or controls to compel individuals and groups to engage in the desired activities. The rationale behind this approach is that changes in laws lead to changes in behavior, and that behavioral change will encourage the attitude change that insures continuation of the desired behavior. Two examples of coercive strategies are food rationing during World War II and the 55 MPH speed limit to conserve energy. The coercive approach is a straightforward approach to change that utilizes the state's monopoly on legitimate force, but serious dangers inhere in coercion.

First, representative democracies should rarely need to force a majority of their citizens to do what the government deems necessary. Adequate communication between governors and the governed should serve an educative role, leading people toward cooperation in most instances (Smith, 1981). But even strategically, coercion will often prove ineffective unless a substantial commitment of resources is made to enforce vigilantly the regulations. At worst, the program will fail and the government's legitimacy will be challenged as well.

The irony is that even government coercion entails persuasion. The government must inform people of the mobilization campaign and its sanctions. It must persuade them of its ability and willingness to use those sanctions, and of its ability to achieve its goal, even over their opposition. This is not always easy. The rhetorical irony of coercion is this: successful coercion requires persuasion, so if the government is going to justify coercion with persuasion, it might better use persuasion to achieve voluntary compliance.

Voluntary compliance is the second approach to mobilization. It requires that the president be rhetorically attuned to the needs of people. That task is complicated by the fact that the incongruent interpretive communities respond differently to the same discourse. Thus to mobilize, the president must build a coalition of supporters with a successful public campaign. Whether coercive or voluntary, the public campaign needs to use a blend of five strategies of persuasion. The major strategies for inducing voluntary compliance are a self-improvement strategy, an exemplification strategy, an incentive strategy, the hanging sword strategy and a humanitarian strategy.

In the self-improvement strategy the government attempts to show how one can better fulfill one's personal needs by adopting new behaviors which, almost coincidentally, serve the public good. The needs of the individual and the community converge when understood in the new way. Such campaigns have transformed the status ascribed to driving large cars and drugs; and they have emphasized the health and beauty benefits of walking to satisfy people's personal needs for fitness and attractiveness, while saving gasoline in the process. The

self-improvement strategy addresses people who comply with government directives when the new behaviors provide personal need satisfactions, not because they can help other people or solve problems.

Exemplification necessitates that those who recommend a change enact it for the public. Thus, while President Truman called for a significant reduction in bread consumption, the White House reduced its own bread consumption (Lee & Cohan, 1946). The egalitarian theme in American political rhetoric makes it imprudent for leaders to ask more of their followers than they themselves are prepared to sacrifice. Furthermore, those setting the example need to publicize their actions and to indicate the continuing nature of their behavior, lest it be dismissed by the public as but a token act. Those individuals and groups who follow the directives can be used as models to indicate the program's success and to stimulate a bandwagon effect and a positive spiral of public opinion (Noelle-Neumann, 1984).

The third strategy for motivating the public is to provide economic incentives to sacrifice. Pricing uses cost as an incentive to achieve compliance with desired goals (Olsen, 1978). When the cost of non-compliance with a government campaign is unacceptably high, individuals should prefer cooperation. Following this strategy the rapid increase in the cost of heating fuel and gasoline should have produced a concerted effort by consumers to lower their home thermostats and to drive less. The Federal Energy Administration's 1977 national telephone survey concluded, in part, that rising prices were not enough to change consumption patterns (Milstein, 1978), but "higher fuel rates" was, nevertheless, the most frequent reason given by those who did conserve (Olsen, 1978). The lesson is that pricing induced many Americans to conserve because it addressed their needs, but it left many other Americans' needs unmet.

Tax credits for weatherproofing and certificates of achievement for energy efficient construction are other ways of applying the incentive strategy. Basically, voluntary cooperation results from individuals believing that they can reap greater personal benefits from compliance than from ignoring the government's advice. This motivational strategy can hurt the less affluent consumers, particularly when it proves ineffective.

The fourth strategy for promoting voluntary compliance is the hanging sword strategy, so named because it portrays doom as the inevitable consequence of non-compliance. Crucial to the success of this strategy are the credibility of the president and the citizens' belief that the danger is real. President Truman was probably credible when he told the nation on April 19, 1946 that, "We cannot doubt that at this moment many people in the famine-stricken homes of Europe and Asia are dying of hunger" (1946d, p. 215). But according to a New York Times

poll (Survey, 1977) only half of those surveyed believed that the oil-supply situation was as serious as Carter had reported. This strategy requires either a belief in, or some visible proof of, the threatened danger and its immediacy.

The final strategy, humanitarianism, also stresses danger and depends upon the credibility of the president, but it emphasizes the need for us to sacrifice in order to help others. To be effective this strategy must convince people (a) that a real need for sacrifice exists, (b) that their personal sacrifice will help significantly to alleviate that need, (c) that everyone in the society--individuals and communities--is sharing in the sacrifice. Failure to establish any of these three arguments weakens the persuasive effort. Relieving hunger was a problem that Truman properly couched in humanitarian terms. "We would not be Americans," said Truman, "if we did not wish to share our comparative plenty with suffering people. I am sure I speak for every American when I say the United States is determined to do everything in its power to relieve the famine of half the world" (1946d, p. 215). President Carter also used humanitarian appeals to conserve so that all Americans could have the energy they required. But his explanation of the program failed to meet the three criteria outlined above. Particularly, surveys found that many Americans believed that their group would be unfairly burdened by the energy plan (Gottlieb, 1978).

In sum, the need for sacrifice campaigns occurs periodically in the nation's history. These campaigns need to be directed by the people's national spokesman, the president. Both coercive and voluntary approaches can be employed to induce these society wide changes. Voluntary compliance can be sought through the self-improvement, exemplification, incentive, hanging sword, or humanitarian strategies.

SACRIFICE CAMPAIGNS

Truman's famine relief program and Carter's energy program were chosen as examples of large-scale campaigns that asked the American people for sacrifices. The food and energy plans share at least four significant characteristics. Both programs were identified with, and personally promoted by, presidents. In both cases, the public was asked to respond immediately to the directions being issued from the Executive Office to meet an imminent threat. Both plans required a sacrifice from the American people to reach a necessary goal. And, finally, although neither program relied entirely on voluntary cooperation, both stressed that success of the programs depended on the individual voluntary actions of the American people. Despite their similarities,

they also have glaring differences which should be noted before comparing them.

Perhaps the greatest difference between these two programs concerns the spirit of the times in which they were implemented. Truman operated in the immediate aftermath of World War II, a time of extensive national sacrifice. The public was accustomed to putting aside their personal desires for public needs, and they were accustomed to presidential directives. They had seen what the concerted effort of the American people could accomplish for the war effort, and they had little reason to doubt that individual efforts would produce results in peace as well. They believed that their government was legitimate and truthful, and that their new president needed their support. Indeed, when we compare the public approval levels of Presidents Truman through Reagan three months into their presidencies, we find that Truman's 87% was the highest of the group (King & Ragsdale, 1988, p. 294). All these factors point to a population which would respond well to one more request by a president for sacrifice.

On the other hand, these post-war Americans had been sacrificing, at times severely, for four years. Their lives had been restricted by numerous government policies that were just beginning to be lifted. For some, making one more sacrifice by not eating the foods that they could only now afford was quite difficult. Furthermore, some Americans felt that Americans had already sacrificed sufficiently to help the world. "No food for Germans!" wrote a New York City woman to President Truman to complain about his call for yet another sacrifice. "Haven't we lost enuf [sic] sons without adding our money. When Americans are bankrupt, who will feed us?" (McCarthy, 1957). Even in post-war America, Truman needed to mobilize the people behind the famine emergency program, because their support was not automatic.

President Carter spoke to a society in 1977 that was not accustomed to working together for a united purpose. Public attachment to the federal government in the aftermath of Vietnam and Watergate was much lower than it had been in the early Truman years. The energy plan's appeal for conservation was addressed to a population that turned a cynical ear to the president. Thus, the times in which the famine and energy programs were promoted were distinctly different.

The two programs also differed in their substance and implementation. There are differences between reducing the consumption of food and the consumption of energy. Although food is physiologically necessary and most energy consumption is not, one food can be substituted for another while most energy conservation leads to physical discomfort. In addition, President Truman directed most of the famine relief effort from within the executive branch, while President Carter's energy plan required substantial congressional action. Comparisons of

these two campaigns suggest the difficulties of presidential mobilization.

TRUMAN'S FAMINE RELIEF PROGRAM

The devastation of World War II left millions of people on the brink of starvation. President Truman responded with a nationwide famine relief program to supplement the relief efforts of the United Nations. On April 19, 1946, Truman asked the national radio audience to conserve food. This brief address included all of the sacrificing strategies discussed except pricing.

The April 19th address emphasized the humanitarian theme in lines such as: "Surely we will not turn our backs on the millions of human beings begging for just a crust of bread" (1946d, p. 215).

Truman cited the United States Government as setting a good example of exporting wheat and supporting conservation. But the hanging sword nevertheless dangled over the world. The United States was in danger because it could never be safe in an unsafe world. "Millions will surely die unless we eat less and a sound world order can never be built upon a foundation of human misery" (Truman, 1946d, p. 215).

But alongside these lofty goals Truman used the self-improvement appeal. "I am glad here and now to renew an appeal which I made the other day. I said then that we would be better off, physically and spiritually, if we ate less" (1946d, p. 215) Truman pressed on with specific suggestions for his listeners to adopt, such as consuming two days a week the amount of food eaten by "the average person in the hungry lands" and reducing "every slice of bread, ounce of fat and oil consumed" (1946d, p. 210). In sum, President Truman used a number of appeals to promote sacrifice. He emphasized not what he personally would do, but what the citizens needed to do.

The program was administered within the existing structure of the executive branch in conjunction with a series of temporary support groups. On February 27, 1946 Truman sent a telegram to twelve noted Americans which read in part, "I have directed the agencies of Government to do everything possible to this end [end famine]. But government is not enough. We cannot meet this situation without an aggressive voluntary program on the part of private citizens to reduce food consumption in this country" (1946b). This telegram invited the recipients to a Food Conference to be held at the White House the following week. The conference became the nucleus for the development

of a continuing organization called the Famine Emergency Committee (FEC).

The Committee was appointed by President Truman to "1) help bring about as much voluntary conservation of food by the American people as was possible and 2) to create a 'moral climate' that would permit the Government to institute even more drastic controls" (Famine, 1948). Former president Herbert Hoover was appointed Honorary Chairman with Chester Davis, president of the Federal Reserve Bank of St. Louis, serving as Chairman of the Committee. The illustrious members of the Famine Emergency Committee included representatives of businesses, universities, civic groups, and the mass media.

To achieve even broader public representation and involvement a National Famine Emergency Council was formed at the suggestion of the FEC and the personal invitation of President Truman. His telegram to about 125 leading citizens indicated the grassroots nature of the Council. Truman wrote on March 12, 1946 that a "General meeting of the Council is not to be called but you will be asked to serve in your community and organization to further objectives of emergency food program, and to submit your suggestions and recommendations" (1946c). Those invited to join the Council included representatives from labor, business, farmers, social groups, religious groups, veterans groups, and other assorted civic leaders.

On September 25, 1947 President Truman announced the appointment of a Citizens Food Committee "to advise on ways and means of carrying out the necessary conservation efforts." This non-partisan committee was comprised of 26 business, labor and public leaders. Headed by Charles Luckman, it was called upon to "develop plans for bringing the vital problem of food conservation to the attention of every American for action" (Truman, 1947). There was no federal funding for the committee, which was intended to act quickly and then dissolve (Food, 1947).

Within the more formal confines of the Executive Office Truman established a Cabinet Committee on Food in September of 1946. The three permanent members were the Secretaries of State, Commerce, and Agriculture with the latter serving as chair. The role of this committee was to keep abreast of the world food situation and to recommend government actions. President Truman asked that this committee develop a "coordinated information program" to keep Americans informed about the changing world food situation and the attendant actions which the government might take in the future (Anderson, 1946a). The Department of Agriculture particularly led efforts to promote, coordinate and implement the famine relief program. Structurally, Truman's famine relief program used the existing organization of the

Executive branch while emphasizing the role of voluntary, non-governmental groups in taking the program to the American people.

Some coercive strategies were applied to the growers, manufacturers and shippers of food, but the main thrust of the appeals to the people was voluntary cooperation. Several government orders were issued to increase the supplies of wheat, corn, and oats available for export. These orders included requirements that bakers reduce the weight of bread and rolls by 10%, prohibitions on the manufacture of flour of less than 80% extraction, and tighter restrictions on the licensing of wheat exporters. But Secretary of Agriculture Clinton Anderson was quick to add that, "These limitations are not a substitute for voluntary conservation efforts. On the contrary, vigorous self-rationing will continue to be necessary" (Anderson, 1946b).

All five of the previously discussed strategies for promoting voluntary cooperation--self-improvement, exemplification, incentives, the hanging sword, and humanitarianism--were employed in the famine relief program.

The self-improvement strategy was used to show the personal gains to be derived from the conservation of food. The Famine Emergency Committee suggested a number of retail advertisements geared toward personal gratification. When menswear stores promoted their lightweight summer clothes it was suggested that their customers could also eat lighter lunches--"all adding up to the formula for cool comfort" (Famine, 1946). The FEC also emphasized the slimming benefits of the emergency diet. An advertisement for men's suits mentioned that "stripes will produce an optical illusion on a fat man, but less wheat and fat will produce a lasting result" (Famine, 1946). Slogans such as "less bread, less spread," and "for a figure that's neat, go easy on wheat" were also promoted by the Committee.

Even a customer's complexion would be improved by the emergency diet. Cosmetic ads would sell their products along with the advice to "also live on this wonderful complexion-clearing diet that's so full of vitamins and so free of fats and starches that cloud your complexion. Pretty is as pretty eats" (Famine, 1946). Thus, following the emergency diet could make one cooler, slimmer, and generally more attractive.

The exemplification approach to conservation was also employed. Through radio and newspaper coverage the famine program stressed conservation by public officials and voluntary conservation by the general public. A CBS interview revealed that the White House served only one-crust pies (less flour and fat), saved bread by serving a Truman favorite "potato casserole," had one breadless day per week, saved crumbs for cooking, and did not serve bread at formal White House dinners (Lee & Cohan, 1946).

Federal government cafeterias promoted the program by placing on most tables double card posters that explained the "desperate plight of millions of starving people throughout the world," by making verbal appeals over the Muzak system, and by providing menus of the least restricted foods (U. S. Cafeterias, 1946).

Radio stations held contests to publicize the best food conservation ideas, with winners receiving both prizes and the opportunity to have their ideas publicized by the local press in columns like "Martha Ellyn's Platter Chatter" (Ellyn, 1946). Newspapers covered neighborhood block parties and other community efforts that raised food contributions.

Even a trip to a hotel restaurant reminded Americans that others were conserving food. Menu placards often indicated that "the usual second roll or slice of bread with each meal; and extra helpings of food-fat items, salad dressings and oils will be served only if you request it" (American Hotel Association, 1946).

Some appeals were also based on providing incentives to voluntarily conserve food. Since some wartime pricing restrictions remained in effect, the cost of restricted items was not drastically increased to reduce consumption. Rather, the pricing appeal was applied to the growers and manufacturers of food items. The Department of Agriculture offered a bonus of thirty cents above the market price on the date of delivery for each bushel of corn sold to the U.S. Commodity Credit Corporation (Famine, 1948). These plans were intended to provide farmers with an incentive to market their crops and not to use (or hoard) them for livestock feed.

The hanging sword appeal attempts to show the dangers of non-cooperation. The Famine Emergency Committee had a media division which produced and distributed newsreels and films. One of their four-minute messages included the following:

> Many are determined to forage for themselves in the sheer effort to keep alive--ready to pillage, rob and kill if necessary. How we treat these children today may determine the kind of world we live in tomorrow--a generation of peace loving people or another generation of storm troopers. The helpless of today may become the Hitlers of tomorrow. (Truman, 1946a)

The hanging sword was often found with the humanitarian appeal, as indicated by an excerpt from an address by Agriculture Secretary Clinton Anderson, "The desperate world food shortage and its consequences--hunger, misery, death and danger to the world's future--point unmistakably to the need for more effective action now" (Anderson, 1946b). Thus, the anti-famine campaign highlighted the dangers to world

stability and to peace for Americans if the world's need for food was not met by the United States.

Finally, the humanitarian appeal was a natural approach considering the central nature of food for human life. In his radio address to the nation, President Truman said that:

> It is my duty to join my voice with the voices of humanity everywhere in the behalf of the starving millions of human beings all over the world. We have a high responsibility as Americans, to go to their rescue. . . Now we cannot ignore the cry of hungry children. . . . Once again I appeal to all Americans to sacrifice so that others may live. (1946d, p. 215)

Newspapers carried cartoons of the grim reaper checking off lives as shoppers purchased bread and fat. Members of the FEC and the Council publicly related their personal experiences with hungry victims of war throughout Europe (Fenton, 1946). Movies like "Suffer Little Children" dramatized the problem and were distributed to schools, churches and civic groups. This appeal for voluntary cooperation stressing the benefits of conservation for others was a central part of the anti-famine campaign.

In summary, the famine program utilized some governmental coercion to meet the established food quotas. But voluntary cooperation and personal sacrifice were central to the program's success. All five strategies were used to induce compliance.

CARTER'S ENERGY PROGRAM

President Carter was not the first president to address the problem of energy conservation. But he was the president who "staked his reputation on the National Energy Plan, addressing Congress and national television audiences when he introduced it, defending it vigorously, (even emotionally) and dramatically postponing a foreign trip to be available" (Davis, 1979).

In his first televised address on energy policy, April 18, 1977, Carter said that, "I want to have an unpleasant talk with you about a problem unprecedented in our history" (1977a, p. 656) Few listeners flock to the prospect of an "unpleasant talk," yet so began Carter's dialogue with the American people on energy policy. Throughout the address Carter told the audience that the energy proposals would not be well received. Not content to state that "many of these proposals will be unpopular" (1977a, p. 656), Carter said that, "I'm sure that each of you will find something you don't like about the specifics of our

proposal. . . . To some degree, the sacrifices will be painful-- but so is any meaningful sacrifice. It will lead to some higher costs and to some greater inconvenience for everyone" (p. 661). This address ignored the humanitarian, exemplification and self-improvement strategies and it mentioned incentives only once. Instead, it focused on the hanging sword. According to Carter, "The most important thing about these proposals is that the alternative may be a national catastrophe. Further delay can affect our strength and our power as a nation" (1977a, p. 656). No specific suggestions for individual change are discussed in the speech.

Six months later, Carter again addressed the nation on the National Energy Plan. On November 8, 1977, the goal was to tell the American people "how serious the challenge is" (1977c, p. 1982). Using mainly the hanging sword approach again, Carter quoted the Secretary of Defense's remark that, "The present deficiency of assured energy sources is the single surest threat to our security and to that of our allies" (1977c, p.1983). In discussing the dimensions of the problem Carter spoke of how "we" are "proposing," "recommending," "using research and development projects." President Truman's "we" had connoted the unity of president and people, but Carter's "we" referred only to his administration. He further separated himself from the public by using "I" repeatedly and by asking for citizens' help only rarely. In concluding, Carter returned to the unpleasant nature of the choices to say that, "I'm confident that we can find the wisdom and the courage to make the right decisions - even when they are unpleasant" (1977c, p. 1987). Where Truman had taken an irritating everyday incident--a housewife unable to buy bread--and interpreted it as a positive sign that the grain was helping starving people, Carter emphasized the generally negative nature of the energy proposals.

Two years later, April 5, 1979, President Carter again addressed the nation on the energy problem. At this late date in his administration he still felt compelled to say that "the energy crisis is real" (1979a, p. 197). His main appeal was the importance of the passage of the Windfall Profits Tax. The address asked people, not to conserve, but to "please let your Senator and Representatives in Congress know that you support the Windfall Profits Taxes" (1979a, p. 612). The need for this appeal at this date was attributable to his rhetorical inattention to pricing as a legitimate strategy of conservation. He also asked citizens to honor the fifty-five mile per hour speed limit and to "drive 15 miles a week fewer than you do now" (1979a, p. 613).

The other sacrificing strategies were not used on April 5th other than as a continuation of the hanging sword approach. But the address was given by a president with very low public approval ratings on a topic that he had been addressing repeatedly with little apparent

effect. It was therefore unsuccessful in persuading citizens to act. Carter's public approval dropped to 37%.

Almost 150 advisors came to Camp David to advise President Carter before his next address, the jeremiad of July 15. Vice-President Mondale said in a subsequent interview that "I felt very strongly that the American people had to be approached in a positive, hopeful way" (Germond & Witcover, 1981, p. 31). But this good advice became a small part of the July 15, 1979 address. Carter gave the six points of his energy policy and pledged leadership, but he also lamented "a crisis of confidence that strikes at the very heart and soul and spirit of our national will" (1979b, p. 1237).

President Carter took the high moral plane in this speech to direct the country's attention to the meaning of our nation and our heritage along with the present problems. Significantly, Carter used the self-improvement strategy for the first time in his energy addresses. A solution to the energy crisis would not only "rekindle our sense of unity but it will give our nation and all of us individually a new sense of purpose" (1979b, p. 1240).

Carter talked about the comments of individual Americans and humanized what he had called the "invisible threat." Not only did he set out what he as president would do, but he also concluded with a specific painless request: "Whenever you have a chance, say something good about our country" (1979b, p. 1241). This speech promoted the need for a general national unifying effort of which the energy crisis would be a test, but it requested few specific sacrifices. The initial response to the speech was positive. It brought an eleven point increase in Carter's approval rating and a volume of (overwhelmingly favorable) mail to the White House that was more than had been received at any time since Ford had pardoned Nixon (Germond & Witcover, 1981). But Carter did not trust the usefulness of the speech without direct action, so he collected resignations from sixteen cabinet level officials and eighteen members of the Senior Staff of the White House. The public response turned dramatically negative.

In sum, Carter used public addresses to persuade the American people to follow his energy program. But his appeal stressed his own leadership role rather than the specific ways in which citizens could help solve the problem with voluntary conservation. Few of the sacrificing strategies were well applied to his programmatic ends. Structural and strategic problems also awaited Carter's energy campaign.

Structurally, American energy policy had been administered by the Federal Energy Office and the Federal Energy Administration prior to the Carter administration. These agencies lacked centralized direction, and they were often divided and ineffective. Soon after his election Carter

appointed James Schlesinger to head an Energy Task Force in the Executive Office of the President, and this later became the leadership group in the new Department of Energy (DOE). The new cabinet level organization was established by the Department of Energy Organization Act of August 31, 1977. A major goal of the new department was the centralization of government planning and activity in the area of energy policy.

President Carter's remarks on the establishment of the new Department of Energy foresaw the basic problem:

> The creation of a Department of Energy is an important step toward dealing with our energy problems. . . . But simply creating a department will not solve our energy problems. We will never do that without a clear will among government and our people to end waste, to use energy more efficiently and to look for practical new sources of energy. (1977f)

Three years later the "public will" was still not forthcoming, and the White House organized a communication and support plan for the DOE "Energy Conservation Visibility Program."

The White House plan outlined twenty-six major work areas to be covered by seventeen lead administration people (H. Carter, 1980b). As late as February 29,1980 the White House plan sought to "help DOE mobilize massive grass roots participation in the President's energy conservation programs" (H. Carter, 1980a). An effort billed as "continuing" the mobilization effort of the DOE would have been a more positive sign of the conservation efforts ongoing success.

Unfortunately, the cool James Schlesinger did not become a favorite with the members of congress who dealt with energy policy. The new department had frequent conflicts in congressional hearings over conflict of interest with their personnel, their inefficiency, and the lack of strict enforcement measures against oil executives (Mollenhoff, 1980). Secretary Schlesinger lost his position in the cabinet purge of July, 1979 and was replaced by Charles Duncan whose direct link to the White House diminished the Department of Energy's institutional initiatives. Duncan acted less as a spokesman for his department than as a presidential appointee perched on the back of a large bureaucratic organization.

Unlike Truman's vigorous attempts to involve many sectors of the society in the development of the food campaign, the Schlesinger task force on energy was secretive. Only after demanding entrance into the deliberations did representatives of the Treasury, the Office of Management and Budget, the Council of Economic Advisors, and the

National Security Council see the final draft of the energy plan (Davis, 1979).

The legislative package on energy policy became the centerpiece of what Carter called "an exhaustive fight" lasting over the years of his administration (Carter, 1982). This legislative struggle reduced the number of coercive measures available to the President, although he could still issue Executive Orders. But it did not strike directly at the heart of the program: voluntary conservation.

Various structures were used to foster conservation, including inter-agency committees and White House support groups. But all such groups worked under the DOE leadership. The viability of the new department, therefore, would affect the operations of all administration conservation efforts. Thus Carter attempted to centralize the energy plan in a new department, and he relied heavily on government promotion and implementation of the conservation effort.

The self-improvement approach was rarely used by the Carter administration to promote conservation. Although the DOE published numerous teaching pamphlets consumers ways to conserve, the rationale was usually either the national interest or thrift. Little attention was given to the personal benefits to be derived from reduced energy conservation.

Ironically, the Carter White House Staff Files contain examples of advice given to the Ford administration that highlighted a personally oriented strategy. The Gallup Poll prepared a report on consumer energy conservation for the Federal Energy Administration on March 26, 1976. Based on group discussions with teenagers, the report had concluded that, "Instead of the ineffective themes of self-denial, sacrifice, and patriotic duty, the positive rewards of energy conservation, that is, the development of a satisfying life style that can be 'fun',[italics added] might be an effective theme" (Gallup, 1976). Individuals would prefer to conserve because of the personal benefits and enjoyment they might achieve.

Two and a half years after Carter's first energy address the White House staff continued to grapple with the conservation program strategy. In a Memorandum for the President on August 14, 1979, Jack Watson observed that:

> We can only turn supporters into allies if we ask them to take specific, concrete actions which people believe others are also taking. This is true of both opinion leaders and the public-at-large. Giving them briefings is not enough. . . . Our energy goals should be translated into terms that better reflect the immediate concerns and daily activities of individual Americans.

> It's hard for people to identify with "barrels-per-day" savings. (Watson, 1979)

Unfortunately this astute memorandum on the need for an individual benefit strategy was not well received by Carter, who wrote on the memorandum, "we seem to be going backward from more specific to generalizations. . . . Enough W.H. memos" (Watson, 1979).

From the White House Press Office came a background report promisingly entitled "Energy Conservation The Individual" [sic] (Office of Media Liaison, 1979). The six-page report began with one and a half pages on the reasons for conserving before discussing the many ways in which the individual can help. But even that brief justification did not follow the self-improvement strategy. Five examples explained the benefits of conserving, but every example discussed solely national, rather than individual, benefits in statistical, rather than visionary, language. The examples included: improving insulation in homes to save enough national gas to heat an estimated four million homes; lowering household heating temperatures by six degrees over a 24 hour period to save over 570,000 barrels of oil per day; raising air-conditioning temperatures by six degrees to save the equivalent of 190,000 barrels of oil per day, doing household chores during off-peak hours to reduce public utilities' fuel use, and putting one more person in the average commuter car to save over 600,000 barrels of oil per day (Office of Media Liaison, 1979). The figures were impressive, but the strategy of emphasizing national public benefits instead of individual private benefits continued to prove uninspiring.

Conservation ideas could have been framed in a self-improvement strategy. Weatherization was promoted in order to "reduce the load on the heating and cooling equipment," but a more personal approach would have suggested the more comfortable, cozy home environment obtained by eliminating those nasty drafts of cold air. The appeal that reducing the use of hot water by using "half hot and half cold water for bathing . . . would save about five gallons of hot water each time" could have stressed a personal benefit by saying that the warm water would be less drying and better for one's complexion. Finally, the conservation promotion of "eliminating unnecessary car trips" by using the mail and telephones could have taken the next step of mentioning the precious time to be saved which could be used for personal enjoyment (Office of Media Liaison, 1979). A self-improvement strategy could also have emphasized the healthy effects of walking or cycling to work, or the beneficial effects of lower home temperatures on skin condition and house plants. In short, energy conservation could have been promoted as a source of numerous personal benefits for citizens.

The exemplification strategy was employed by President Carter and the executive agencies as they lowered thermostats, reduced the number

of federal employees entitled to government motor vehicles, and increased the number of fuel efficient vehicles in the government motor pool. Additionally, President Carter was frequently filmed in warm attire as he performed his White House duties. His televised fireside chats showed President Carter sitting in front of a roaring fire dressed in a cardigan sweater, presumably because of the lowered thermostats in the White House. But was this Carter's normal attire, or merely a staging device? Successful exemplification requires that the audience perceive the example as normal and routine. Some praised the anti-imperial nature of the setting, while others criticized the informal nature of Carter's presidential demeanor.

Within the executive branch, the postal employees cut their gas consumption by 7% in 1978 by using smaller vehicles and walking more. Unfortunately, the Department of Energy itself used 29% more fuel during the 1976-79 period than the agencies from which it was formed (Energy, 1979). Despite the DOE's example, the President and his agencies generally set an example of conservation.

The incentive strategy for encouraging voluntary conservation was often cited in the energy conservation campaign. The variety of monetary assistance programs in operation was a common theme of government brochures and reports. These programs gave citizens financial incentives to weatherize their homes, to conduct energy audits, and to invest in solar or wind energy. (Office of Media Liaison, 1979). Residential Energy Credits on federal income tax forms for the installation of approved home insulation provided another kind of pricing incentive. Separate publications on home insulation, driving techniques, and solar energy stressed the incentive to save money by conserving energy. The appeal was reinforced by continuing increases in the price of gasoline and other energy sources. By Executive Order Carter phased out controls on domestic crude oil, in 1979 allowing the prices to quickly rise. But according to energy experts, by the end of the Carter Administration "the failure of price controls and other regulations was taking hold" (Basile, 1982, p. 214).

As previously discussed, the hanging sword approach to conservation was used frequently to induce cooperation with the Carter program. He appealed to Americans to view the energy problem as a "moral equivalent of war" (Carter, 1977a, p. 656). The threats of worse days ahead included gasoline rationing, continued dependency upon foreign energy, and continued increases in cost. According to the President, "If we fail to act soon, we will face an economic, social, and political crisis that will threaten our free institutions" (1977a, p. 659). Similar examples of the hanging sword approach can be found throughout the energy address. Unfortunately, the Carter team had great difficulty persuading Americans that these threats were real, significant, and amenable to change through conservation. Moreover, he

failed to persuade the public that they were armed with the weapons needed to fight a moral equivalent of war.

Finally, humanitarian appeals to assist other people by conserving energy were not a major facet of the Carter campaign. This may seem surprising in light of the human rights theme of his administration. Actually, President Carter did discuss the humanitarian aspects of the energy crisis as when he said that, "I am even more concerned about the growing cost in human suffering that will increase if severe winter weather continues" (1977g, p. 6). But such references were rare, and they were not pursued by the public relations arm of the energy program apparatus. The effects of energy conservation on other people is more difficult to visualize than President Truman's, "saving food--saving lives." Nevertheless, this appeal would have been applicable as a national appeal when California and the Northeast were dangerously low on gasoline and/or heating oil and supplies elsewhere were adequate.

Symbolically, Carter proclaimed October, 1979 International Conservation Month and all of 1980 as the Year of Conservation to focus attention on his high priority issue of conservation. But the public perceived an abundance of words and a paucity of actions. Pollster Patrick Caddell (1979) wrote to Carter that, "You are seen at the moment as someone who talks a lot about the problem. Education is crucial. Speaking out is a vital leadership component. However, too much speaking without the support of actions/accomplishments runs the risk of being seen only in a PR or campaign posture." He added that, "You are seen as a president with programs that are (a) complicated, (b) long term, and (c) cause pain. What has been lacking has been an identification by [sic] you as being personally concerned with the impact of the energy situation on consumers and ordinary citizens" (Caddell, 1979).

Caddell not only criticized the President's personal stance, but his coalition building strategy as well. He described a significant problem in the conservation efforts when he wrote that, "What is lacking is a sense that we need and want real allies as opposed to supporters for this program. We are briefing, we are asking for support but we have not established the programs of involvement and participation that build true allies" (1979). Caddell realized that Carter had confused mobilization with acquiescence.

In summary, the Carter energy plan worked with a new Department of Energy and less reliance on existing community groups than had the anti-famine campaign. The techniques employed included both pressure tactics and appeals for voluntary compliance. But only the exemplary, incentive, and hanging sword approaches were utilized to any significant extent. The self-improvement and humanitarian strategies were largely ignored.

CONCLUSIONS

The president has a vital role to play in mobilizing the American people behind national campaigns. This task is particularly difficult when people are asked to sacrifice personal benefits for the broader national good. Truman's famine program and Carter's energy program both requested such alterations in the lifestyles of millions of Americans, but they met with different degrees of success.

The famine program was successful because its goals were met within the required time. Secretary of Agriculture Clinton Anderson told President Truman that:

> The 400 million bushel "bread" grain commitment for the year was met by June 30 . . . The real extent of this accomplishment in grain export is brought out by the fact that the amount shipped is nearly double the original requirement for the year which was presented to the Cabinet Food Board a year ago. (Report, 1946)

A 1948 report acknowledged that, "Conservation efforts, in response to our urgent request last fall, and careful handling of our supplies made it possible to set a new record of grain exports without putting any limitations upon the use of bread and other cereal products by United States consumers" (Cabinet, 1948).

President Carter's energy plan met with considerably less success. His congressional disappointments were compounded by the lack of voluntary conservation. In July, 1977 Carter observed that, "The public is not paying attention. . . I would say at this point, the public has not responded well" (1977b, p. 1391). He noted specifically that, "We've had in the first half of this year a rate of importing oil--it's higher than we've ever experienced in the history of our country" (1977e, p. 1599). This was necessary in part because "gasoline consumption was higher [in 1977] than it has ever been before" (Carter, 1977d, p. 1685).

Both structural and strategic elements for a successful sacrifice campaign can be inferred from these two programs. A sacrificing campaign needs to maintain the sense of urgency established by the president's first announcement of the problem. This requires the administration to act quickly and with unity. If time is short, establishing a new cabinet level department is rhetorically inappropriate and politically dysfunctional because of the attendant growing pains and jurisdictional battles. Formation of a new department

exonerates other parts of the executive branch from their responsibility to work on the problem. Since cooperation rather than rivalry is necessary between departments, the best approach may be to include various cabinet members in a joint committee to promote the campaign.

This principle of broadening participation and committing more factions to the campaign also applies to volunteer groups. In our pluralistic society, interpretive communities are sensitive to exclusion from government deliberation and implementation. People are most susceptible to persuasion from the people with whom they have frequent, positive contact: authority figures in their interpretive communities. Therefore the president needs to reach out and pull these grass roots communities into his programs, and to build broad based interpretive coalitions. As we have seen, Truman did this effectively, and Carter did not.

Strategically, presidents must sell the importance of their programs and solutions. But Carter learned that it is difficult to convince people of government's wisdom during a period of low confidence in government. This is complicated by the notion of a "Spiral of Silence" in which people are more likely to voice support for a president or policy that they perceive as popular (Noelle-Neumann, 1984). As his popularity declined, Carter compounded his difficulties by describing his policies as unpopular and his leadership as ineffective. A massive public relations effort was therefore needed to produce a "mood of acceptance" in the country for the specific governmental policies and regulations which Carter later issued. But Carter's rhetoric of unpopularity continued to confound his efforts. If active support cannot be mobilized, the president at least needs public acquiescence. But public acquiescence does not lower the thermostat.

Sacrificing campaigns need a coercive element to promote rapid responses and to establish the level of governmental commitment to the problem. But these regulations must be perceived as scrupulously fair to all elements of society if everyone is asked to sacrifice. The energy program suffered from the charge that the program burdened the poor and middle class more than the wealthy (Gottlieb, 1978), and Carter needed their support to be re-elected.

Coercion may begin a program, but voluntary cooperation by the people is essential for its success. Of the five strategies discussed, the self-improvement approach may be the most effective for producing public compliance, because it speaks to personal, everyday needs. This conclusion is based on the success of the Truman campaign, the failure of the Carter campaign, and on the temper of our times. When relatively few people can even remember a united national effort they may prefer appeals to help themselves, and if the country benefits in the process, so much the better.

The exemplification approach is necessary for any presidential campaign geared toward joint popular action. Presidents are generally expected to enact the same behaviors that they ask of their constituents. Therefore a presidential example is important whether or not it motivates people, because it protects the president from criticism such as President Clinton received from his well-publicized $200 haircut during a rocky economic period. Grass roots examples of conservation are also an important component of sacrifice campaigns because they are easier to identify and may imply a groundswell of support.

The incentive approach can be useful if the benefit received for cooperation is substantially greater than the perceived sacrifice. Studies applying this to gasoline pricing found that a dramatic increase in the cost per gallon was required before most Americans preferred to alter their consumption patterns. Program goals might, therefore, be met at an unacceptably high level of personal hardship and social inequality. Additionally, people are likely to return to their prior consumption patterns when they become accustomed to the higher prices. Pricing incentives may work better for short-term changes than for long-term adjustments, but short-term dramatic price changes can have long-term economic consequences.

The hanging-sword strategy will emerge in any sacrifice campaign because there should be a significant perceived danger before a president issues a call for action. But presidents need to be very cautious about overplaying this approach and losing their credibility. This is a primarily negative appeal based on fear. Short term responses may be forthcoming, but a continued effort to sacrifice will be difficult to maintain unless the threatened danger materializes.

Finally, the humanitarian approach can be a very effective strategy if the results of one's sacrifice are readily visible, if the requested sacrifice seems justified, and if the brunt of the sacrifice is fairly shared. For example, newspaper coverage of families that need clothing or shelter generally produce an outpouring of assistance from the citizenry, often more than the family requires. People may respond voluntarily to the needs of specific persons more readily than to the more abstract concept of "the national good."

One theme runs throughout this chapter: successful national sacrifice campaigns motivate the individuals who comprise the society. They must be motivated directly, personally and truthfully. To motivate millions of people directly, personally, and truthfully, the campaign must (a) offer a blend of all five rhetorical strategies, (b) coordinate existing interpretive communities, and (c) simplify the administration of the program. The best rationale for preferring to change one's personal lifestyle is personal, but personal needs will vary with the

times, and each president works within their unique temporal framework. Thus successful presidential sacrifice campaigns require that the president understand both the approaches to persuasion and the mood of the people. The answer many Americans may give in 1993 to the question "Why follow the president?" may be the straightforward but limiting response, "What's in it for me?"

COMPARATIVE ENVIRONMENTAL PROGRAMS AND THE RISKY POLITICS OF SOLID WASTE POLICY-MAKING

Paul A. Smith and Ronald G. Ketter
Binghamton University (SUNY)

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association

Introduction

Problems of solid waste (trash) disposal are very familiar to most local communities in the United States--and in other countries as well. While these problems are not new, they have been exacerbated in recent decades by several developments. The first was a growing appreciation of the environmental threats associated with solid wastes. Actually, this is probably part of a more general and well known increase in environmental sensitivity that began in the 1960s and has continued since (Mitchell 1990).

The second development is the filling up of existing landfills as some reach their capacity while others are closed due to environmental threats. Solid waste industry representatives predict that about half of the 6,000 or so landfills currently in operation will close in the next several years (Chakravarty 1993, 97). The third, and closely related development is the loss of available space for siting new landfills (Ehrlich & Ehrlich 1991, 142). In some cases, physical space limitations preclude new siting while in others, local citizen or political opposition has blocked vacant land from being used for new landfills. A generation ago most landfills--especially those in rural communities and small towns--were called "dumps," and were treated with little regard for the environmental impacts noted above. In any case, landfills were virtually the universal mechanism for solid waste disposal, whether the community was New York City or a small town in Wisconsin.

Yet with these simultaneous developments of environmental sensitivity and space shortage there has also been a search for alternative methods of disposing of--or "managing"--solid wastes (Breen 1991b). Of course the wastes themselves are both quite common (e.g., food and newspapers) and highly varied (e.g., paint and insecticides and tires), partly because of their different sources. We can see this by comparing municipal, industrial, and other sources of waste. Municipal waste is the largest. While this is dominated by common and relatively benign elements, in its variety it obviously includes some that are hazardous (NYT 1/21/92; 4/13/93).

The second source is industrial waste, which tends to be more toxic since it includes large amounts of complex substances. The final source, or category of sources, includes such things as medical and federal nuclear facilities (NYT 11/28/91). All of these affect some local communities and require different types

---

"Although this paper is devoted to solid waste policy-making in the United States, virtually all of the solid waste problems noted are present in other countries as well. Indeed, often they are worse. Landfill space, for example, is scarcer in Europe.

of disposal (NYT 10/11/92; 4/13/93). This is an important point, since some local policy-makers face waste disposal problems that go beyond those usually considered to be facing local municipalities, as those in Monmouth County, New Jersey (NYT 12/12/91).

Taking municipal waste alone, the last twenty years have seen a variety of disposal alternatives come and go as research and experience made them more or less promising. Resource Recovery (incineration), for example, enjoyed considerable popularity at the beginning of this period because the prospect of converting waste to energy appeared economically and environmentally attractive. Yet this method now faces intense opposition as communities fear both the environmental and health threats of polluted air and residual ash, and the enormous economic costs of construction (Breen 1991a).

Another result of the combination of increased environmental sensitivity and regulations, and the loss of space, has been the decline in the number of landfills (O'Leary, et al, 1988, 36). Al Gore points out, for example, that "Out of 20,000 landfills in the United States in 1979, more than 15,000 have since reached their permanent capacity and closed" (1993, 151). And, as noted earlier, about half of those remaining are expected to close in a few years. Yet as landfills have declined in number, their size and sophistication has grown (NYT, 1/6/92), as have the problems involved with their design, construction, and management (O'Leary, et al, 1988, 40-42).

These problems have been sharpened not only by increased local knowledge of environmental impacts, but also by new national and state regulations that reflect the same increase in environmental concerns (NYT 2/20/92). By and large, these regulations include restrictions on how landfills are constructed and operated; but they also establish a "hierarchy" of solid waste strategies that begin with waste reduction and proceed through recycling and composting, incineration, and end with landfilling. Thus landfills have moved from being the most to the least desirable alternative for solid waste disposal.

For community policy-makers, decisions about solid waste disposal or management must incorporate all the preceding developments. The closure of landfills by itself means that a growing number of local officials have solid waste on their agendas. We can place the problems they face into two interrelated categories. The first are the traditional threats to public health and the environment that are posed by the content and treatment of their solid wastes. This requires local officials to become knowledgeable about the nature of the dangers posed by various wastes and technologies. The second are the political problems they face as they deal with more or less environmentally sensitive and knowledgeable constituencies.

A useful way of understanding the way local policy-makers deal with these two types of problems is to see them as confronting interrelated risks. Following the same schema as above, one type of risk is environmental in nature--those affecting the quality of the air, land, and water--and the resulting dangers to public health. The other type is political--those affecting the relationship between policy-makers and their constituents, particularly in the form of elections. We note, in addition, that environmental risks are often used for political purposes (Sapolsky 1990).

The Analysis of Risk

While risk analysis is part of decision theory (a larger body of work), it is unusually variegated in itself. This includes the way it is conceptualized and the way the subject is organized (e.g., Andrews 1990; Shrader-Frechette 1991; Wildavsky and Duke 1990). Nonetheless, the concept of risk includes three essential elements:

1) The probability that a dangerous event will occur (e.g., the pollution of an aquifer by a landfill or of air and water by an incinerator).

2) The seriousness of the effects of the event (e.g., the harmfulness of the pollution to public health).

3) The extent or scope of the event's effects (e.g., the size of the area and population affected by the air and water pollution).

For each of these elements, the implication is that there is an objective measurement of it (Costanza and Cornwell 1992). One could argue that no truly objective measure of the probability of certain outcomes regarding solid waste management technologies can be obtained in the sense that we can determine the objective probability of getting heads from a single coin flip. Whether or not this is true, however, the more important factor in terms of public decision-making is how the risk is perceived. In this respect, a key distinction must be made between what may be called expert risk assessment on one hand and public assessments or perceptions of risk on the other. In the case of the former, assessments are based on analysis, opinions, and sometimes data of scientists, engineers, statisticians, and others who try to assign an objective value to both the probability of events and their seriousness. These assessments often carry substantial credibility among industry and government policy-makers (Ahearne 1993). Yet it is important to bear in mind that many of these estimates are derived from expert opinions, not empirical data.

Experts often base their risk estimates on technologies that have not been fully implemented, which means that little

empirical data exists. The public in general or specific opposition groups may question data on which these estimates are based, arguing that controlled or laboratory situation do not accurately reflect potential risks from implementing these technologies.

Public perceptions of risk often vary significantly from those of experts. Initially, these differences were explained as resulting mainly from a lack of understanding by weakly informed citizens (Ahearne 1993). But further analysis has indicated that, in many cases, the public's estimates of probability and impact of events is not substantially different from those of experts. The public, however, tends to be more "risk averse." They tend to reject activities that have small probabilities but catastrophic effects in favor of those having larger probabilities but less serious effects--even if the expected value of harm is greater for the latter (Tversky and Kahneman, 127).

Differences between expert and public perceptions of risk are highly relevant when it comes to assessments of alternative approaches to local solid waste disposal. Indeed, the phenomena of risk aversion has fueled a debate over whether public acceptance of different disposal technologies is "rational." Just as the public is willing to accept the risks of riding in an automobile over those associated with a nuclear power plant (Shrader-Frechette 1991, 161), local communities are inclined to accept the environmental risks of a landfill over those of a resource recovery facility--even though experts rate cars and landfills as more dangerous.

As we shall see later, differences in risk assessment can have powerful affects on solid waste policy-making in local communities, especially when political risks are involved. Similarly, such differences affect a rather specific area of solid waste policy that is becoming increasingly common--compensation packages awarded to those areas of a community where disposal facilities (e.g., incinerators or landfills) are located (Portney 1985). Justification for these "payoffs" is usually that they achieve a measure of intra-community equity and that they help overcome public opposition to the siting decision. The trouble is that publics in the vicinity of the facility are inclined to have a much deeper concern about the risks than policy-makers advised by experts. These differences can result in asymmetries between the willingness to pay compensation by those wanting to locate landfills and other noxious facilities in a particular community , and the willingness of that community to accept a specific compensation package for risks incurred (Smith and Desvousges 1986).

Compensation packages tend to take two forms. The first type provides direct benefits to compensate for the risk that the selected neighborhood will face as the result of siting the facility nearby. These benefits can range from direct payments to affected individuals to reduced tax assessments to the provision

of special services, such as parks or recreation facilities. The second type makes commitments to monitor and address specific damaging effects should they occur. Examples are testing groundwater or air, and providing corrective measures should pollution be found. Of course, compensations can combine both of these types. A recent study of compensation in the form of host community benefits found that compensation packages combined with citizen participation greatly facilitate the ability to site landfills and what would otherwise be locally undesirable land uses (Fort and Scarlett 1993).

Although we believe that compensation is an issue of increasing importance in the area of solid waste policy, we have too few cases of compensation in our data base to make further analysis practical.

Methodology

Our data base is of two types. The first consists of several New York communities (cities and counties) in which we were able to examine the dynamics of policy-making in detail. These data were the primary base for our hypotheses. The second type consisted of cases of solid waste management and policy-making from 1991 to the present reported in a variety of sources, such as the New York Times and other newspapers, and magazines and journals, such as Environment and Garbage. These cases ranged in detail from New York City, the solid waste trials and tribulations of which were followed closely by the Times and other daily papers, to Seattle, which, while mentioned infrequently, was covered in depth, to others that ranged widely in detail.

Altogether, the number of cases before us was roughly 85-100. We say "roughly" because there was such a range of detail that to claim more would be misleading. For example, a report on community recycling in northern New Jersey might mention half a dozen different communities, but only to illustrate certain problems or policies, and not to reveal details of the policy process. We emphasize, therefore, that our data base is not systematic; we took those cases that were reported and cannot say they are representative of all community solid waste experiences. But we have no reason to think they do not present a fair picture of what is going on in solid waste practices across America.

In any case, these data are used for rough tests of our hypotheses. For each hypothesis, we were careful to use only those cases that clearly are relevant and contain enough detail to support their application.

Hypotheses

(1) There is a clear difference between the perception of environmental risks by affected publics and by community policy-makers.

In addition to its theoretical base, this hypothesis follows for two reasons. First, community policy-makers must take into account not only the option being considered and how it affects a specific area, but also alternatives to that option and the how the entire community will be affected by them (Brion 1988, 451-52). Second, the policy-makers are likely to commission studies and hire experts (consultants) to assess environmental/ technological risks. The public, on the other hand, are likely to base their perceptions of how they personally will be affected only in part on such systematic assessments (Kraft and Clary 1991, 315).

(2) As solid waste technologies have increased in number and complexity, their perceived risks have also increased.

The public tends to associate complexity with risk of failure, a relationship that often holds true empirically. Since this empirical evidence will be known to expert advisers, it is reasonable to expect that policy-makers will also see more risks in complex than simple technologies, even though some--new landfill technologies, for example--are intended to reduce environmental risks.

(3) As differences in perceived risks of solid waste disposal have grown in local communities, so has community conflict over disposal options.

With growing sensitivities to environmental risks, and especially with differences in risk perception, it is inevitable that community conflicts over which disposal options should be selected and where placed will increase.

(4) The risks associated with new solid waste technologies have led to growing popularity of low-risk options, such as recycling.

This hypothesis follows naturally from the previous two. Recycling, for example, to the extent that it is perceived as low-risk, will be desirable not only for that reason, but also because it produces less community conflict.

(5) Although recycling is not perceived as very risky, its many interdependencies actually produce a high risk of operational breakdowns.

While many communities initially perceive recycling as a panacea, its success depends on the actions of many different actors, ranging from individuals who are responsible for separating recyclables from other solid waste, to those responsible for collection, to those involved with marketing or other disposal. And the last is at least partly beyond local control.

(6) The growing concern about environmental risks has led to an increase in the importance of scientific and technological knowledge for community solid waste policy-makers.

Since policy-makers must respond to a more sophisticated constituency demanding not only the delivery of public services, but also the protection of health and the environment, their need for information to cope with these demands has gone up sharply. Moreover, the threshold of safety has changed dramatically over the last half-century. Where risks of one-in-a-million were once thought to be well within the margin of safety, now these and even lower risks are routinely used to justify government intervention (Sapolsky 1990). Most of the knowledge underlying these factors is scientific and technological in nature.

(7) The political risks associated with solid waste decisions have led many local policy-makers to defer such decisions and to avoid high risk options.

Our model of policy-makers suggests that their interest in public approval, and specifically re-election, makes them reluctant to support policies not favored by their constituency. Some policy-makers may attempt to educate the public concerning the costs and benefits of various alternatives (Matheny and Williams 1995, 74). But solid waste disposal tends to be characterized by technological uncertainties. We therefore predict that policy-makers will be risk averse when it comes to disposal options, preferring low-risk options and delaying decisions when those of higher risk must be considered. The acronym "NIMTOFF" has been coined to described this "Not-In-My-Term-Of-Office" behavior.

Findings

Hypothesis (1). <u>There is a clear difference between the risks perceived by affected publics and by community policy-makers</u>. Perhaps the clearest evidence supporting this hypothesis can be found on Long Island, where various communities turned first to and then away from incineration (NYT 12/12/91; 12/18/91). Yet the predicted clear differences between expert and public risk perceptions are often not so clear. There appear to be several reasons for this that do not undermine the theory. One

is that community policy-makers usually are not "experts." Although we did not expect that they would be experts themselves, our hypothesis rests on the assumption that policy-makers would be advised by experts, and thus would be inclined to have different perceptions of risk than the general public. We think that such differences in perception do exist in the early stages of the policy process when officials are receiving information from consultants who are not communicating with the public.

However, in most cases it does not take very long before issues such as landfill siting, originating among small groups of "inside" policy-makers (e.g., in legislative committees) become more public. This is no accident, since it is in the interest of at least some of them to seek support from others. Furthermore, they will try to protect themselves among constituents who are likely to be opposed to the policy taking shape by going public with the issue. In short, as Elmer Schattschneider reasoned long ago, "inside" participants who are not doing well on an issue will try to expand the conflict in order to gain support (Schattschneider 1960, 2-5).

The result is that at least parts of the public will be alerted to the issue and will proceed to develop their own "partisan analysis" of the risks involved in order to make their opposition more effective (Braybrooke and Lindblom 1963, Ch. 5 and 235). Depending on how well these people are organized, and their other resources, they will become more knowledgeable about the issue (and risks) and let policy-makers know how they perceive matters (Ingram et al 1992; NYT 12/18/91). For their part, even if the policy-makers originally had a different perception of the environmental risks, their perception of political risks will cause them to move closer to the perceptions of their constituents.

Hypothesis (2). As solid waste technologies have increased, their perceived risks also have increased. Our data, drawn from the short period 1991-93, do not provide a very precise test of this "longitudinal" hypothesis. Nevertheless, our sources from the scholarly literature generally confirm it (Collingridge 1983). And among advanced technologies, those devoted to the disposal of hazardous wastes tend to the most complex. For example, the risks associated with hazardous waste incineration are perceived to be especially great (NYT 3/28/92; 12/20/92).

Studies going back ten or twenty years show, in addition, that new solid waste technologies tend to be more expensive. This is particularly true for new landfills and resource recovery facilities (NYT 1/6/92; O'Leary et al 1988), and can be seen in sharp increases in the costs of solid waste disposal, including "tipping fees." Of course, it has been argued that a large part of these costs (e.g., for cleanups and health effects) have been there all along without being appreciated as they are today.

Certainly, controversies over this new appreciation can be seen in almost all our cases (Breen 1991b). Even so, the increasing expense of new solid waste technologies are incorporated in this developing perception of costs and can be seen in community conflicts over what essentially is the tax bill. Thus without attempting to separate newly perceived environmental costs from the increased expenses for advanced technology, it is clear that this hypothesis is sustained.

Hypothesis (3). As differences in perceived risks of solid waste disposal have grown in local communities, so has community conflict over disposal options. The evidence related to this hypothesis is partly an extension of that just discussed, but with the added element of intra-community conflicts over such issues as siting (NYT 3/23/92). Good examples of this are controversies over resource recovery facilities and newly designed landfills, reflecting changing national and state regulations (NYT 1/6/92). Advancing public perceptions of the environmental risks of these facilities clearly have increased community conflicts over where they should be placed (NYT 12/12/91, 3/25/91). A recent study by the Reason Foundation provides some interesting findings that suggest that the use of compensation packages can soften community conflict (based on perception differences) over the siting of solid waste facilities (Fort and Scarlett 1993).

Hypothesis (4). The risks associated with new solid waste technologies have led to growing popularity of low-risk options, such as recycling. In almost all our communities recycling is seen as a benign option compared to landfilling or incineration (NYT 4/9/92). Moreover, recycling is perceived as requiring only rudimentary technologies (Holmes 1991, 42; NYT 1/1/92), and certainly as low risk compared to the high technology resource recovery. In fact, one risk associated with proposed incinerators is that the amount of waste they will require to operate efficiently will work against recycling programs (Breen 1991a, 49; NYT 1/5/92). Obviously, this risk is based on human motivations, and part of the community conflict hypothesized earlier involves incinerator supporters arguing that recycling will be encouraged while recycling supporters assert that the need to keep waste away from recycling is inherent in the incinerator's operation, whatever its supporters say.

The involvement of states complicates community decisions, since there are sharp differences between states in their support for recycling (Khator 1993). In those states that support recycling, local communities are encouraged to adopt such programs. Especially when these encouragements take the form of requirements or economic subsidies, they provide local policy-makers protection against the risk of recycling problems or failure.

Hypothesis (5). Although recycling is not perceived as very risky, its many interdependencies actually produce a high risk of operational breakdowns. With recycling perceived as the ideal solution to solid waste disposal, the difficulties of its implementation come as a shock to most communities (NYT 4/7/92). To make matters worse, in many communities the fact that recycling involves selling materials to buyers leads to an early expectation that it might be a money-maker. If newspapers and bottles and aluminum can be sold, for example, isn't it reasonable to expect that the income from these sales will offset the costs of the program (Holmes 1991, 39)? It turns out that available markets for recycled products have been quite erratic, making the economics of recycling more uncertain. The experience of market failure has led a number of small communities to organize "market cooperatives" in attempts to stabilize their situation (Holmes 1992).

An outstanding case is newspapers, which take a large amount of landfill space, and the sale of which seems particularly promising. But the newspaper market showed an early tendency to glut, and some communities faced the prospect of having to pay to have their papers accepted (Breen 1990). Tires are another example of a promising but difficult recycling target. They are a blight on the landscape, bad for landfills, and hard to process (Martin 1991; McPhee 1993). So recycling markets have proven to be a serious challenge for local recyclers to master.

Then there are the administrative difficulties of collection and processing. Recycled materials must be separated from regular trash and collected separately. New York City is a notable case of these difficulties being extremely hard to overcome (NYT, 1/16/92; 2/5/92; 2/20/93). New York, which even has had to fight off attempts by organized crime to exploit waste disposal (NYT 2/20/93; 5/20/93) also illustrates the extremely wide-ranging character of implementation difficulties in large cities (Magnuson 1990).

Seattle, a more successful case (NYT 4/20/93), has experienced similar problems (Kourick 1990). These difficulties of implementation have been confronted by virtually all recycling programs and, when combined with marketing problems, have led to many disappointed expectations (Khator 1993). As these difficulties have become better known, they have also led community policy-makers to realize that recycling programs have operational risks; that is, not risks of environmental impacts but of administration.

Hypothesis 6. The growing concern about environmental risks has led to an increase in the importance of scientific and technological knowledge for community solid waste policy-makers. Evidence supporting this hypothesis is derived primarily from those communities we have been able to observe directly. Issues of environmental impacts have invariably required the application of knowledge about science and technology. Persons with this

knowledge have become much more influential in the policy process than those without. One example of this is the growing use of expert consultants in community solid waste programs. Indeed, the Environmental Impact Statements required for most waste disposal projects are almost always farmed out to major consultants because of their technical complexities. And the local process of reviewing these statements (in draft form) tends to be dominated by arguments over technological effectiveness--such as of pollution control devices.

Hypothesis 7. The political risks associated with solid waste decisions have led many local policy-makers to defer such decisions and to avoid high risk options. Evidence for this hypothesis can be found in many local communities, although often it is subtle. In the first place, there is little doubt that policy-makers supporting options perceived as risky face political consequences. Good examples of such consequences are not hard to find. In the first referendum of its kind in New Jersey, the voters of Monmouth County rejected a proposed incinerator that had been planned--and approved--for almost ten years. "The whole thing was a case study in hysteria," said Robert Collins, the County Administrator (NYT 12/12/91). On Long Island,

> burning garbage has become the most powerful single [political] issue. Last month, Assemblyman Lewis J. Yevoli ran for Oyster Bay Supervisor with a solid promise: no new incinerators. A Democrat in a Republican fortress, he won handily. From Baltimore to Nashville and Boston to San Diego, any politician who supports the burning of garbage risks political death. (NYT 12/12/91)

Of course, this hypothesis states the policy consequences of such political risks--essentially that because decisions are risky, politicians will avoid making them. We already have some "backhand" support for this in the popularity of the low risk option of recycling. And it is also suggested in the reluctance of communities to abandon filled landfills if the alternative is a high risk option (NYT 3/18/92). But New York City provides perhaps the clearest case of decision avoidance. Late in 1991, the city's Sanitation Commissioner, Steven M. Polan, resigned in part out of frustration over his inability to enhance recycling or build incinerators. Within three months, mayor David Dinkins once again delayed the construction of a large incinerator in Brooklyn (NYT 3/25/92; 3/26/92).

Conclusions

We have used the case of local community solid waste management to show how two forms of risk--environmental and political--affect policy-making. In an ideal world, many environmental risks can be objectively determined. But we have

found that, instead, risk becomes one of many elements used by various partisans in the political process to obtain their desired outcomes. As opposition groups mobilize against a proposed solid waste alternative, they employ their own risk assessments to "arm" themselves against the risk assessments used by the other side(s). And policy-makers may soon find that it is in their best interest to adopt risk assessments from constituent groups instead of their own experts.

Driven by perceived environmental risks presented by advanced waste disposal technologies (e.g., incineration and landfilling), most local communities currently view recycling as the most benign option for solid waste management. Yet despite its supposed low-risk characteristics, in many ways recycling is the most technologically complex of all disposal options, with numerous chances of breakdowns and with many of its elements beyond local control. The high probability of such operational breakdowns--small and not so small--is seldom discussed in the local policy-making process.

Perhaps our most pervasive finding is the extent to which issues of solid waste disposal/management have become part of local community politics in America. This goes beyond the fact that decisions about solid waste confront local policy-makers with environmental risks, adding pain to their lives. But worse, often environmental risks associated with various solid waste options are translated into direct political risks for these policy-makers. We have noted the extensive use of environmental issues in community politics, including in electoral campaigns. One result of this is the deferral of decisions that will commit to high risk options. Another is an increase in the scientific and technological sophistication of community debates over waste disposal, whether or not in campaigns--the use and abuse of science!

(An earlier version of this paper was presented at the Seminar on "Migration, the State and International Relations" at New York University, Center for Latin American and Caribbean Studies, on May, 7, 1993 and published by the Center as an Occasional Paper. Thanks to the Center's Director, Dr. Christopher Mitchell, for inviting me to present it there.)

DE-TERRITORIALIZED NATION BUILDING: TRANSNATIONAL MIGRANTS AND THE RE-IMAGINATION OF POLITICAL COMMUNITY BY SENDING STATES[1]

In January 1993 I attended a dinner hosted by leaders of the Mexican community in New York City for Dr. Roger Diaz de Cossio, the Director of the Mexican Foreign Ministry's "Program for Mexican Communities Abroad." The dinner was an event intended to build links between the Program and the Mexican community in New York. Anticipating that we would pick up on an earlier conversation about how to explain the Program's mission, I had brought along a copy of an article by Bela Feldman-Bianco (1992) which discussed, among other things, the role of the Portuguese state in the creation -- through such organs as the World Ministry of Portuguese Communities -- of a "Portuguese 'global' nation." As we spoke, I pointed out the following sub-heading in the paper to him: "The Reinvention of Saudade and the Creation of a Portuguese 'Global' Nation." Upon reading this, he became quite excited and pounded his finger once on the page, saying in English: This is exactly what I am trying to do. This is my job: "to create the Mexican global nation."

This statement is emblematic of the Mexican state's attempt to re-imagine its political community to include transnational migrants and their children residing in the US. Put differently, the Mexican state is attempting to re-define its nation to extend beyond its borders, and to institutionalize this relationship through the Program for Mexican Communities Abroad.[2] Moreover, the Mexican state is not alone in attempting to re-negotiate its relationship with its emigrants and their children. [3] To varying degrees and at varying times, the Portuguese, Haitian, Colombian, Indian, Korean, Paraguayan, West Indian, Italian and (former) Yugoslav states have also extended themselves in similar ways. (Feldman-Bianco, 1992; Richman, 1991 and 1992; Glick-Schiller, et al, 1992a and 1992b; Jones, 1993; Lessinger, 1992; Kim, 1981; Riquelme, 1993; Sutton and Chaney 1993; Sutton and Makieksy-Barrow, 1987; Kasinitz, 1992; Heisler, 1986 and 1984) While each state has had particular reasons for doing so, these re-negotiations attest to three points: First, the extent to which migrants and their children have created a transnational space within which political communities form; second, the inadequacy of the classical model of political community which assumes that citizenship in a sovereign state is the only possible form of membership; and third, the uncertain resolution over struggles between migrants and states to define political community and decisive sites of political practice.

Political Community, Transnational Migration and the State.

The central empirical and theoretical question in this paper involves the state's relationship with political community. In particular, it regards how states attempt to construct nations, a particular form of political community. Historically, the problem has regarded how, in Anderson's (1991) words, the state attempts to persuade those residing in its territory to "imagine" that they are members of the state -- that they are, in a word, "citizens." The question here is slightly different. In the cases I am looking at, the state is attempting to persuade immigrants and their foreign born children living outside of the sending state's territory to believe and act as if they are still members of the national political community. While the task is the same -- fostering the imagination of a nation -- it is complicated by the fact that the state must operate in a transnational space. (Glick-Schiller et al, 1992 and 1993; Kearney, 1991 and 1993; Kearney and Nagengast; Goldring 1992; Smith 1992; Sutton et al 1987; Rouse 1992) This space has been created by the migrants themselves and represents in a significant way an alternative form of political community to that of membership in the state. How will the state accomplish its old task within this new space? Given this transnational setting, the theoretical problem, as it was neatly stated by Basch and Glick-Schiller (1993: p. 21), becomes "the need for a theory of nation building in the transnational era." [4]

This need for a theory of nation building in a transnational era becomes clearer when we look at the two alternative ways of looking at these activities by states. The first involves the classical model of citizenship, which defines membership in the nation in terms of membership in the state, or citizenship. This equation between the nation and the state is axiomatic in the classical model of citizenship (Brubaker, 1989) and is achieved through the concept of the sovereign state. (Walker, 1990) Inherent in the concept of sovereignty is a normative proposition positing the state's border as the line which divides "Us" from the "Other." Hence, a primary task theorized in the modernization literature was the state's crucial role in "building" a national identity. (Tilly, 1975; Bendix, 1964) Consequently, the world becomes divided into

mutually exclusive political communities called sovereign states. A second normative proposition, that political action must be pursued through the sovereign state, leads to the "reification of political community" as political practice is channeled through the state (Walker, 1990). Eventually, the state seems to become the natural container for politics, and in this way, nations seem naturally to express themselves through states. In this view, for individuals to act politically they must be citizens, the "molecular units of the state," in Kearney's (1993) words. It is this very naturalness of the state as the embodiment of political community inherent in the citizenship model of community which I challenge in this paper.

Criticizing exactly this view of migrants as "citizen-molecules", Kearney and others such as Rouse (1992) offer another way of looking which I call "Membership Before and Beyond Citizenship". This perspective argues that contemporary migrants have created transnational spaces which free them from the state's capacity to create political community. In the case of Mixtec Indians, Kearney (1993) argues that they have defined political community apart from the state for centuries even while existing within it, in a form similar to Wolf's (1957) "closed corporate peasant communities." This is Membership Before Citizenship. Moreover, now through their migration, these migrants have begun to imagine a pan-Mixtec consciousness which defines a political community autonomously from the state. These migrants have superseded and escaped from the state in defining their political communities. Kearney (1991) argues, "... national identities can no longer be constructed. In this post-national world, members of transnational communities... escape the power of the nation state to inform their sense of collective identity." This is Membership Beyond Citizenship.

Leaving aside for now the important differences between the empirical material Kearney and I are analyzing, I follow Glick-Schiller and Basch (1993) in arguing that this absolute alternative does not describe what I have observed. Rather, I concur that nation states have developed or are attempting to develop "new ways to encapsulate the identities and loyalties of transmigrants." (1993: p. 9) I conceptualize these attempts by the state to develop a deterritorialized nation as attempts to create a condition of "Membership without Residence." [5] "Membership Without Residence" involves a relationship between sending states and their emigrants that does not comport with the citizenship model, nor with the model of Membership Before and Beyond the State. [6] Rather, I argue that when sending state programs attempt to create Membership without Residence they are re-defining what it means to be a member of the nation. That is, they are attempting to re-negotiate the relationship between the state and its emigrants to form a deterritorialized nation. They attempt to do this through the creation, adaptation and institutionalization of practices which foster collective identities among emigrants focussed on the home state.

The current attempts of sending states to capture this transnational political space echo the successful efforts of European nation states during what the Tillys (1975) call The Rebellious Century (1830-1930) to supersede local power structures and sites of political practice. The Tillys argue that it was not the stress and strain of industrialization per se that yielded such political conflict in this century, but rather the "reorganization of everyday life (which) transformed the character of conflict..." and occasioned the "long-run reshaping of solidarities." As a result of this restructuring of everyday life, the locality became a less decisive site for politics and local solidarity a less decisive form for social and political conflict, while the structures which gave some control over national resources (electoral systems and parties, unions, the state) became more decisive. In this way the state captured the politics of that century and in the process eclipsed the locality as an important site for political action.

The Tillys' analysis has much to teach us regarding the current relations between sending states and migrants. Just as industrialization was an underlying but not determinative cause of the political conflict of that century, so the current globalization of the economy is a basic cause of migration and, subsequently, of the formation of transnational communities and struggle over the transnational political space we are observing. Yet, as with the Tillys' argument, globalization of the economy cannot explain the current transnationalization of political space and activity. Rather, it is the "reorganization of everyday life" for migrants that has made the local and communal again decisive in their political and social lives and which has prompted sending states to act again. Migrants had created a political space lying outside the control of the very sending states on which much of this politics focussed; states have attempted, as they did in the nineteenth century, to capture this space and substitute the state as a site of political practice, using its forms as well. The current struggle between the state and migrants echoes, with some modification, that

between localities and states at the outset of the rebellious century.

In the paper which follows, I analyze how several sending states are attempting to create and institutionalize Membership without Residence in the form of deterritorialized global nations which include foreign residing emigrants and their children. In Section II, I examine the case of Mexico in some detail. I argue that through the Program for Mexican Communities Abroad, the Mexican state is introducing itself into pre-existing meaning-creating practices by which migrants create transnational communities, and is also creating new transnational practices itself. In this way, the state is attempting to become, and with varying degrees of success, the organizer of a transnational space that previously was organized outside of its control. In Section III, I then compare the Mexican Program with similar though distinct efforts by five other sending states: Portugal, India, Haiti, Colombia and Italy. In Section IV, I comparatively analyze all six programs, focussing on certain consistencies in them, and where possible the different struggles between the migrants and their sending states in defining and controlling transnational political space; and the reversal of the presumed order in the agent-structure problematic in this new migrant-state relationship. Finally, I conclude with some brief remarks about models of membership and their relationship to transnational migration, the state and the de-territorialized nation; and the struggles between states and migrants over forms and sites of political practice.

II: THE MEXICAN STATE AND THE CREATION OF THE MEXICAN GLOBAL NATION: THE PROGRAM FOR MEXICAN COMMUNITIES ABROAD.

The Origin and Scope of the Program[7]

Created in February of 1990 by Executive Order in the Ministry of Foreign Affairs, the Program for Mexican Communities Abroad (referred to in the rest of this section as "the Program") represents both a continuation and an important re-orientation in the Mexican state's policy towards Mexicans and Mexican Americans in the US -- that is, to the Mexico de afuera.[8] The Program's closest historical referents are the "glory days" of the 1920s-30s, when outreach to Mexicans, and also Mexican-Americans, was part of the mission of the Mexican Revolutionary state. Such activity has been continued at a lower level since then, with a notable increase during the Echeverria administration (1970-76). (Zazueta, 1983; Garcia y Griego, 1993) As in the 1920s, the Program is an attempt to indirectly legitimize the Mexican state through its contact with its nationals abroad, and respond to events in the US which affect Mexico's interests. What differs from previous periods is the systematic intent of the Program to re-orient and institutionalize a new relationship between the Mexican state with Mexicans and Mexican Americans in the US.

According to La Paloma, the newsletter and newspaper which is the official "Organ of Diffusion" of the Program, the Program was created to answer the "requests made to President Salinas de Gortari by Mexican and Mexican-American groups during his campaign and his first year in office" for closer links with Mexico. (La Paloma, No. 1, p.1) While this is indeed true, it is not the whole story. Such groups had been around for a long time, and had not received so much attention since the 1920s. What had happened at this time to spur this new interest? Moreover, why was then Candidate Salinas "campaigning" for the Presidency of Mexico in California and elsewhere in the US?[9] The main reasons have to do with President Salinas's search for legitimacy as his Presidency began, and the potential effects of US immigration policy in Mexico.

As in the 1920s, a central intent of the Program is to garner legitimacy at home by attending to Mexicans abroad. (Zazueta, 1983: 461[10]) Whereas the Revolutionary state was consolidating its power, Mr. Salinas confronted a powerful opponent before the election and a substantial legitimacy "debt" after it. Cuahutemoc Cardenas' trips to the US during the 1988 campaign were often translated into impressive, sometimes largely spontaneous rallies, especially in Los Angeles, but also in places like San Francisco and Chicago. Cardenas explicitly reached out to US residing Mexicans, a strategy which has contributed to the larger trend in which Mexican politics increasingly includes campaign stops in important popular and academic sites in the US. The reports of widespread fraud and the convenient collapse of the computer system for counting the ballots during the 1988 election resulted in such a lack of legitimacy that there was widespread fear among the Mexican elite that the new President would not be able to govern. Moreover, the PRI was made nervous by Cardenas' apparent strength of support in the US and decided that decisive

action was needed to counter these efforts. The Solidarity Program in Mexico was the most important, and a quite impressive, response in Mexico. The Program for Mexican Communities Abroad -- which includes an International Solidarity program -- was the response, also impressive, abroad.

The other reasons for the initiation of the Program relate to Mexican response to changes in US immigration law in 1986. The legalization of almost 2 million undocumented immigrants, a majority of them Mexicans, under the Immigration Reform and Control Act shook the Mexican elite out of what one Mexican official called the "myth of return." That is, the Mexican elite had previously held the complacent assumptions, based on the experience of the Bracero program, that the migrants who left would come back, or were migrating circularly, or that the number of migrants who settled, if not small, was not too large. The legalization of so many Mexicans through the amnesty program made this myth increasingly untenable. The question then became how to relate to this extremely large and now seemingly permanent and growing Mexican population in the US.

Another effect of the amnesty program was the fear of the effects of massive return-migration if employer sanctions (which for the first time imposed penalties on employers of undocumented workers) were vigorously enforced. While such return migration never materialized,[11] the fear of it provoked a closer examination of the role of migration in Mexico's economy, and its dependence, especially on a regional level, on remittances from the US. While they had been seriously considering the possible effects of changes in US immigration policy at least since the early 1980s (Garcia y Griego, 1993), the 1986 Immigration law forced them to confront the fact that in many areas in Mexico the population depended more on what the job market was like in the US than in the immediate area.

The links with the Mexican and Mexican-American groups in the US offered another advantage for Mexico: they had many similar interests and could become allies in lobbying for these interests. The Program has cultivated strong links with organizations such as La Raza and the Hispanic Chambers of Commerce, and have lobbied jointly for the North American Free Trade Agreement (NAFTA) and other legislation. However, the Program is not simply a mechanism for more effective lobbying. While one of the ultimate goals of the Program is to get better US policies towards Mexico, the Program itself embodies an important change in the relationship of the Mexican state to Mexicans abroad that goes well beyond the goals of particular policies or foreign relations.

One measure of the profundity of the change in the orientation of the Mexican state towards Mexicans and Mexican-Americans in the US can be seen in the change in the current activities and role of the Mexican Consulates in the US compared to their immediate predecessors of the last ten to fifteen years. During that time, the Consulates and the Mexican government have been seen as being unresponsive to the needs of Mexicans in the US. Apart from the activism of the 1920s-30s, and to a lesser extent in the 1970s (Zazueta, 1983; Garcia y Griego 1993; Gonzalez, 1992; Gil, 1990), the Mexican Consulates have not systematically attempted to cultivate relations with Mexicans or Mexican-Americans in the US beyond their narrow duties regarding the protection of legal rights and the conferral of documents. Indeed, Program officials have often told me that when they began their outreach work, the first question they would always receive from the Mexican or Mexican-American groups was, Why, after so long, are you paying attention to us? What do you really want from us? They were, the officials said, understandably suspicious.

The role of the Consulates has changed since the Program began. They are one of the most important mechanisms through which the Program has cultivated links with Mexicans and Mexican Americans in the US. The Consulates have served as the agents attempting to makes the links between the Mexican state, through the Program, and the Mexican and Mexican American groups in the US. These activities include English teaching, cultural exhibitions, the donation of money or other things to one's community of origin, and others. While all or most of these activities by the Consulates have historical referents, their systematic pursuit with the intent of institutionalizing a new relationship is the aspect of the current situation which differs most profoundly from previous ones.

The important re-orientation that this indicates concerns the re-imagination of the boundaries of the Mexican nation to include ethnic Mexicans residing in the US. [12] The Program's re-imagination has several elements. First, the Program's work recognizes the important difference between the state (a territorial,

political unit) and the nation (a community of sentiment with no necessary territorial incarnation). Second, it recognizes the crucial importance of multiple identities experienced by contemporary migrants, and attempts to foster rather than fight this holding of a "portfolio" of identities. It does so in large part by recognizing that identities emerge and are maintained through practices which generate meaning. The Mexican state in the form of the Program has attempted to adapt or insinuate itself into existing practices or create new ones which afford it a more central place as an object of political identity.[13] Third, the Program has attempted to institutionalize these practices by making concrete links between Mexican and Mexican American groups within US civil society and the Mexican state at various levels. Taken together, these practices constitute the most extensive effort by the Mexican state not only to cultivate relations with the Mexico de afuera, but also to cultivate the idea of a permanent and sustainable Mexico de afuera in the US. Below, I analyze the practices which create meaning and identity and their institutionalization, organizing them according to their US and Mexico sites.

THE PROGRAM IN THE US: INSTITUTIONALIZING THE IMAGINATION OF THE MEXICAN GLOBAL NATION WITHIN A TRANSNATIONAL SPACE

My argument is that the Program is attempting to create and institutionalize the imagination of a Mexican global nation. I believe that it is doing so in several related ways through the institutionalization of practices which teach Mexicans and Mexican Americans in the US to feel themselves to be part of the Mexican nation and which create a relationship of Membership without Residence between Mexicans in the US and the Mexican state. More specifically, I argue that the Program is attempting to institutionalize this imagination of a global Mexican nation in two related ways: 1) by attempting to institutionalize certain existing meaning-creating practices, both local and transnational in scope, under the symbolic aegis of the Mexican state; 2) by attempting to create new practices which institutionalize new links between and Mexican-American groups within US civil society with the Mexican state. I discuss each of these in turn below.

Institutionalizing Existing Meaning-Creating Practices under the Aegis of the Mexican State

Dr. Diaz de Cossio noted that the two most important ways in which the Program has been able to gain access to and the trust of the Mexican communities in the US are through their (the US residing Mexicans) own strongest organizations: the sports leagues and the community of origin committees. These are organizations that draw on pre-existing identities, and which constitute themselves in the US over time. Indeed, these types of structures, built upon social networks, structure the constitution of immigrant communities in the US. Below, I examine how the state in the form of the Program has insinuated itself into these existing practices and how it has created new meanings and practices in the process.

One important set of meaning-creating practices which the Program has attempted to institutionalize are the Community of Origin Committees mentioned earlier. ("Communities of origin" normally refers to the municipios from which migrants hail, and to which the strongest attachment is felt.) It has not been able to affect the activities of all or even most of these Committees, but it has made impressive strides where it has tried. The institutionalization of the activities of these Committees is important because they represent practices affirming "Membership Before and Beyond Citizenship" as outlined in the introduction of this paper. That is, they represent the maintenance and cultivation of an identity for members of a municipio within a transnational context. By giving money for a public works project in your municipio, you demonstrate your membership and "exercise" this identity as a member of the municipio. Moreover, this identity and membership have most definitely not taken the state as their object; rather the municipio (or county) of origin has been the object.

However, the Mexican state, through the Program, has insinuated itself into these meaning-creating practices by providing technical and logistical assistance, and coordinating activities. For example, when US-residing members of a municipio decide to donate money or something else (say, an ambulance) to their home municipio, the Program can act as an intermediary between the US and Mexico residing members. (In at least one case, the Program offered to arrange for donations to the community of origin to be used for purchasing Mexican debt, which would convert their donation in the US into a more than equal sum in Mexico.) Moreover, it can act as an advocate for them with respect to other parts of the Mexican state,

particularly corrupt customs agents and federal police. They can help with everything, from getting the money or ambulance into the country, to arranging for technical assistance from the state or federal government in the execution of the public works project. Of particular importance has been the funneling of Solidarity funds for community of origin projects coordinated through the Program.[14] With the Program talking for the US-residing Mexicans, the Mexican bureaucracy listens.

The importance of the participation of the Program in both of these activities lies in how their meaning changes when the state becomes involved. Rather than being something which is outside two nation states and done by the members of municipios themselves in a transnational space they have created, the Mexican state in the form of the Program has entered into the picture: It presides over the ceremonies, disseminates the information through its newspaper[15], La Paloma, and in many other ways now also creates the meaning of the experience. While they are still operating within the transnational space which the migrants have been instrumental in creating, it is now a space which is less autonomous from the Mexican state than it had been.

Initiating and Institutionalizing Practices Which Form Links Between Mexican Groups in the US and the Mexican State Through the Program

An important new practice which the Program has initiated involves cultural, sports and social exchanges between US and Mexico residing Mexicans, and most crucially, their institutionalization so that they last beyond the Salinas sexenio (presidency). Among the most important of these involve the sports leagues and youth exchanges for Mexican and Mexican American youth in the US.

The youth exchanges are of at least two kinds. First, they mirror the adult exchanges in that they bring US residing Mexicans to Mexico to compete against Mexican teams residing in Mexico. These exchanges are organized through the National Commission on Sports, whose important role is discussed below. The other type of exchange is the National Encounter of Youth in Solidarity. In September 1992, 500 Mexican-American youth joined 4,500 Mexican youth at the second National Youth in Solidarity Conference held in Morelos, Mexico. As reported in La Paloma (No. 10, Sept. 1992), the youth attended lectures "mainly on themes pertaining to the Mexican nation...." and during the week toured various historically important sites and were treated to exhibitions of Mexican traditional events such as the lienzo charro ("a rodeo-like event").

Mrs. Salinas, the President's wife, hosted the Conference. La Paloma quoted this message from her to the US residing youth at the close of the conference, where she spoke after a chanting chorus of "Me-xi-co" had been "thud(ded) out" by the youth:

> You are invited to continue discovering your forefathers' country. Keep strengthening your relations with fellow Mexicans, take your experience of their unity and their fight for the preservation of Mexican culture home to your communities and country.

Another article in the same issue of La Paloma was written by Mexican residing youth who attended a "Future Leaders of America" conference in Washington.[16] In the article, three Mexican youths describe their initial trepidation at going to the US, but end up discovering that they are really part of the same community with the US residing Mexicans. They comment that: "It turned out to be a tough program, but the links we established with our Mexican American and Latino friends were just as intense. We learned a lot, but the most important thing was a new word: us. We were all one."

An important theme that runs through the articles is that the Mexico and US born Mexicans are still members of the Mexican nation, despite the fact of birth in different countries. They are "fellow Mexicans." By organizing such activities and then reporting about them, the Program is attempting to show and teach the next generation of US born Mexicans how to be members of the Mexican nation, and also to give them concrete practices to make this membership real to them.

The Program has attempted to institutionalize certain links between Mexican groups in the US and the Mexican state. One important example involves the new duties of the leaders of the newly created

Mexican Federation of Sports Leagues in the Northeastern United States, centered in New York. The repeated trips to Mexico by the leaders of the Sports Federation have helped them to establish contacts there. Most important, they now have direct relations with the members of the Mexican Commission on Sports, and indeed have been involved in planning events directly with them. The relations between these US residing Mexicans and the members of the state in Mexico no longer require intermediaries. They can contact the President of the Commission in Mexico and plan activities with him. The meaning of the activities of the NY Federation has changed too. When they plan an event now, for example, the travel of US residing Mexicans to compete in Mexico, they do so as leaders closely associated with the Commission.[17]

The second way the Program is institutionalizing these links involves the Community of Origin Committees. The Program is supervising the creation of what could be called Offices of Emigrant Affairs in each of the most important sending states of the country. They hope to institutionalize these links so that the leaders of Mexicans from a state in Mexico who reside in the US can have an on-going relationship with officials in this Office. I discuss this in the section which follows.

THEY ARE MEXICANS, NOT "POCHOS": THE ACTIVITIES OF THE PROGRAM FOR MEXICAN COMMUNITIES ABROAD IN MEXICO.

I begin my discussion of the activities of the Program in Mexico with a description of a scene from New York. At a dinner hosted by Mexican community leaders in New York City for Dr. Diaz de Cossio, he outlined his measure of what the Program had done. He said that the Program's biggest success has been in "changing the image of you there (in Mexico)...". The Program had changed "how they think of you" in Mexico, that "they know that you are not pochos" (defined in endnote #13),[18] but rather Mexicans too, even though you live in another country. Heads nodded quietly around the room. Dr. Diaz de Cossio's words had connected with his audience.

The view of Mexican immigrants in the US as pochos has been a common one among Mexico's elite. This has been a problem especially in the treatment of the returning immigrants by Mexican government officials, who have often ignored migrants' requests for services or straight-forwardly exploited them. Customs agents are most notorious. In short, they have been viewed as exploitable outsiders, as "second class Mexicans."

Changing this image has been a primary goal of the Program. In doing so, the Program also is also re-defining the Mexican political community. Dr. Diaz de Cossio and other Program staff have undertaken the dual tasks of "educating" (his word) the members of the Mexican state and elite about how to think about the Mexicans residing in the US, and of advocating on their behalf in Mexico. Through these two tasks, the Program is attempting to teach other parts of the state and the elite surrounding it to re-imagine the Mexicans in the US as part of the Mexican nation. Moreover, they have attempted to institutionalize the links which express this change. In so doing, they also change the meaning of membership in the Mexican nation.

The Program's "education" efforts have focussed on mainly on elected officials and members of the government bureaucracy (state and federal), but also on elite private groups. They have further focussed on the largest migrant states: Zacatecas, Guanajato, Michoacan, Jalisco, and Oaxaca. He said that in a recent meeting, he presented the issue to the Governor of Jalisco in this way:

> You have 5,600,000 inhabitants in Jalisco, and you have 2,000,000 in the US. What are you going to do for them? You don't have one single, solitary public servant in the state of Jalisco devoted only to them.

He went on to stress the economic importance of the Mexicans in the US, saying that in Jalisco they do not have any other source of foreign exchange that even comes close to the money remitted by US residing Mexicans. And he discussed Census figures which described the extent of the changes in population due to migration in Jalisco, and other issues.

The point of these education efforts is not just to inform, but to change the way of thinking and to institutionalize communication mechanisms between the US residing Mexicans and the Mexican state. With support from the President's office, the Program has instructed the Governors offices to set up what can be called Offices of Emigrant Affairs. The purpose of these was illustrated to me by Dr. Diaz de Cossio using the example of an ambulance that a group in Los Angeles wanted to donate to their home town in Mexico. They have problems getting it across the border, and once they get to the state there is not anyone from the government to officially receive it. With the creation of such an Office, however, there would be someone to receive it. More importantly, the groups in Los Angeles could call a person they know personally in the Office if there were problems. And over time, through the regular interaction of these groups with the Mexican state, the relationship would become institutionalized in a way that is more likely to last beyond one Presidential term. The Program is currently preparing an instructional package for the Governor's Offices in these states, describing various steps that should be taken towards the opening of such offices. The goal seems to be to create a relationship similar to the one they have created between the Mexican sports leagues in New York City and the Mexican National Commission on Sports.

Two examples of a more institutionalized, formal connection between groups in the US and in Mexico involve education. First, there is the close coordination between certain school districts in the US (mainly in California and one in Wisconsin), through which records for the school-age children of migrant farm workers are exchanged between the Mexican and US schools. These efforts pre-date the Program by many years in California, but the one in Wisconsin was established with its help. The second example involves links between Mexican American groups in the US with the Program and the Mexican state. For example, the program has stressed the importance of bilingual education in the US, and has even provided English teachers and other support through the Mexican Cultural Institutes in the US. More important are the links the Program has established with groups like the California Association for Bilingual Education, and other chapters of the National Association for Bilingual Education. The Program has attended the Association's meetings for several years and shares their concern for the promotion of bilingual education. The Program has met with the Mexican Secretary of Education in order to formulate goals through which the educational needs of Mexicans living in the US can be served.

A final note about the re-definition of what it means to be a Mexican involves the aspirations that the Program has for Mexicans in the US. Among the most important of these is that they do well in their adopted country. Put differently, success in the US is an important way in which one fulfills his duties as a Mexican living abroad. Program staff have outlined the logic to me this way: Mexico wants to have friends in the US. The most natural friends that Mexico has are the Mexicans, Mexican Americans and Latinos in the US. Therefore, we hope that they will succeed because it is better to have rich and powerful friends than powerless, impoverished ones. Hence the Program will do all it can to help the Mexicans and Mexican Americans in the US succeed. Such an attitude is reflected in the considerable effort they have put into educational programs in the US and between the two countries.

It is also reflected in the attention and respect accorded to Mexicans who have been economically successful in the US. In one case, a Mexican who had migrated as an undocumented worker to the US became wealthy there, and then invested a lot of money back in Mexico. Program staff enabled him to avoid paying millions of pesos worth of bribes, and speeded up his obtaining municipal services like water and electricity. At the opening ceremony of one of this plants in Mexico, he was honored for his initiative and drive, as a true Mexican who had not forgotten his roots. Privately, Program staff admired his business acumen in becoming a US citizen in order to take advantage of tax breaks. What seems most interesting about this account is that he was not vilified as a traitor to Mexico for giving up his Mexican citizenship to make money in the US. Rather, his succeeding in the US and then helping Mexico constituted an important part of his being a good Mexican abroad.

Theoretical Discussion

The Program's participation in the sports leagues and in the activities of Community of Origin Committees offer good examples of the analytical point of Basch and Glick-Schiller (1993). They take issue with Kearney and Rouse, whom they see as theorizing the emergence of transnational forms of community

which are so autonomous from the state and that they allow migrants to escape completely the capacity of the state to "inscribe" an identity on them. Basch and Glick-Schiller argue that while the transnationalization of community has indeed provided a space outside of the state for the cultivation of identities, this is not the end of the story. Rather, sending states have attempted, with some success, to insinuate themselves into these spaces and to coopt previously autonomous practices or cultivate new practices which reinforce one's political identity as a member of the nation based within a particular state. They cite the cases of politicians in the West Indian and Caribbean states pursuing politics in New York as a primary example: the "transmigrants" living in New York are approached as members of their sending states and asked for donations and other cooperation on the basis of their common membership as Haitians, Grenadians, etc. Donating or supporting the Grenadian or Haitian politicians or state members re-affirms the Haitian or Grenadian identity of these US residing "transmigrants."

In the case of the Program for Mexican Communities Abroad, we have a similar process at work. The state, in the form of the Program, has presented itself as an umbrella organization for sports leagues and for the supportive activities of US-residing Mexicans for their communities of origin. In this way, the state has become involved in activities which previously (according to my analysis at the beginning of this paper) were "Before or Beyond Citizenship" and thus has transformed them. Whereas these activities before were practiced independently of the state, especially the centralized, federal state, they now are being increasingly coordinated through the Program. In the practice of this coordination lies a great capacity to define and engender the meaning of a practice, particularly in terms of what the practice means for one's political identity. In the Tillys (1975) terms, it is an attempt to redefine the meaning of these events such that the solidarity that emerges reinforces the state's central position and its decisiveness as a site for political practice.

However, this is not to say that the citizenship model of membership tells the whole story either. Indeed, the very creation of the Program contradicts the classical theory of citizenship, in which the nation and the state must reside within the same territory. The state has attempted to modify its manner of inclusion of members. To the extent that it succeeds in "capturing" these transnational practices, it again asserts itself as the proper container for politics as predicted in the citizenship model of membership. We will return to these issues as we examine the comparative cases in Section III.

SECTION III - MEMBERSHIP WITHOUT RESIDENCE IN PORTUGAL, INDIA, HAITI AND COLOMBIA: THE PROGRAM FOR MEXICAN COMMUNITIES ABROAD IN COMPARATIVE PERSPECTIVE.

My argument in the first part of this paper began with the observation that the classical model of membership in a political community as citizenship in a sovereign state no longer fits with the practices of contemporary migrants and their states. Instead, I argued that states were attempting to create a relationship between themselves and their emigrant populations (and their children) which I call "Membership without Residence." This relationship has two elements: the re-imagination of membership in the nation to include emigrants and their children; and the institutionalization of these relationships by the state. In this section, I examine the ways in which five other sending states -- Portugal, Haiti, India, Colombia and Italy -- have attempted to re-define and institutionalize membership of their emigrant populations as membership in the nation despite their foreign residence. I compare their practices for redefining and institutionalizing membership in the nation with the Mexican case and with each other. In short introductory remarks for each case, I try to take into account the contexts of the migration and state policies, especially regarding the state's location within the global economy and geo-political system. [19]

PORTUGAL: The Ministry of Portuguese Communities and the Portuguese Global Nation

I began this paper by citing the impact which Bela Feldman Bianco's (1992) article had during my conversation with the Director of the Program for Mexican Communities Abroad. This impact was not without reason, because the Portuguese and Mexican programs are nearly identical in several respects, though the context of their conception and current operation are different. However, the programs are very similar in how they re-define what it means to be a member of the nation and then attempt to institutionalize

this re-definition as a relationship of "Membership without Residence."

The Portuguese state's efforts to create and institutionalize a global nation began in the 1960s and 1970s, as labor emigration increased and after Portugal lost its overseas dominions after the 1974 revolution.[20] Portugal's past as a seafaring, colonizing nation has provided it with a central concept which underpins its efforts at creating a global nation: saudade, which can be translated as "longing" or "nostalgia." This nostalgia for Portugal's past provides what Feldman-Bianco calls the "collective memory" that is drawn upon in the creation of a global Portuguese nation.

The Portuguese state, at various levels, has taken a very active role in re-defining what it means to be a member of the Portuguese nation. Recognizing the increasing numbers of Portuguese involved in international migration, the state moved to change the perception and treatment of Portuguese emigrants in society as well as their relationship to the Portuguese state. We can note the change occurring between the 1940s and late 1970s. In the 1940s, emigrants were still considered second class citizens and defined as "'those passengers traveling second and third class by boat'"; through the early 1960s emigration was considered a necessary evil, and illegal immigration "a serious crime.". (Feldman-Bianco, 1992: p. 149) In society, the "pocho syndrome" prevailed: returning emigrants were called "French" or "American," as if they were now only members of their adopted countries, and no longer Portuguese.

In the mid-1960s, the state began to completely change its relationship with its emigrants. By the late 1970s, it had created full-fledged framework for a global nation. After negotiations related to its entrance into the European community in 1965, the Portuguese state took on the responsibility of recruiting and placing workers. In the late 1970s, it gave Portuguese emigrants full dual citizenship rights, but also charged them with a "dual responsibility: 'to integrate in(to) the host society without assimilating and to establish the presence of Portugal in the world'". This change was captured in a poem by an emigrant poet with the line, "A Portuguese who is only a Portuguese is not a Portuguese." Most recently the word "immigrant" was replaced by the term "portuguese Abroad and portuguese spread throughout the world'" in Portuguese laws and state regulations related to emigration. (Feldman-Bianco, 1992: 180)

In addition to redefining how Portuguese emigrants were thought of, the state also created agencies to institutionalize the links between Portuguese abroad and the Portuguese state. The Ministry of Portuguese Communities in the Ministry of Foreign Affairs was created. Most recently, organizing has begun for a World Ministry of Portuguese Communities which will provide for the participation of representatives of the myriad Portuguese communities abroad. (Feldman-Bianco, 1992: p. 150) In addition to these federal projects, the regional governments of areas with high emigration (for example, the Azores) also have created such programs.

In addition to these state agencies, there are practices which institutionalize these links. For example, the President of the Azores visits Massachusetts at least four times per year, and there are other regular exchanges and joint celebrations between the Portuguese and US sides of the Portuguese (or Azorean) community. Moreover, frequent use of TV and radio keep Portuguese in Massachusetts and Portugal informed on the news and state actions in both places. The Portuguese state regularly bestows awards on leaders of the Portuguese community in Massachusetts. Together, these agencies and practices institutionalize the relationship between the Portuguese state and its Portuguese abroad.

The Mexican and Portuguese cases provide interesting comparisons because of how similar the programs are. Indeed, they virtually have the same names. One might speculate that these similarities have to do with the similarity of the migrations and their relationship to the global economy. That is, that both are primarily low-wage labor migrations to more developed countries, and in both cases the extent of migration is greater than for the other countries considered, with the exception of Haiti in which political factors outweigh the others. The granting of full citizenship rights to emigrants in the Portuguese case but not the Mexican case is an important difference in otherwise similar programs. These issues are discussed more in the comparative section which follows.

INDIA'S "NON-RESIDENT INDIAN" PROGRAM: Come Home, and Bring Your Money.

India's "Non-Resident Indian" program was conceived within the context of the economic modernization program begun in the 1970s. The new strategy shifted towards bringing in foreign capital for direct investment. Non-Resident Indians (commonly known as NRIs) were seen as an ideal way to do this because they allowed state planners to balance India's xenophobia with its need for foreign capital: NRI investment would be less foreign, and still foment development. That NRIs were targeted indicates how many of them are economically privileged, part of India's "brain drain" of doctors, lawyers, industrialists and businessmen. The idea was to make these foreign-residing Indian professionals also into domestic investors, and hence indirectly put Indian talent to work in developing the country.[21](Lessinger, 1992)

The Non-Resident Indian program differs from the Mexican Program in the scope of its redefinition of membership in the nation, and in its manner of institutionalization. One aspect of this difference is that rather than being a program for all Indians outside the country, as in the Mexican or Portuguese cases, it is a program aimed specifically at potential Indian investors. This reflects the different composition of migrants from India. However, we could also consider the Mexican case to be an "investor" program if we looked at remittances as investment.

A more important difference with the Mexican case lies in the kind of re-imagining being done by the Indian versus the Mexican state. There are two aspects to the Indian state's re-definition. First, the Indian state hopes through the fostering of investment in India by NRIs to induce them to return home. What I will call the "pochos syndrome" is very strong in the relationship between NRIs and the Indian state and society. NRI's of more than one generation's removal from Indian birth are generally viewed as being "not real Indians." (Lessinger, 1992: p.72) Hence it is hoped that those who are Indian born or first generation will return home and become "re-Indianized." In this way, the Mexican and Indian programs differ because the Mexican Program reaches out to all ethnic Mexicans, regardless of generation or territorial residency. Second, the Indian NRI program does not attempt to institutionalize and thus make permanent the definition of NRIs and their children as members of the Indian nation. This contrasts with the Mexican case, where Mexican ethnicity and desire to become more Mexican are the only criteria for participation.

The Mexican and Indian cases are similar in that the kind of membership offered in not full political membership. In both the Mexican and Indian cases,
the state has refused to grant dual citizenship, including voting rights, on the grounds that these privileges must be reserved for those residing inside the state. The demand for full voting rights has been made both by Indians and Mexicans abroad.

However, the Indian state's practices and intents are contradictory. That is, while the NRI program's intent is not to foster the permanence of Indian residence abroad nor to uphold the authenticity of Indian-ness outside of India, several elements of the NRI institutionalize conditions that do just that. The first regards how the Indian state defines who is an NRI: "'Indian nationals and foreign passport holders of Indian origin. They include even wives of Indian citizens and those whose parent/s or grandparent/s was/were resident in undivided India'." (Lessinger, 1992: p.56 source cited in India Today, which cited a Citibank pamphlet soliciting investments) The broadness of this definition includes as NRIs people who are not members of the Indian state. Another practice which acts to foster an Indian identity in NRIs is the publication abroad of several newspapers directed at Indians. One, India Abroad, has very close ties to the Indian state. Drawing on Anderson (1991), we know that newspapers are important mechanisms for fostering the imagination of community among groups of dispersed peoples. Finally, the state sponsorship of identity affirming events organized by NRIs themselves fosters the permanence of NRI status. The First Global Convention of People of Indian Origin was held in New York in 1989. An important sponsor was the State Bank of India, and high ranking government officials spoke at the event. Their presence contributed to the maintenance and institutionalization of Indian-ness abroad by "authenticating the event as an item of Indian cultural identity, in offering a channel for NRI contact with the Indian government, and in forming an audience for the event's assertion of a global Indian identity." (Lessinger, 1992: p. 73)

The Indian state also affirms and enables the holding of Indian identity through its concrete measures for attracting investment from NRIs. For example, NRI's receive tax breaks on investments and significant technical and financial assistance in setting up business ventures in India. Also, NRI's have special accounts where they receive higher than normal interest rates on remitted money. These accounts

are denominated both in US dollars and in rupees, making access to one's money equally easy from the US or India. These types of arrangements facilitate the maintenance of two lives, one as a professional in the US and the other as a businessman in India. In both cases, the NRI feels himself to be Indian, and practices a kind of "Membership without Residence."

As we have seen, these kinds of practices have been used in the Mexican Program as well, though they have been designed for a very different population of migrants.

HAITI: Aristide, the Tenth Department and the Deterritorialized Nation State[22]

The Haitian case is different from the others for several reasons. Here, we are not examining an on-going program, as such, which attempts to institutionalize a relationship of membership in the nation without residence in the state. Rather, we examine something which is more transnationalized than the other four cases we have looked at, with the possible exception of Portugal. Indeed, we could say that Haiti's political system cannot realistically be considered except with reference to the transnational actors who help constitute that system, nor can its economy be understood except with reference to its peripheral position in the global economy.[23] (Glick-Schiller and Basch, 1993; Richman, 1992; Chalmers, 1992) However, I focus here on Aristide's Campaign in the Diaspora and his creation of the Tenth Department, taking the former as examples of the de-facto imagination of a global, deterritorialized nation, and the latter as an attempt to deepen and institutionalize that relationship. Had Aristide's Presidency not been interrupted by the coup, we might today see in Haiti the most extensive institutionalization of Membership without Residency of our cases. The extant situation is less institutionalized, but not less transnationalized.

The evidence of a de-facto transnationalized nation in the election campaign is plentiful. Richman (1992) points out that Aristide's last-minute candidacy was greeted by massive grassroots movements both in Haiti and the US, especially in New York and Miami. These movements were known in Haiti as the Deluge (Lavalas) at Home and the Deluge for Home. The idea was that the Deluge of the people would sweep out the tyrants and sweep in the people's representatives. Moreover, Aristide campaigned a good deal in New York and Miami in person, and more extensively over the radio, raising a great deal of money for his campaign in the US. Similarly, he thanked supporters outside Haiti and promised renewal in his election-eve "Speech to the Diaspora." After the election, he appealed to the "Bank of the Diaspora" for funds to rebuild Haiti.

Aristide's creation of the Tenth Department of Haiti gave institutional form to the relationship of Membership without Residence. In creating the deterritorialized Tenth Department (the Haitian state has nine Departments), Aristide was explicitly accepting and embracing the transnationalized nature of the Haitian polity, and affirming the legitimacy of a "deterritorialized political entity" (Richman, 1992) within the state. Not only was this political entity announced, but it constituted itself in the US before the coup by electing representatives from the various districts which made up the Tenth Department. For example, there was a district from New York, one from Canada, one from Guadeloupe, etc. According to Richman (1992: p. 73), these same districts have "mobilized protest marches and fund raising campaigns to restore <u>their</u> president to power after he was deposed by the Haitian army..."

An important consideration in comparing the Haitian case with the others is that the other states are "more sovereign" than the Haitian one. This fact leads to two observations. First, the greater sovereignty of these other states makes it easier for them to re-define and institutionalize their relationship with their emigrant members. However, that all five of these countries are implementing (or implemented) some measures to institutionalize the membership of their emigrants underlines the importance of transnationalization as a force changing the conditions under which states negotiate their relations with "their" populations, resident and emigrant.

COLOMBIA: A Narrow, Politically Substantive Membership without Residence[24]

The Colombian government has not instituted a formal program for Colombians abroad, but still

provides an interesting case for comparison. We can characterize the Colombian state's re-negotiation of its relationship with its emigrants as re-defining political community more narrowly than in the Mexican or Indian cases, but institutionalizing it in a more politically substantive way. That is the Colombian state has granted full political rights to its citizens aborad, but has not re-defined its deterritorialized political community nation to include non-citizens as have Mexico and India. There are three concrete elements of the Colombian "program."

The first element is the practice of campaigning for Colombian Presidential (and other) elections in New York. For more than thirty years, Colombian politicians have been coming to New York to raise money and support for their campaigns back home. The traditional parties, the Liberals and Conservatives who alternate in power in Colombia, are also constituted here in New York, and control of the Consulate also changes when the party in power changes in Colombia. The second element is the legislation providing for the dual citizenship with voting rights for emigrant Colombians. Accordingly, Colombians living in New York have been able to vote in Colombian elections at voting places in Jackson Heights, Queens, and at the Consulate in Manhattan. Though only a small percentage of Colombians vote, there are several thousand who do, and the campaigning among the party members can be quite intense. The third and most recent is a Constitutional Reform made within the last year which provides for the election of a representative to Congress from abroad. While the enabling legislation for this provision has not yet been passed, when (and if) it is, it will ensure, for all intents and purposes, that there will be an elected representative from New York in the Colombian Congress. Each of these practices -- and especially the third -- institutionalizes the participation of Colombians living in the US in the governing process of the Colombian state and nation.

These elements add up to a more politically substantive Membership without Residency for Colombians Abroad than for Mexicans or Indians, but also one involving a narrower imagination or definition of community. The Colombian community does not include the second or third generation of ethnics, and hence the political community is re-defined only in terms of residence, not in terms of who is included. It is still a community of citizens and members of the state, even if they do not reside within the state. This is in contrast to the Mexican, Indian or Portuguese cases, where community membership is redefined to include non-citizens.

ITALY: Emigration and Return as State Strategies. [25]

The Italian case offers an interesting comparison because it can be considered the "original" program for communities abroad, and because its founding was part of the Italian state's strategy for consolidating its nation. Hence, no current re-imagination of the nation is necessary because the nation was founded with the notion of including "Italians abroad." Moreover, the links between the Italian state and Italians abroad have been institutionalized since shortly after the state's founding in 1871.

The new Italy faced the "southern question" -- how to deal with the disparity in development between the relatively prosperous north and the "backward" south. One answer was to actively promote both the emigration of Italians from the south to other parts of the world, and their return and repatriation to Italy. This allowed Italy to avoid the political instability that the "southern question" might cause, so that emigration would, as one contemporary observer put it, serve as "'a safety valve against class hatred.'" (cited in Heisler, BS: 1984: 330) In this way, Italy created a "new view of citizenship" resting on the assumption of both temporary emigration and eventual return.(Heisler, 1984: 330)

The first emigration laws were passed in 1888, but the real beginning of a program for Italians abroad began with the Emigration Act of 1901 which created the General Commission on Emigration. Its philosophy was that emigration was necessary and should be encouraged, but must also be temporary and periodic. To institutionalize this relationship, the Italian state set up an extensive network of state (or state-sponsored) agencies for its emigrants. These agencies have been active throughout this century, especially during the 1920s and during the great migrations to northern Europe in the 1960s and 1970s. These agencies include large consular staffs, a set of "patronati (helping institutions) administered by trade union federations but financed and juridically recognized by the state," and the Directorate (formerly the Commission) which works through two major organizations, the National Union of Emigrant and Immigrant

Associations and the Italian Federation of Emigrant Workers and Families. These institutions have provided extensive services and support for the needs of Italians abroad as well as their return home. For example, the Italian state has provided subsidized transportation for Italians to return home to vote. Heisler characterizes the result as twofold: it fosters isolation from the host society and "simultaneously reinforc(es) ties with Italy." Some studies have noted a 50% return rate among Italian emigrants. (cited in Heisler, 1984)

The Italian case offers an interesting comparison to the Mexican case and others for two reasons. First, there is not a contemporary "re"-imagination of the community in this case, because the first program for Italian communities abroad was initiated as one strategy of the Italian state to deal with the southern question, which is really a nation building question. Hence, the Italian notion of citizenship treats as normal the emigration, return and on-going participation of many of its citizens abroad. Moreover, it is different from the Mexican and Portuguese cases and similar to the Indian case in that it attempts to foster the return of emigrants to Italy. Unlike the Indian case, it has had some success in this endeavor. Second, and consistent with the first point, is that it has from the outset devoted considerable resources to institutionalizing the organic relationship between Italians abroad and the Italian state. These issues are discussed more below in the comparative section to which we now turn.

SECTION IV: COMPARATIVE ANALYSIS: STATES, MIGRANTS AND THE RE-NEGOTIATION OF POLITICAL COMMUNITY IN A TRANSNATIONAL SPACE.

We can make several general observations in comparing the above cases of "programs for members abroad" or "Membership without Residence." These observations lead us into a discussion of what I call the "pochos syndrome" and of the importance of the reversal of the presumed order in the structure-agent problematic in the relationship between states and migrants.

The first general observation we can make is that each of these programs (except the Italian one) attempts to re-define who is included in the "we" of a national political community. This re-definition has gone furthest in the Portuguese case, where full dual-citizenship rights are extended to Portuguese abroad, and the relevant laws have been re-written to abolish the term "immigrant" and substitute "Portuguese abroad." This redefinition has similar dimensions in the Mexican case, with the important exception of the failure of the Mexican state to include fully its "Mexicans abroad" in the political community by granting voting and other political rights, as in the Portuguese case. The Haitian case is different because of the coup, but still merits attention here. Aristide went very far in redefining who was inside the political community -- even to the point of providing for the election of representatives from the Tenth Department. Moreover, the difference between members residing inside and those residing outside the state seems to be the least consequential in this case because of the prior, extreme transnationalization of the political system. In the Indian case, the re-definition by the Indian state of who is inside and who is outside the political community includes non-citizens and foreign born, ethnic Indians abroad, and even non-Indians related by marriage to India. The Colombian "program" re-defines membership in the least radical way in terms of the state -- only Colombian citizens can vote or get special consideration -- but it is radical in its providing (at least in theory) for an elected representative from abroad (eg New York). The Italian case is different because the Italian state never stopped "imagining" that emigrants were part of its political community. Rather the Italian state actively promoted both their emigration and simultaneous inclusion in the Italian nation as part of its development strategy.

A second observation is that in at least five of the cases the programs were created in the midst of great searching about the meaning of national identity provoked either by changes in the nation state's relation to the world economy or its political relationship with its people. In the case of Mexico, the Program was initiated in response to the success of Cuahutemoc Cardenas in California, and the Mexican elite's realization of the permanence of US residency for many Mexicans and their importance to Mexico's economy. However, we can go deeper in looking for causes. One cause of the Cardenas phenomena was the abrogation of the implicit, post-revolution pact in Mexican political life beginning with President Miguel de la Madrid in 1982. The pact had been: the party-state of the PRI will provide steady growth in the

economy and an increasing pie to re-distribute, and in return it gets labor peace and near complete control over the electoral process. (Cornelius et al, 1988) The Mexican state's break (or at least important modification) of its traditional role as the protector of the national economy and popular sectors from outside economic forces inherent in its neo-liberal project was an important factor in persuading many that the bargain was no longer being kept. Cardenas' support in the 1988 election reflected this sentiment. Combined now with the logical extension of the neo-liberal project -- NAFTA -- Mexico has been searching to re-define its national identity over the past decade, to re-define what membership means in a Mexico which is increasingly integrating itself into the world economy.

The other cases have similar contexts. The Portuguese programs were begun after the 1974 Revolution and the loss of its overseas empire, which occasioned great debate in Portugal over the meaning of Portuguese national identity. The Indian NRI program was begun as a more palatable, "third way" of opening the economy to "foreign" investment. The Haitian program was initiated as an integral part of a wide-reaching democratization process which was attempting to change what membership in the Haitian state and nation meant for the vast majority of Haitians. Moreover, as the politics of Haiti have been practiced within a transnational context for quite some time, the formation of the Tenth Department was really an attempt to enfranchise de-facto members of the Haitian political system and nation. In short, we can say that each of these cases have involved the re-definition of political community by the state in response to crises in the meaning of national identity. The Italian program, as previously discussed, began as part of a strategy to consolidate the Italian nation.

One dynamic which recurs in these re-definitions is what I call the "pochos syndrome."[26] In a program of this sort, the state takes on the responsibility of attempting to reverse the perceptions of Mexicans/ Portuguese/ Indians etc abroad as "not real Mexicans/Portuguese/Indians etc" -- eg as "pochos." This perception is held both by those inside the state, and by members of civil society. In the Mexican case, reversing this perception has been a priority, as discussed above. In the Portuguese case, the re-writing of laws (to say "Portuguese abroad" and not "immigrant") as well as the extensive interchange between Portuguese in Portugal and those in the US offer evidence of a similar process. In Haiti, Aristide's direct appeals to Diaspora for money and support, and the creation of the Tenth Department attest to a marked departure from treating Haitians abroad as less Haitian than those at home.

In the Indian case, the reversal of this image is made more complex because of India's intense xenophobia and the NRI program's own contradictions. Its stated attempt is to induce both NRI investment and return migration, so that NRIs can be "re-Indianized." Yet, as discussed above, the program facilitates the maintenance of a community and an identity as an Indian abroad, both logistically and in terms of defining the community. The very designation of a program for "Non-Resident Indians" bespeaks its attempts to re-define the NRIs as members of India.

However, by talking of "the state's re-definition of political community" I do not mean to say that political community is all the state's to define. Rather, we must acknowledge that even where the state has been able to play an important part in re-defining political community to include in some way Mexicans/Portuguese/Indians etc abroad, this represents a response to an inversion of the "presumed" state-migrant relationship. That is, it represents an inversion of the normal assignment of positions for the state and migrants in the structure-agent problematic (See Mahler, et al, 1992): migrants here have created a structure and a space through their transnational practices, and states are attempting now to capture that space. The migrants are agents who have created a structure to which the state is responding, attempting to make that structure the state's in important ways.

This reversal is of more than academic concern. Leaving the Italian case aside for now, we can say that this reversal is reflected both in how the state is attempting to capture these structures and the practices which institutionalize them, and in the struggles between Indians or Mexicans etc. abroad and their states and societies of origin. For example, these programs for members abroad indicate that it is possible to live abroad and still be a good Indian, Mexican, Portuguese, etc by being successful in the host society and thereby directly or indirectly contributing to the sending state. The Portuguese case evidences this most explicitly. The Portuguese state charges Portuguese abroad with the responsibility of integrating without assimilating and thereby "establishing the presence of Portugal in the world." (Feldman-Bianco,

1992)[27] Mexican Program officials tell me that they want the Mexican American community, their "friends" in the US, to be prosperous and powerful, and hence they are attempting directly or indirectly, to promote the economic, social and political development of the Mexican American community in the US. Educational and business issues are among the most important. The praise of a Mexican who became a US citizen so that he could more profitably invest in Mexico is another example. The Indian NRI program has likewise amended the practices which manifest Indian-ness to include making money abroad and investing it at home in India. In Haiti, Aristide encouraged Haitians abroad to repatriate funds, and, more commonly, to return periodically and spend money like "'good homegrown Creole tourists'". (Richman, 1992: 195).

The sending states logic seems to be: since our emigrants have established themselves abroad and we cannot change that, we must do something to make them still "ours" and to benefit by their labor. Since we cannot tax them, we must induce them to spend or send money based on their membership as Haitians, Mexicans, Indians, etc. Since we cannot change the fact of their migration, perhaps we can change what it means and how it is practiced.

The Italian case is slightly different: it "sent" its emigrants abroad, but did so at least in part because of its position in the world economy. That is, the "southern question" is really a question of dependent development in an earlier period. Hence, the "new view of citizenship" based on temporary emigration on return can thus be seen as the definition of citizenship in one of the first dependent states attempting to develop economically and politically. While the logic of the migrant-state relationship is not reversed in the Italian case, this is because of the timing more than anything else. The same forces impelled the migration, and induced an initial imagination of community quite similar to the re-imagination which the other countries are experiencing now.

This reversal of the structure-agent problematic is also seen in the struggles between the Mexicans, Indians and Haitians abroad with the efforts of the home state to "capture" them and this transnational space through the programs for members abroad.[28] According to Lessinger (1992), the NRI program created a legal framework for defining who is an insider/outsider, which legitimized and catalyzed the resistance among Indians abroad to the dominant ideology which viewed them as less authentically Indian. (This resistance is especially significant in a culture which, Lessinger tells us, during the nineteenth century required purifying rituals for Indians returning from abroad.) The First Global Convention of People of Indian Origin in 1989 in New York City was an important example of Indians abroad asserting their identity as Indians, and the legitimacy of being Indian outside of India. The Convention also served as a platform for making demands on the Indian state, particularly for protection of Indians in other states such as Fiji and South Africa. Finally, a central theme of the Convention was the question, "'What is an Indian?'" (Lessinger, 1992: p. 73) By convening such a meeting, focussed around such a question, and using the occasion to make demands on the Indian state, these Indians abroad were asserting their authenticity as Indians living outside India. They are thus disputing the state's attempts to capture the transnational space in which they live, by not accepting the state's design of what the NRI program should be: a way of repatriating both capital and Indians. Rather, they have incorporated the NRI program into the Indian life they are constructing outside the Indian state in a transnational space they have in large part created.

This reversal of the structure-agent problematic is susceptible to an analysis similar to the Tillys' (1975) analysis of an earlier period of state-civil society conflict over the decisive site of political practice. Just as industrialization occasioned the "reorganization of everyday lives" which subsequently reorganized solidarities which then gave preeminence to national structures of power, so has the globalization of the economy been a basic but not determinative cause for the transnationalization of politics. As globalization in the economy "pushed" and "pulled" more migrants to the developed world, the everyday lives of these migrants were profoundly "reorganized." An important aspect of this reorganization was to enhance the importance of local level ties and community attachments -- which can be retained by migrants through the process of migration and thus the communities themselves are transnationalized -- through which a transnational space for politics was created. Stated another way, we could describe the story this way: local communities were captured by the state, as described by the Tillys; migrants from certain communities migrated to other states but still retained their attachment to their local communities, creating a set of forms and sites of political practice that transcend the state; the state has recognized these sites and forms and is attempting to capture them again. This, of course, will result in struggle over the control of these

practices.

In terms of struggles over the control of practices and politics in a transnational arena, the Mexican case is especially interesting. Because it is a case I know well, it permits me to refine my analysis. Moreover, it permits direct discussion of the work of Kearney (1993) and Kearney and Nagengast (1992), which conceptualizes the creation of an autonomous space through the creation of which migrants have "escaped" the state. While I have agreed in this paper with Glick-Schiller and Basch (1993) by saying that Kearney's formulation does not describe what I have seen, there are at least two ways in which I believe Kearney's argument (1991) will be born out. The first is that the state's ability to define the meaning of practices will vary according to a variety of factors, including the kind of activity which it attempts to capture. The second is that different groups from within Mexico will have different (or almost no) relations to the Program just as they had different relations with the Mexican state in Mexico.

In a somewhat counterintuitive fashion, I hypothesize (and preliminary evidence bears this out) that the Mexican state has been and will be more successful in "capturing" the processes of community formation based in the US first and then carried back into Mexico, as compared to those initiated autonomously in Mexico and carried into the US. This will be especially so when the state initiates a new practice or site rather than simply reacts to an existing site or practice. I have in mind here the differences between the state's involvement with the sports leagues and the community of origin committees. The sports leagues are US based, and while the particular teams are organized around membership in the communities of origin, when the teams come together it is an important exercise of Mexican-in-the-US identity. The state then adds another dimension to this identification through its current activities conducted by the Program: bringing Mexican sports personalities to the US and US based teams to compete in Mexico, and developing the links between leaders of the sports leagues and the members of the National Commission on Sports and other official Mexican organizations. The point is that the sports leagues cohere in an important way based on Mexican identity to begin with, so that it is easier for the state to act as a catalyst in promoting Mexican national identity through the Program. The state moves itself squarely back to the center as an object of political identity in this way.

This relationship is different than that which the Program has with the communities of origin. The Program's Director has noted that the identity as oriundos (people from a certain place) is attached mostly to one's municipio of origin, or perhaps sometimes to the home state (eg "state" of Guanajato, not Mexican state; this meaning of "state" is intended only in this one usage here.). One never speaks of an oriundo of Mexico, the country. My experience has been that members of some communities of origin may selectively resist the state's help (in the form of the Program or in other ways) because they view it as an imposition from above by "politicians." These state officials are viewed as being outside the community, and the members inside the community wish to maintain their autonomy relative to the state. I speculate that in a significant minority of committees of oriundos approached by the Program this will be the case.

This point brings us back to the work of Michael Kearney (1991). (See also Kearney and Nagengast,1990) Kearney has analyzed a condition I describe as Membership Before and Beyond Citizenship. In the case of Mixtec Indians, this is most clearly so: Mixtecs had constituted themselves as members of their own, indigenous communities before the establishment of the Mexican state, and continue to do so today even while being located within the state. Moreover, through their struggles as Mixtecs in each of the sites on their migration -- Oaxaca, the agricultural fields of northern Mexico, the border, and in US agriculture -- they have both been identified in their "foreign relations" (Suttles, 1968) and come internally to understand themselves as being "Mixtec." The result is that whereas before these folks thought of themselves primarily as members of a particular, village-level, community, they now have begun to also think of themselves as Mixtecs in the US and in Mexico, to be holders of a pan-Mixtec identity. (Kearney, 1993)

The point is that such a community identity -- conceived in opposition to the state -- is unlikely to be easily captured by the state through the Program. The Program may be able to initiate certain projects with the Mixtecs, but the fundamental relationship with the state will likely remain largely antagonistic. This is a very different story than the mestizo immigrants in New York I have been working with, who while they have a much stronger sense of being oriundos than of being Mexicans per se, do not attempt to hold

identities based so much in antagonistic objects. Their identities can take the village and the state as their objects in a reinforcing way, whereas for the Mixtecs these objects are antagonistic. These two identities can be complementary and are not inherently antagonistic as with the Mixtecs. In this way, Kearney seems to be on target when he argues that "national identities can no longer be constructed" and that migrants are creating identities for themselves within an autonomous, post-national, transnational space.

CONCLUSION: THE CITIZENSHIP AND TRANSNATIONAL MODELS OF MEMBERSHIP

In this paper, I have tried to analyze how contemporary sending states are attempting to re-define their political communities to include their emigrants abroad, and to institutionalize this new relationship through what I call "Membership without Residence." I posed these "programs for members living abroad" as problematic both for the citizenship model of membership and Kearney's model of transnational membership completely outside the state. In closing, I would like to highlight a few conclusions regarding these theories.

Regarding the citizenship model, the very re-definition of those outside the state as members directly and indirectly contradicts the citizenship model of membership in a political community. As stated in Brubaker (1989), only if the state and nation have a one to one relationship can the "nation's state be the nation state." This constitutes a direct violation of the model. The indirect contradictions stem from the kind of politics the state must practice with its members abroad. A corollary to the principle of sovereignty which underpins the citizenship model is that politics within the state is conducted according to a dialectic between civil society and the state, whereas politics outside the state is a matter of state to state relations, often in terms of war or the threat of it. (Walker, 1990) In the case of the activities of the Program, the state is involved in a dialectic with part of "its" civil society which lies outside the state. Moreover, this part of civil society is transnational and has not been created by the state. Hence, the state has in an important way acknowledged a change in the conditions under which it claims to be sovereign, and is conducting its politics in a transnational space created in large part by the migrants. Curiously, however, the state still has the same intent even as it operates in this transnational space: to channel, coopt, coerce, and otherwise control the participation of the migrants in the state and society of origin.

Regarding Kearney's transnational membership model, I would argue that there are in fact being created transnational spaces in which national identities are not being constructed or are more difficult to construct. Certainly, the case of the Mixtec Indians is very different from that of mestizos from Mexico which I have studied. My conclusion, however, considering Kearney's and Kearney and Nagengast's work, the work of Glick-Schiller and Basch (1993), and my own work, is that transnational space created by migrants will not necessarily remain autonomous of the state, but neither will it necessarily be "captured" by the state. Rather, there will be struggle between Indians, Mexicans and others abroad and their respective states of origin to define the terms on which they are members of their respective deterritorialized, national, political communities.

ENDNOTES.

1. I would like to acknowledge the generous support I have enjoyed in researching and writing up the material on which this paper draws. A significant part of the research for this paper was undertaken while the author held a Dissertation Fellowship for Research on the Urban Underclass from the Social Science Research Council with funds provided by the Rockefeller Foundation. Other research and write up was conducted during the author's tenure as a Visiting Research Fellow of El Colegio de la Frontera Norte in Tijuana with funds provided by the Tinker Foundation; my thanks to Drs. Jorge Bustamante and Luz Maria Valdez de Montano. Also, my thanks to Dr. Douglas Chalmers and Katie Roberts-Hite, the Director and Assistant Director of the Institute for Latin American and Iberian Studies at Columbia University, for logistical, intellectual and moral support. Finally, thanks to Drs. Christopher Mitchell for inviting me to present this paper and to Manuel Garcia y Griego for commentating at the seminar; and to the participants of the Seminar for their helpful comments.

2. Concretely, the Program has coordinated Mexican sports leagues in the US and sports-centered exchanges between US-residing and Mexico-residing Mexicans; has sought to create and institutionalize links between Mexican and Mexican-American groups in civil society in the US with the Mexican state at federal, state and local levels; publishes a bilingual newspaper distributed in the US and Mexico; has opened cultural institutes; and has pursued related activities. Each of these activities is aimed at fostering a greater sense of community both on the part of US-residing Mexicans towards Mexico and on the part of Mexico-residing Mexicans -- especially within the Mexican state -- towards US-residing Mexicans.

3. A note on usage regards the word "transnational". "Transnational" as I use it here does not actually mean "across nations" as its roots would have it, but rather "across nation states" or "across states." Hence, a more precise term would be "trans-nation-statal". I will use the term "transnational" in this paper because it has become standard usage, and the term is commonly understood to mean "across nation states/states".

4. We must bear in mind this discussion the distinctions between the terms "nation," "state," and "nation-state." Briefly, a "nation" is a group of people who speak the same language, share a common culture and feel themselves to be members of community of sentiment which unites them; they are also, by virtue of their status as members, possess certain political rights. In defining "the state" I follow Weber, who, in "Politics as a Vocation," describes the state in this way: the "state is a human community that (successfully) claims the monopoly on the legitimate use of physical force within a given territory." That is, the state is constituted by the coercive, corporate apparatus controlled by the government within a given territory. It is by necessity a territorially bounded entity, while a nation is not. A "nation-state" is what results when the state and the nation are coterminous: one nation, one state, occupying and defining themselves in one and the same territory.

5. In the larger work of which this is a part, I elaborate three ways in which the practices of contemporary migrants and their states do not comport with the classical model of citizenship in the sovereign state. These can be described as alternative types of membership: "Membership without Citizenship," (following Brubaker, 1989), "Membership Before and Beyond Citizenship," and "Membership Without Residence." (Glick-Schiller et al, 1992; Goldring 1992; Rouse, 1989; Kasinitz, 1992; Smith, 1992; Goldring and Smith, 1993) In "Membership without Citizenship," immigrants become incorporated into the social and economic spheres of society, but are not fully incorporated as members of the political community -- that is, as citizens. "Membership Before and Beyond Citizenship" refers to the ways in which contemporary immigrants create, through imagination and practice, an alternative political community which is transnational in scope but which co-exists with the political communities (eg of the nations states) between which they migrate.

6.It does not necessarily compete with Membership Before and Beyond Citizenship, but probably does in most cases.

7. This section has been significantly rewritten based on comments made during the Seminar on May 7, 1993, especially those of Manuel Garcia y Griego.

8. My use of "Mexican-Americans" as a term does not imply my acceptance of some of its political connotations, particularly in regards the assimilationism it seems to suggest. Rather, I use the term "Mexican Americans" to denote Mexicans who happen to be born in the US, to distinguish them from Mexicans born in Mexico. The notion of "Mexico de afuera" was created after Mexico ceded much of its territory to the US after the 1848 war. Zazueta identifies the efforts to protect Mexicans who were, in Manuel Garcia y Griego's words, "crossed by the border" in 1848, as the "beginning" of Mexican-Chicano relations. (Zazueta, 1983: 443)

9. Campaigning by Mexican presidential candidates is not without precedent. Indeed, Vasconcelos did so as an unsuccessful presidential candidate in the 1928 election (Garcia y Griego, 1993), and scores of revolutionaries, including Benito Juarez, have fled to the US for refuge and re-organization.

10. In Zazueta's words, "As several actions by the government during the 1920s show, it was sensitive to the domestic criticism that not enough was being done to protect the rights of Mexican citizens abroad, and it was astute enough to recognize the legitimizing function of certain activities which protested the violations of those rights or which served to defend the nation's dignity before the United States. Then, as now, symbolic responses were significant." (1983: 461)

11. There was both a small but significant return migration out of fear of how the Migra (the US Immigration Service) might make life unbearable for undocumented people, and a brief deterrence of new out migration from Mexico due mostly to the uncertainty of the enforcement of employer sanctions. (Cornelius, 1990; Smith, 1990; Massey et al 1989)

12. This re-imagination is clearly evident in comments made during several interviews and extended conversations I have had with the Director General of the Program, Dr. Roger Diaz de Cossio, in the US and in Mexico, since August 1991.

13. Beginning with the distinction between state and nation, the theoretical underpinning of the Program presupposes that many US-born children of Mexican immigrants hold what Dr. Diaz de Cossio called "double identities": one as Mexican, the other as American, or some other combination thereof. There are a series of hyphenated, identity possibilities: Mexicans, who are born in the US and think of themselves as Mexicans; Mexican-Americans, who are born in the US and think of themselves as both Mexican and American; and American-Americans of Mexican descent, who only think of themselves as American. A central point is that citizenship, or the fact of being born in the US, does not make one necessarily or only an American. Rather, Americans, like all members of nations, are made not born. Hence it is possible for people born in the US to identify themselves as members of the Mexican nation, and perhaps to identify themselves at the same time as members of the American nation. The distinction is a legal one, not one which turns on identity.

14. Denise Dresser (1992) has called the Solidarity Program a "Neo-Populist Solution to a Neo-Liberal Problem:" that is, the worsening of social conditions for the popular classes in Mexico that results from the neo-liberal opening is being addressed through a neo-populist, patronage and redistribution program (Solidarity). Dresser's logic has an interesting, if slightly cynical application here: Mexicans whose worsening social condition (an effect of the neo-liberal opening) drives them to migrate to the US will now be attended to more responsively through the Program, including its International Solidarity program.

15. The reporting of the event in the newspaper is important in light of the crucial role assigned by Anderson (1991) to newspapers in his analysis of the imagination of national political communities.

16. This presumably was not organized by the Program, and I do not know if they paid the expenses of the Mexican attendees. The point is that it is being reported in La Paloma.

17. This point was underlined to me in a small detail, when leader of the Federation gave me his business card. When I got home I took it out and compared it to the one he had given me the previous year. The old one, in black and white, had simply indicated that he was the President of the Mexican Baseball League.

The new one, in red white and green (Mexico's colors) had on it the imprints of both the Federation and the National Commission on Sports. The implication is clearly that he represents or is in some way closely associated with the Commission. So whereas before he represented Mexican immigrants New York, now in his capacity as President of the Federation, he represents Mexicans in New York to the Commission and the Commission to them. He is a link between them.

18. "Pochos" is a derogatory term used to describe a Mexican who is not considered to really be a Mexican anymore, primarily because they have migrated to the US. The word is sometimes used by Mexico residing Mexicans to describe US residing Mexicans, and sometimes by US residing Mexican immigrants to describe US-born second generation Mexican immigrants. The word implies that one has abandoned one's homeland, and perhaps one's family or other responsibilities. In its more derogatory usage, the term also implies a strong social disenfranchisement: whereas before you were a Mexican, a child and inheritor of the Mexican Revolution and Mexican traditions, now you are a nameless immigrant in America, a place with no values or culture. The term implies that one has chosen badly and been forever impoverished for it by losing one's Mexican-ness. Carlos Monsivais, in criticizing the perception of Mexican Americans and Chicanos as "pochos" describes this perception in the late 1970s in this way:"In the popular mind, the bracero is transformed into the pocho, the outcast, an almost always ridiculous figure that speaks both languages badly and who will never be respectable in either (society)... cited in Zazueta (1983:466).

19. In the Seminar, a question was asked regarding the importance of the relative peripheral-ness of each of the countries involved and the effect this might have on the kinds of programs it creates. While this is a good question, I will not develop the point here beyond saying that it seems clear that migration and hence these programs seem to be, at the broadest level of causality, the results of dependent development. Moreover, the extent of peripheralization of the economy and the degree of penetration and transnationalization of the political system will undoubtedly have an effect on the state's relations with its emigrants. These are precisely the issues which I argue make Haiti a special case.

20. The information used in this section is drawn from Feldman-Bianco, 1992.

21.The information about the NRI program in this section is drawn from Lessinger, 1992.

22. Most of the information in this section comes from Glick-Schiller and Basch, 1993; Glick-Schiller 1991; and Richman, 1992 and 1990.

23. See Chalmers, 1992, ("New Forms of Internationalized Politics in Latin America," paper presented at the American Political Science Association Meetings) for an analysis which argues that we must think in a similar way for all of Latin America.

24. Information for this section comes from telephone interviews with several leaders of the Colombian community in New York, and with Michael Jones, a Ph.D. student in Political Science at Princeton University who is writing his dissertation on immigrant politics in New York.

25. The information in this section comes mostly from Barbara Schmitter Heisler, 1986 and 1984.

26. I have not researched whether Italians abroad were also considered "pochos," but one can speculate that such tensions did emerge. Such an appellation was most probably directed at the sizeable number of Italians who did not return. I also have not information on this point for the Colombian case.

27. A more extreme statement of a similar sentiment was given by a Portuguese Civic Society in Massachusetts in the 1920s and 1930s, "' If you want to be a good Portuguese, become an American.'"

28. I do not have enough information on the Portuguese, Italian and Colombian cases to analyze the kinds of struggles which occurred, if any. We can suspect that struggles emerged, especially in the Italian case, between the autonomous organizations of settled emigrants and the state sponsored organizations for temporary emigrants.

Paper to be delivered at the 1993 annual convention of the American Political Science Association, Washington, D.C., September 2-5, 1993.

Introduction

In recent years, the post World War II welfare state has been in transition as governments are buffeted by calls for decentralization, greater consumer involvement in social policy, community control, and privatization. These trends, to varying degrees, are restructuring social welfare services in many countries including the United Kingdom, United States, Germany, the Netherlands, and France to name just a few. Given the extent of the change underway or contemplated in the welfare state, the role of intermediary groups such as political parties and voluntary advocacy organizations which define and articulate social needs is particularly important. This essay focuses on the latter and poses the following question: in the United States, it is far easier than in other countries to form voluntary organizations due to favorable tax laws and other public subsidies. What difference to social policy and government's response to need does it make that the United States has so many voluntary advocacy organizations?

The Puzzle

The level of participation in voluntary groups in the United States is actually on par with other advanced industrial countries if all types of voluntary organizations are taken into consideration. What distinguishes the United States is the much higher rates of participation in church-related and civic-political organizations.(Wilson, 1973, p. 78-79) According to theorists such as Mancur Olson (1965) and Wilson (1973), individuals are moved to join political organizations only if the benefits exceed the costs. Olson focuses on material benefits which Wilson expands upon to include solidary (friendship) and purposive (ideological) incentives as well. The puzzle stems from the continuing increase in the number of voluntary political organizations while at the same time the citizenry appear to be increasingly dissatisfied with the American political system as indicated by the large Presidential vote for Ross Perot, low election turnout, and low public esteem for politicians. If people see few benefits in terms of policy change from political participation in organized groups, why are so many groups continuing to form? What is the political significance of the continuing increase in voluntary organizations amidst high levels of alienation from politics?

This essay is based upon preliminary research by the author on the role of voluntary organizations in political advocacy in social policy.[1] This research is focused on the voluntary organizations that participate in political advocacy at the national, state, and local levels in substance abuse policy. However, the essay also draws upon previous work by the author on the political impact of government contracting for social services with nonprofit service organizations. The types of organizations investigated are the following: community coalitions and task forces at the local level, and national and statewide associations and coalitions of social welfare organizations and advocates. The basic argument of this essay is that the growth of voluntary advocacy organizations in social policy is linked to the transformation of the welfare state and the changing response of public and private organizations to social need. While this essay focuses on the United States, the analysis and conclusions are also relevant to other advanced industrial countries.

Background and Hypotheses

Most interest group studies have focused at national level policymaking.(Schlozman and Tierney, 1986; Heinz, et al., 1993; Berry, 1989) The approach of this essay is different; all three levels of government are analyzed to discern the differences in interest group activity and influence at these three levels. In this sense, this research builds upon the work of McConnell

(1965) and Peterson (1981) who have argued that business groups tend to be more powerful at the state level than at the national level. In their opinion, policies to benefit the disadvantaged are more likely at the national level.

The political scientist, David Truman (1951) offered the first comprehensive theory for the formation of groups in his book, The Governmental Process, where he suggested that groups arose in response to disturbances in the environment. Major economic reversals, an unpopular piece of legislation or a controversial Presidential decision might be sufficient to prompt individuals to come together to form a group to press for certain political goals. The difficulty with this explanation is that the steady rise in voluntary advocacy organizations in social policy appears unrelated to the level of societal disturbances.

This disturbance theory of Truman has been critiqued in Mancur Olson's pioneering work (1965) on collective action which points to the difficulties of forming groups because of the free rider problem. He argued that groups tend to be either small or use selective incentives to induce individuals to join and contribute to the work of the organization. To him, the political agenda of an organizations is often the by-product of group organized for other purposes (e.g. low cost insurance). While some advocacy organizations and political associations in social policy offer selective benefits, many do not (or they are so meager as to be insignificant). Thus selective benefits would appear to be incomplete as a explanation for the growth of political organizations.[2]

The work of Jack Walker (1989) suggests a variation of the by-product theory. Instead of politics as a by-product of a group organized for other purposes, the group is a by-product of the political activity of key members of a group. An individual agency executive might have a political agenda and believes that her chances of achieving passage of her agenda in the legislature may be enhanced if she forms a political organization. The scenario is consistent with the view that the decision to create a nonprofit organization reflects the calculation of key individuals on the merits of forming a particular organization.(Smith and Lipsky, 1993) This leads to the following hypothesis.

H1: Many of the new voluntary advocacy organizations are not membership organizations but are dominated by a few key people who create a voluntary organization as a way of enhancing their legitimacy and political influence.

Another line of explanation for the growth of voluntary organizations is also suggested by Jack Walker (1989) who argued that institutional patrons such as government and foundations are increasingly important in shaping interest group activity and formation. Robert Salisbury (1990) notes as well the greater presence of institutions such as state and local governments, universities and hospitals in Washington, D.C. as responsible for some of upsurge in interest group activity. However, Walker and Salisbury's work stops short of investigating the implications for the functioning and impact of interest groups of institutional patronage and participation. This leads to the following two hypotheses.

H2: The increase in voluntary organizations will represent direct or indirect patronage from government entities and foundations.

H3: The membership of the new voluntary organizations will not be primarily comprised of lay citizens but instead will represent public and private institutions (many receiving government funds) involved in a particular issue.

The work of Berger (1981), Offe (1981), Skowronek (1983), March and Olson (1989), Steimo, et al. (1992) and others stresses the role of political institutions in structuring interest group activity. This perspective would suggest that the increase in interest group formation is indicative of a change in political institutions and the opportunities they offer for interest group formation and influence. For example, the decentralization of social policy or the fiscal crisis of government could alter the perceived costs and benefits of interest group mobilization. A greater role for state governments in social policy might affect the calculus of citizens on the opportunity for influence thus affecting the likelihood of interest group formation. Also, structural changes alter the incentives of government officials and their relationship to private groups. This leads to the following hypothesis.

H4: Institutional changes in the welfare state have provided added incentives for government officials to facilitate the formation of private advocacy organizations. These officials view certain types of advocacy organizations as playing highly useful supportive roles for government officials in their relations with the legislative and executive branches of government.

Salisbury (1969), Berry (1977) and Moe (1983) point to the political entrepreneur as critical to interest group formation. In this view, the entrepreneur helps convince potential members that participation in the group or organization will yield significant benefits; they help overcome the collective action problem wherein citizens may be dubious about the potential benefits of organizational membership. This leads to another hypothesis.

H5: While changes in political structure or institutional patronage may help explain the growth of voluntary political organizations, the timing of organization formation will be affected by the presence of political entrepreneurs.

The proliferation of voluntary advocacy organizations has been greeted with alarm by many scholars. Samuel Huntington (1975) argued that America suffers from an "excess of democracy"; too many special interest groups exist, making comprehensive policymaking very difficult. Over time, governmental authority erodes because of a perceived lack of effectiveness. Richard Rose (1980) argued that America has too many sub-governments creating fragmentation and resistance to change. He suggested that the US try to borrow some ideas from parliamentary democracies to provide insulate political leaders to a greater extent from interest group pressure. Mancur Olson (1982), expanding upon his earlier work, observed that since political organizations tend to be organized for interests of their members, as opposed to the broad public good, the growth of these organizations poses a threat not only to democratic governance but to the overall efficiency of the economy.

Yet an alternative perspective on the implications of interest group activity comes from scholars such as E. E. Schattschneider (1975) who suggest that strong parties are essential if disadvantaged groups are to be adequately represented. In countries with weak parties, business elites are able to dominate the policy agenda. This view was echoed recently by Karen Paget

(1990) who expressed concern that the growth of citizen organizations was resulting in many relatively weak political organizations without the capacity to push for a progressive policies against the opposition of well-mobilized business and elite groups. This leads to the following hypothesis.

H6: Voluntary social welfare advocacy organizations will face great difficulty in initiating major policy change. Instead they will be most successful in preserving already won political gains.

Insight into the role of voluntary organizations in society is also provided the literature on political development. One definition of political development is the "capacity of a political system to both articulate people's needs and to respond to them effectively." (Pressman, 1975, p. 141) Voluntary organizations are critical to this process because they can serve as the vehicle to represent citizen interests. Political development strengthens to the extent that viable political organizations are institutionalized.(Huntington, 1965; Pressman, 1975) This perspective has found support in the recent work of Robert Putnam in Italy who concluded that the performance of governmental institutions was higher in regions of Italy with a greater level of community associations and groups.(Putnam, 1993)

In the United States, great variability exists across states and localities on the level of voluntary advocacy activity. The work of Pressman (1975), Walker (1989), and the neo-institutionalists such as March and Olson (1989) suggest that the relationship of government to the voluntary sector is a key determinant of the extent of political development in a particular area. This leads to the following hypothesis.

H7: States or localities with extensive contracting for services with nonprofit agencies will have more extensive and politically stronger networks of nonprofit advocacy organizations in the field of social welfare. State or localities with a greater reliance on public sector agencies will have smaller and weaker advocacy group networks. In other words, contracting acts as a strategy of political development. The capacity of the political system to respond to advocacy group demands will depend upon several factors including fiscal situation of government and the structure of political institutions.

One major theme of these hypotheses is that the focus on citizen demand as an explanation for the growth of voluntary advocacy organizations is insufficient to adequately account for the variation and timing of voluntary activity.(See Weisbrod, 1989; James, 1987; Salamon, 1987) Instead, political institutions and their relationship to voluntary organizations are also crucial in determining the shape and character of voluntary activity.

Research Method

The data used in this study was collected through archival research, detailed, semi-structured interviews, and participant observation of voluntary organizations. More specifically, the study included the following elements:

* Over 100 interviews were conducted with individuals representing voluntary organizations at the national, state and local levels.

* Detailed case studies of 21 community coalitions and partnerships involved in substance abuse prevention and advocacy. These case studies included interviews with key personnel and volunteers and analysis of organizational records.

* Interviews with government officials at the federal, state and local level.

* An analysis of government funding of substance abuse services and regulations affecting substance abuse programs.

* Research on government contracting with nonprofit agencies which included case studies of 30 nonprofit social welfare agencies receiving government contracts.

The remainder of this paper reports on the preliminary results of this research. The following three sections report on research at the local, state and national levels. The concluding section analyzes the implications of the rise in voluntary advocacy organizations for public policy.

Advocacy at the Community Level

In the 1960s, support for community-based organizations as a way to fight poverty, mental health and illness was widespread. The federal government created several new programs as part of their War on Poverty that relied almost exclusively on community organizations for their implementation including community mental health centers, neighborhood health centers, Headstart, and community action agencies. Some of these programs were conceptualized as primarily service delivery agencies such as Headstart but other agencies such as community action agencies were viewed by many policymakers as primarily organizations that would allow citizens--particularly poor people--to advocate for their own concerns. For example, these CAP agencies were required to reserve a certain number of slots on their board of directors for poor citizens of the agency's service area.(Marris and Rein, 1982; Peterson and Greenstone, 1977) Despite the good intentions of many individuals connected with community action agencies, many CAP agencies encountered stiff opposition from local political leaders and a variety of internal organizational problems. Over time, the advocacy component of their programs diminished as they focused on the provision of direct services such daycare and intervention programs for at-risk youth.

During the 1980s and early 1990s, a revival of interest has occurred in community advocacy organizations. President Bush in his now famous reference to the "1000 points of light" looked to voluntary organizations in the community to take the lead in addressing America's social problems. Again, part of the appeal was to community organizations as service agencies; but another aspect was the idea that community agencies could bring together disparate groups in the community and decide the appropriate response to local problems. Implicitly, these organizations would also try to initiate policy reforms if needed.

President Clinton has warmly supported community organizations through several proposals including national service and urban redevelopment.(Stanfield, 1993) Many advisors to the Clinton administration are also associated with the communitarian movement which regard community groups as a way of transcending the problems posed by either rampant individualism or a reliance on the state.(Etzioni, 1992) To them, community organizations are important for their political activity and the socializing role they play for the citizenry.

This vision of community organizations has been a source of motivation for the extensive network of community coalitions and partnerships to fight drug and alcohol abuse that were established in the mid to late 1980s across the country. Typical examples are the Durham (N.C.) Coalition on Chemical Dependency, the Buncombe County (N.C.) Drug Commission, and Project High Road, a program affiliated with the Fund for New York City Public Education. There are literally hundreds of these coalitions across the country. These substance abuse coalitions are particularly well-suited for analysis of the strengths and weaknesses of political advocacy by local voluntary organizations since the wide publicity given to drug and alcohol abuse would provide added incentives for citizens to join organizations. These coalitions offer at least theoretically some of the best opportunities for overcoming the collective action problem outlined by Olson and others.

Organizational Creation

These coalitions are created due to three different though sometimes related factors: government-initiation, direct foundation or government funding, or a political entrepreneur in the public or voluntary sectors. The first category occurred in 5 out of 21 organizations in the study. Usually, these coalitions are the result of political pressure on county or municipal government "to do something" about the escalating problem of drug abuse. Since most local governments do not have much discretionary money to devote to new programs (and may be at a loss on exactly what to do), government officials create a task force or coalition to investigate the drug abuse problem and make recommendations to the city or county on the best course of action. Some of these coalitions have small grants from the county or city to get started, with the assumption that the coalition will attract additional public and private funds to support the coalition on an ongoing basis. Other coalitions created due to government initiative have no public funding and must sustain themselves through volunteer effort and small cash and in-kind donations. These new coalitions can defuse neighborhood or citizen pressure on the mayor, city manager or county commissioners to combat drug abuse.

Coalitions are established through direct foundation or government funding. Thirteen out of 21 programs in the study were created in this way. Several funding programs exist to establish coalitions across the country. The most extensive funding source is by far the federal Community Partnership Demonstration Grant Program administered by the Center for Substance Abuse Prevention (CSAP) in the Department of Health and Human Services.[3] Since the program's inception in 1989, the Center has awarded $221 million in grants to approximately 250 community-based coalitions.(GAO, 1993, p. 2) Twelve of the 21 agencies in the study receive CSAP grants which are usually for 5 years on a declining basis. The range of annual funding among the study agencies in FY 1991 was from $136,000 at the Alamance County (N.C.) Coalition Against Drug Abuse to $722,903 for a three site coalition operated under the aegis of the New York City Fund for Public Education.(GAO, 1993, p. 37) Until recently, only 10 percent of the CSAP funds could be used for direct services; most of the money was required to be spent on planning, needs assessment and public education. CSAP programs are designed as primarily volunteer organizations with a small paid staff. Some CSAP programs evolved out of mayor's task force.

The other large pool of funds is from the Robert Woods Johnson (RWJ) foundation which has provided "a total of up to $48 million through one- or two-year planning grants awarded to 15 communities in 1990 and implementation grants for up to five years awarded to 13

communities in 1992."(Pacific Research, 1992, p. i) This community-based initiative is called the Fighting Back program. Its "goal is to demonstrate that by creating an intensive, community-wide system of prevention, early identification, treatment and after-care, communities can reduce the demand for illegal drugs and alcohol."(Pacific Research, 1992, p. 1) In contrast to the CSAP program, the RWJ implementation grants allow coalitions to spend money on direct services. Other foundations have supported coalitions on a more modest level, usually with short-term, start-up funds.

In addition, states run their own programs. Rhode Island has extensive subsidy program which encourages the formation of coalitions in every major community in the state. North Carolina has a $1000 challenge grant program for coalitions.

The CSAP and RWJ programs are designed to support programs with demonstrated support from community leaders. The funding was simply allow an existing community coalition to stabilize and expand its operation. But in practice the formation and establishment of these coalitions through CSAP and RWJ funding is more complex. In some cases, a mayor's task force on drugs might learn of a CSAP opportunity and then apply for the money. More typically though is the following scenario. An agency or group of substance abuse professionals learns of the CSAP or RWJ funding opportunity. This spurs the creation of a committee to apply for the money. Usually the committee is helped by consultants with extensive federal grant-writing experience. A successful grant award then spurs the organization to actually try to do community planning, outreach and advocacy. In other words, in many cases, a representative community coalition does not really pre-date the grant award.

Unsuccessful grant award applicants often struggle along or apply for additional funding. The current Durham (N.C.) coalition unsuccessfully applied for the RWJ money; it has struggled ever since without stable funding. The Fayetteville (N.C.) coalition failed to win RWJ money. It submitted a revised application to CSAP and was awarded a five-year grant.

Political entrepreneurs are often critical to local coalition organizing. Skilled professionals, ambitious, or charismatic individuals will convince people of the need to create a coalition to combat substance abuse. Sometimes they are part of government but they can also be part of existing voluntary organizations. The growth of the welfare state has increased the supply of these entrepreneurs which in turn has promoted more voluntary organizations. With increased funding for social welfare services, a leadership infrastructure has been created which previously did not exist. Many of these leaders are eager to capitalize on new funding opportunities for career advancement and/or enhancing the capacity of their organization to address a particular problem.

Indeed, an analysis of the leadership of community coalitions at their inception reveals that most coalitions are directed by professionals in the field of substance abuse. This includes individuals working in public and nonprofit treatment programs, school prevention programs, and the local housing authority, police officers involved in prevention work such as the DARE program,[4] and an assistant to the mayor or county commissioners. Occasionally, elected officials or departmental heads such as the chief of police will take an active leadership role. In the study sample, these professionals or elected officials comprised the majority of the founding members of the coalition board or steering committee.

With drug and alcohol abuse a widespread social concern, why were so few lay citizens involved in the founding of these coalitions? Several reasons appear to be responsible.

Time. Coalition organizing is time-intensive, making it difficult for people with normal 9 to 5 jobs to attend meetings. Substance abuse professionals can often integrate coalition meetings into their regular work day. Frequently, employers will also allow these professionals to use their office supplies and telephones; a major expense for fledgling coalitions. This is not to suggest that coalitions do not have evening meetings; however, many of the key meetings occur during the day. Indeed, in the formative stages of a coalition, all day meetings are not uncommon.

Information. Substance abuse professionals are part of the local network with access to important information relevant to coalition building. They are aware of various prevention activities and can take advantage of political contacts in support of the coalition. The potential for sharing information serves as a critical motivating force for these professionals. Participation in the coalition reduces the "transaction costs" of their work. They can learn of new service and career opportunities, exchange notes on problem cases, lobby a funding agency for more money, and publicize the services and activities of their organization.

Stigma. Drug and alcohol abuse evoke highly negative images among the populace. Many drug and alcohol programs such as needle exchange programs, methadone maintenance, and higher alcohol taxes are extremely controversial. Consequently, many citizens are reluctant to become involved in coalition activities.

Due to these three factors, the non-professional people involved in coalitions tend to be either people with an individual or family substance abuse problem, retired people or small business persons with substantial discretionary time. Involving neighborhood people from low-income communities affected by drugs and alcohol abuse is usually very difficult.

Organizational Development

Most of the major issues affecting coalitions as they develop are related to funding: How do they obtain it and what coalition projects are likely to receive a favorable response? Coalitions without public funding either fail after a short time or struggle at a relatively low level. For example, coalitions in Rockingham, Onslow, and Robeson counties in North Carolina started with bright promise. In Onslow, 150 people attended one of the initial organizational meetings. But without permanent funding, all three coalitions collapsed. Part of the difficulty faced by these coalitions is the reluctance of businesses, local foundations, and private individuals to donate significant amounts of money to coalitions. Typically, the only activities that business or individuals will fund are short-term, high-profile events that publicize the name of the business. And, without stable funding to hire a permanent executive director and staff, it is virtually impossible to sustain a coalition over time.

Some exceptions to this general proposition exist. The Chatham County coalition is basically designed to help fundraise for major drug and alcohol prevention activities in the local schools. It plays a decidedly support role to the professional leadership of the coalition. The Durham County coalition has survived with modest foundation funding, but its long-term viability is in doubt since most foundation grants to coalitions are non-renewable.

Coalitions with major CSAP or state grants usually rely heavily upon volunteers for the work of the coalition. Staff recruit and supervise community volunteers who typically work in one of several coalition committees such as prevention, ministerial, schools, treatment, and employment and business. The committee volunteers are supposed to decide on their priorities and seek funding for their implementation. Coordination and technical assistance is provided by the program staff. Great variation exists in level and type of volunteer activity, with the number of volunteers ranging from a few dozen to over two hundred. CSAP or RWJ funding appears essential to large numbers of volunteers since coalitions without major funding lack the staff capacity to effectively organize and recruit volunteers.

The legal form of these coalitions varies a great deal. Some coalitions such as the Onslow and Rockingham county coalitions that have no major funding were informal groups rather than formally incorporated nonprofit organizations. Many coalitions are operated through existing public and nonprofit service organizations. Other coalitions are separately incorporated nonprofit 501 (c)(3) organizations. No coalitions are operated as for-profit entities. One CSAP-funded coalition in Fayetteville, N.C. was originally part of the public mental health agency but is trying to become a separate 501 (c)(3) agency.

The experience of coalitions suggests that one reason for the growth of voluntary agencies is the relative ease with which a group of individuals can form a nonprofit. Obtaining 501 (c)(3) status requires competent legal help but it is not very expensive and relatively straightforward. The CSAP program and the private foundation programs encourage the creation of new nonprofits and the splintering of existing agencies. The absence of for-profit coalitions is due to two reasons: CSAP and private funders will only award money to nonprofit or public entities and contributions to for-profit entities are not tax-deductible, a major consideration for programs that depend heavily on volunteers and private contributions.

Organizational Activities

The Problem of Direct Services. Until recently, CSAP-funded coalitions were limited in the amount of federal funding they could devote to direct services. Consequently, most CSAP-funded coalitions focus on planning and needs assessment. Indeed, four out of the 12 CSAP coalitions in the sample are three years into the grant and still doing planning and surveys. This is typical of many CSAP coalitions.[5] The RWJ projects actually have money for direct services so after a two-year planning process, the Columbia, S.C. Fighting Back program is operating an extensive afterschool program. CSAP-funded programs in New York City are operating direct services but in these cases the nonprofit agency which received the CSAP grant leveraged its CSAP grant to obtain other public and private grants for direct services. For example, Project High Road in NYC runs an innovative peer counseling program with at-risk youth.

Coalitions without major direct service funding tend to focus on inexpensive prevention activities. These include: red-ribbon campaigns to call attention to alcohol and drug abuse, Project Graduation, an alcohol free graduation party for high school seniors, the distribution of educational material, and speeches to local schools. Due to the lack of major program money, many coalitions are also involved or in the process of developing Employment Assistance Programs (EAPs) for businesses. These programs usually involve confidential referrals for workers with substance abuse problems and drug testing of employees. The advantage for coalitions is that they are a low-cost programs since businesses bear the EAP cost. (Some

coalitions hope to operate EAPs themselves and thus make money for the coalition.)

The Advocacy Dilemma. Evaluating the advocacy efforts of coalitions is complex. To an extent, coalitions are advocating, by their very example, for a reduction in alcohol and drug abuse. For example, Project Graduation is a program which advocates alcohol abstinence during a year-end senior party. However, this definition is too broad to be useful analytically. This essay defines advocacy as an attempt to influence legislation or policy.[6] Using this definition, these coalitions do relatively little advocacy. Rarely do they focus on system change at the local level such as trying to reorganize the service delivery network to substance abusers to make it more effective or reforming alcohol laws.[7] Advocacy can be very controversial. Controls on liquor sales and restricting the number of retail liquor stores is plausibly a valuable strategy to curtail alcohol abuse. For most coalitions, this issue is too divisive. The non-professional volunteers of the coalition usually join due to a vague sense of contributing to the public good. Most of these volunteers do not want to be associated with controversy since this could disrupt many of their long-established community relationships and arouse powerful opposition in the community from small businessmen.

Advocacy on certain treatment and policy issues also risks dividing the service provider members of the coalition. Many service organizations participate in coalition activities is to prevent the coalition from infringing on what they deem to be their agency's turf as well as their general concern with substance abuse problem. Taking sides on treatment issues can be very fractious. Also, most coalitions are fearful that forceful advocacy could alienate potential funding sources, especially the local city or county.

One other advocacy dilemma is related to citizen empowerment. Many of the most vocal lay volunteers involved in coalition work are individuals with a personal agenda due to the impact of substance abuse on their personal lives. This agenda may be stiffer penalties for users and traffickers or it may be massive block sweeps and evictions. These activities fit with the communitarian agenda (Etzioni, 1992) because they represent the imposition of community norms and offer the opportunity to inculcate community responsibility and individual obligation for social problems. However, a growing body of literature suggests that these initiatives have only a fleeting effect on the drug problem (and do nothing to address alcohol abuse).

A small minority of coalitions have tried to do more classic community organizing focusing on political mobilization of poor or disadvantaged communities. The Providence and Pawtucket (R.I.) coalitions have created neighborhood associations throughout the city. The Greenville, S.C coalition is organizing in several low-income minority communities with serious drug and alcohol problems. The goal of these coalitions is to get local neighborhoods to mobilize and demand better services for themselves, to control the public services provided in their area, and to develop their own responses to substance abuse. These coalitions encounter serious problems in mobilizing and sustaining neighborhood involvement in coalition activities.

Coalitions are rarely a presence in state level policymaking. Occasionally, coalition leaders will meet on a statewide basis. But these meetings are generally to share information and listen to speakers on coalition building. Most coalition leaders are too busy trying to keep their coalition together to put much time in trying to influence state policy. Additionally, coalition leaders generally do not have political experience that would help them at the state level. Among the study sample, the only coalitions leaders with significant experience operating agencies were the New York City coalitions. More typically, coalition leaders tend to be either substance abuse

professionals or concerned citizens with good leadership skills. Since coalitions rarely get state funds, little incentive exists for them to get involved in state policymaking.

Recently, two national organizations -- Join Together, based in Boston and Community Anti-Drug Coalitions of America -- have been founded to provide technical assistance to coalitions and advocate for coalition concerns at the national level. These organizations were established with money from the Robert Woods Johnson foundation and other private donors.

Assessing the Community Coalition Movement

The political scientist, Hugh Heclo, observed once that "behavior connected with policy is dynamic; the phenomena at issue are moving events, routines, strategies, and adaptations."(Heclo, 1972, p. 106) So it is with community coalitions; they are constantly in the process of transforming themselves in response to changes in their political, social and economic environment. Any evaluation of coalitions must be accompanied by a caveat that indicates that coalitions as they evolve may turn into something very different. Community action agencies created in the 1960s as part of the War on Poverty are a case in point. Widely considered a failure as a vehicle to empower the poor; over time, some agencies have promoted citizen participation and mobilization in city politics.(Baker, forthcoming)

With this evaluation concern in mind, the potential of coalitions as advocacy organizations for policy reform remains largely unfilled, partly due to the structure of program as mandated by funding agencies are the internal politics of the coalitions which discourage active and aggressive advocacy action. But the proliferation of coalitions due to institutional direct and indirect support has had important symbolic functions since coalitions suggest by their very existence that meaningful policies to address drug and alcohol abuse are being developed when in fact coalitions focus on a mix of relatively non-controversial prevention activities. Community empowerment and neighborhood control of services remains largely elusive.

Significantly, the experience of coalitions to date confirms four of the initial hypotheses. The proliferation of coalitions is a product of direct and indirect government subsidies (H2). The membership of the coalitions is primarily comprised of institutional actors rather than lay citizens (H3). Related to H2, state and local officials face incentives are mobilizing coalitions at the local level.(H4) And, the timing of coalition founding is sometimes related to political entrepreneurs in the public and voluntary sectors.(H5)

Voluntary Advocacy at the State Level

Prior to the 1960s, state and local governments provided most of the spending on social welfare services. In 1960, for example, state and local government contributed 63.4 percent of all social welfare services such as mental health care, child protective services and residential care facilities for youth.(Bixby, 1992, p. 67) Publicly supported services tended to be provide through the public sector either in large congregate facilities such as state hospitals for the mentally ill or by state and local caseworkers. The universe of nonprofit service agencies tended to be quite small in most areas. These agencies include child and family service agencies, settlement houses, and child guidance clinics. Most nonprofit agencies did not receive public funds.(See Smith and Lipsky, 1993)

At this time, voluntary advocacy organizations at the state level were rare and quite weak politically. Since state expenditures were devoted primarily to public institutions and spending tended to be incremental, little reason existed for individuals or private agencies to mobilize to influence state policy. The small numbers of private agencies further dampened the motivation to participate in political advocacy. What state level activity that did exist tended to be cooperative efforts of concerned social welfare advocates and leading executives of private agencies. A paid lobbying and professional staff was unusual. Instead, advocacy depended on the willingness of private agencies and individuals to "donate" their time for policy reform. Typical of this era was the successful effort to revise the child welfare laws of Massachusetts in the early 1950s.

After 1960, federal spending on social welfare rose rapidly. From 1960 to 1980, federal spending on social welfare services increased from $416.7 million to $8.7 billion; at the same time, the federal contribution to social welfare services rose from 36.6 percent to 64.6 percent. Total per capita spending on social welfare services (in constant 1989 dollars) went from $24.64 to $88.23 during this period.(Bixby, 1992, pp. 63, 66)

The sharp and dramatic rise in federal spending transformed social welfare services across the country. Much of this federal spending was channeled to nonprofit social welfare agencies through government contracts either directly in the such cases as community mental health centers or community action agencies or through state and local governments which then distributed the money to an array of social welfare agencies, from child welfare agencies to emergency shelters for youth to drug and alcohol treatment agencies. Some of the funding to these agencies allowed an expansion of services to children and adults in need (e.g. more funding for residential care) while other funding created services such as alcohol and drug treatment services that did not previously exist except to a very limited extent.[8]

The federal funds and multiplicity of new agencies created a changed political environment for nonprofit agencies at the state level. States were now responsible for administering millions of dollars of federal money. They were also contributing more and more of their own money for social services even if the overall percentage of state contribution was dropping. State and local spending[9] on social welfare services almost tripled between 1970 and 1980, from $1.8 billion to $4.8 billion.(Bixby, 1992, p. 64) State and local responsibility increased even further in the 1980s when President Reagan reduced federal spending on social welfare and decentralized the responsibility for many federal grant programs to the states.(Gutowski and Koshel, 1982) The federal share of social service spending has been dropping ever since, from 64.6 percent in 1980 to 51.1 percent in 1989.(Bixby, 1992, p. 67)

State regulations have also increased in scope as the role of state administration and funding has grown. These regulations are sometimes required as a condition of receiving federal funds but many of the regulations are developed at the state level and pertain to virtually all fiscal and programmatic aspects of public and private service programs. As a result, nonprofit contract agencies have a great incentive to mobilize politically to advance their interests at the state level.

At the same time, state governments have an incentive to help organize the nonprofit community because of the great increase in the number of nonprofit agencies. Some large state departments of social service or mental health contract with hundreds of nonprofit service providers. From the state's perspective, a statewide association is a more efficient way of trying to negotiate rates and regulations than trying to deal with hundreds of agencies.

The New Organization of Nonprofit Interests

The continuing establishment of state associations representing nonprofit service agencies is a product of this interest of state officials and the pressure from below for more influence with state lawmakers on social policy matters. In Massachusetts during the mid-1970s, state officials created a statewide provider association with the cooperation of nonprofit providers in the state called the Massachusetts Council of Human Service Providers. Around the same time, Florida officials facilitated the creation of the Florida Alcohol and Drug Abuse Association (FADAA). It currently has 90 agency members and over 1400 individual members.(FADAA, 1992, p. 2) A variation on this effort exists in North Carolina where the secretary of the state Department of Mental Health organized a coalition of 16 statewide associations representing service providers and citizen groups in substance abuse policy called the North Carolina Substance Abuse Federation. The goal is the same as in the case of the FADAA--to provide state officials with an efficient way of receiving input from a fragmented, diffuse provider system.

The structure of these coalitions reflects in part the organization of state government because the perception of their own interest by nonprofit leaders is shaped substantially by state government. In Florida, the state department of substance abuse funds drug and alcohol treatment thus the association developed as one organization. By contrast, in New York State, two statewide associations existed until recently--one representing alcohol treatment providers and one representing drug treatment providers--because the state until a few years ago had separate agencies to fund and administer alcohol and drug programs. After the state agencies merged, the two separate state associations merged. In North Carolina, the state department of mental health has three separate divisions: mental health, developmental disabilities, and substance abuse. Advocates for programs funded by the three divisions organized a major lobbying effort for money called "Coalition 2001".

The increasing number of these statewide associations and coalitions illustrate the importance of state funding and regulations to nonprofit agencies and the entrepreneurship of leading state administrators interested in managing the far-flung service system. Additional confirmation of this point is provided by South Carolina. In this state, substance abuse treatment programs are administered by one state agency that has done very limited contracting with private nonprofit providers. Services are provided either by the agency directly or through local agencies affiliated with the state. The result is that no statewide association of drug and alcohol treatment providers exists. Indeed, there is no statewide association of any kind in the substance abuse field.

In a state with extensive contracted services, the actual number of associations and coalitions in a given state appears to be due to timing and entrepreneurship. To the extent a statewide association representing most of the providers in a given service category organizes early, this can preempt subsequent efforts by some nonprofit executives to create their own associations. In Florida, the statewide association was organized relatively early after the creation of the publicly funded, largely nonprofit treatment network in the mid-1970s. But in North Carolina, a unified statewide association was never really formed, resulting in the fragmentation of the advocacy community. In the last 10 years, four different statewide associations have been created, each with limited membership to advocate for the concerns of service providers in the state. These organizations tend to be created by a powerful nonprofit agency executive (or a few

executives) who view an organization as a way of obtaining greater political legitimacy and influence. It is in this sense that the group can be regarded as a by-product of an individual's political agenda.

One issue for further research is the extent to which associational fragmentation is related to the relative absence of state funding or direct funding cutbacks. That is, to the extent funds are rising groups with different agendas may put aside their disagreements to participate in one association or coalition. As funding stagnates or declines, more and more individuals will become impatient with the limitations of the one large organization and seek to create their own organization.

Consumer Advocacy

In the last 10 years, substantial interest has developed in trying to involved consumers of services in the governance and delivery of social services.(Potter, 1988; Morrison, 1990; Grunow, 1992; Mowbray and Tan, 1993) During the 1960s, the federal government promoted the participation of poor people in community action agencies. At the same time, the welfare rights movement advocated for the concerns of the poor, especially at the local and state levels. During the 1970s, this movement declined amidst a changing political environment and internal organizational problems. In the 1980s and early 1980s, consumerism in social policy has tended to be most prominently advanced in the mental health and developmental disabilities fields. The National Alliance for the Mentally Ill (NAMI) and its state chapters have had a profound effect on mental health policy, especially at the state level. Most state chapters are compromised of parents and other relatives of the seriously mentally ill. These chapters have successfully lobbied for a restructuring of publicly-funded services targeted on the seriously mentally ill.

More recently, the seriously mentally ill themselves have tried to create their own organizations, either to provide direct services (Mombray and Tan, 1993) or to advocate for their issues in the political arena. The major differences in advocacy between these consumer groups and NAMI and its state chapters are on the relationship to the state. Many NAMI chapters are in alliance with psychiatrists who favor revising current commitment laws to make it easier to commit a seriously mentally ill person to a psychiatric facility. Consumer groups have tended to be quite opposed to what they see as a threat to community living for the seriously mentally ill.

NAMI and the consumer chapters fit with the growing interest in self-help organizations as a way of responding to social need. The early self-help movements were, like NAMI, parent-run organizations focused on providing services to their children. Examples from the early post World War II period include associations of retarded citizens (now called simply the Arc) and United Cerebral Palsy.(See, Katz, 1960) In the last few years, the local Arc chapters have tried to promote the independence of the developmentally disabled in their own separate apartments and give them a greater role in making decisions about their own lives.

In substance abuse policy, Alcoholics Anonymous (AA) and now Narcotics Anonymous (NA) are the proto-typical, self help organizations: militantly non-professionals local AA and NA chapters are led by recovering alcoholics and drug addicts and dependent on the financial contributions of members for support. The chapters steadfastly refuse to accept public funds.[10] The AA philosophy--the famous 12 steps-- requires that AA chapters and members have "no opinion on outside issues; hence the AA name ought never be drawn into public

controversy."(AAWS, 1976, p. 564) Consequently, AA members tend to avoid politics although some AA members advocate for specific public policies that affect alcoholics as individuals as opposed to AA members. In part due to this AA orientation, consumer and citizen advocacy at the state level is quite limited. In North Carolina, two advocacy organizations exist that represent consumer or client interests: Citizens Against Substance Abuse (CASA) and the NC Association of Children of Alcoholics (NCACOA). CASA is a relatively new organizations started by a husband and wife team who had been personally affected by substance abuse. Their goals are increased public funding for services and reforms in the treatment system. But CASA is starved for funds since it relies upon private donations; it is currently operated out of the family home and has a small membership base. NCACOA was founded in the late 1970s by individuals whose parents had a history of alcoholism. It was the first state chapter in what has become a national movement. Most of the members were initially substance abuse professionals with a family history of alcoholism; over time, more lay people have joined although the organizational leadership is still primarily from substance abuse professionals. NCACOA has struggled with its own resource problems: initially it tried to operate an operate an ambitious advocacy and technical assistance program for members only to encounter financial difficulties and problems obtaining their tax-exempt status. Currently, NCACOA has no paid staff and all advocacy is done on a volunteer basis, making it difficult for them to be a major political force.

The experience of consumer organizations in substance abuse, mental health, and developmental disabilities suggests several generalizations about voluntary advocacy organizations. First, the collective action problem as described by Olson (1965) and Wilson (1973) remains strong. Most participants are family members or substance abuse professionals (who often are given release time from their employers for their organizational activities.) Few lay citizens take an active role in these organizations even though the platforms of these organizations could be regarded as in the public interest--i.e. more treatment funding, greater access, and early service intervention. Private donations are scarce. Not surprisingly, many consumer advocacy organizations eventually look to public patronage as a way of stabilizing an agency's finances and hiring a professional policy advocate to lead their organization. State chapters of NAMI have received public funds to hire an executive. In North Carolina, both CASA and NCACOA have investigated the possibility of receiving a state grant to fund their advocacy activities.[11] From the state's perspective, supporting consumer organizations such as NAMI can be an effective and popular way of responding to the emergent pressure to be more sensitive to consumer concerns. No doubt, state officials hope that the grant will channel the group's political advocacy into acceptable avenues.

Second, statewide political advocacy in social welfare services is dominated by voluntary associations representing provider groups. Most consumer organizations are small and politically weak unless they enter into an alliance with the state. Voluntary advocacy organizations comprised of non-consumers and non-providers in social policy tend to be even rarer. These organizations tend to be unattractive to state officials for funding because they do not represent a valued constituency. In North Carolina, the only advocacy organization of this type with any involvement in substance abuse policy is the N. C. Center for Crime and Punishment. Supported by foundation grants, this organization is primarily concerned with prisoner rights and death penalty issues. In New York State, the only major non-provider advocacy organization in substance abuse policy is the Legal Action Center which originally was focused on protecting the legal rights of addicted people although it is now involved in a wide variety of substance abuse policy issues.

Evaluating Statewide Advocacy

From one perspective, advocacy at the state level is more vibrant than ever. There has been an explosion of advocacy groups and coalitions in the states reflecting the increased importance of state government in substance abuse policy, direct and indirect funding of advocacy organizations, and the desire of state officials to mobilize organizations and individuals concerned with substance abuse issues.

In substance abuse policy, the dominance of provider groups and the weakness of consumer organizations contributes to the lack of change in the substance abuse service system. The provider organizations support existing programs without major pressure from consumer or non-provider advocacy groups. One consequence has been the ability of many treatment programs to resist major alterations in their programs in the face of changing demographics and new developments such as crack and AIDS.[12] Program changes tend to be in response to fiscal imperatives from government or insurance companies and usually involve program modifications such as shortening the length of treatment rather than developing new models. In general, new treatment models have been due to federal research and demonstration monies to local public and private treatment programs that represent "add-ons" to the existing system rather than a fundamental restructuring of the service system.

Policy Advocacy at the National Level

Many commentators on American politics including James Madison (1956) and Grant McConnell (1966) have suggested that diffuse interests such as the disadvantaged and the powerless will be more likely to have policy advocates at the national level than at the state level. This suggests that the interest group universe will be substantially different at the national level than at the state level with a greater number of organizations representing the disadvantaged. In substance abuse policy, this predicted situation does not exist. Instead, the interest group universe is dominated by provider interests.

Advocacy in Washington

Seventy very diverse organizations are listed as part of the Coalition on Alcohol and Other Drug Issues that represents national organizations interested in substance abuse issues, ranging from the American Psychological Association to the National Association of State Alcohol and Drug Abuse Directors (NASADAD) to the National Association of Black Substance Abuse Workers. But this array of organizations in this coalition masks the small number of organizations actively involved in substance abuse policy. Congress regularly debates and considers major policy issues such as treatment funding and regulations, the division between law enforcement and treatment funding, legalization, the connections between substance abuse and HIV, and now the place of substance abuse treatment within national health insurance. The major substance abuse treatment provider associations such as Therapeutic Communities of America (TCA) or NASADAD are involved in these issues. But the other organizations face great constraints to active participation in legislative advocacy on substance abuse issues. A brief look at different categories of associations helps explain this situation. Three basic types of organizations exist within the coalition: substance abuse providers such as NASADAD, non-provider substance abuse associations such as the National Council on Alcoholism and Drug Abuse (NCADA) and associations with only a tangential interest in substance abuse. The latter category are the most

numerous, but their focus is on the concerns of their members so they usually have little time to devote to substance abuse issues. The non-provider associations such as NCADA and the Alcohol and Drug Problems Association (ADPA) are continually faced with resource problems. Typically, they are financially insecure with only a few staff. For instance, the ADPA was forced to lay off its executive director until it could rebuild its finances. With inadequate resources, these organizations are not an active presence in Congress except for a few select issues that they decide is their top priority.[13] Even the provider associations tend to have only a few staff available to do advocacy. TCA has one professional, the executive director, who does advocacy as well as respond to the concerns of TCA members nationwide. NASADAD is the only provider organization with substantial resources. Consumer or parent organizations are virtually non-existent at the national level.

The weakness of interest group advocacy at the national level reflects developments in the American welfare state and the characteristics of the drug abuse issue itself. First, federal drug treatment funding is provided primarily through the alcohol, drug abuse and mental health block grant which gives substantial authority over spending decisions to state governments. To an extent, it has made interest group mobilization more difficult because the connection between federal block grant spending and local constituency groups is relatively weak. The exception is state substance abuse program directors who benefit from block grant spending. They are an active presence in Congress lobbying for more block grant spending and greater state control over federal funds. But as a measure of the influence of the state directors' association, block grant funding has declined significantly over the last ten years in real terms and more federal controls have been imposed on the distribution of block grant funds.[14] The latter is particularly significant because it indicates how Congress makes decisions on substance abuse services. Increasingly, block grants funds for substance abuse have been restricted to specific client populations such as IV drug users and pregnant women. These "set-asides" reflect the interests of influential Senators or representatives who may also be responding to constituency groups other than national substance abuse organizations. In short, Congress has felt at liberty to allocate funds according to their own agenda, unconstrained by the demands of advocacy groups from the substance abuse community.

Second, the federal government has been successful in controlling the agenda on drug policy through federal agencies such as the Office of National Drug Control Policy in the White House, and the Justice Department. This has tended to put many of the advocacy groups in drug policy on the defensive and make their efforts to mobilize much more difficult.

Third, the Reagan and Bush administrations tended to see their agenda in drug policy as at odds from most of the organized advocacy groups in substance abuse policy. Consequently, the administrations avoided active organizing of substance abuse advocacy associations and groups. As a result, national associations have not generally benefitted from the direct and indirect public subsidies or the support and cooperation of high-ranking federal officials.

Fourth, drug and alcohol policy is highly controversial and fraught with many religious, racial, and moral concerns. Many families and individuals affected by addiction are understandably reluctant to speak out or participate in organizations involved in substance abuse advocacy. Like other disadvantaged groups, the negative image of addiction tends to depress political participation.(See Schneider and Ingram, 1993)[15]

Appraising National Advocacy

While, the number of advocacy organizations in substance abuse has exploded in the last 15 years. Yet the political impact of these organizations tends to be only at the margins of policy--a slight change in a regulation or a shift in the formula allocating block grant funds. Major policy issues appear to be dominated by the Congress and the administration. The national organizations are either traditional trade associations focused on the concerns of their members and struggling, underfinanced advocacy organizations. The cutbacks in treatment funding and the decentralization of policy has further complicated national level advocacy by putting nonprofit associations on the defensive and diverting the attention of many of their members to the state level.

Consequently, the hypotheses presented in the initial part of the paper do not apply with the following exceptions. The national trade associations represent local service providers that are heavily dependent upon public funding. These national associations were not formed by government but instead represented the recognition by service providers such as therapeutic communities or methadone clinics of mutual interests related to government. This would partially support H2. Some of the non-provider associations such as the Alcohol and Drug Problem Association represent substance abuse professionals with an interest to influencing federal substance abuse policy. It is not a lay organization. This would partially support H3. Recently, former senator Harold Hughes established a national organization of recovering people called SOAR. This organization is primarily lay people but it is too soon to evaluate its policy impact or long-term chances of survival.[16]

Political Advocacy and Voluntary Organizations: Implications for Policy

Several scholars have called attention to the increasingly blurred boundaries between the public and private sectors in the welfare states in advanced industrial countries.(Heclo, 1975; Flora and Heidenheimer, 1981; Rein, 1982) This shift in welfare states is profoundly affecting political advocacy by voluntary organizations. It is providing incentives for voluntary agencies to organize and for government to facilitate the creation and maintenance of voluntary advocacy groups and coalitions through direct funding or help in organization building. The sharp increase in voluntary advocacy organizations reflects these changing incentives for both government and voluntary personnel.

The role of voluntary advocacy organizations in substance abuse policy also suggests that the relationship between government and voluntary advocacy organizations differs depending upon the level of government. At the state and local level, the mutuality of interest between state and local officials and voluntary agencies promotes government organizing of substance abuse interests, even to the point of trying to forge unity among conflicting interests. But at the federal level, this mutuality of interest does not generally exist; thus, federal officials have not tried to organize voluntary advocacy organizations. The decentralization of substance abuse programs has also shifted the attention of many advocacy organizations away from Washington. With the decentralization of programs, local substance abuse programs view Washington as largely irrelevant to their interests.[17] Many political entrepreneurs take advantage of the ease of incorporating as a nonprofit organization to create their own organization to further their political

agenda. This tends to be most characteristic of state level organizations since the states are viewed as the most important public funding agent in substance abuse policy.

Absent government funding or encouragement, representation at the national level in substance abuse tends to be by a small band of provider groups and an even smaller number of nonprovider advocacy groups. The limited influence of these groups on federal substance abuse policy suggests a broader lesson for political representation in Washington, D.C. Without outside support in the form of public grants or official support, political advocacy for disadvantaged and unpopular target groups is likely to be weak and ineffectual. However, consumer and client groups in AIDS, mental health and developmental disabilities have demonstrated that demonstrated that personal lobbying and testimony by persons with specific problems or diseases can be a very powerful way of overcoming the resource problems of non-provider groups and their limited political influence.

As voluntary advocacy evolve though, they are increasingly faced with a serious problem. Aggressive lobbying may have diminishing returns because this type of lobbying is at variance with the image of nonprofit service providers by lawmakers as charitable organizations interested in the public good. But without a forceful advocacy posture, legislators will not be respond favorably to the policy agenda of these nonprofit associations. It is for this reason that the involvement of client and consumer groups is so important if voluntary associations representing disadvantaged groups are to be effective politically.[18]

Finally, the surge in voluntary associational activity is only inexplicable if government and society are considered as separate and voluntary associations as comprised of citizens unconnected to government. But, with the restructuring of the welfare state, voluntary advocacy groups increasingly reflect either the interests of government subsidized organizations or coalitions and interests organized by government. This new advocacy activity can signify greater representation of diverse groups in society. The risk for these groups is that to the extent that they become tied to government they are susceptible to changing political priorities and symbolic politics. More policy advocacy by groups working on behalf of disadvantaged populations such as substance abusers may have limited impact unless these groups can mobilize citizens without direct ties to either the state or existing provider organizations.

Endnotes

1. The author is indebted to the Center for the Study of Philanthropy and Voluntarism at Duke University, the Josiah Trent Foundation, and the Aspen Institute for financial support for his research.

2. Another explanation for the growth of voluntary organizations is offered by Claus Offe (1990) and others who suggest that since the 1960s, advanced industrial democracies have witnessed the development of so-called "new social movements" which include groups or organizations associated with peace, feminism, social policy, and the environment. The distinguishing characteristic of these new movements is a qualitative change in the motivation of people participating in politics. In these new movements, citizens are committed to cooperative decisionmaking, decentralization, and an appeal to broad values rather than narrow special interests.(see, Handler, 1991, p. 35). Thus, the surge in voluntary organizations in social welfare policy would represent a major underlying value shift in the population. This perspective would fit with the work of James Q. Wilson (1973) who suggests that a commitment to a social cause or ideology (purposive incentives) or the prospect of fellowship (solidary incentives) serves as a key incentive for individuals to join an organization. In this view, individuals might participate in a political organization due to its political goals. For example, a person might join the National Organization for Women because of his or her commitment to women's equality. If indeed people's values and goals had shifted, the willingness to join a voluntary organization due to an ideological commitment would likely increase as well.

3. When the Partnership program was created in 1989, CSAP was called the Office for Substance Abuse Prevention (OSAP).

4. The DARE program is nationwide program with a structured prevention curriculum for elementary and middle school youth directed by police officers.

5. newspaper articles on Asheville and Whiteville.

6. This definition is close to the Internal Revenue Service's view of lobbying by nonprofits. The IRS regards lobbying as any expenditure by a nonprofit in support of activities to influence legislation.(Smucker, 1991, p. 66)

7. The inability to effect system change through local service integration efforts was noted by the General Accounting Office (1992).

8. In most of the nation, these services were sparse or nonexistent prior to the 1970s. The federal government operated two public institutions and some states operated public institutional programs for alcoholic patients. Many states offered little or no services for drug addicts. In North Carolina, drug addicts were sent to the federal institution in Lexington, Kentucky. Alcoholics without means were sent one of three public institutions, while alcoholics who could pay could go one of the few private programs. Federal money created an entirely new network of public and private treatment programs. Some of this money was given directly to treatment programs while some of the money was given to state and county governments for distribution to local treatment programs. Nationally, most public drug and alcohol treatment funds are spent by nonprofit agencies.

9. States spent far more than local governments on social welfare services although exact figures are unavailable.

10. Occasionally, AA and NA chapters will agree to hold their meetings on the premises of public programs so individuals in those programs can take advantage of the AA meeting.

11. This problem has also affected prisoner advocacy groups. In New York State, Prisoners' Legal Services of New York was started in the early 1970s with a federal grant; it was then supported by the state for 13 years and then transferred to a private voluntary organization. This support was cut off in 1992 and the agency has appealed to the state for support. Richard Perez-Pena, "Prisoner Advocacy Group Battles Financial Woes," The New York Times, 28 December 1992, p. B6.

12. For example, methadone programs were designed as a response to the heroin epidemics of the 1960s and 1970s. These programs have been very slow to change in response to the crack and AIDS epidemics.

13. The National Council on Alcoholism and Drug Abuse has lobbied for the several years for increases in federal alcohol taxes.

14. To an extent, the block grant is having the intended effect on interest group activity. Many conservative supporters of block grant programs hoped that it would reduce the interest group advocacy at the national level.

15. AA members are not prohibited from taking political positions as private citizens. In this capacity, many AA members or former AA members have worked to obtain more funding for treatment services or reform government regulations. However, these individuals tend to be the exception. It is also noteworthy that the national organization of AA is based in New York City and does not participate in any political activity on substance abuse issues.

16. Given the importance of state and local government to treatment programs, SOAR also faces a challenge in convincing recovering people that they need to join a national organization.

17. The exception would be community coalitions and partnerships funded by CSAP.

18. Of course, consumer and provider groups may diverge in their policy preferences. However, many mutually beneficial alliances have developed across the country.

The Canadian Supreme Court and Provincial Charter Politics, 1984-1992

Shannon Ishiyama Smithey
University of Pittsburgh

Presented to the Annual Meeting of the American Political Science Association, Washington, D.C. September 2-5, 1993

In April, 1982, Canada adopted a new constitution, the Charter of Rights and Freedoms. Prior to that time, Canada's constitution was still a statute of the British Parliament. By ratifying the Charter, Canadians gained complete institutional independence from Britain. For the first time in their history, they also received entrenched constitutional protection for their civil liberties and language rights, and a judicial system empowered to enforce these rights.

Prior to the Charter's adoption, most of the attention paid to the Canadian courts focused on their federalism decisions. Although the Canadian courts were generally dismissed as politically insignificant, lacking the power to forbid government actions entirely, they did have the power to determine whether a law was enacted by the appropriate level of government.[1] Laws which the courts found to have been enacted by the wrong level of government were declared ultra vires and therefore void. Even though the power to declare acts ultra vires is a limited form of judicial review, and even though courts were reserved in its application, it was the most significant review power that they possessed. When scholars wanted to study the political activity of the Canadian courts, they turned to their federalism decisions (see, for example, Hogg 1979; Vaughan 1975).

The Charter has effectively shifted scholarly attention away

---

[1]The British North America Act, passed by the British Parliament in 1867, was Canada's first written constitution. The B.N.A. divided authority for different areas of public policy between the national government and the governments of the provinces.

from federalism to new judicial and constitutional issues. Judicial power and judicial interpretation of civil liberties and defendants rights have tended to take center stage. While these issues are certainly important, the Charter and its interpretation by the Supreme Court also have important implications for federal arrangements in Canada that should not be ignored. The application of the Charter to provincial law has added strain to the tensions caused by regionalism and the co-existence of French and English speaking Canada.

In this paper I discuss a number of issues of Canadian federation that are implicated in the Charter decisions of the Canadian Supreme Court. First, there is the conflict between the national and provincial levels of government. Second, there is the conflict between English Canada and Quebec, whose demands for recognition of its distinct culture have escalated from protecting the use of the French language to achieving partial secession. Third, there are regional differences and animosities to consider. The Charter and the Supreme Court's interpretations of it have a number of implications for each of these issues.

National Power versus Provincial Power

From its outset the Charter had ramifications for federalism as well as civil liberties. During the 1970's "virtually all of the provinces, no matter how economically dependent some of them were on Ottawa, began to seek expanded jurisdiction in some areas" (Russell 1992, 97). Pierre Trudeau and his allies took up the cause of a charter of rights, in large part because they sought

greater power for the national government over the provinces. With the Charter they hoped to foster the development of a stronger common identification with the nation of Canada for all Canadian citizens. Axworthy (1986, 21) puts it this way: "While not denying the diversity of Canada, federalist spokesmen argued that Canadians possess a common patrimony. They argued that while Albertans are distinctive from Nova Scotians and Quebeckers, as Canadian they partake alike in our country's heritage and destiny." Nationalists were also concerned with protecting language rights for "francophone" (French-speaking) Canadians throughout Canada. This was more than a civil rights issues; by ensuring the rights of francophones throughout Canada, Trudeau hoped to undercut the Parti Quebecois and its supporters by guaranteeing rights to speakers of French in all parts of Canada rather than by granting more power or special privileges to the province of Quebec (Russell 1992).

Leaders of eight of the ten provinces were initially opposed to Trudeau's proposal. Much of this opposition came from the perception that the proposal represented a decrease in provincial government power. Their rallying cry was parliamentary sovereignty, which would be infringed by the requirements of a Charter of Rights (Matkin 1986). A Charter would also have the centralizing effect of creating national standards for individual rights, regardless of province. This was an important symbolic departure from the former constitution which spoke only of national and provincial government rights. Only the leaders of Ontario and New Brunswick were willing to support the Charter.

Provincial leaders resented the fact that the new constitution was proposed without any input from the provinces. Trudeau also angered many by arguing that the constitution could be amended without following the constitutional convention of achieving unanimous provincial consent. Several provincial governments consulted their courts of appeal to determine whether this decreased role for the provinces was constitutionally acceptable. The Supreme Court made its first important contribution to the nationalist cause when it decided the issue in the Patriation Reference case [1981]. It decreed that "only a 'substantial degree' of provincial consent was required" to patriate the constitution and bind the governments of Canada to abide by the Charter (Russell 1992, 119).

In November, 1981, Trudeau obtained the substantial agreement he needed. The leaders of every province but Quebec negotiated a compromise that gave Trudeau most of what he wanted. The provincial governments had succeeded in adding two provisions to the Charter: Section 1, which proclaimed that Charter rights existed within those limits reasonable and justified in free and democratic societies; and the Section 33 override provision whereby the legislatures could exempt laws from Charter application for renewable periods of five years. Once this compromised had been reached, the Supreme Court's Patriation decision allowed the government to depart from the tradition of unanimity, and Quebec was unable to stop the Charter from taking effect.

The Charter was a victory for nationalist forces in the way

that it was adopted and in that it established national standards for civil liberties. It could also be construed to weigh in on the national side of the balance of federal power because of the role given to the Supreme Court. Under the Constitution Act of 1982, it is the courts which decide what is inconsistent with the Charter and what the impact of such inconsistency will be. The Supreme Court, at the top of the judicial hierarchy, has the final say in setting constitutional policy.[2] Thus, the Charter "transfers many areas of provincial jurisdiction to an institution of the federal government (the Supreme Court)" (Bzdera 1993, 13).

The provinces might well be concerned that increasing the power of the Supreme Court would further the cause of centralization. Bzdera (1993, 19) suggests, for example, that "federal high courts have generally favored the extension of central legislative power in the important cases concerning the division of powers." The Supreme Court's record in federalism cases in the era leading up to the adoption of the Charter is consistent with Bzdera's suggestion. From the end of 1949, when the Supreme Court became the final court of appeal for Canada,[3] until June of 1979, the Court demonstrated a tendency to be less supportive of provincial than national laws. In its constitutional cases during

---

[2]Even though the provinces may override the judicial nullification of a policy, such action does not invalidate the Court's constitutional judgment. An override merely sets aside enforcement of judicial decisions for renewable periods of five years.

[3]Until December, 1949, decisions of the Canadian Supreme Court could be appealed to the Privy Council of the House of Lords in Great Britain.

that period, the Court invalidated 25 of 65 (38.5%) challenged provincial laws but only 4 of 37 (10.8%) of challenged national laws (Hogg 1979). This is consistent with Bzdera's argument (1993, 20) that

> the centralist tendency of federal high courts logically leads them to abandon effective judicial review of federal legislation while at the same time they continue to review and often invalidate legislation of the member states.

If this is true, increasing Supreme Court power would not seem to bode particularly well for provincial prerogatives.

All of this might lead one to expect that Supreme Court decisions in the Charter era to be more supportive of national than provincial authority. We can examine this hypothesis by comparing the rates at which the Supreme Court has supported the policies of each level of government in its Charter cases. Between 1984[4] and June, 1992, the Supreme Court decided 220 Charter cases, involving 91 national policies and 128 provincial policies.[5] If we compare the rate at which the Supreme Court upheld challenged actions of both levels of government, we find that the Court was generally supportive of state authority, upholding the actions of both levels of government in a majority of cases. (See Table 1).

Contrary to what we would expect from a national institution interpreting national Charter of Rights, the Supreme Court has not

---

[4]Because it took some time for cases to work their way through the appeals system, the Supreme Court's first Charter decision was not issued until 1984.

[5]Two cases involved territorial policies, one from the Yukon and another from the Northwest Territories.

lived up to Bzdera's prediction. In fact, it has done the opposite, becoming a bit more supportive of provincial policies than the policies of the national government. The outcomes of the Supreme Court's Charter decisions have not helped to shift the balance of federal power to the advantage of the national government. The Charter may have subordinated the province's legislative authority to a national statement of rights, but it seems clear that the national government has not become the Supreme Court's constitutional favorite.

Table 1
Supreme Court Support for National and Provincial Policies
1984-June, 1992

	National Policy Challenged	Provincial Policy Challenged
Court Rules For the Government	62.3% (57)	70.3% (90)
Court Rules Against the Government	37.4% (34)	29.7% (38)
Total	100% (91)	100% (128)

The Supreme Court and Quebec

The Charter and the Supreme Court's interpretation of it have increased the divide between Quebec and the rest of Canada. The constitution "rubbed Quebec the wrong way" from the beginning. When Trudeau met with the ten provincial premiers in November of 1981, Quebec was initially joined by seven other provinces in opposing constitutional change. Many in Quebec still view the acceptance of the compromise package by the seven other objectors as a betrayal, referring to the evening the compromise was reached

as the "night of the long knives" (Russell 1992, 119). A certain amount of French animosity spilled over onto the Supreme Court when it undercut the claim that no constitutional amendment was possible without Quebec's approval. The Charter went into effect the following April, despite vocal Quebecois opposition.

Besides rejecting the process through which the Charter was adopted, the political leadership in Quebec rejected the Charter itself. The Quebec National Assembly voted against ratification. When that failed, its members automatically attached a Charter override to every piece of legislation it passed until the defeat of the Parti Quebecois in 1985 (Russell 1992, 145).[6] While Robert Bourassa's new Liberal government did away with the automatic override, it maintained the PQ's general objection to the Charter.

Quebeckers rejected the Charter as a whole, but they were most offended by the Charter's guarantee of equal treatment for both English and French. As Bickerton (1992, 285-6) suggests, "For the Quebec government, charter supremacy is viewed as a threat to the province's power to promote the French language and culture." By requiring equal treatment of both languages, the Charter limited Quebec's leaders ability to advantage the use of French. This was perceived as endangering Quebec's viability as a separate culture.

Attempts were made to reach another constitutional compromise that would address Quebec's dissatisfaction. In 1987, the provincial premiers met with Prime Minister Brian Mulroney at Meech

---

[6]They preferred to rely on the Quebec Charter of Rights, which they insisted had primacy within the province.

Lake. The resulting Accord addressed several provincial concerns along side Quebec's. Meech Lake increased provincial control over immigration, allowed the provinces to opt out of certain national cost-sharing programs or substitute their own programs to achieve certain national policy objectives, and gave the provinces the right to submit a list of names from which Supreme Court vacancies would be filled.

Although these rights were guaranteed to all the provinces, Quebec's concerns did receive some special attention. The tradition that three Supreme Court justices should come from Quebec would be entrenched in the constitution. Quebec was also to gain recognition as a distinct society, albeit in a clause that was not as broadly phrased as the Quebecois might have wanted. The following clause would have appeared as the first substantive clause of the Charter: "a fundamental characteristic of the Canadian federation is the existence of French speaking Canada, centered in but not limited to Quebec, and English-speaking Canada concentrated in the rest of Canada but also present in Quebec" (Russell 1992, 138).

Reaction to the Accord was in many ways typical of the unity crisis facing Canada. Meech Lake encountered opposition from Quebeckers for being an insufficient protection of their rights and from English Canada for giving Quebec too much special treatment. Trudeau attacked the Accord for its increase of provincial power at the expense of the good of the nation. Others were afraid that allowing the provinces to pursue national objectives in different

ways could threaten social welfare policy or undermine the newly won Charter rights of women and minorities (Russell 1992).

At the end of 1988, the Supreme Court stepped into the process, incensing the Quebecois and sealing the fate of the Accord. On December 15, it reached a decision in the case of Ford v. Quebec [1988] 2 SCR 712. In Ford the Court was asked to consider the constitutionality of the Quebec Charter of the French Language, which forbade the display of public signs, posters and advertising in any language other than French. The Court held that the S.2(b) right to freedom of expression included personal and commercial expression in the language of a person's choice, and that Quebec's prohibition on the use of English was too sweeping to be justified as a reasonable limit in a free and democratic society. It was as if the justices had never heard that there was a constitutional crisis or that there was talk of secession in Quebec.

For the supporters of Meech Lake, it was not an opportune moment for such a ruling. In Quebec, there could be no opportune moment for such a decision. Ford sparked rallies in support of the French Charter, and the Bourassa government quickly invoked the override. This inspired a backlash in English Canada, including the rejection of Meech Lake by the legislatures in Manitoba and New Brunswick and its revocation by Newfoundland (Russell 1992). Russell concludes that the Ford decision helped kill Meech Lake. He writes (1992, 146-7)

> English Canada's wrath over Quebec's use of the override revealed the irony of the Charter of Rights. That

> Charter, Trudeau's Charter, designed to unify Canada, had become a profound source of disunity....It was not the substance of the Charter but the Charter as symbol, as icon, which in the heat and passion of mega constitutional politics became profoundly divisive.

The Charter was certainly instrumental to the conflagration. But is crucial to understand that it was not the Charter alone that so angered the Quebecois and set off the backlash throughout the rest of Canada. Focusing solely on the Charter's role omits an important part of the story. Constitutions do not interpret themselves.

It was the Supreme Court's interpretation of the Charter that caused so much controversy. The Court was not compelled to reach the decision it did in Ford. It could have relied on S.1, declaring the sign law to be a reasonable limit on expression rights in a free and democratic society. It did exactly that with a similar law in Devine v. Quebec, which it handed down on the same day. Instead, the Court struck at the heart of efforts to preserve francophone culture in a "distinct society." By rejecting the Charter of the French Language, the justices made a singular contribution to shaking the foundations of Canadian confederation.

From this discussion it would appear that the Supreme Court is opposed to Quebec's interests. Certainly the Court's most high profile case from Quebec worsened relations between Quebec and the rest of Canada. A look at the Court's overall treatment of Quebec, however, suggests a fairly balanced treatment of the province. Policies from the province have been challenged in 15 of the Court's Charter cases. The Court has upheld provincial action in

9 (60%) of them. While this is a bit lower than the mean rate of support for the provinces, it is similar to the treatment received by several other provinces. Ontario, Saskatchewan, New Brunswick and British Columbia receive higher rates of support than Quebec, but the province fares slightly better than Alberta (8 for 14) and Manitoba (4 for 7), and considerably better than the four Maritime provinces (a combined 6 for 13). In other words, the Supreme Court's support for Quebec is just about average.

Even in the sensitive area of language rights, the Supreme Court has not been completely hostile to Quebecois aspirations. The Court has decided four cases challenging language policy in Quebec. The Court ruled against Quebec in Ford and Quebec v. Quebec Protestant School Boards [1984] 2 SCR 66. It ruled for Quebec in Devine and MacDonald v. Montreal [1986] 1 SCR 460. It is clear that Quebec stands an even chance of succeeding at the Supreme Court, even in language rights cases.

The Supreme Court has also held the other provinces to the same standard it has applied to Quebec. In Quebec Protestant School Boards the Court invalidated a section of the French Charter that limited educational opportunities in English to children whose parents were educated in English in Quebec. The Court reached a similar decision in Mahe v. Alberta [1990] 1 SCR 342. In Mahe the Court disallowed the Alberta School Act requirement that French schools give 20% of their instruction in English. Both jurisdictions were required to follow through on the Charter's guarantee of bilingual education.

The Court also took similarly permissive positions toward Quebec and New Brunswick in cases concerning linguistic requirements in the administration of justice. In Societe des Acadiens v. Association of Parents [1986] 1 SCR 549, the Court upheld New Brunswick's practice of allowing judges whose first language was English to sit on panels hearing cases to be argued in French. The right to use both languages was construed not to include a reciprocal right to be understood in both languages. In MacDonald the Court upheld Quebec's issuance of an arrest summons written only in French. The administration of justice apparently need not adhere as strictly to bilingualism as other aspects of provincial policy. These cases suggest that the Supreme Court has taken an even-handed approach to evaluating the government of Quebec.

Why should the Court be perceived as an anti-Quebec institution if the Court treats Quebec just like the other provinces? The key point here is that Quebeckers are upset to the point of seceding because they do not want to be treated like every other province. Theirs is "une province pas comme les autres"--a province unlike the others (Dion 1992, 1). Unlike the other provinces, Quebeckers did not agree to the Charter; having it applied to them in the same way it applies to other provinces is insulting, not mollifying. This is particularly true in language rights cases, which raise issues that are central to Quebecois attempts to save their culture from assimilation with English Canada. Ford makes it clear that Quebec cannot achieve "distinct

status" if the Supreme Court applies Charter rights to laws in Quebec as if it were any other Canadian province. By choosing to treat Quebec like the others, the Court has in fact encouraged the belief that Quebec will have to weaken its ties to the rest of Canada if it wants to maintain its cultural integrity.

The Supreme Court and Regionalism

One can understand why much of the attention paid to the problem of Canadian unity focuses on the divide between French and English Canada. It is important to remember that Canada has its share of regionalism as well. Bercuson (1977, 1) argues that

> Canada is a country of regions....If the stubborn regional identification of British Columbians, prairie Westerners, and Maritimers could only be melded with the all too powerful and sometimes parochial "Canadian" awareness of Ontarians, the land could be neatly split between the French and the "English" of the bicultural illusion. That is the wish of some, but the ever-present reality is quite different. Regions exist, distinguished by geographical setting, economic role, history, culture, and even different ambitions for the same Canada to which they all belong.

Canada is normally considered to consist of two territories (the Yukon and the Northwest Territories) and five regions: Ontario; Quebec; British Columbia; the Maritime provinces of Newfoundland, New Brunswick, Nova Scotia and Prince Edward Island; and, the Prairie provinces of Alberta, Saskatchewan and Manitoba. Even though there are differences of opinion within these regions (see, for example, Milne 1992), each region has certain political and constitutional concerns in common, and together they have a decided impact on Canadian politics.

Regional concerns were clearly evident in the constitutional

debate and referendum that followed Ford and the death of Meech Lake. Western premiers, who had been asked to wait in pursuit of more equal representation in the Senate, insisted on its inclusion in the new round of constitutional making (Russell 1992). Quebec increased its demands for provincial autonomy. The Mulroney government tried to accommodate these concerns in the Charlottetown Accord. The Charlottetown package offered more independence to Quebec, self-government to Canada's indigenous peoples, and Senate reform to the western provinces ("New Framework for Canada," New York Times Sept. 25, 1991, A4). In a move that tried to placate earlier concerns for provincial autonomy, the Accord's acceptance was to be contingent on unanimous provincial approval.

The Charlottetown attempt to adjust the constitution to deal with regional tensions was resoundingly rejected by public referendum in October, 1992. In a process where only one province's refusal could kill the Accord, six provinces voted "No."[7] Not only was Charlottetown rejected, but the general process of constitutional reform seems to have engendered a great deal of ill-will between the different regions of Canada. The Maritimes, as the poorest provinces in Canada, are wary of attempts, like Charlottetown, to increases provincial authority, for fear that this might lead to reductions in the amount they received in equalization payments (Bickerton 1992). Much of

---

[7]British Columbia, Alberta, Manitoba, Saskatchewan, Nova Scotia and Quebec voted "No." Newfoundland, New Brunswick, Prince Edward Island and Ontario voted "Yes." The popular vote for the whole country rejected the Accord, with 54% voting against.

English-speaking Canada has become less willing to give Quebec what it views as special (and therefore unfair) treatment, even as Quebeckers have become more adamant in its pursuit. A number of provinces were also opposed to the national government proposal for self-government for native Canadians. And, with Charlottetown's defeat, westerners were again denied an improved voice through Senate reform.

After Charlottetown, the odds against achieving some form of consensus seem even higher. It is ironic that each attempt to draw Canadians together through constitution making has pushed them farther apart. In 1980, surveys showed that the primary identification of 62% of Canadians was with the nation rather than their province; by 1990, national identification had fallen to 49%.[a] While other factors are surely at work here, each attempt at reform seems to aggravate rather than alleviate Canada's trouble getting along with itself. The Economist ("Glug, Glug," Oct. 31, 1992, 18) accurately portrays the situation as one of increasing discord:

> In the early 1980s, when the search began for a constitution acceptable to all Canadians, only one province, Quebec, was unhappy. Over the years, as efforts to satisfy Quebec, others have become disaffected, annoyed both by what has been offered to Quebec and by what has not been offered to them.

No one should claim that the Charter or the Supreme Court are alone to blame for regional resentments, but they have made their own contribution to Canada's unity crisis. It was the Charter, after all, that started Canadians off on more than a decade of

---

[a]These data are from the Environics Poll of Canada, as reported in Swinton 1992, 122.

regionally contentious constitutional negotiation. It was adopted, with the help of a nationalist Supreme Court decision, despite regional and provincial objections. And, the Supreme Court has interpreted it in ways that served to exacerbate Quebec's feelings of resentment toward the rest of Canada, and the rest of Canada's resentment toward Quebec.

The Supreme Court's behavior in Charter cases also has the potential to contribute to the animosity between the center and the periphery in Canada. Resentment of "central Canada" (Quebec and Ontario) runs high in the Atlantic and the west. The Supreme Court can be viewed as a centrist institution since the provinces have no input into the selection of its members, and six of its nine justices are always chosen from Ontario and Quebec. If the Court favors the policies of the center over those of the Prairie and Maritime provinces, it may reinforce the perceptions of the latter that they are not equal partners in the Canadian confederation.

Given Canada's history and political arrangements, such perceptions are understandable. Ontario and Quebec have always had much greater populations than the other provinces. Together they have 174 of the 295 seats in the House of Commons. As a result, central Canada has been the "major beneficiary of national economic, cultural and social policies" (Bercuson 1977, 2). From the railroad and development policies of the late nineteenth century through the price controls on oil in the 1970's and 80's, Ottawa's "tariffs and transportation policies...were responsible for protecting industries at the centre, while impairing the

peripheries" in the Atlantic and the west (Arseneau 1992, 327). These provinces share the complaint that they lack "political voice in the central government. Whether rich or poor, the seven provinces experience the same feelings of political powerlessness" (Arseneau 1992, 328).

The Supreme Court's record in dealing with the claims of the different regions has the potential to reinforce the power of the center over the periphery. There has been no landmark case like Ford that pitted the center against the "hinterlands." Nevertheless, by comparing the treatment the Court gives to different regions we can look for the same center-periphery relations that are present in Canadian national politics at large.

We begin by examining the treatment the Court has given the policies from different regions. (See Table 2). With one notable

Table 2
Supreme Court Support for Regional Policies
1984-June, 1992

Region	Court Rules for Government	Court Rules Against Government	Total
Ontario	85.4% (41)	14.6% (7)	100% (48)
Prairies	65.6% (21)	34.4% (11)	100% (32)
British Columbia	61.9% (13)	38.1% (9)	100% (22)
Quebec	60.0% (9)	40.0% (6)	100% (15)
Maritimes	46.2% (6)	53.8% (7)	100% (13)
All Regions	69.2% (90)	30.8% (38)	100% (128)

exception, the Court is fairly even-handed in its treatment of the provinces. It upholds around 60% of the policies from the Prairies, British Columbia and Quebec. It is a bit less supportive of the Maritimes, but there have only been 13 cases from that region combined, so it is too early to say much on that basis. The number of cases from most of the provinces is fairly small, so one must be careful about attributing too much significance to small differences in the rates of judicial support.

Nonetheless, the data do reveal one clear favorite in the Court's first 220 Charter cases. The Court is much more supportive of Ontario than the other regions. Its approval rate for policies from Ontario far surpasses the support it gives to the other provinces. (See Table 3). Such overwhelming support for the policies of Ontario clearly indicates that the Supreme Court's Charter decisions favor the center.[9]

The Supreme Court treatment of the lower courts also reveals its impact on the tension between center and periphery. 204 Charter cases reached the Court on appeal from the highest ranking courts in the provinces.[10] The Supreme Court affirmed the decision of the

---

[9]The average rate of support given to Quebec might be seen as working against the argument that the Court favors the center since in other areas central Canada includes Quebec. However, in Charter discussions, Quebec has not had the voice or the impact that is typical of its place in Canadian politics generally. Its demands have had little more success in the rounds of constitution making than those of the Prairies and or the Maritimes. In constitutional matters, then, Ontario is the true "center."

[10]One of the other 16 was referred directly to the Supreme Court by the national Governor in Council. The other fifteen were appealed from the Federal Court of Appeal, the courts of appeal from the territories, or the military courts.

Table 3
Supreme Court Support
for Policies from Ontario and the Rest of Canada

	Policy Upheld	Policy Overturned	Total
Ontario	85.4% (41)	14.6% (7)	100% (48)
Other	61.2% (49)	38.8% (31)	100% (80)

Chi square= 8.3936, df=1, p≤ .006

lower court in 133 (65%) of these cases. When we break them down by region, we find that the Court again gives the most support to Ontario, although it is almost equally supportive of British Columbia. (See Table 4).

The Court is least supportive of the Quebec Court of Appeal. It rejects that court's reasoning a substantial majority of the time (68%), although again the number of cases is fairly small for drawing airtight conclusions. This figure is nevertheless consistent with the Quebec Court's general success on appeal to the Supreme Court. Morton, Russell and Withey (1990, 9) report that the Quebec Court has traditionally lost more than half of the cases in which its decisions were appealed to the Supreme Court. The fact that the data here are consistent with a more general trend reinforces the credibility of the idea that the Court's Charter decisions are having a disparate regional impact.

Table 4
Supreme Court Support for the Courts of Appeal
1984-June, 1992

Region	Upholds the Appeals Court	Overturns the Appeals Court	Total
Ontario	77.2% (61)	22.8% (18)	100% (79)
British Columbia	75.0% (27)	25.0% (9)	100% (36)
Prairies	57.4% (27)	42.6% (20)	100% (47)
Maritimes	55.0% (11)	45.0% (9)	100% (20)
Quebec	31.8% (7)	68.2% (15)	100% (22)
All Regions	65.2% (133)	34.8% (71)	100% (204)

Before translating judicial rejection of regional court decisions into disapproval of regional policy, however, we need to investigate which litigants are winning when the Supreme Court overturns the lower courts. Some lower court decisions have found Charter violations and invalidated provincial policies. By overturning these decisions, the Supreme Court is actually supporting provincial policy. On the other hand, if the Supreme Court upholds such a lower court decision, it is in fact acting against the provincial interests discussed earlier in this paper.

In the case of Quebec, the Supreme Court is more likely to save Quebec policies than invalidate them when it overturns the Quebec Court of Appeal (it does so in 9 of 15 cases). This is not the case for any of the other regions. In each of the other four, the Supreme Court is more likely to reverse the lower courts for

not being active enough in enforcing Charter rights.[11] Perhaps the Court ought not be considered to be so hard on Quebec after all. The Supreme Court could be viewed as protecting Quebec policy from too much Charter activity on the part of its own Court of Appeal. For obvious reasons, however, Ford being first among them, this opinion is not likely to be widely subscribed to in Quebec.

The most complete picture of the Supreme Court's impact on the regions comes from measuring the combined success of provincial courts and provincial policies before the Court. To retrieve this information we divide the cases into four categories: the Supreme Court upholds the lower court in supporting the government; the Supreme Court upholds the lower court in supporting Charter rights; the Supreme Court overturns the lower court to save the policy; and, the Supreme Court overturns the lower court to invalidate the policy. Cases that fall into the first category indicate a "double dose" of support from the Supreme Court. The province with the highest percentage of its cases in this category should be considered most in line with the thinking of the justices on Charter issues.

On the basis of this analysis, Ontario again stands out as the Court's favorite. (See Table 5). With 65% of Ontario's cases falling into the first category, it clearly receives the highest degree of combined support of all the regions. British Columbia is

---

[11]The Supreme Court reverses the Court of Appeal in favor of the Charter right with the following frequency: Ontario, 13 of 18 cases; B.C., 7 of 9 cases; the Prairies, 15 of 20 cases; and the Maritimes, 7 of 9 cases. All are in the neighborhood of 75%.

not far behind with 58%, but it is telling that Ontario is at the top of every list of regional preference indicators.

Table 5
Supreme Court Support for Provincial Courts and Policies
1984-June, 1992

Region	Lower Court & Policy Upheld	Lower Court & Charter Rt. Upheld	Lower Court & Policy Overturned	Lower Court & Rights Claim Rejected
Ontario	51	10	13	5
B.C.	21	6	7	2
Prairies	21	6	15	5
Marits.	8	3	7	2
Quebec	4	3	6	9
All Regions	105	28	48	23

The data seem to bear out the hypothesis that in deciding its Charter cases the Court is favoring the center over the periphery. The Prairies and the Maritimes are the most peripheral regions in Canada. The Supreme Court only affirms 57% and 55% of their appeals court decisions, compared to 77% of Ontario's. Less than half of their cases fall into the category of combined appellate and policy support, compared to Ontario's 65%. These provinces seem to be on the judicial, as well as the political, periphery.

The rates at which the justices of the Supreme Court cite the decisions of the lower courts is also relevant to our evaluation of their impact on the conflict between center and periphery. Courts in common law systems like Canada's issue opinions to explain their decisions. In these opinions they include references to previously

decided cases to help justify their conclusions. Reference of one court by another is considered a sign of influence.[12] Even if the citation is really only added "for show," it is an indication of the esteem in which the source is held; why cite an "inferior" prestige court to strengthen an argument? Courts that are cited more frequently are considered more influential than those that are cited less frequently. (See generally, Merryman 1954, 1977; Friedman et. al. 1981; Caldeira 1988). By comparing the rates at which the Supreme Court cites the provincial courts, we determine which provincial courts may be influencing the development of Canadian constitutional law, and whose opinions are valued by the Supreme Court.

Comparison of the rates at which the lower courts are cited is very revealing. (See Table 6). Those regions that resent their lack of voice in general politics are similarly quiet in the Court's Charter opinions. The Supreme Court's low citation rate of the Prairies and the Maritimes can only serve to reinforce their complaints. Quebec, with its civil law tradition, is cited less than any other region (although P.E.I. is the least influential province, with only 6 citations in all 220 cases). British Columbia and the Prairies do a bit better in securing the Court's notice, but far and away the most notice is given to Ontario. It monopolizes the Court's attention.

---

[12]To be aware of a case in another jurisdiction and then to form an opinion of its relevance to the case at hand requires consideration of another's ideas. Borrowers are exposed to the reasoning of others, which may influence their own reasoning and result in similar case outcomes.

Table 6
Supreme Court Citation of the Provincial Courts
1984-June, 1992

Region	Number of Citations	Number of Citations Per Case
Ontario	438	19.9
Prairies	174	0.8
B.C.	159	0.7
Maritimes	81	0.4
Quebec	65	0.3
All Regions	917	4.2

This finding is not really surprising given the greater population and the higher rate of litigation in Ontario. There are clearly more cases from Ontario for the justices to choose from. Three of the justices also come from Ontario, which surely contributes to a greater number of citations of that province, even though the same number of justices comes from Quebec and it is not similarly influential. However, we should not dismiss Ontario's influence over the Supreme Court just because the system is set up in ways that make such influence predictable.

In its Charter decisions the Supreme Court has given the advantage to central Canada (in this case, Ontario) over the periphery. While it would have been remarkable to find another province with as much influence, it is undeniable that, whatever the cause, the Supreme Court pays a great deal more attention to the courts of Ontario than to those in any other province. Whether the justices find Ontarians extremely convincing, know the case law

because there is more of it, or appreciate Ontario citations for their value as "window dressing," it is precedent from Ontario that appears so frequently in the Canadian Supreme Court Reports. The Charter opinions of the Supreme Court are peppered with references to Canada's constitutional center.

Conclusions

Our discussions reveal that constitutional change and constitutional interpretation have significant implications for the Canadian unity crisis. The Charter embodied nationalist hopes for increasing Ottawa's power over the province. After the Patriation reference, people might have expected the Supreme Court to use its expanded power to promote national government power at the expense of the provinces. Instead, the Court has made Charter decisions that maintained a balance of federal power similar to the one that existed prior to constitutional change.

The Charter was promoted as a document that would pull Canadians together because it secured full national independence from Britain and created a common set of rights and liberties. It was hoped that one set of rights, those guaranteeing bilingualism throughout Canada, would pacify separatists in Quebec by satisfying francophone demands for the protection for both Canadian cultures. In fact, the Supreme Court egalitarian approach to the Charter's language rights has had exactly the opposite result. Obviously, things do not always turn out the way we plan.

The Supreme Court has also reinforced the power gap between the Canadian center and periphery in its Charter decisions. It has

done so by strongly favoring the policies and appellate courts decisions of Ontario. The influence of the center is also seen in the permeation of Charter decisions by Ontario's judicial reasoning. Although this sort of favoritism is much less likely to receive the public attention of the language rights cases, it has significant implications for constitutional development. And, since the Court, through judicial interpretation of Charter rights, now has the power to veto provincial policy, this favoritism also has significant implications for conflict between the Canadian center and periphery.

THE ASYMMETRY OF RACE AS A POLITICAL ISSUE: PREJUDICE, POLITICAL IDEOLOGY AND THE STRUCTURE OF CONFLICT IN AMERICAN POLITICS

A longstanding and rather obvious hypothesis holds that, the more whites dislike blacks, the more likely they are to oppose policies to help blacks. In contrast to this view that prejudice shapes political preferences, the current article tests the hypothesis that political preferences determine when prejudice becomes politically consequential. Our argument unfolds in several empirical steps. First, we develop and validate a measure of negative racial stereotypes. Second, we demonstrate that the impact of prejudice on policy preferences is much larger among political liberals than it is among conservatives -- a finding that holds up against both statistical counterarguments and substantive objections such as "are anti-black liberals truly liberals?" and "are conservatives who say they like blacks sincere?" We eliminate these latter objections by drawing not only on traditional self-report data, but also on reaction time and experimental data collected in a representative sample survey. We conclude by commenting on the broader political implications of our finding that prejudice is most politically potent where it is least suspected: namely, on the left.

THE ASYMMETRY OF RACE AS A POLITICAL ISSUE: PREJUDICE, POLITICAL IDEOLOGY, AND THE STRUCTURE OF CONFLICT IN AMERICAN POLITICS

Prejudice represents a deep and continuing strain in American culture. It surely has diminished since the days that blacks could be jailed for drinking from a "white" fountain or sitting on a "white" seat in a bus or picnicking in a "white" park. But just as certainly prejudice has by no means disappeared, and it manifestly is of the first importance to establish the continuing power of racial bigotry to shape the reactions of ordinary Americans to public policies dealing with blacks.

A broad interpretation on the role of race in American politics has emerged (Carmines and Stimson 1989). Beginning in the early 1960s, the issue of race moved to the center of American politics, partly in response to structural changes in the American economy and the consequent outflow of blacks from the South (Lemann 1991), still more in response to the success of the civil rights movement in dramatizing the violence and hardships suffered

---

* Data collection was supported by the National Science Foundation (Grant NO> SES 8508937). We want also to thank the Survey Research Center and the Institute for Personality and Social Research, both of the University of California, Berkeley, for invaluable assistance.

by blacks in the South (Woodward 1983). Having again become salient, the issue of race served as a fulcrum for a realignment of the party system, a realignment which got underway with the Johnson-Goldwater presidential contest in 1964 but which has proven to be an enduring and pivotal feature of American politics (Carmines and Stimson 1989). The Republican party, which had been the champion of racial liberalism under Lincoln, became the party of racial conservatism under Goldwater. The Democratic party, which had been a bulwark of racial conservatism, became the champion of racial liberalism under Johnson.

It would be a mistake to suggest that race was the only dynamic factor, producing all on its own a realignment of American politics. But it has come to such prominence, it is now agreed, because cleavages over race coincide with rather than cut across cleavages over ideology and partisanship. For a variety of historical and cultural reasons racial politics in America has been rooted in the deep and often irrational feelings and stereotypes whites have harbored toward blacks. But, increasingly, ideology and party have come to reinforce the impact of prejudice. On issue after issue --from government spending to improve the social and economic position of blacks, through regulatory oversight of employment practices, through busing and affirmative action -- the political left, liberals and the Democratic party, have championed the use of government to come to the assistance of blacks, and the right, conservatives and the Republican party, have stood consistently in opposition (Carmines and Stimson 1989; Edsall and Edsall 1991; Sniderman et al. 1991a).

Racial prejudice, it thus appears, plays its largest role on the right. Ideology and prejudice are independent forces, but politically they seamlessly

reinforce each other, both encouraging whites to oppose public policies to help blacks whatever the policy's specific objectives or strategy. Indeed, so naturally and intimately do prejudice and ideology complement one another that the shape of contemporary racial politics has been said to be defined by the "conjunction" of conservatism and antiblack affect (Kinder and Sears 1981).

The view of prejudice as exerting its force chiefly on the political right we shall call the "prejudice-on-the-right" thesis. It is based, we shall show, on a misspecified model of reasoning about political choices. The misspecification arises from the analysis of citizens' choices as though they have no political perspective -- the "view from nowhere" as we call it -- on the political issues they confront. That certainly applies to some in the mass public, but by no means to all. And to understand how they make political choices it is necessary to understand that they approach them as political choices. A liberal and a conservative often and appropriately approach public choices from different perspectives. What is expected of them in making a public choice need not be the same. Their choices about public policies are political -- that is, to be made in the light of their political commitments.

Choices about public policies can be political choices even for (substantial parts of) mass publics, and without proceeding from an appreciation that citizens sometimes are -- and understand themselves to be -- making a political choice, a causal account of how they go about making such choices is irremediably misspecified. The misspecification, moreover, is doubly misleading when it comes to issues of race. It is misleading, first, because it underestimates the importance of prejudice on political thinking and, second, because it mislocates its impact. Properly specified, we shall

show that the impact of prejudice on political reasoning is larger than it initially appears to be, and contrary to the prejudice-on-the right thesis, we shall demonstrate that racial bigotry has its largest impact on the political landscape not on the right but rather on the left.

More broadly, this paper weighs two contrasting views about the nature of mass politics and hence of the role of prejudice in political thinking. The classical view proceeds from the assumption that ordinary citizens are apolitical: they approach political issues from a point of view outside politics -- the view from nowhere -- taking the choice before them to be the same choice whether they see themselves on the left or on the right. On this view, the more whites dislike blacks, the more likely they are to oppose policies to help them. As against this view that prejudice determines their politics, we want to explore whether it is their politics that determines whether their prejudices are relevant. What is at issue, in short, is whether the analysis of public opinion and politics reduces to a branch of applied social psychology or represents instead an autonomous body of knowledge, to be understood in its own terms.

We shall first show how the accepted view of race and political thinking has gone wrong in failing to attend to the constitutive role of politics and then demonstrate empirically that the impact of prejudice on political thinking is larger, sometimes by a factor of four or more, on the left than on the right. With the basic results in hand, we want carefully to weigh a pair of objections. On the one side, it could be questioned whether liberals who defect on racial policies really are liberal; on the other, it could be doubted whether conservatives who say they like blacks really do. Having critically evaluated both objections, we shall close by discussing the larger

implications of our findings on the asymmetry of prejudice, political ideology and racial policy preference, paying particular attention to the abiding quandary that the issue of race poses to the left in American politics.

The View From Nowhere: Racial Affect and Racial Policy Reasoning

The classic account of the connection between the positions that whites take on racial issues and the feelings they harbor toward blacks runs as follows. The average citizen, it is argued, doesn't have to know much about particular racial issues in order to see which side he or she wants to be on; all they have to know is how they feel about blacks. As Converse remarked, for the average citizen questions about different racial policies:

> "would tend to boil down for many respondents to the same single question: "Are you sympathetic to Negroes as a group, are you indifferent to them, or do you dislike them?" The responses would be affected accordingly. (1964, 235)

Here, exactly expressed, is the idea we mean to explore: the positions whites take on issues of race follow directly from their feelings toward blacks -- positive if their feelings are positive, negative if their feelings are negative.

What is, or ought to be, most striking about this interpretation of racial politics is the irrelevance of politics. Indeed, politics is irrelevant twice over: first, public policies -- including both the objectives they aim at, and the means they advance to accomplish them -- do not inform or constrain the reactions of ordinary citizens; second, the political orientation or beliefs of the citizen do not inform or constrain their reactions to racial policies. Instead, on this account, issues of race all "boil down" to citizens' feelings toward blacks -- Whether and how far they are sympathetic to them? Whether and how much they dislike them?

Our objective, in contrast, is to demonstrate how politics defines the relevance of racial affect for racial policy preferences. Put in broad enough terms, most people would concede the importance of taking politics into account. Manifestly, no commentator on problems of race and politics proceeds from complete disinterestedness or absolute neutrality. What everyone sees of the politics of race depends on where they are situated politically. In the analysis of public opinion, however, it is routinely assumed that the reasons whites take the positions they do on issues of race can be identified on the assumption that everyone is situated alike whatever their political orientation. Hence the standard practice of regressing racial policy preferences on, for example, ideological self-identification and feelings toward blacks. Hence also the standard finding that the more conservative a person is, the more likely he or she is to oppose the proposal to increase government spending for blacks, and that the more negative his or her feelings toward blacks, the more likely he or she is to oppose more government spending for blacks (e.g. Sears, Hensler, and Speer 1979). But conservatives and liberals bring to issues different presumptions; they see the same issues from different perspectives. One and the same issue can represent quite different choices for those on the left and those on the right. From the point of view of a thorough-going conservative, making a decision about whether welfare assistance for blacks should be expanded or whether racial quotas should be imposed is easy; easy because, just insofar as a person is politically conservative, he or she will object to government activism of this stripe however he or she feels about blacks. In contrast, issues of race can be hard for those on the left precisely because they are vulnerable to being pulled in opposing directions depending on their feelings toward blacks, inclined to

favor government activism to assist blacks because they are liberals but tempted to oppose it if they dislike blacks. In a word, liberals are cross-pressured in their attitudes toward racial public policies in a way that conservatives are not. There is is then, we would hypothesize, a significant asymmetry to the politics of race. The left should find it more difficult, the right easier, to mobilize support. Liberals should be more likely to defect insofar as they dislike blacks; conservatives, more likely to stay in place even if they like blacks. Prejudice will play a major role in shaping the thinking of those on the left, a minor one in shaping the thinking of those on the right.

Prejudice, Ideology and Racial Policy Preference

Previous research certainly has shown or implied an association between negative stereotyping of blacks and ideological orientation (Adorno et al. 1950; Sears, Hensler and Speer 1979; Sniderman et al 1991b), and it is part of the broader lore that conservatives are more likely than liberals to evaluate blacks negatively, and perhaps particularly with respect to the (perceived) failure of blacks to uphold the tenets of the Protestant Ethic (Kinder and Sears 1981; Sniderman et al. 1991a). Popular impressions notwithstanding, however, studies of the distribution of racial stereotypes in the general population are notable chiefly by their absence.[1] Accordingly a major objective of the Race and American Politics Project[2] was to establish the actual frequencies with which a representative cross-sectional sample of white Americans endorse negative stereotypes of blacks. Following the path of Rothbart and John (1932), the Project developed a battery of racial stereotypes canvassing a range of negative characteristics commonly attributed

to blacks. In all five stereotypes were covered -- namely, whether blacks tend to be "aggressive or violent," "lazy," "boastful," "irresponsible," and "complaining." Given the desirability of avoiding either-or choices which require unconditional acceptance or rejection of a stereotype, respondents were instead asked to indicate how good a description of blacks each of these characterizations were; the higher the score, which could range from 0 to 10, the more accurate they believed the negative characterization to be. Table 1 describes the percentage of the white population as a whole agreeing and disagreeing with negative racial stereotypes[3], plus the percentages of (self-identified) liberals, moderates, conservatives, and those without an ideological identity agreeing with them. In addition, responses to the five negative stereotypes have been summed to form the Index of Negative Stereotypes,[4] and the scores of all groups on the trichotomized Index are also presented.

Insert Table 1 About Here

Are conservatives markedly more likely than liberals to agree with negative stereotypes of blacks? Conservatives are always more likely than liberals to indicate a negative characterization is an accurate description of blacks as a group, although those who characterize themselves as either middle-of-the-road or as lacking an ideological orientation altogether are still more likely to view blacks negatively. But although we would emphasize the consistency of these differences, we must also point out their weakness. Of the five observed differences, only two are statistically significant -- "lazy" and "complaining" -- and in each case the difference between (self-identified) liberals and conservatives is by no means enormous -- about one half a scale point. It is necessary to recognize both that conservatives are

(slightly) more likely to accept negative characterizations of blacks and that a substantial number of (self-identified) liberals accept a substantial number of negative characterizations of blacks -- very nearly half of them describe blacks as aggressive or violent, four in every ten of them describe blacks as boastful, and three in every ten describe them as complaining. Differently put, the most striking result is the sheer frequency with which negative characterizations of blacks are quite openly expressed throughout the white general population. Quite simply, in every instance but one, at least as many whites accept a negative characterization of blacks as reject it.

Our central concern, however, is not the relative frequency of racial stereotyping among white Americans but their importance in shaping their thinking on racial issues. Table 2 accordingly reports the correlations, depending on ideological self-identification, between the Index of Negative Stereotypes and positions taken on an array of specific racial policies, including more jobs for blacks, fighting discrimination, welfare, fair housing vs. property rights, employment quotas, and affirmative action in higher education. Taking the public as a whole, issue positions and racial prejudice are only modestly connected. Prejudice's impact is largest for the issue of government spending to promote black employment, but even here -- at its largest -- the correlation is conspicuously modest ($r=.20$), and across the full array of different formulations of racial issues, from social welfare through affirmative action, the mean correlation between policy position and racial prejudice is small indeed ($r=.12$). On the basis of the modesty of these zero order correlations, it is surely tempting to conclude that prejudice has been reduced to a minor force in shaping the views of ordinary Americans about contemporary issues of race. Tempting but wrong: if prejudice

plays only a minor role in the public as a whole, it is a major factor shaping the thinking of liberals. On the issue of government spending for black jobs, for example, the correlation between issue positions and prejudice is .39. Indeed, across a number of issues, the role of prejudice in shaping the political thinking of liberals is striking, including fighting racial discrimination in employment (r=.36), when property rights and fair housing explicitly conflict (r=.34), welfare (r=.27), when quotas should be imposed on companies that discriminate (r=.31), and when preferential treatment should be given to blacks in university admission (r=.32). In contrast, correlations between issue position and prejudice among conservatives are to all intents and purposes negligible. The largest is .12, and the mean is .07. By way of corroboratory evidence, Table 2 also reports correlations between prejudice and issue positions by partisanship.[5] The pattern of results for partisanship matches exactly those for ideology.[6] Prejudice is markedly more important for Democrats than for Republicans; indeed, correlations between prejudice and policy preference are larger for Democrats than for Republicans by nearly a factor of three.

Insert Table 2 About Here

Issue positions are recorded in pro-con form, and given that the dependent variable is dichotomous, a logit regression analysis has been performed. Table A(ppendix)1 reports the beta coefficients and associated standard errors from this analysis. These coefficients, comparable to slope coefficients in ordinary least squares regression, further confirm that prejudice has a significant effect on racial policy preferences among liberals (and Democrats) but not among conservatives (and Republicans). Since summary measures can be ambiguous, and more particularly since correlation

coefficients comparing different subgroups of an overall population can be misleading, Table 3 presents a further analysis documenting the asymmetry of race as a political issue and driving home its political complications. The table compares the mean position on an array of racial issues of four groups of white respondents: liberals who like blacks, liberals who dislike blacks, conservatives who like blacks, and conservatives who dislike blacks.[7] Looking first at the conservatives, one can see that anti-black conservatives, not surprisingly, seem to be less supportive of these racial policies than pro-black conservatives. But the key point is that these differences are exceedingly small. In fact, not one of these mean differences is statistically significant, as revealed by the t tests in column 5. How conservatives feel about blacks is virtually irrelevant to the stand they take on government assistance to blacks. Conservatives who like blacks are just as likely to take conservative stands on racial issues as conservatives who dislike blacks. By contrast, white liberals who like blacks take more liberal stands on racial issues than white liberals who dislike blacks -- and, in this instance, the t values in column 6 indicate that all but one of the mean differences reach statistical significance. In short, the camp programmatically committed to government assistance for blacks is split by a cleavage defined by their feelings about blacks, with those who like them on one side of the political divide and those who dislike them on the other.

Insert Table 3 About Here

How deep is this cleavage? Comparing the racial stands of liberals who dislike blacks and conservatives who like blacks, Column 7 shows that not a single one of these mean differences is statistically significant. Liberals with negative feelings toward blacks take positions across an array of racial

issues indistinguishable from those assumed by conservatives -- even conservatives who like blacks. Table 4 presents comparable analyses, substituting party identification for ideological self-identification. Democrats who like blacks are the politically isolated group -- the only group that consistently supports these racial policies. As the t tests make plain, Democrats who like blacks are significantly more likely to support these racial initiatives than anti-black Democrats. Regardless of their feelings toward blacks, they consistently oppose these policies; and the measure of their defection is, quite simply, that they are as likely as Republicans to take an opposition stance on racial issues. There is of course no comparable division among Republicans, and the result is that prejudice among Democrats bolsters support for conservative positions whereas pro-black sentiment among Republicans provides no additional support for liberal positions.

Insert Table 4 About Here

All these results demonstrate the asymmetry of race as a political issue. On issues of race, the right seems to enjoy its own strength plus a portion of the left's. But perhaps the appearance of a cleavage on the left is more illusory than real. In particular, a pair of contrasting counter-arguments deserve consideration. On the one side, the appearance of cleavage on the left may be illusory because liberals who dislike blacks are liberal in name only. On the other side, the lack of cleavage on the right may be illusory because conservatives who like blacks and nonetheless take conservative positions on racial issues only <u>say</u> that they like blacks.

We will take up the two questions -- Are liberals who dislike blacks really liberal? Do conservatives who say that they like blacks really like them? -- in order.

Cleavage on the left: illusion or reality

The ideological labels that ordinary citizens pin on themselves can be misleading, notoriously so, and it is, in consequence, not difficult to imagine that many of those who dislike blacks and yet describe themselves as "liberal" in their political orientation may be liberal in name only. If so, the cleavage on the left is more illusory than real, a byproduct of a wish by some to see themselves -- or to be seen by others -- as adhering to the left when in fact they belong to the right. In assessing whether their adherence to liberalism is indeed sincere, we shall consider two quite different kinds of evidence -- one conventional and overt, the explicit positions that liberals take on a range of issues, the other more novel and covert -- the length of time they take to answer a racially charged question.

Table 5 accordingly compares the positions, first of liberals and conservatives, then of Democrats and Republicans, on mainstream social welfare issues, depending on their feelings toward blacks. The issues include government spending to reduce unemployment, narrowing the gap between rich and poor, caring for the homeless, providing medical insurance for the unemployed, and repealing tax breaks for the rich. The results are striking and consistent. Liberals who dislike blacks are just as likely to believe that government should offer spend more money to reduce unemployment and should narrow the gap in income between the rich and the poor; just as likely, also, to attach importance to taking care of the homeless; and just as likely, finally, to get angry over special benefits like tax breaks going to the richest people and biggest businesses and the lack of affordable medical care for people who don't have jobs. In short, on bread-and-butter social welfare

issues, liberals who dislike blacks are just as liberal as liberals who like blacks; they are not liberals in name only.

Insert Table 5 About Here

But their social welfare liberalism goes hand-in-hand with a pair of concerns that define two of the most prominent features of white reaction since the eruption of race riots in the mid 1960s and the emergence of affirmative action in the early 1970s -- a concern over law and order and anger and resentment over never-ending (in their eyes) black complaints of unfair treatment. The Race and Politics Study has a triad of measures of a concern for order -- the importance people attach to strengthening law and order, to ensuring respect for authority, and to maintaining respect for America's power in the world -- and as Table 6 shows, all three (and particularly the first of the three) are markedly correlated with disliking blacks among white liberals. In addition, agreement with negative stereotypes is also markedly correlated, again among white liberals, with anger over giving blacks and other minorities special advantages in jobs and schools and -- above all -- with anger at spokesmen for minorities who are always complaining that blacks are being discriminated against. Regressing the Index of Negative Stereotypes on all the indicators shown in the upper panel of Table 7 drives home the absolutely dominating role of anger over "spokesmen for minorities who are always complaining that blacks are being discriminated against." It is not merely that this item has the largest coefficient but -- still more strikingly -- none of the other beta coefficients even attains statistical significance. We shall return to this result in the conclusion, paying particular attention to the light it throws on the politicization of race as a political issue. Here, however, we want to consider a new form of

evidence that race has become a hard issue for those on the left caught between the pull of their political convictions and the push of their dislike of blacks.

Insert Tables 6 and 7 About Here

If race is indeed a "hard" issue for some on the left, then they should take longer in coming up with a response to an issue of race. The faster the response time, other things equal, the easier the issue; the slower, the harder the issue. Taking advantage of computer-assisted interviewing, response time was measured in the hundredths of seconds between the time that the interviewer finished reading a target question and the respondent began to answer. Reaction time was measured in response to a question which asks about support for job training and welfare programs, with the beneficiaries of the program for a random half of the sample being "blacks and minorities," and for the other half, "new immigrants from Europe." Since this question occurs very near the beginning of the interview, and (for half of the sample) constitutes the first mention of race, respondents have not yet been had an opportunity to rehearse their responses to issues of race. If race is indeed a harder issue for liberals who dislike blacks, they should find the question harder -- hence, take a relatively long time to respond -- when it refers to blacks and minorities and find the question easier -- hence take a relatively short time to respond -- when it refers to new immigrants from Europe.

Table 8 presents the mean reaction time[8] controlling simultaneously for ideological self-identification and affect toward blacks and comparing (in the upper and lower panels, respectively) response time depending on whether the issue is racial or not. As the figures make plain, in taking a position on whether blacks and minorities should be given assistance, liberals who dislike

blacks are approximately one half of a second slower than are liberals who like blacks. But it is not true that liberals with negative feelings toward blacks are -- for whatever reason -- slower in answering any question whether it refers to blacks or not. As the results summarized in Table 8 clearly show, liberals who dislike blacks are nearly a second faster (x=109.6) in answering the question when it is asked in terms of new immigrants from Europe receiving assistance than when it is phrased in terms of blacks and minorities benefiting (x=206.3). Liberals who dislike blacks find race, as the response time results make plain, a hard issue for them.

Insert Table 8 About Here

What, then, can and should be said about conservatives who say they feel positively about blacks? Are they only saying what they think they ought to say, or is there reason to think that they are being sincere? For that matter, may conservatives who like blacks conform all the same to a conservative line on racial issues not because their positive feelings toward blacks are a sham, but because they are superficial and lack the power to influence their behavior? The crux of the matter is conservative opposition not to the new agenda of race policies like affirmative action, which have a character and politics of their own (Sniderman and Piazza, 1993), but to longstanding government efforts to improve the social and economic position of blacks. Is the conservative opposition born of a political conviction that such social welfare policies are ill-designed to remedy problems of poverty? Or is it driven by ill-will and lack of sympathy for blacks? The "government dependency" experiment is designed to determine to what extent conservatives' opposition to government assistance is driven by considerations of race. Very briefly, in the first -- or "poverty" -- condition a (randomly selected) set

of respondents is asked to respond to the following statement:

> "Most poor people these days would rather take assistance from the government than make it on their own through hard work."

In the second -- or "race" -- condition a second (randomly selected) set of respondents is asked to respond to the statement:

> "Most blacks these days would rather take assistance from the government than make it on their own through hard work."

Finally, in the third -- or "combined" -- condition, yet another (randomly selected) set of respondents is asked to respond to the statement:

> "Most poor blacks these days would rather take assistance from the government than make it on their own through hard work."

It should be emphasized that the three statements are exactly alike but for the variation in the description of recipients. Given our particular interest in whether conservatives who say they like blacks are being sincere, we shall concentrate on the responses of conservatives (and Republicans), although for the sake of completeness the responses of liberals (and Democrats) will also be reported.[9]

The reason for the absence of defection on the right comparable to the one on the left, we have suggested, is not that conservatives who report relatively positive feelings toward blacks are being insincere but rather that these feelings are, from their perspective as conservatives, irrelevant to taking a position on a racial policy issue. After all, from the perspective a person on the right, government should be restricted to a narrow social welfare role and it ought to be so restricted whether the group to benefit is blacks or women or whoever. But if this reasoning is correct, then even though conservatives who like blacks do not deviate on issues of public policy, they should respond markedly more positively to blacks outside of the context of the government's agenda than their fellow conservatives who dislike

blacks. In terms of the "government dependency" experiment, conservatives with relatively positive feelings toward blacks should be markedly less likely than those with relatively negative feelings toward blacks to agree that blacks "these days would rather take assistance from the government than make it on their own through hard work." For if they are not less likely to stigmatize blacks, it must be accepted that they do not mean what they say when they say they think highly of blacks. In addition, and more subtly, if conservatives who score as positive in their feelings toward blacks are opposing government assistance for blacks out of political conviction and have not merely simulated a positive regard for blacks, then two things should follow. They should manifest their conservatism by characterizing the "poor" who avail themselves of government services as people who "would rather take assistance from the government than make it on their own through hard work;" and, indeed, in the identical circumstances, they should respond more negatively to a person who is poor than to one is black.

Insert Table 9 About Here

Table 9 shows the percentage of whites saying that "poor people," "blacks," or "poor blacks" would rather take assistance from the government than make it on their own through hard work depending on their feelings toward blacks and their ideological (or partisan) orientation. Two aspects of the results deserve to be underlined. First, the more positive whites' feelings toward blacks -- whether described simply as blacks or as poor blacks -- the less likely they are to say they want to exploit government assistance; and this is just as true for whites on the right as for those on the left. By way of example, 78 percent of Democrats -- and 79 percent of Republicans -- with relatively negative feelings toward blacks believe that poor blacks exploit

government assistance, compared to only 31 percent of Democrats -- and 39 percent of Republicans -- with positive feelings toward blacks. The second result is still more striking. If conservatives who say they like blacks are engaging in a sham, and they do not genuinely feel positively toward blacks, there is no mystery at all about why they oppose government assistance for blacks. The "government dependency" experiment provides a severe test of whether a sham is being perpetrated. For one test of whether conservatives who say they feel positively toward blacks mean what they say is whether they respond not simply as positively to blacks as to people who are poor, but whether they respond even more positively to blacks than to people who are poor -- but not necessarily black.[10] And, indeed, as Table 9 shows, conservatives who like blacks are more likely to believe that the poor take advantage of government assistance than that blacks do so. Specifically, 47 percent of them believe that poor people prefer to take advantage of government assistance than to take care of their problems, as compared to only 22 percent of them who believe the same about blacks.

Even so, it could be argued that the results of the government dependency experiment show not that conservatives who say they like blacks should be taken at their word, but rather that such conservatives are sensitive to social desirability pressures. They are indeed consistent -- saying they like blacks when asked to describe what blacks are like, and they are less inclined to describe them as parasitic on government assistance: but perhaps they say both of these things to present a socially desirable image of themselves?

Arguments invoking considerations of social desirability are notoriously difficult to assess empirically, but the "government dependency" experiment

was designed to provide a honest check on impression management. It accordingly contrasts three conditions -- when the beneficiaries of government help are described as "poor people," "blacks," and "poor blacks," respectively. Notice that, in Table 9, conservatives who like blacks are as likely to say that poor blacks take advantage of government assistance as do poor people. They are thus not unwilling to express negative reactions to blacks. As conservatives, they are apprehensive about the abuse of government help and they express this apprehension as readily when blacks are involved as when they are not -- as long as they are poor. In short, the trigger that leads to increased apprehension among pro-black conservatives is "poor," not "blacks."

All the various lines of evidence, then, converge: all run against the suggestion that conservatives who score low on the Index of Negative Stereotypes are saying not what they think but what they think they should say.

Conclusions

A generation ago, at the height of the civil rights movement, the politics of race was captured in Philip Converse's (1964) classic study of American public opinion. Whites, Converse argued, were driven by their feelings toward blacks. They took the stands they did on issues of race, not because of their convictions about the aims of particular racial policies, not even because of their views about the methods by which particular policies proposed to accomplish their objectives. On the contrary, from the point of view of the ordinary white, they all boiled down to "the same single question:" how whites felt about blacks. A generation later, our results

suggest, there has been a fundamental change. It is not that prejudice has disappeared or that it no longer matters. But rather than prejudice defining the politics of race, politics now defines the role of prejudice.

What does it mean to say that the clash over race is now, at its core, an argument over politics? Most crucially, the apparent eclipse of prejudice itself as a force propelling white reactions to issues of race is clarified. Prejudice gives the appearance of having dried up as a wellspring of white reactions, judged by the strikingly modest correlations between how whites -- taken as a whole -- feel about blacks and the positions they take on issues of public policy dealing with blacks. But that only appears to be the case, as we have seen, if no attention is paid to what citizens -- as political actors -- believe is expected of them. Race has become a hard issue for those on the left, an easy issue for those on the right, and failing to realize this results in markedly and systematically underestimating the continuing importance of prejudice in the political thinking of white Americans.

There is now a fundamental asymmetry to the politics of race. Prejudice remains a politically significant factor, but its influence is now most pronounced exactly where it is least suspected. It is common to think of the politics of race as defined by an alliance between conservatism and racism, but an alliance in which ideology has been buttressed by serving as a screen for bigotry. It has been natural to view prejudice rather than conservatism as the driving force in part because of the debunking thrust of public opinion research. The ordinary American, we have been repeatedly assured, knows and cares little about larger political ideas; indeed, is, in a striking phrase, "innocent of ideology" (Kinder, 1983). But part of what we mean by asserting that politics shapes the contemporary argument over race is that substantial

numbers of Americans see issues of race as presenting political choices -- that is, choices they approach in the light of their larger political commitments. From the point of view of a person who has made a commitment to a conservative perspective, a suggestion that still more government money be spent or yet another governmental agency be established to assist blacks will not seem a surpassingly sensible idea; and it will not appear more sensible even if he or she quite sincerely rejects the ragbag of stereotypes about blacks. And, as we have seen, what white conservatives think about blacks -- even if they harbor no hint of prejudice toward them -- does not affect their position on racial positions. They remain largely opposed to such policies precisely because they are conservatives. Conversely, prejudice is politically strongest just where it is supposedly weakest -- on the left, in the ranks of liberals and Democrats. It is politically strongest there, precisely because those on the left know they ought to support an unqualified effort to overcome racial inequality and to a remarkable extent <u>do</u> throw themselves behind a legislative program to assist blacks. Yet a sizeable minority of white liberals now seem to sufficiently dislike blacks that they no longer support the liberal racial program. They may be liberals but they are not racial liberals.

In a word, politics matters more than many students of politics have appreciated. Political considerations count in and of themselves, and count yet again insofar as they define the relevance of other considerations. Prejudice counts for more politically on the left than on the right, not because the left is more prejudiced than the right -- if anything the opposite is true -- but because politics determines when prejudice matters.

Indeed, it is only against a background of politics that the deeply

paradoxical character of race as an issue in American public life makes sense. "White flight" has become a pervasive theme in the study of race. Quantitative analyses of elections, both national and local, emphasize the defection of whites who once belonged to the liberal, Democratic coalition (Huckfeldt and Kohfeld 1989; Edsall and Edsall 1991), while ethnographic studies detail a kaleidoscope of traditional Democratic party constituencies, elderly Jews in Canarsie, Irish Catholic parents in Roxbury, working class whites in rustbelt cities, who see themselves as having been deserted by the Democratic party and left to bear the brunt of housing projects, busing, and residential integration (Rieder 1985; Levine and Harmon 1992). This story of Democratic vulnerability to defection on the basis of race has become part of the conventional wisdom of American politics, and indeed, has become one of strategic principles defining Democratic electoral strategies, most obviously but by no means exclusively at the presidential level. Yet, the "white flight" theory has paradoxically carried with it an implicit note of reassurance. The vulnerability of the left is only temporary; it would -- indeed, it necessarily must -- diminish as those most susceptible to racial appeals crossed over from Democratic to Republican ranks.

Our results suggest that race is likely to prove a continuing quandary for the left. On one side, whites on the left who have a negative view of blacks are as far to the left on bread-and-butter elements of social welfare liberalism as are those who have a positive view of blacks: they cannot readily move permanently to the right, even if they give their vote from time to time to candidates on the right; they are held in place by their political convictions. On the other side, the general thrust of liberal opinion, together with the rise of black leadership, above all, in the Democratic

party, have fixed attention on racial inequity and fixed also the terms of its public discussion; in turn, the very success achieved in this has reinforced the reaction of some white liberals against blacks -- as we have seen, anger and resentment at "spokesmen for minorities who are always complaining that blacks are being discriminated against" is far and away the most powerful correlate of negative stereotypes among white liberals. And the clash between these two sides is unlikely in the near term to ease, and may well worsen, because the dilemmas of race in American life are rooted fundamentally in the abiding meanness of life for many blacks -- in the mounting violence, the increasing poverty, the sheer tenacity of the prejudice that scars so many of their lives. The fact that liberalism now finds itself partly stymied by prejudice on its own side of the political aisle is thus not just a new datum about contemporary America but a fundamental feature of our political life.

APPENDIX

SAMPLE DESCRIPTION

We shall rely on data from a new national telephone survey -- the Race and American Politics Study -- to explore these issues. The survey, funded by the National Science Foundation, was carried out on a nationwide random-digit telephone sample that the Survey Research Center of the University of California, Berkeley designed. The target population for the study is all English-speaking adults, 18 years of age or older, residing in households with telephones, within the 48 contiguous states. An unusually large number of interviews, 2223, were completed, with a 65.3% response rate.

Because the telephone interviews, which the Survey Research Center of the University of California also conducted, were computer-assisted, we were able to randomize many elements of the questionnaire, including some items discussed in this paper. The interviewing was implemented using the CASES software developed by the Computer-Assisted Survey Methods Program of the University of California, Berkeley.

The sample of telephone numbers for this survey was generated using a new stratified two-phase procedure that produced a high proportion of households in the sample, yet did not require the replacement methodology of the two-stage Mitofsky-Waksberg method. A discussion of the sampling methodology used for this study can be found in R.J. Casady and J.M. Lepkowski "Optimal Allocation for Stratified Telephone Survey Designs," Proceedings of the Section on Survey Research Methods, American Statistical Association, 1991. The sampling was carried out in the following steps:

1. The area code and prefix combinations on the AT&T Bellcore tape were ordered geographically, and a large first-phase sample of those combinations was selected with systematic random sampling. Four-digit random numbers were appended to the area code and prefix combinations to generate complete telephone numbers.

2. The selected first-phase telephone numbers were compared with a tape created by Donnelley Marketing Services, which gives the number of listed residential telephone numbers in each series of one hundred numbers -- that is, how many residential telephone numbers in phone directories begin with the same eight digits. Based on this information the selected telephone numbers were placed into two strata -- telephone numbers from series with no residential listings, and telephone numbers from series with at least one listing.

3. From the stratified pool of first-phase selections, a second-phase sample was drawn. Many replicate samples of telephone numbers were drawn from the stratum containing telephone numbers from series of numbers with at least one residential listing; a random sample of telephone numbers was also drawn from the other stratum, but with a smaller sampling fraction. This method of disproportionate sampling resulted in the selection of a second-phase sample in which approximately half of the selected telephone numbers turned out to be households. The difference in selection probabilities between the two strata is compensated for by using weights. Only four cases were completed from the zero-listing stratum, but they receive weights of 10.3, relative to cases in the main sample.

4. A small supplementary sample of telephone numbers from new prefixes was also drawn, to compensate for the fact that the major sampling work

described above was carried out several months before the beginning of this study. A new Bellcore tape was obtained, and 761 area code and prefix combinations that had not appeared on the older tape were identified. A sample of 102 such prefixes was selected at random, and four-digit random numbers were appended to each selected prefix to generate the supplementary sample. Of those 102 numbers, 6 turned out to be households, and interviews were completed at 5 of them. Those completed cases receive weights of 3.0, relative to cases in the main sample.

In addition to the weighting adjustments for selection probabilities already mentioned, the weight used for analysis incorporated adjustments for number of telephone lines and number of eligible adults in the household. The final weight also included poststratification adjustments for gender, race, age, and education. The variance of the weight is .45 for all cases; it is .42 for whites alone.

Notes

1. In their seminal study, Schuman, Steeh and Bob (1985) exhaustively combed the files of the principal longitudinal surveys -- the National Election Studies, the General Social Survey and Gallup -- and were able to identify only a handful of questions dealing with how whites felt about blacks, only one of which matches the definition of a stereotype. Until recently, the only validated studies of racial stereotypes held by white Americans were confined to sample of college undergraduates (Katz and Braly, 1933; Rothbart and John 1993). What has passed for measures of racial stereotypes have been negative characterizations typically taking the form of statements like "Most blacks on welfare could get a job if they really wanted one," a statement conservatives are more likely to agree with if only because they are more likely to believe that everyone on welfare could get a job if they really wanted one. See below for results on the "government dependency" experiment for a demonstration of this.

2. The details of the survey are reported in Appendix A.

3. Disagreement is defined as assigning a score of 0 to 4, neutral as assigning a score of 5, agreement as assigning a score of 6 to 10.

4. The mean intercorrelation of the five negative racial stereotypes is .45, and the correlation between the overall Index of Negative Stereotypes and an index of Anti-Semitism is .39.

5.. Following Keith et al. (1992), party identification takes the standard measure and classifies "leaning" Democrats and Republicans as partisans. Exactly the same pattern of results is observed, it should be added, if leaners are classified as Independents.

6.. The consistency of the pattern is striking, although the absolute size of the coefficients tends to be smaller for partisanship (Democrats) than for ideology (liberals), which is just as it should be, since partisanship is a more indirect (and less valid) measure of political orientation than ideology.

7.. "Liking" and "disliking" blacks is a measure derived from the Index of Negative Racial Stereotypes. Respondents were divided into equal thirds depending on their score on the Index. Those scoring in the highest one-third are considered to dislike blacks or are anti-black whereas those scoring in the lowest one-third are considered to like blacks or are pro-black; the middle third of the respondents is excluded from the analysis since we have no expectations about how their attitudes toward blacks would affect their policy attitudes.

8.. Following convention, outliers are chopped off; see Bassilli and Fletcher, 1991.

9. Responses are scored in a modified Likert format: strongly agree, somewhat agree, somewhat disagree, strongly disagree.

10. For the record, there is no significant difference between conservatives and liberals who like blacks in the percentage of the poor who they believe to be black.

WESTERN SPACES AND DEMOCRACY: RESISTANCE AND ACCOMMODATION IN REFUGEE AND IMMIGRANT MOVEMENTS

Nevzat Soguk
Department of Political Science
Arizona State University
Tempe, Arizona 85287-2001

DRAFT

©

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993.

Introduction

This paper explores the impact of refugee movements on the perceptions and practices of democracy and its proper subjects in the Western spaces such as France, Germany, England, the Netherlands, Switzerland, and Austria . The underlying argument of the paper is that refugees and immigrants have increasingly become by virtue of their mobility and visibility the objects/subjects of change in the construction, and re-conceptualization of the notion of democracy, democratic practices, their scope and meanings. Their subjectivity is both resistant and accommodative, and finds expression in the middle of increasing agitation and incitement around their names.

Refugees and immigrants are resistant in so far as they transgress political and cultural borders and boundaries, and undermine familiar meanings of democratic life and its institutions as the domain of "citizen". Their movements partake in the activities that construct and negotiate new identities for the subject of democracy in the Western spaces. They are also accommodative or recuperative of some of the conventional practices of democracy in as much as they participate in the exclusionary legal, cultural, political and economic practices of a specific kind of democracy (which privilege citizen as the proper entity adequate to the task democracy and the sovereign territorial state as the facilitator of the conditions of democracy).

Against such a background, this paper has two overlapping and ontologically linked objectives. The first is to analyze the significant impact of refugees and immigrant movements on the rethinking and reconceptualizations of the traditional citizen-oriented conceptions of democracy in the contemporary times in the Western spaces.
To the degree that the conventional conceptualizations of democracy and democratic practices are predicated on the existence of a well-bounded, sovereign, territory under the control of the forces of the modern state; the second objective then, is to study and understand the reconceptualizations of democracy and democratic practices *vis a vis* refugee and immigrant movements as activities that simultaneously problematize--undermine and/or reaffirm-the images of modern territorial state. A claim is made here that the reconceptualizations of democracy are reconceptualizations (problematizations) also of the modern state, and its territoriality.

The notion of problematization is crucial for this study. Problematization is defined by Michel Foucault as "the totality of discursive and non-discursive practices that introduces something into the play of true and false and constitutes it as an object for thought (whether in the form of moral reflection, scientific knowledge, political analysis, etc.) (Foucault, 1988: 257).

Informed with this meaning of problematization, the paper starts with some reflections on the proliferation of activities around the names of the

refugee and immigrant in order to point out the referentiality of the paradoxical--resistant and accommodative -- nature of the refugee and immigrant movements. The proliferation of activities are understood as the activities of problematization that introduce refugee and immigrant categories into the politics of (writing) democracy and state sovereignty as both objects and subjects, that is, as elements that are exploited for the affirmation of the discourse of democracy as simultaneously also the discourse of sovereign territoriality.

Elaboration of the notion of problematization is followed by a section in which the paper explores the connections between the notion of citizen-oriented democracy and sovereignty. The section builds on the ideas of William Connolly on democracy and territoriality. However, it attempts to advance Connolly's arguments on two different fronts.

First, the paper introduces the linkage between refugee and immigrant discourses and the question of the territorial democracy; a linkage that hardly figures in the studies on the discourse of democracy. Second, the paper argues that deterritorialization (or "disaggregation") of democracy under postmodern pressures is not free from the challenges of the recuperative strategies of the territorial statism. Accommodative activities and problematizations of refugees and immigrants, in terms that privilege integration, citizenship, are explored as examples of sovereignty practices that continually attempt to produce, transform and stabilize specific aspects of what it means to claim to be the sovereign state.

Finally, in the last section, problematizations of the notion of democracy and democratic practices are grounded against the occurrences in the European spaces and their connections with the notion of state sovereignty explored. The paper establishes that politics of problematization, that is, constructing and maintaining fields of refugee and immigrant identity, and continuous activities in/around them, far from being humanitarian and managerial issues of marginal importance, are crucial to the hierarchy of State/Nation/community/ citizen. All of which is done by way a series of interpretive readings rooted in problematization as a strategy of knowledge and praxis.

Refugees, Immigrants, Identity Politics and the Paradox of Refugeeism:

In recent years, the refugee and immigrant phenomena have unmistakably come to the fore. Contributing to this visibility is the mobility of millions of people across the globe from the Middle East to the former Soviet Union and Yugoslavia, and to regions of Africa and the Americas. Suffering or affected by poverty, famine, natural disasters, military coups, civil wars, slow-working societal disjunctures, or enamored of the "imagined possibilities" of other homelands in distant places, a steady flux of people adds up to the world's "refugee" and migrant population. The enormous political, social, and technological changes and transformations trigger mass movements of people in search of "better" and "safer" places. Ironically, in

the case of refugees, it is also the immobility of people that is increasingly becoming an element in the accentuation and visibility of "refugee" situations. The case of Bosnia and Herzegovina, with thousands of people "immobilized" in towns like Srebrenica, Tuzla, and Sarejevo is a testimony to the visibility of immobility as an element of refugeeness.

Seeing the world as a continuous space with countless imagined possibilities, many in Sri Lanka, Turkey, or Algeria turn into immigrants, refugees and strangers in their inertia in the midst of their native places. Movements of the mind, driven by the double desires of better and safer places outpace the movements of the body as people consider the possibilities of other homelands in distant places. Concomitantly, refugee and migrant images, thriving in scenes of movements and "non-movements", continue to proliferate in the face of the traditional conceptualizations of refugee and immigrant gradually blurring the imagined clarity of identity borders and boundaries.

The questions as to "who is a true refugee, and who is a true immigrant"? are confronted with unsure explanations. Although numerous familiar definitions are in circulation, there is also an increasing agitation and incitement around the names of refugee and immigrant in the quest for new images, definitions, and labels. All the while, parties, whether governments or not, express their confusion as to how to distinguish a "real" refugee from an immigrant or the political refugee from an economic refugee (who is also an immigrant), or the forced migrant (who is also considered a refugee) from a voluntary migrant, or an involuntary migrant from an internally displaced person, and on and on. Yet this seeming confusion seems also the source of all kinds of activities that are intent on "rewriting", or in Michel Foucault's terminology, problematizing the refugee and immigrant categories in order to service a multitude of interests. The activities of writing refugee or immigrant increasingly command a central place ever-more and ever-intense than in any period in memorable history.

I

Now, take the issue of defining and determining who is a real refugee, and the difficulties of the agitation become manifest.

At first, it seems hardly any difficult for one to distinguish a bus full of Bosnian or Kurdish "refugees" from a bus full of "tourists", or, in a similar way, the inhabitants of a Mediterranean Club on the Turkish coastline from the inhabitants of a barbed-wired "refugee" camp on the Turkish borderline with Iraq. But questions as to the politics of labeling in the midst of seeming confusion loom larger and heavier. By whose vocabulary and by way of what practices are tourist marked as tourists and refugees as refugees? Is so marking just a practical exigency of life without power implications? What are the implications of those vocabularies and practices around the corner once it is out of sight?

To intimations revolving around these questions, there is the quick reply that starts with a "lesson" on the distinctions between "economic refugees" and "political refugees". This distinction underlines what nowadays

is the "privileged", idealized refugee category as written in the conventions and protocols of the United Nations, OAU (Organization of African Unity), OAS (Organization of American States), European Community and so on. According to the idealized definition of "refugee phenomenon", refugee is an individual who "owing to a well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country." (Mayotte, 1992: 3)

If you ask the Bosnian woman in the UN truck leading out of Srebrenica, she confesses to her unawareness of the reasons and requirements of the idealized definition. For her, refugee is a person (herself) who very desperately wants to get in that UN truck into "relative safety" out of a death zone. She whispers hurriedly, "that is all I want to be for now, that is all I can afford to be, for I want to 'live'". In that sense, "refugee" might just be a person whose "usual" everyday sources of identity are no more possible to invoke effectively, and for whom, not only the epistemological and ontological instruments/technologies of "usual self" are rendered ineffective, but also the possibilities of physical existence are greatly curtailed. Put simply and succinctly, refugee becomes a person (or a person becomes a refugee) who is "on the run" from some danger, however the danger is perceived.

If you ask Julia Kristeva, "we are all refugees and immigrants", that is, we are all strangers first and foremost to ourselves in the heart of this identity we call community (Kristeva,1991 and 1992). Preceding Kristeva, Nietzsche (1987) forcefully argues the same point in On the Genealogy of Morals. William Connolly (1987) takes up his line to suggest that we are deeply "homesick" for the identity "homes" (of cultural, political and aesthetic nature) that we have never had but, have always been in search of. In other words, insomuch as we are not the "men of knowledge" with respect to ourselves, whether we are in that bus out of Srebrenica or in the Mediterranean Club on the Turkish coastline, we are all wanderers, only of different concerns and circumstances, in the shifting terrain of imagined identities (Warner 1993; Kristeva 1992).

Meditations on the question of "refugee" continues unabated. If you ask Lynelyn (1993), the answer turns existentialist, prodding one to look for some sort of "refugee consciousness" that recognizes itself as that of refugee. For Lynelyn Long, refugee exhibits a "hegemonized" consciousness in the face of the dominant consciousness of the "non-refugees". Concomitantly, being a refugee is a manifestation of "a defeat" in the networks of ethnologies of power (p.7).

If you ask Pierre Bourdieu (1986), the proposition that "we are all refugees" is not, and does not have to be, exclusive of the sensitivities, concerns and experiences of a Kristeva or an Algerian immigrant in France, a Turkish "Gastarbeiter" in Germany or a Kurdish exile in Sweden or the women in the U.N. truck in Srebrenica. For Bourdieu, what is imperative to recognize is the temporally and spatially unique/distinct/discursive qualities

of the experiences that color the taste/pain/hope of experiences. This recognition will then reveal the convenient yet arbitrary and "passing" quality of the "refugee" or " immigrant" categories to which people turn in order to make sense.

If you ask the professional politicians, the German Interior Minister or the Home Secretary of Britain, there is really no such thing as a "real refugee" but all illegal immigrants whose presence in "German soil" or in "English territory" spell out a clear danger to the security and stability of the authentic community, that is , Germany or England. If you listen to a young German in a CNN or NPR special on Immigration, refugee or immigrant is" the scum that roams the earth" who in the processes also "steals" 2000 Marks every month form the deserving true citizen-Germans like himself. Solution? Kick them all out!

If you ask the former Prime Minister of France, Jacques Chirac, immigrant or refugee is the smell and noise that is non-French, while the current Interior Minister, Charles Pasqua, argues that an illegal immigrant could be anybody reading the English edition, International Herald Tribune on the street. Expected action? Stop and check their identity and determine their Frenchness!

II.

In the face of this plurality of images as to who is a refugee or immigrant and who is not, while the uneasy scholar frantically cries out pointing to the problematic nature of the attempts to attribute "essences" to refugee and immigrant situations, agitation around the names of refugee and immigrant continues. The name of the refugee and immigrant is summoned to speak of "security", "political stability", "democracy", "human rights", and "sovereignty" (Weiner, 1992; Loescher, 1992, Frelick, 1992). As Weiner (1992) affirmingly suggests, "Heads of states, cabinets, and key ministers involved in defense, internal security, and external relations focus their attention more on refugee and migration issues" (p.91).Think-tanks, bureaucracies, centers for international studies, policy groups on immigration and refugee issues, IGOs and INGOs, international financial and corporate institutions (Der Derian, 1993) turn to "refugees" and immigrants as proper subjects of new political and social "science". Scholarly and/or governmental conferences and meetings convene with a converging view to "study", "fully comprehend" and to "treat" the "refugee" "problem" or immigrant "invasion". Amendments and revisions in the relevant constitutions, laws, documents and declarations on refugees and immigrants are made so that the new aspects of refugeeness and immigration are safely covered.

Now, the curious question still waiting to be asked here is: "Why is all that agitation and incitement around the terms of refugee and immigrant just in these times and just in these ways?"

One answer to all such questions would be to argue that there are now more refugees and immigrants than ever before, and that this requires a high level of response. It is, it could be suggested, necessary to curb "illegal immigration" as the receiving countries cannot shoulder anymore the heavy,

unbearable social and economic burdens associated with immigration and refugeeism.

Without contesting the claim that there are many more millions of "moving" people in the world, I would like to try here to read a little more into the politics of new agitation around the names refugee and immigrant. I would like to do this by suggesting that, in the midst of this seeming confusion, there exists a myriad of activities working not so much to control the flow and mobility of peoples (for the people flow into and out of spaces in the face of all kinds of barriers), but to control the representations (images) with which political, social, and cultural images, and identities of community, non-community, belonging/citizenry, non-belonging or strangeness/refugeeness are constructed and maintained.

Such are the activities (of the control) of representations, that aim primarily at a fixed understanding of space, territory, and identity in the quest for constructing "representable" images, meanings, identities and cultures as belonging to a clearly and unambiguously demarcated territory (territorial state). In this sense, these activities are engaged not only in the construction of "referable" national physical borders and boundaries but also in the construction of "representable" cultural, political, economic identities (of bodies/spaces), ostensibly overlapping with the physical borders (Soguk, Forthcoming in Michael Shapiro, ed.).

These effects (nation, community, identity) are realized through the production and effective circulation of exclusionary definitions (representations) of world as consisting of "culture/nation gardens separated by boundary values" (Malkki,1992), and manifested in various aspects of state sovereignty. At a more visible level, the most effective of the sovereignty practices is the (re)inscription onto space/body dividing lines, imaginary or physical, separating those that belong to "us" and those that do not: foreign, unfamiliar, strange, alien, dangerous, and refugee (Ashley, 1989; Walker 1990 and 1991; Gupta and Ferguson 1992).

It is precisely at the juncture where a variety of identities (of community, non-community, home, exile and familiar and non-familiar) are negotiated, mediated, and represented as such that, I suggest, we might just be able to read that "little extra" into the politics of refugeeism and immigration.

My contention in this paper then is that these and other similar practices enable specific acts of problematizations; the totality of discursive and non-discursive activities that works to establish the boundaries re/constituting inside/outside, hierarchy/anarchy, citizen/refugee, security/danger-refugee, and democracy/non-democracy-refugee. In such problematizations, "refugee" and immigrant representations become instrumental in the boundary-establishing "identity" activities governed by a peculiar rationality which may have its stated as well as unstated objectives. While, for instance, the stated objective of the activities staged on refugee and immigrant bodies by states could be given as refugee protection, an unstated objective might just be to salvage the increasingly difficult claim by

the state that it is in control of its designated sovereign domain in the face of the movements of refugees and immigrants that challenge and expose the (non)-truth of that claim. I suggests that the presence of the bodies of those people marked as refugees and immigrants empower specific acts of problematizations by just being. This seemingly paradoxical situation can in fact be further explained with what I call the "Paradox of Refugeeism"[1] which is also applicable to the term illegal immigrant (Soguk, Forthcoming in Michael Shapiro, ed.).

According to the Paradox of Refugeeism, "refugee" bodies are seen simultaneously as undesired and desired objects . On the one hand , "refugees" are perceived and indeed represented as undesired bodies to the extent that they (refugees) undermine the images of "sovereign" site(s); the security, stability, relative homogeneity, democracy and so on. On the other hand, it is precisely in the event of representing the "undesirable" that "refugees" turn also into desired/ desirable subjects. Their desirability inheres the usefulness of a refugee category for a variety of sovereignty practices trying to recuperate that which is already under challenge, that is, the name and the image of the " territorial sovereign state" as the facilitator and even embodiment of security, stability and democracy.

Thus the supposedly neutral and marginal refugee category, in fact, remains rooted in the intersections of power relations. The presence of groups of peoples marked as "refugees" becomes party to a specific problematization; the interplay of "connections, encounters, supports, blockages, plays of forces, strategies and so on which at a given moment establish what subsequently counts as being self-evident, universal and necessary (Foucault 1991, 76) with respect to an issue or issues (such as the meanings and practices of democracy and their connections to the context of territorial governmentality). Put more specifically, the site of refugee conceived in a variety of activities, becomes the site of identity politics known also to be the site of the territorial sovereign state. Two interpretive instances of such politics should exemplify the dynamics of this kind of politics.

Consider the first instance in which the governments of Mexico and the United States use the Chinese people in the vessels off the coast of California to represent the dangerous "other" in the form of illegal immigrant. The effect here is to equate the "sovereign" inside of the US with a supposed "self" which is confronting a possible danger from the Chinese "other", or the illegal refugee or the immigrant that overflows, spills over, identity borders and political boundaries. Here the sovereign territory

---

[1] The Paradox of Refugeeism is not to be understood as a paradigm that governs the sensitivities of this study. Nor is it to be construed as referring to a stillness in terms of the identities and events of refugeeism. Contrarily, the Paradox of Refugeeism, by referring to ongoing problematizations, accentuates the historical-constructedness and contingency of the identities that are suggestive of the paradox itself. At its most assertive moments, the paradox of sovereignty is to be seen as informing interpretative critical postures reflecting on the dynamics of specific problematizations of the refugee.

becomes the body of the citizen-self while the Chinese bodies represent the supposed anarchy of the without.

Consider also Witold Pawloski 's observation of the "undesirable aliens": "Every state avoids the refugees like plague, even if they travel in escorted carriages.... All over the world the problem of refugees, or concern for the refugees, is a kind of tax levied on democracy and prosperity" (Polish News Bulletin, February 25, 1993). Hence, "refugee" is (written to be) perceived as "plague" devastating prosperity and democracy, undermining the security of the community. In this game , refugees become reference points or signifiers as well as signified by which an aspect or aspects of the territorial context, in this instance, of democracy and security, are reconstituted. Such instances and practices of identity crafting become possible through what Michel Foucault called "Problematization" as a strategy of knowledge with real power effects "out there".

Problematization As a Strategy of Knowledge

III.

I suggests that all the agitation and incitement around the issues of immigration and refugeeness can best be understood as strategies of problematization understood in the sense as Michel Foucault has understood it . "Problematization", wrote Foucault,

> does not mean representation of a pre-existing object, nor the creation of, by discourse of an object that does not exist. It is the totality of discursive and non-discursive practices that introduces something into the play of true and false and constitutes it as an object for thought (whether in the form of moral reflection, scientific knowledge, political analysis, etc.) (Foucault, 1988: 257).

Problematization is a "knowledgeable" activity of the true and false play that incorporates a series of life activities into the play for consideration. It continually defines their dynamics of existence, their objects and subjects, and their supposed ontological connections to the field of activity, all the while embedding their logic of existence in a particular epistemology, in a particular possibility of knowledge.

As such, problematization, though rooted in praxis, is a thought process (as an activity) that constructs its field of activity, its subjects and objects in the form of problems to which responses are given by differentiating and hierarchizing the contingencies of the past and present. Problematization is the totality of the simultaneous activities which produces not only the field of possible activities in the form of problems, but also simultaneously the field of possible responses to the problems . Foucault argues that this is the point in which the simultaneity of the two moments of problematization -- the moment of translating the difficulties of a particular issue area or practice

into problems/questions and the moment of conditioning the possibilities of responses to these problems/questions -- are rooted and made viable in spite of their differences and contradictions (Foucault, 1987: 389).

It is crucial to stress here that problematization is not an activity that works in a vacuum without a memory of the pasts and a knowledge of the presents. Contrarily, problematization, as an activity of production, is rooted in a specific temporality and spatiality with countless variety of difficulties which human beings have to consider and tackle. It is at the moments of consideration of the difficulties that problematization, as one of many life activities, takes place. Problematization introduces and reintroduces these difficulties into the play of true/false, into the play of power relations, as a set of questions with a distinct vocabulary, peculiar objects and subjects and their possible identities and meanings.

Problematization is then the art of asking questions and formulating problems by which an ongoing process of constituting the fields/domains of identities and governance is made possible. It is through ongoing constitution of these domains /fields that the categories of identity -- safety, stability, security, freedom as well as danger, instability, and insecurity -- become viable and profitable in the nexuses of power relations. So, the crucial activity here is not so much to produce and stabilize the meanings of the categories of safety and danger as to produce and stabilize a domain/field of activity where it then becomes possible and profitable to engage in the politics of identity construction on an ongoing basis.

This is so, for the sources of identity activities are historically bound. That is why identity activities themselves must be and, in fact, are temporary and contingent, always adapting to emergent exigencies of "identity-crafting". It is the stabilization of the field of identity in/through problematization, not an everlasting stillness of identities themselves, that makes possible the continuous articulations of the categories of identities in the face of changes and transformations. In fact, problematizations in the face of changes and transformations leave open the possibility for the formulations of new problems/questions and responses though, as Foucault suggested, new formulations that arise from current problematizations remain connected to the old problematizations, modifying only several of the postulates or principles of the previous ones (Foucault 1987, p. 390).

Problematization, then has many facets and aspects. It has many participants who in their significant and not so significant ways contribute to the making and transforming of identities, their meanings and strategies, however temporary and fluid they might be. Problematization is a sort of power activity in which identity practices, whether oppressive or resistant, are always mediating one another. There, resistance, whether effectual or not, is always at work in the face of oppression or exploitation. Or, regimentation, formalized in many practices and institutions, is almost already nested in resistant activities. Overall, problematization is the totality of discursive and non-discursive activities by which an economy of desire, resistant and accommodative, disruptive and regimenting, is continually produced. It is

there that the boundaries of the desirable and undesirable, unhurrriedly and publicly construct the images of the inside versus outside, hierarchy versus anarchy, citizen versus refugee or the immigrant or democracy versus non-democracy.

Once recognized, problematization activities remind us that the effects of a multitude of activities that seem not immediately related or connected to one another might in fact be quite effectual in one direction or another. Or their effects in the field of identity construction could be deployed to empower and give content and voice to a variety of actors and their objectives. It is precisely this that (a paraphrased) Mikhail Bakunin might have had in mind when he said: "The source of all order is indeed disorder or ordeal."

In what follows, an attempt will be made to demonstrate the ongoing problematizations of identity generally and those of democracy specifically in Western Spaces *vis a vis* the the bodies of those people who are marked as refugees and immigrants. As the aphorism by Bakunin intimates, It will be argued that specific problematizations and their convergent effects on the notions and practices of democracy are realized by playing the forces of ordeal and disorder.

Problematization, Citizen-Oriented Democracy, and Sovereignty: IV

The overall argument advanced here with respect to the practices of democracy[2] in the Western spaces is that refugees and immigrants have increasingly become by virtue of their mobility the subjects and objects of the discourse on democracy and its peculiar citizen-oriented practices and subjectivities. The Paradox of Refugeeism suggests that the refugee and immigrant bodies are significant elements in the ongoing problematizations of citizen-oriented democracy discourse.

One of the most interesting, and certainly most significant effects of the ongoing problematizations is the continuous reaffirmation of the citizen-oriented meanings and practices of democracy by further expanding the contextual and thematic scope of the original exclusionary practices of democracy.

---

[2] In this paper, I shall make no sustained attempt to define what democracy is or should be. I agree with R.B.J. Walker that "The meaning of democracy has become more obscure and contentious, because the interpretation of specific events, claims about grand philosophies of history, and accounts of what democracy has now become are all caught up in fundamental uncertainties about the direction and significance of contemporary trajectories. (Walker, 1991:247) Although it is a significant concern, here, I am not just (solely) interested in what democracy becomes or what becomes of democracy. Rather, I am more interested in the question of "How, by way of what practices (whatever) democracy becomes what it is." In this sense, the fact that the citizen is the privileged agent of democracy is not necessarily of primary concern to me. Instead, I would like to know how the citizen has become and remains to be the privileged agent of democracy. Furthermore, I would like to know the linkages of just such privileging with other categories of identities and experiences and its implications on the possibilities of democracy.

These practices of exclusion are realized in terms of membership in a community via participation and representation. In the conventional foundational meanings and practices of the contemporary notion of democracy, citizen occupies the central place as the constitutive element of community in the territory/space of the state. It is that community of citizens that empowers the state, and it is the community of citizens that the state claims to represent and protect within that clearly demarcated territory. It is within that space that democracy, that is, participation, representation, accountability, creativity, and change, becomes possible. The territorial state becomes the provider and protector of that space, which could then be designated as the space enabling both citizenship and democracy. As R.B.J. Walker stresses, "The legitimacy of the state depends in the final instance on the claim that it, and it alone, is able to allow the citizens of particular states to participate in broader humanity" by making possible the presence of the particularity of the inside.(Walker, 1991:252)

To the extent that possibility of "true" citizenship is predicated on the exclusionary presence of a space of particularity, the contemporary practices and meanings of democracy reflect the limits and prejudices of the modern territorial state, most specifically, in organizing life experiences along the dichotomy of inside versus outside. The citizen remains the undisputed legitimate/privileged agent of democracy which links the possibilities of democracy to the claims of the modern territorial state.

Although the globalizing challenges of recent times, radical extra-territorial, supra-territorial democratic movements of environment, human rights and so on, are exposing these limits and prejudices to new tests, the proponents of these limits too are busily devising counter strategies of new problematizations to respond to these challenges. In fact, citizen-orientedness democratic practices and meanings remains as intact as ever.

Furthermore, indications are such that the space for tolerance within the space of the citizen-oriented democracy is dwindling *vis a vis* the interplay of the alarmisms/chauvinism of the territorial nativist movements and the deterritorializing postmodern pressures that question the conceptualization of the symbiotic relationships among state, nation, and citizen. Put differently, while the meanings of the citizen-orientedness of the original exclusions are oscillating in orientation between the ascriptive (learned) and hereditary (acquired) rights to citizenship[3] and democracy, the space in between the two orientations is becoming ever more intolerant of the presence of any subjectivity other than that of citizenship. Increasingly less space for refugees and less tolerance for immigrants are becoming the reality in that space between the two moments of citizenship. An appropriately symbolic manifestation of intolerance is reported to have taken place in the

---

[3] For a thought provoking exploration of the connections between the evolution of the concept of citizenship and refugee and immigrant movements into European spaces, see Jurgen Habermas (April 1992). "Citizenship and National Identity: Some Reflections On the Future of Europe.". Praxis International 12, No.1: 1-19.

city of Dolgenbrotdt near Berlin in Germany where the people allegedly hired an arsonist to burn down a designated refugee house even before the refugees had arrived.(The New York Times, August 25, 1993, p.5)

The hectic activities, all across Europe, especially in Germany and France, but also in many other countries in Europe[4], are generating ever-more restrictive and exclusionary policies and positions with a view to further sharpening the contra-subjectivity of citizenship vis a vis the refugee and immigrant subjectivities. Put in most simple terms, certain problematizations of democracy are attempting to write more restrictive, repressive and intolerant versions of democracy. In the middle of all that are the refugees and immigrants who continue to navigate the spaces designed and reserved exclusively for the citizen and her/his versions of democracy (Tololyan, 1991: 4).

Refugee and immigrant presence in those spaces is both resistant and accommodative (recuperative) as intimated in the Paradox of Refugeeism.

They are resistant insofar as they transgress political and cultural borders and undermine the conventional narratives of democratic life as the domain of citizen and domestic community of citizens. Refugee and immigrant bodies, by moving into the space of the citizen, disrupt the seeming tranquillity and order of that space, thus forcing once comfortable positions and postures to recognize drastically unfamiliar forms of otherness and subjecthood, be it in terms of language, skin color, mores, or as the former Prime Minister of France, Jacques Chirac put it, in terms of "the smell and noise". Or as Gunter Grass points out, they become "irritants to the rigid orders of the self", reminding constantly how meaningless borders are in terms of imagining/creating new homes once the willingness to do so exists. (Grass, 1993 :178). As such, refugee and immigrant movements are constructing and negotiating new identities for the consideration of democracies in the Western spaces, though they may not be the most powerful mediators of the new directions of democracy.

In the problematization of their activities and their presence, refugees and immigrants are also inevitably accommodative of some of the

---

[4] Still, the most controversial of the recent activities/developments have taken place in Germany and France. In Germany, the constitution was amended to drastically restrict the refugee and asylum status. The editorial in The Frankurter Rundschau, for instance, called the changes a "big mistake" and turning blind eye to the "truth" of immigration. It further stated that the major parties " have not linked their policy on foreigners to the fact millions of people have already immigrated and that the mechanism... must continue to run so that society remains capable of functioning. For many reasons, including racial ones, targeted and planned immigration did not appear on the agenda". (German Information Center, May 28, 1993) In France, the country's National Assembly passed equally restrictive laws supposedly discouraging immigration. The goal of the new law was stated by the Interior Minister Charles Pasque as "Zero Immigration". Coming in the immediate aftermath of the Nationality Law which had already narrowed the interpretation of the French citizenship, the immigration laws further complicated the political/cultural identity plane. (The Christian Science Monitor, June 21, 1993, p.3)

conventional practices/understandings of democracy, for, as I noted above, the practical meaning and force of their presence is mediated , coopted, and deployed as a referential resource with which other categories of life activities are constituted and empowered. Referentiality of refugee and immigrant partakes in legal, economic, cultural and political activities that are ontologically and epistemelogically rooted in the conventional practices that privilege the citizen as the most proper agent adequate to the task of democracy, the sovereign state as the facilitator of the conditions of democracy, and finally, the sovereign territoriality as the *sine qua non* for the possibility of democracy. If nothing else, given the opportunity, refugees and immigrants do not remain aloof to the enticements of citizenship. At least historically they have shown a willingness to integrate into the citizenship category, fulfill its demands dutifully and help stabilize its privileged, but never finalized content.

Consider , for instance, the case of the now "legal immigrant" in the town, El Centro, the regional headquarters of the Immigration and Naturalization Service in California whose bumper sticker read: "My child was the proud recipient of the good citizenship award.". If nothing else, the stamp of the state seems to afford a license for more "legitimacy" to enjoy the late afternoon Sun.

In fact, the name of the citizen stands at the heart of identity politics organized around the modern notion sovereign territorial state, for it is by constructing and reaffirming the voice and content of the citizen that various manifestations of the notion community, us/them, inside/outside and democracy/non-democracy, are imagined, and questions of membership within the perceived community resolved (Connolly, 1991: 472).

It is here, in the moments and events of constructing the citizen, as constitutive of domestic community, that the names of especially refugees and also immigrants turn resourceful. Activities that construct an image of the citizen with peculiar characteristics and content are also activities of constructing the non-citizen supposedly lacking those essential characteristics. Or, as William Connolly put it, they are activities that construct the identity "walls" which separate "us" from "them", safety from danger, citizen from non-citizen, stranger or refugee.

In these moments of identity constructions as boundary constructions, refugees and immigrants, situated against the postulated normalcy of the lives of citizens as the agents of democracy, appear to be paradoxical supplements. On the one hand, their presence testifies to the completeness of the category, citizen . On the other hand, it signifies their own aberrance and ineffectuality *vis a vis* the posited qualities of the citizens. Such moments of supplementarity are also moments of problematization, no less important in their total/convergent effects on the transformations of the meanings of the category of the citizen and the notion of democracy than the effects of the French Revolution on the emergence of the citizenship and democracy themselves. How does this suplemantarity work? The politics of the refugee category proves further insightful here.

In its most comprehensive form, refugee problem is comprehended in terms of the sovereign territorial state and its counterparts, the nation and the citizen. In effect, the so called refugee problem is understood in terms of a postulated ensemble of agents and identities that spans the state, as authoritative agent representative of a sovereign territory and people, to the citizen, as the proper subject of this territorial space. the refugee is defined as one who, by virtue of some event of exclusion, lacks the citizen's unproblematic grounding within the territorial space of the sovereign state and, so lacks the state's effective representation.(Ashley, 1993) The term refugee, then, refers to an aberration of the proper subjectivity of citizenship, which is also the proper subjectivity of a viable democracy.

In short, refugee and immigrant bodies become profitable reference points for new problematizations of a variety of issues and practices, but, most unexpectedly, they simultaneously become resources for new problematizations of the contemporary notion of democracy as rooted within the framework of the sovereign territorial state.

V.

The links between the new problematizations of democracy discourse and the problematizations of the territorial sovereign state should not be surprising since, in the modernist conceptions of democracy, the very possibility of democracy has always simultaneously been linked to the supposed presence of a well-bounded territory patrolled by the forces of the sovereign state. Therefore, neither the problematizations of state nor the problematizations of democracy are secondary, or tertiary, to one another; rather, they are enabled simultaneously through the same practices. It is the "writing" of the notion of the territorially-bounded space that allows for, makes possible, the "writing" of a community of citizens as forming the perceptual infrastructure-- "Frenchness", "Germanness" or "Englishness"-- of the modern state. The community of citizens constitutes the sovereign space for the realization of democracy and empowers the state forces for the organization and protection of democratic forces and practices. In other words, such notions as stability, security, community, democracy, the stability and security of community and democracy are linked to one another through continuing and necessary rearticulations of the notion of sovereignty through a variety of sovereignty practices.

Put succinctly, if it were not the successful reaffirming/projecting of the notion of the territorial sovereignty of the modern state through times and across spaces, the conventional theories and praxis of democracy would have been drastically different from what they are in these times. Thus, it is imperative to study and understand new conceptualizations and articulations of democracy as linked to new articulations of territoriality and modern state-crafting.

The argument that I advance here is simple. I contend, by undertaking that "extra" reading, that the ongoing new problematizations of the discourse on democracy are not attempts solely to clarify the concept of democracy, or

make its practices more efficient in the face of emergent exigencies. Surely, these objectives are part of the problematization activities, since problematizations are reconsiderations of the difficulties of a particular practice or set of practices. It may, for instance, be absolutely imperative to deal with the rise of neo-racism and xenophobia for any form of democracy to remain viable. Therefore, my argument is not that reconsideration of the emergent difficulties of democratic practices has nothing to do with the vitality and viability of the notion and practices of democracy. Rather, I suggest that reconsiderations of the emergent difficulties of democracy in the face of refugee and immigrant bodies are also ontologically related to the difficulties of sovereign statehood. At times, they are, in fact, the difficulties that the practitioners of the territorial state must conceptualize as problems of the sovereign state and to which they must respond. This linkage is clearly manifest in the German Chancellor Kohl's reaction to the prevailing climate of hostility and tension in the country in the face of "foreigner problem" when he declared in December 10, 1992 that "The Federal Republic is a democracy that knows how to defend itself and will prove it. (Klusmeyer, 1993:104)

It seems appropriate then to urge that the discourse on democracy and its transformations, whether more restrictive or more open and less territorial as Connolly (1991) and Walker (1991) would desire to see, has to be studied and understood simultaneously as the problematizations of the notion of sovereignty, since the notion of democracy is predicated on the presence, or at least representation, of a well-bounded territory within which the formulation of the notions of security (national security, of which citizen is the supposed primary beneficiary) and community (nation, of which the citizen is a supposed constitutive member) is realized. Thus, the ongoing transformations/ problematizations of democracy discourse constitute one of many "activities of alignment", to barrow from William Connolly, trying to rewrite the images of security, community, and stability, so that these images continue to coincide with "the high degree of alignment projected by the image of the sovereign, democratic, national territorial state" (Connolly, 1991: 464).

The following report from The Irish Times (June 4, 1993: 4) might perhaps be insightful as an example of "alignment" activities as sovereignty activities that attempt to stabilize a specific representation of the state, its territory and the nature of practices within. The author suggests that

> "the review of immigration policy [by EC officials] was the culmination of several months' work...., The review was originally seen by officials as a polite exercise, but one stressed that the whole thrust of EC immigration policy has changed since the election of the centre-right government in France. 'The French basically rewrote this report', said the official. 'In some ways it simply restated

> what we are already doing to curb illegal immigration. But for French domestic reasons, there is much stronger language. The French want to show that they are getting tough and the Germans are ready to row in.'"

It is clear that the rewriting of the review is not just oriented to address the announced primary problem, that is, curbing immigration, but also rewriting the image of France as a territory of a community of citizens, entry into which can and must only be permitted by the legitimate agent of that territory, the state. Since the countries are already doing all they can to "regulate" immigration to service a variety of interests and needs[5] (to address the labor shortage for low skilled industries and so on), what other purpose could one think of than that of "alignment" between what is claimed by the participants of statist democracies -- Germany or France as a space of the citizen organized around/by the state-- and what is real out there -- Germany and France considered as possible new homes for a multitude of desiring subjects? A report in the Independent on June 6, 1993 points to this alignment aspect of statist practices exemplified in the collaboration of the European Community countries. "A prominent refugee advisor says he was told by EC officials that the recent agreement on immigration was 'mainly for show', and there are doubts about its effectiveness and legality."(p.6)

Further examples as to the reworking (problematizations) of the discourse on democracy from "the Western Spaces" should speak to the rather unconventional connections that I have been making here among

---

[5] Interestingly, many on the ruling intersections of politics and economy acknowledge without hesitation that Europe is in need of continuing immigrant infusion in order to stay alive both economically and socially. This widely shared view is reflected in the following account in Carla Rapaport's report: "Looking ahead, some demographic experts argue that Europe will need the workers it now rejects. According to Bernd Hoff, an economist at the German Enterprise Institute in Cologne, Germany's workforce started shrinking in 1988 because of low birthrates. Says Hoff: 'The Germans have decided to die out.' He figures that Germany needs 300, 000 immigrants a year to keep the work force stable....Other European countries face shrinking work forces as well. Belgium, Denmark, Holland, Greece, and Spain will start seeing their work forces shrivel within this decade'....Horst Kramp, president of the Berlin Chamber of Commerce, says : 'There is no room for hardheaded reservations against foreigners, even if they come from alien cultures.' "(Fortune, July 13, 1992, p.96). In short, European spaces need immigrants who largely do the "dirty" and "undesirable" jobs which are nonetheless indispensable for the survival of individual countries such as France, Germany, Spain, and so on. The contribution of "foreign workers" are thus crucial to the viability of the European spaces as European Spaces. For example, Steger and Wagner (1993) report that the "immigrants produce a minimum net gain of fifteen billion dollars a year in increase productivity in Germany. (p. 65; See also, Schnapper 1991). Thus, the question for Europe seem not whether or not to permit immigrants and / or refugees, but how best to control and regulate their movements within an economy of problematization that makes it possible to speak of Europe or France, or Germany or England in the face of the accentuation of differences (of identity / becoming) within.

sovereignty, territoriality, nation, community, citizen, security, inside, outside, identity borders and boundaries, and democracy.

Refugees, Immigrants and Problematization of Democracy in the Western Spaces

V.

In the beginning of the paper, I referred to the increasing incitement and agitation on the issues of refugeeness, asylum and immigration. Such activities are especially intense in the Western Spaces as those spaces are argued to have been the targets of most human movements in the form of immigration and asylum. Despite the fact that these largely European spaces are not[6] necessarily the centripetal vortex of human migrations, discussion of the refugee and migration issues in these spaces exhibit a deep-running alarmist quality hitherto unobserved. Interestingly enough, this alarmism is reflected in the wire-reports and the titles of policy outlines of both the governmental and non-governmental sources. Just such headlines sufficiently reflect the contours of the form as well the content of the discussion on refugeeism and immigration in Western spaces. The headlines are also suggestive of the complexity and plurality of both the discursive and non-discursive activities that go into new problematizations, both of democracy and the state sovereignty.

Here are select few of them which portray the the context of the Western Spaces vis a vis refugee and immigrants[7]: "Europe slams doors on immigrants", "CSCE leaders paint a dark future of refugee wave from East.", "Invisible Barriers are going up as European borders open.", "Even as the

---

[6] Preoccupation of the Western Europeans with the refugee and migration movements in European spaces obscures the dimension of similar population movements in Africa, the Middle East and Asia. In fact the World Refugee Survey of 1991 reports that the largest, most dramatic mass population movements have been the estimated 30 million internally displaced people in the Non-European spaces. Even when the internal displacement turn into international, cross-border, refugee situation, the majority of people merely move into the adjacent countries. In recent years, approximately 10 million Southern Africans, 7 to 8 million Afghanis, 2 million Sudanese, 2 million Ethiopians, and 2.5 million Kurds became refugees within their own regions (World Refugee Survey, 1991, p.14). The World Refugee Survey of 1992 reports similar numbers. According to the report, the total number of refugees and asylum seekers in need of protection in Europe and North America as of December 31, 1991 was 677,700. For Africa the number was 5,340,800, while the Middle East and South Asia had 9,820, 950 people in need of protection. (World Refugee Survey, 1992, pp.32-33).

[7] These reports appeared in the following sources in the respective order as presented above. Reuters, June 8, 1993; Reuters, November 21, 1990; Reuters, May 14, 1991; Los Angeles Times, December 15, 1990; The Irish Times, June 4, 1993; Agence France Press, May 31, 1993; The Independent, May 27, 1993; Reuters, June 29, 1993; The Guardian , June 2, 1993; Australian Financial News, June 3, 1993; Atlanta Journal and Constitution, May 26, 1991; Seattle Times, March 21, 1993; Inter Press Service, August 28, 1992; The Reuter European Community Report, February 26, 1993; The Economist, December 5, 1992; Washington Post, December 20, 1992; The Independent, June 19, 1993; Fortune, July 13, 1992; Reuters, May 7, 1993; Agence France Presse March 16, 1993; Reuters, March 16, 1993; Toronto Star, June 19, 1993; Los Angeles Times, February 23, 1992.

iron curtain has been lifted, the West is erecting its own barrier-- this one to bar migrating poor from Rumania, Hungary and other nations."; "Looking increasingly like fortress Europe."; "E.C. gears for meeting on immigration policy."; "Protests erupt over vote to limit refugees; German MPs forced to run gauntlet of demonstrators to enter parliament for debate on constitutional amendment"; "French confirm trains may be used to expel immigrants."; "E.C. Ministers agree moves to reinforce fortress Europe."; "E.C. gets tough with unwelcome immigration."; "West discards welcome mat for refugees: hopes dashed for many fleeing east bloc."; "Targeting foreigners -- searching for Germany's soul."; "Germany: racism brings refugee rights and democracy into focus." ; "European Parliament debates rise of racism, xenophobia and extreme right." ; "At the Gates" ; "Refugees challenge a continent's stability." ; "France curbs immigrant under new law." "Them" ; "Germany, Poland sign agreement to curb refugee flow." ; " Six central European countries to sign migration pacts." ; "Germany to help Czechs to control refugees."; "Roumanians become stateless in Germany to avoid expulsion."; "European walls of prejudice unlikely to halt the flow of refugees.", and "Influx of North Africans arouses doubts for France's melting pot; immigration: wrenching questions about xenophobia, racism, citizenship, assimilation and national identity come to surface."

The vocabulary with which the discussion goes on is even more suggestive of the general convergent effects produced through such seemingly disparate places and events throughout Europe. The qualifiers that are used the most are those that certainly connote an underlying economy of desire. Words like wealth, poverty, Europe, the Third World, the South countries, refugees, illegal immigrants, tide, rush, flood, frontier, border, territory, barrier, wall, fortress, foreigner, citizen, right of blood, right of birth, security, lack of security, stability, distabilization, burden, welfare, warfare, plague, invasion, smell, noise and many more all converge to produce images of two desire-worlds which stand in contradistinction to one another. One is the prosperous, secure and democratic world of the West European, the other is an amorphous tide, a flow, that is besieging Europe from all directions and forcing it to become a fortress in self-defense.

Also constructed in contradistinction to one another are the postulated desiring subjects of these conflicting worlds. On the one hand is the citizen -- Pierre, Hans or Cecile -- the proper subjects of the democratic European spaces. They are equipped with "creative energy" and "healthy skepticism"; characteristics that cultivate the conditions of democracy within community. On the other hand is the stranger, refugee or immigrant who is just a part of the tide without any mentionable individuality. He/she appears to have only a collective content and voice: a refugee or an immigrant, not Ravi, Hasan or Jose with memorable individual histories. Here, the problematization of the encounters between the citizen and non-citizen places the citizen self against the amorphous flood, the other, in defense of the borders and boundaries of democracy.

The stories of this flood of people, who the West now faces, are told as the stories of political, economic, and moral "warfare" and "damage" in the heart of the host communities (Rudge, 1988: 11). Faced with this "tidal wave" of the unfamiliar other, the once generous West is now forced to consider its own survival. Thus, the questions as to citizenship, community, national identity and democracy gradually become the high issues of the day.

Those questions of identity are finding increasingly a more fertile and a profitable space in the politics of problematizations of a group of moving people as refugees and immigrants with specific characteristics. In this space, simultaneously, the difficulties and challenges of "being" (German or French, secure and democratic) or "becoming" (German or French, secure and democratic) are being problematized by way of a multitude of discursive and non-discursive activities and practices that do not necessarily announce themselves as pure activities of security or democracy, but are interlocked and bound up with each other. Even if an activity announces itself as specific (security) this or (democracy) that, it certainly will have implications on a variety of other issues and phenomena. For instance, it would be rather naive to suggest that the latest change in the German Constitution with a view to "regulating" asylum is just that, and has no significant implications for the perceptions of security. Consider what the German Interior Minister said in the aftermath of signing a treaty with Poland to curb refugees: "Illegal population movements represent a threat to political stability in Western Europe." (Reuters, May 7, 1993). Listen also to the British Home Secretary Kenneth Clark who said that " good race relations and a healthy sense of community depend on an effective system of strict immigration control" (Washington Post, December 20, 1992: A1). Could we then deny here that "a healthy sense of community" and "good race relations" inevitably implicate the projects of democracy and their relations to issues of migration? Perhaps this was the question in mind when Ulrike Klose, the German Social Democratic leader suggested that "Unregulated immigration endangers the stability of democracy and only serves right-wing rabble-rousers (Manchester Guardian Weekly, June 6, 1993: 1).

Aware of the multiple effects of identity activities, problematizations, that is, rearticulations and reconceptualizations of democracy, also have to be interrogated at the intersections where the effects of many discursive and non-discursive activities in a variety of fields -- security, human rights, humanitarian intervention, community, citizen -- converge to suggest, point to and even exemplify the changes and their directions. Imagine then the possible total effects of the following examples all of which speak of activities on refugee and immigration issues.[8]

---

[8] The work of Roland Barthes on the strategies of textual representation is informative in terms of understanding the dynamics of "convergent effects" which are created as a result of a wide variety of activities. Barthes suggests that although many voices inhabit a text, every text has a direction imposed on it by the utilization of "a number of textual codes and signs (hermeneutic, narrative, semantic, cultural, symbolic) that invite a certain interrogation of

In France, the new Nationality Act of 1993 (for all practical purposes, an Immigration act) proposes identity spot-checks for anybody who does not look French. In Austria, an official of the Interior Ministry rewrites the security discourse by referring to 'illegal immigrants" as "Submarines" working under the imagined open seas of Vienna (Reuters, May 14, 1991). In a similar tone, Timothy Garton Ash remarks in The New York Times Book Review: "Yesterday the experts were counting warheads; tomorrow they will be counting refugees." Meanwhile, in Russia, the strategist for the Interior Ministry's Refugee Department, Col. Zbigniew Skoczylas speaks of "his" refugee wars. " I treat it like a war" he concludes his session, referring to his strategy to deal with refugees (Atlanta Journal and Constitution, May 26, 1991: 1). Under a rather telling headline, "Them", Carla Rapaport writes of the fears of "many Europeans" who, in the face of European unification, fear that the rights of the immigrants and their children will be further extended to voting and citizenship (Fortune, July 13, 1992: 96-97). In the same report, "many experts and academics" such as Jean Claude Chesnia, head of demography at the National Institute for Demographic Studies in Paris warns about the "start of a long period of chaos...in the wake of the wave of political and economic refugees who are expected to crowd into Western Europe in the few years to come." Erwin Faul, a German academics, writing in German Comments, an English language daily linked to the ruling Christian Democrats, expresses his fear of the rise of multiculturalism in the following fashion. "If the right to participate in politics is granted, ethnic groups will attempt to gain decisive influence on immigration policy and open floodgates, thus withdrawing sovereignty from the traditional leading group"(Repeated in the Independent, April 11, 1992: 17).

Consider also the concern of this ordinary Parisian women in her 70s who complains: "There is not enough wine in the glass and [my] benefits are in danger because the government is spending so much to help immigrants" (Los Angeles Times, February 23, 1992: 31). Could she, one of the 71 % of the French people who think that "their country has too many Arabs"?. In the German town of Rostock, as the neo-Nazi youth were attacking a refugee hostel, reports contended that the ordinary people in the neighborhood stood by and applauded the ravaging youth. Some were also heard to have been

---

that text. " The range and effectiveness of the codes and signs are mediated by the contingencies of the times and places. However, there are certain common strategies to imposing a direction on the text. "What questions or enigmas are posed, answered, or avoided? What snares are set, false or partial leads implied, delays construed for effect and tension? What themes are suggested by images, figurations and ...flicks of meanings? What sets of knowledges, literature , and science are invoked? (Fortin, 1989:191). By asking these questions it is possible to identify the closures in the text and perceive the imposed direction on it. Similarly, the discourses on the refugee and immigrant, taken as texts, have certain directions imposed on them through the realization of a multitude of activities and a number of textual codes. The examples given in this paper should be considered in light of such textual practices that write a particular refugee and/or immigrant (defined largely in terms of ontological 'lack') instead of the refugee or immigrant with other qualities and subjectivities.

yelling: "Foreigners out. They are not people, they are pigs." (Inter Press Service, August 28, 1992). Consider also the case of Hautmont, a small town in France's depressed northern industrial region. The citizens of the town organize a referendum on immigration to show how very displeased they were by the government's loose policies on immigration.(Agence France Press, June 28, 1992). The results of the referendum were expected to produce a clear "No" to immigration.

Surely, those hostile expressions and occurrences are not the only ones that could be heard and witnessed in the Western Spaces. As always, resistances to the intense hostility against the stranger, the refugee and the immigrant are present throughout Europe both by refugees and immigrants themselves and by the "citizens" of Europe. First, as indicated before, the very presence of refugees and immigrants in the space of citizen is an effective act of resistance to the degree that it disturbs the familiar juxtapositionings of identities, their images and meanings. There exists a variety of human rights groups across Europe which have had limited yet significant effects in promoting more inclusionary and cross-cultural perceptions of democracy. France's SOS Racism, Britain's Anti-racist Alliance, Germany's BundesDeustchland SOS Racism, Belgium's Anti-racist group MRAX ,and Spain's APDHE (Spanish Human Rights Asssociation) are among that spectrum of organizations.

In addition to those already existing, many more come into existence in the face of practical necessities. For instance, as a response to the proposed changes in the French Nationality Law, Harlem Desir, the founder of SOS Racism, launched a new political grouping in 1992 appropriately named " the Movement". The movement's participation in the processes of new problematizations of democracy is different from that of SOS Racism in that "the Movement" attempts to open up a space within the official space (parliament) to promote non-citizen voices. It plans to do so by fielding 50 candidates in the national elections as well as in the elections for the European Parliament in 1994 to contest the rise of racism and xenophobia (Reuters, June 16, 1992).

Many such formal and informal groupings are becoming more active in the political terrain in the Western Spaces, constantly injecting new meanings and nuances into the discourse of the theory and praxis of democracy. For instance, on June 19, 1993, thousands of people demonstrated against the controversial immigration bill, bringing together about 100 organizations across the spectrum --"anti-racist groups, immigrant support groups, trade unions, foreigner's associations and left-wing parties"(Agence France Presse, June 19, 1993). Similar demonstrations took place in Germany after the arson attack that killed 5 Turkish citizens, three of whom were children born and brought up in Germany. More than three hundred thousand people took to the streets in Bonn to demonstrate their solidarity with the "foreigners. Rather interesting acts of solidarity were staged throughout Germany. Taxi drivers put signs on their cars declaring that "their friend is a foreigner." Soccer teams played friendship matches with

"foreigner" teams. Turkish and German youth gangs have started collaborating to exact vengeance on the neo-Nazi gangs. Celebrities, academics and intellectuals have produced shows, papers and articles stressing the dangers of the direction. The German novelist, Gunter Grass, summarized the conditions of Germany in the heading, "On Loss".

Pierre Bourdieu (1986) points out that similar life positionings or the similarities of the mediating experiences of life create contingent alliances out of seemingly disparate and distant lives. In Italy, the long-standing Jewish community marched along with Arabs and Palestinians in condemning racism that hardly seeks nuances to the world of hatred (National Public Radio, November 14, 1992). Meanwhile Romanians in Germany started relinquishing their citizenship in order to avoid expulsion from Germany (Reuters, March 16, 1993).

Words on (In)Conclusions

What then to make of all this agitation and incitement around the name of refugees and immigrant in terms of their implications, if any, on the conventional notions of territorial democracy?

With these examples in mind, allow me to go back for a moment to two points of the paper. The first is about "intersections" where I said that the effects of many discursive and non-discursive activities in a variety of fields -- security, human rights, humanitarian intervention, community, citizen -- converge to suggest, point to and even exemplify the possibilities of living. The second point has to do with problematization. I interpreted problematization to be a thought process rooted in praxis that constructs a field of activity, its objects and subjects, in terms of problems and difficulties, and then produces responses to the difficulties. I also argued that differentiating and hierarchizing of contingencies of the present are crucial to problematization in that their focus and intensity condition and mediate the effects of the responses produced.

These two moments of the paper are suggestive of the most insightful interpretive direction that this discussion can take in the in lieu of conclusions. They suggest that we look for in problematization the intersections where the activities of differentiating and hierarchizing amongst objects and subjects of a field of activity produce specific identity effects. It is those identity effects that stabilize, destabilize and again stabilize what it means to be that momentary self --citizen, refugee, immigrant, democrat -- that has to keep reconsidering itself in view of the availabilities and expectations of resources. When seen from this angle, the above-mentioned activities around the issues of refugeeism and migration and democracy lend themselves to several possible readings.

First and foremost, it could be argued that convergent effects of the differentiating and hierarchizing activities increasingly speak of more restrictive and exclusionary democracy. What makes that direction possible is the continuous stabilization through ongoing problematizations of the

exclusionary domain/field of identity where the hierarchy between the categories of the citizen and refugee or immigrant maintained. The citizen represents the qualities of the inside, intelligence, stability, security, cooperation and democracy while the refugee or the immigrant represents the loss of all these qualities since they are not rooted in an "inside". Once they move into the space of the citizen uninvited, refugees and immigrants undermine and even truncate the capacities of the inside to maintain a viable community, cooperation, solidarity among the citizens, and democratic organization of the polity. In addition to emitting "bad odors" and "unpleasant noise", they become economic burdens, by being either 'lazy bums on welfare' or 'stealing jobs'. The convergent effects of a variety of activities around that hierarchy is to prod many towards embracing more exclusions, differentiating and hierarchizing. Hence, the unceasing hostility towards refugees, immigrants and "strangers", open or subtle racism, discrimination, exclusion, marginalization and new restrictive laws and practices. Above all, those convergent effects feed into the birth of a new normative identity, a mixture of Europeanism and citizen-orientedness of democracy, that recognizes itself as the rational, moral, and universal hegemon capable of "adjudicating" the values and labels of humanity (Said, 1993: 45-46).

In the final analysis, this reading argues that the presence of the "foreign" bodies which are marked and so recognized as refugees and immigrants are thus exploited in the Western Spaces in order to rewrite limited versions of conventional democracy as a convenient instrument of maintaining Europe's relative economic, political and cultural privilege. Between the images of the besieged "Fortress Europe" is a projection of a normatively hegemonic Europe (imagined European self) that wants to see itself as hegemonic.[9] It wants to colonize, but does not want to be colonized, it wants to import/impose its culture, but refuses to consider the legitimacy of the other cultures and identities. It sees itself as the tourist with an inherent right to go anywhere in the world and play ethnography and anthropology, but insists that each and every non-European must be either a refugee or an

---

[9] In a special issue of International Journal of Sociology on the question of "European Identity, the authors John Fells and Jozef Niznik suggests (based on their findings from a nine country survey including France, Germany, The United Kingdom, Poland Lithuania, Austria, Australia, USA, The Netherlands) that "European identity is a fact without doubt", although the basis of European identity is difficult to define. However, values as "civil liberties", "democracy", and "tolerance" are considered to be the most important constitutive elements of an imagined European identity. According to the survey results, three countries, Germany, France, and the United Kingdom, constitute the core of Europe with the other European Community countries as members of an outer circle around that core. An interesting indication of the results is that on the Europeanness of Russia, those from the Western European countries such as The United Kingdom, France and Austria, were ambivalent, while they hardly considered the former Eastern European countries as party to that European Identity. See John Fells and Jozef Niznik. (Spring-Summer 1992)."Conclusion: What is Europe?", International Journal of Sociology 22, No.1-2: 201-207.

illegal immigrant trying to sneak in. For that imagined Europe, there seem to be just two meaningful categories of moving peoples: European tourist self and the non-Western refugee other. Its democracy reflects this mentality in its treatment of the refugee and immigrant other.

A second reading starts from the same premise of increased agitation and incitement , but derives more optimistic intimations. It is a reading that recognizes the agitation and incitement as a manifestation of the disturbances in the once supposedly secure and stable categories of identities in the Western Spaces, now that the space of identity is penetrated by refugees and immigrants. William Connolly suggests that

> "democracy needs common points of reference through which issues can be defined and pressures for action can be organized....it is an egalitarian constitution of cultural life that encourages people to participate in defining their own troubles and possibilities.... It is moreover, an ethos through which newly emerging constellations might reconstitute identities previously impressed upon them, thereby disturbing the established priorities of identity/difference through which social relations are organized"(Connolly, 1991: 476-77).

Hence the possibility of enlarging the meaning and scope of democracy as a variety of groups, refugees, immigrants, and citizens, participate in the construction of "adjusted" identities which recognize themselves as contingent and necessary responses to the drastically different difficulties of living. Such are the radical problematizations in which participants are willing, and, in fact, are forced, to reconsider the familiarity of the strategies and perceptions of selfhood and otherness, belonging and strangeness, possession and loss (of identities), community and outside in the face of changes and transformations. All that takes place in spite of the territorializing moves of the modern state, and its claims on the identities of territories called France, England, Germany, Poland, Austria or Europe. Then, as Connolly suggests, it might just be possible that that common point of reference, the bodies of refugees and immigrants, serves as the instrument for the "disaggregation of democracy in order to escape the confines of the territorial state....Today", Connolly stresses, " a decent democrat must sometimes be disloyal to the state that seeks to to own her morally and politically" (Ibid, 478-79). The examples in Western spaces of the resistances to exclusionary and restrictive projects of democracy (such as by SOS Racism in France which is able to make extra-territorial connections establish cross-cultural solidarity as well as by refugees and immigrants themselves) are ample demonstration of the possibilities of problematization that will create new openings and possibilities of democracy across spaces and cultures. This might mean a renewal of democracy albeit in different forms and meanings.

A third but not the last possible reading tends to study the new problematizations of democracy as yet one more field of problematization where its activities are geared to fulfill a double functions: reproduce the image of the state while rethinking democracy. In premise, this reading shares with the second one the understanding that across the globe novel conditions unleash forces that challenge, undermine, and , in fact, escape the exclusive claims of territorial states over the images and possibilities of living.

However, such challenges do not necessarily herald the demise of statist sovereignty practices. Indeed, as explained in the Paradox of Refugeeism, some of these true challenges, their force, are coopted by the proponents of the territorial state to stabilize an aspect of the state, the community of citizen in which democracy is realized. In other words, the very challenges advanced *vis a vis* the claims of the territorial state always run the risk of lending themselves to political maneuvers recuperating the state as yet a significant and necessary element of intelligent, secure, and democratic living. Nowadays, for instance, it is partially by reference to the refugee and immigrant bodies that the rearticulations of democracy in the Western Spaces work to reaffirm the primacy of the territorial state, for the epistemic logic and ontology of democratic projects remain rooted in the premise of the world as consisting of discontinuous, separate, "culture/nation gardens" with positively distinct identities that should not and can not be mixed. On the basis of this premise is presumed the presence of the territorialized order of sovereign states. The difficulties of mounting the kind of challenges to the territorialization of the possibilities of democracy and democratic practices is indirectly, but, skilfully implicated by Edward Said in the following words.

> When we ask ourselves, "Whose human rights are we trying to protect? we need to acknowledge that individual freedoms and rights are set irrevocably in a national context. To discuss human freedom today therefore is to speak about the freedom of persons of a particular nationality or ethnic identity whose lives are subsumed within a national territory ruled by a sovereign power. It is also true that withholders of freedom, its abusers so to speak, also belong to a nation, most often also a state, that practices its politics in the name of that nation's best, or most expedient interests (Said, 1993: 46-47).

In an article curiously entitled "A Host Country of Immigrants That Does Not Know Itself", Dominiqeu Schnapper argues that the best possible solution to the questions of immigration is integration. In the case of France, this means an integration into France defined by the Jacobin Tradition. If particularisms of the immigrants maintain a bifocality, that is, if they insist

on clinging to a culture of another territoriality(difference), thus undermining the culture/tradition that defines France, their particularisms become unacceptable. "France cannot call into question this tradition without calling into question its very existence as a state. No nation can have suicide as a vocation (Schnapper, 1991).

There is no question that identity problematizations on/by reference to the bodies of people marked as refugees and immigrants remains to be one of the most profitable fields of activity in terms of identity construction and negotiation. Proliferation, intensity and scope of the activities therein are a testimony to the profitability of the field. Despite such a proliferation of activities, studies exploring the role that the ongoing problematizations of the refugee and immigrant play in the politics of the territorial state -- the notion of sovereignty, and its manifestation in various fields of activities such as in that of democracy -- are rare at best. It has been the primary objective of this study, however preliminary, to initiate a dialog precisely on this and related concerns.

STATE-LOCAL RELATIONS IN CALIFORNIA: WHAT HAPPENS WHEN THEY TAKE AWAY THE PROPERTY TAX?

Alvin D. Sokolow,
University of California, Davis

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993.

Abstract

STATE-LOCAL RELATIONS IN CALIFORNIA: WHAT HAPPENS WHEN THEY TAKE AWAY THE PROPERTY TAX?

Alvin D. Sokolow, University of California, Davis

Without strong revenue authority in the hands of city councils, county boards, and other local elected legislative bodies, home rule is a hollow structure. Such is the generalization offered by this study of fiscal and policy change in California local government since the passage of Proposition 13 in 1978. The famous initiative of course substantially reduced property tax revenues for the state's local governments. But more significant for home rule was its elimination of local control over the annual tax rate, a traditional and continuing feature of the property tax elsewhere. California's experience illustrates the centrality of the property tax to this connection between fiscal discretion and home rule

Following a summary of the home rule status of cities and counties in California, this paper traces the effects of property tax restrictions on local finance and programs over the 15 years since Proposition 13. A major element of the story is how state government frequently changed the rules governing local finance during these years, culminating in the property tax transfers of 1992 and 1993. Also of note is the impact of the fiscal restrictions on nonfiscal actions, especially the land use strategies of cities and counties driven by more competitive pro-growth policies.

Jennifer Swenson conducted much of the analysis for this paper and together with Anita LaViolette prepared the charts.

STATE-LOCAL RELATIONS IN CALIFORNIA: WHAT HAPPENS WHEN THEY TAKE AWAY THE PROPERTY TAX?

Alvin D. Sokolow, University of California, Davis

"While most states are making mincemeat of their aid payments to local government, it is a bit bizarre to see a state taking away the locals' tax base. But that's California for you." (Peterson, 1993)

It was not a typical populist crowd that gathered on the west steps of the California state capital on May 19 earlier this year, carrying placards and shouting demands at the Legislature and the Governor. Instead of the usual assembly of school teachers, state employees, welfare recipients, tax cutters, health care providers, abortion rights advocates, right to lifers or AIDs activists, the more than 1,000 demonstrators were local government officials. They were elected and appointed city and county officials--mayors, councilmembers, supervisors, managers and administrators. In place of their usual style of lobbying state government--quiet, dignified representations in committee hearings and state offices--the local elected officials and bureaucrats were making their case in Sacramento in a very visible and argumentative fashion. Like other special pleaders who march on Sacramento, they were angry with the state and wanted the media and the rest of the world to know about it.

The immediate cause of the demonstration was Governor Pete Wilson's plan to transfer $2.6 billion in property taxes from counties, cities and special districts to school districts, to help state government solve its latest budget crisis. More basically, the demonstrators were expressing the frustration of having to govern their communities with a revenue authority that had been eroding for 15 years. Their ultimate target really was Proposition 13, the 1978 ballot measure that fundamentally altered the nature of the property tax and hence the mix of state-local power in California. By reducing yields and eliminating local control over the tax rate, the 1978 constitutional amendment shifted power from local governments to the state. This scenario was merely confirmed by the proposed (later enacted) transfer in property taxes for the 1993-94 fiscal year, following a similar transfer of half as much the year before. With the loss of local government control over the rate and with the state able to change allocations yearly, it is stretching to continue to characterize California's property tax as a <u>local</u> revenue source.

Local revenue authority is the dominant issue of state-local relations in California and it has been since Proposition 13 came on the scene. California is a still a strong home rule state in nonfiscal terms--in the organizational flexibility, spending authority, and regulatory scope enjoyed by city and county governments. But as the constraints on fiscal discretion implicit in the limited property tax spill over to policy and programmatic arenas, it becomes evident that home rule without strong revenue authority in the hands of city councils, county boards and other local legislative bodies is a hollow structure.

California's experience illustrates the centrality of the property tax to this connection between fiscal discretion and home rule. Following a summary of the home rule status of cities and counties, this paper traces the effects of property tax restrictions on local finance and programs over the 15 years since Proposition 13. A major element of the story is how state government frequently changed the rules governing local finance during these years, culminating in the property tax transfers of 1992 and 1993. Also of note is the impact of the fiscal restrictions on nonfiscal actions, especially the land use strategies of cities and counties driven by more competitive pro-growth policies.

Home Rule in California

California local governments have long enjoyed a great deal of freedom from state control, according to conventional standards. California was one of the first states to give its cities home rule, in the 1879 constitution that prohibited special legislation. Since that time municipal powers have proliferated (Martin, 1984). Charter status is available to both cities and counties. But as the Legislature steadily liberalized the service delivery and regulatory powers of all such governments, the authority gap between charter and general law cities and counties became almost imperceptible in everyday practice.[1] Today, there is little reason for communities to adopt charters if the intention is to increase governmental flexibility. Indeed, the argument is made that charters often have excessively detailed language that stifles organizational and policy change and that needs to be frequently amended by the voters.

ACIR's recent review of state laws dealing with local government structure confirms this generalization for California, especially in noting the "broad functional home rule" possessed by counties and cities in this state (U.S. Advisory Commission, 1993, 20,22). Formal home rule on structural matters overlaps into policy and programmatic discretion. California cities and counties are not bashful about exercising their corporate and police powers to operate a very diverse and large set of municipal programs. Counties in their local capacity, governing unincorporated areas, have virtually identical service delivery and regulatory powers to cities. The major difference with cities concerns the counties' other role as administrative agents of the state for social services, health, and other countywide programs, a mandated relationship that severely reduces county government discretion.

Another aspect of the flexibility available to California communities for public sector purposes are the numerous special district options. While California special districts lack the ordinance-making and other regulatory authority possessed by cities and counties, they have extensive corporate or service delivery powers. Most major municipal services--fire protection, parks, water supply, sanitation, transit,etc.--delivered by cities are also part of the repertoire of California special districts (Senate Local Government Committee, 1991). Most are single purpose units, but California law also provides for the organization of multi-purpose agencies--Community Service Districts with separately-elected boards and County

Service Areas governed ex officio by county boards of supervisors. In some unincorporated but highly urbanized areas, CSDs with multiple programs are like "mini cities".

The ACIR inventory is confined to specific organizational and procedural powers.[2] An alternative approach to measuring local discretion is to examine in qualitative terms the mix of flexible and restrictive components found in broad functions or programs. Table 1 makes this comparison for several select areas of community governance in California, including aspects of citizen control as well as organizational and policy features of local government. Discretion obviously differs from one area to another. One striking contrast in local control is between planning powers and the authority over K-12 education. While city councils and county boards of supervisors can legislate the rate, direction, and form of development in their jurisdictions, school district boards have only minimal authority over the educational matters of curriculum, personnel, and textbook selection.

Some indicators of local discretion recorded in Table 1 do not reflect the powers of formal governments per se. Rather, they suggest the empowerment of other local parties who frequently have an adversarial relationship with formal governments--citizens who are policy opponents in the case of the direct democracy devices of recall, referendum and initiative, and public employees in the case of collective bargaining. Such empowerments of course frequently restrict the actions of elected legislative bodies, the city councils and county boards who the formal power and legitimacy to represent and make policy for their communities. . At issue perhaps is the clarity of the "local control" concept. Must it be confined to what the elected bodies and their formal organizations can or cannot do? Or does it also extend to the broader local polity, the electorate itself?

In California as in other states, the dimensions of local government discretion are continually evolving. The courts, Legislature, and voters are major parties in the process. California courts have not explicitly rejected Dillion's Rule about the strict construction of delegated power to local governments (Sato, 1984). But in many areas they have steadily affirmed the expansion of local activities, such as in community planning and land use regulation. The courts frequently turn in the other direction, however, when citizen rights in relation to local government authority are at issue. Examples include open meeting requirements, the sanctity of the initiative and referendum, and the environmental review of projects approved by local governments.

The greater threats to local government discretion in California, however, originate with the Legislature or the statewide electorate. Campaign money and lobbying often bring about legislative proposals (not always enacted) to restrict local powers in specific ways. In recent years this has included efforts to: (1) Overcome in individual communities the denial of specific development projects, (2) Restrict the ability of cities and counties to regulate the sale of fireworks, (3) Limit county control of agricultural pesticides; and (4) Prohibit local legislative bodies from enacting stringent no-smoking ordinances. When given wide exposure in newspaper articles and editorials, such proposals rarely progress past the full house or the Governor's desk.

Table 1: LOCAL GOVERNMENT DISCRETION IN CALIFORNIA FOR SELECT FUNCTIONS OR PROGRAMS

Function/Program	Nature, Degree of Discretion
ORGANIZATIONAL OPTIONS	Optional city and county charters adopted by local voters. Varied structural possibilities--manager, administrator, non CAO--for cities and counties. No city and county classifications. Numerous enabling acts for special districts.
PROGRAM FLEXIBILITY	Cities and counties have broad corporate and police powers, including for counties the full range of municipal service powers. Counties are limited by state-mandated responsibilities. Special districts can deliver almost all municipal services, but lack police powers.
MUNICIPAL INCORPORATION	Minimum population of 500 registered voters. Voter or landowner petition. Requires feasibility study, reviewed by boundary commission with approval and revision power. Final voter approval.
MUNICIPAL ANNEXATION	Initiated by voter or landowner petition, or by local government resolution. Review, with approval and revision power, by boundary commission. Election required for inhabited annexation with minimum voter or landowner protest.
INTERGOVT. AGREEMENTS	Flexible joint powers mechanism permitting any local governments to engage jointly in virtually any public service or administrative activity permitted individual units.
STATE MANDATES	Reimbursement program requiring filing of claims.
PERSONNEL MANAGEMENT	Local governments can engage in collective bargaining with all classes of employees.
DIRECT DEMOCRACY	Local recall, referendum, initiative with stiff petition requirements. Initiative limited to "policy" questions.
LAND USE PLANNING & REGULATION	Counties and cities have equivalent powers in their respective jurisdictions. State-required general plans with specific elements, plan-zoning compatibility, and environmental review of projects. But considerable local discretion in plan content and policies, especially relating to development.
K-12 EDUCATION	School districts have little authority in curriculum, personnel, textbook selection, and building standards.

Prepared by Al Sokolow, Cooperative Extension, ABS, UC Davis, August 1993

California voters over the years have faced a number of initiatives intended to restrict local government in one way or another. The subjects have included rent control, compensation of officials, fair housing ordinances, teacher employment, and liquor regulation (Allswang, 1991). It was the approval of such an initiative, Proposition 13 in 1978, that had the most negative impact on local government discretion in the state's history.

Proposition 13 And The Property Tax

The changes brought about by Proposition 13 are the major exception to the substantial local authority described above. The authority to spend, and otherwise provide services and regulate private behavior, is still extensive and firmly established among California local governments. But the companion authority to tax is severely constrained, thereby affecting how nonfiscal powers are exercised. By altering in a fundamental way the property tax, traditionally the dominant local revenue source, the 1978 initiative cut deeply into the programmatic as well as fiscal discretion of local governments in California. It was passed by a 65 percent voter majority in the June primary. Voters were largely reacting to the rapid escalation of property values and subsequent tax increases that occurred in the 1970s (Sears and Citrin, 1985).

The property tax generates income by applying the tax rate set by local governments to the value of privately-owned property, as assessed for tax purposes. Proposition 13 altered both components--the rate and the assessed valuation. The total tax rate in an area in the state was capped at one percent of market value. Assessed values were rolled back to 1975-76 levels and future increases were limited to two percent a year (or the rate of inflation if lower) for property retained in the same ownership. Reassessment at market value occurs for property changing hands or newly constructed. Proposition 13 also imposed a two-thirds voter requirement for approving local "special" taxes.

The immediate effect was a drastic reduction in local government income. Statewide, total property taxes collected by cities, counties, school districts, and special districts decreased from $11.7 billion in 1977-78 to $5 billion in 1978-79, a decline of about 57 percent. The impact on individual budgets was severe, since the property tax was the top revenue source for California local governments. At that time it accounted for almost 40 percent of their total revenues; a majority of school district income came from this one source. As property tax income decreased by more than half in 1978-79, California local governments collectively lost about a fifth of their total revenues.

In home rule terms, however, the even more critical impact of the initiative was the elimination of the property tax as a discretionary revenue source. Control over the property tax rate had been the most potent fiscal tool for local governments. In determining the annual rate in pre-13 years, a local governing board was able to use its budget to establish policy and programmatic priorities for the community. The rate and hence the property tax

yield could be varied from year to year, depending on overall spending needs, other revenues, assessed valuation trends, and constituent pressures. Typically, setting the rate was the highlight of the budget process and the singlemost important action taken each year by thousands of city councils, county boards of supervisors, and other local legislative bodies throughout California. It was a supremely political and accountable action, closely watched by citizens in each community.

This is the continuing and familiar routine for local governments in most other states. But that variability and local control no longer exists in California. The maximum one percent rate under Proposition 13 effectively is a fixed rate. At the time of the initiative's passage the total rate (the combination of the rates used by all local governments in an area) in virtually every California community substantially exceeded the 1 percent level. Since 1978 the property tax rate throughout the state has remained at the same one percent level, with the exception of small increases for voter-approved general obligation debt. Local budgeting as a result is vastly different than before, exhibiting less flexibility on the part of decisionmakers and less attention from local publics.

Post-13 Revenue Trends

The fiscal impacts of the property tax restrictions are easily traced. As compared to the 1970s, increases in local government revenues and spending slowed down considerably in the years after the initiative was approved:

	Fiscal Years 69-78	Fiscal Years 78-87
County Revenues	+ 154.4%	+ 86.4%
County Expenditures	150.7	82.9
City Revenues	186.3	92.0
City Expenditures	185.0	104.8
California Consumer Price Index	+ 72.8%	+ 82.4%

Reduced by both rate and assessed valuation caps, the property tax became far less significant in the total revenue picture of California local governments. After dropping

precipitously in 1978-79, the year after Proposition 13 passed, total property tax income for all local governments in California began a gradual increase due to new construction, other reassessments of real estate, and the two percent allowable increase in valuations, as Figure 1 shows. But not until ten years, in 1988-89, did the statewide total reach the $11.7 billion level recorded in the year of the initiative. While the property tax had accounted for 40 percent of all local government revenues ten years earlier, in 1988-89 it generated only about 18 percent of all such income.

What has replaced the once dominant property tax in the local government revenue mix? State aid, service charges, and other local taxes now take up the slack in various ways for the different types of California local governments. Figure 2 identifies the changes in the revenue mixes for counties, cities, school districts, and non-enterprise special districts between 1977-78 and 1990-91. During this 13-year period, counties and school districts became much more dependent on state aid. Cities greatly expanded their use of service charges, non-property taxes, and other local revenues. Counties also increased their use of service charges as a percentage of total revenues.

However, no single local revenue source succeeded to the primacy of the pre-13 property tax, either in its revenue generating or discretionary importance. The increase in all other local revenues for cities and counties combined in the 1980s did more than make up for the loss in property tax income. In 1984-85, for example, cities and counties earned about $9 billion more in other local revenues (including sales tax, various other local taxes, service charges and other local income) than they had collected in 1977-78. Foregone property tax revenues for the cities and counties in 1984-85, projected from the Proposition 13 reduction, were about $6 billion, a third less than the increase in other local revenues.[3]

These figures obscure important differences between California cities and counties in adjusting to the property tax loss in the years after 13. Cities were relatively successful because they had access to a wide range of local revenue sources (Reid, 1988; Sherwood-Call, 1987). They diversified revenues in several ways--shifting costs from general fund accounts to user charges and adopting or increasing a variety of non-property taxes and revenues, including business license, utility user, and hotel occupancy taxes. These revenue sources are discretionary in part, because cities have some control over rates and can decide whether or not to adopt them. Still, these sources lack the flexibility and yield of the old property tax. User charges, for example, are limited to the actual cost of delivering the service and the business license tax is generally imposed as a flat rate on business activity.

California counties, the other general purpose type of local government, coped only poorly. Initially, the principal limitation was the relatively restricted revenue authority of counties. Until 1990 the counties lacked the power to tax local business activity and utility bills. Even today, with the counties recently given legislative authority to apply such taxes in unincorporated areas, they are relatively unproductive for county governments because taxable commercial activities in California are located primarily within city boundaries. With less access than cities to other local taxes, counties continue to depend more heavily on

the property tax (21 percent of total revenues for counties in 1990-91 as compared to 10 percent for cities), although to a lesser extent than before Proposition 13.

Further fiscal restrictions for California counties are inherent in their close programmatic relationship to state government. The counties are as much administrative arms of the state as they are true local governments. About 60 percent of total county spending statewide is in mandated health, welfare, and criminal justice programs. The perennial problem is the underfunding by state government of the mandates, requiring counties to make up the shortfall from own-source and other non-earmarked revenues. The reduction in property tax revenues, combined with periodic declines in state funding in the 1980s, increased the mandate problem through the 1980s (Raymond, 1988). The proportion of non-earmarked revenues devoted to paying for state mandates steadily increased during the decade, reaching 55 percent statewide in 1987-88 (California Legislative Analyst, 1990; Simpson and Jung, 1990). As a result, county spending on local programs--such as parks and recreation, libraries, basic law enforcement and planning--declined. The accumulation of these factors brought unprecedented fiscal stress to most California counties in the late 1980s and early 90s, marked by wholesale employee layoffs, elimination of programs, and discussions about the possibilities of bankruptcy (Simpson and Jung, 1990).

Changing the State Rules

State government leaders were certainly sympathetic to the plight of local governments in the aftermath of Proposition 13. They could afford to back up their sympathy with action, since at that time the state had a budget surplus of almost $7 billion. Expressing parental-like concern for the situation facing their local creatures, state leaders initially accepted some responsibility for cushioning the fiscal blow. But in later years, depending on the state's fiscal condition, revenue givebacks from local government alternated with revenue giveaways.

Immediately after the passage of Proposition 13 in June, 1978, Governor Jerry Brown and the Legislature enacted an emergency, one-year "bailout", using their surplus funds. State block grants totalling $3.3 billion were allocated among local governments according to relative property tax losses, and the state assumed for the year certain county health and welfare costs (Simpson and Jung, 1990, 74-75).

A more permanent response to the problem was crafted the next year with the passage of Assembly Bill 8, establishing a formula for allocating the remaining property tax collections among local governments.[4] A major feature of the AB8 formula was the transfer of about a quarter of school district property tax funds to the other local governments--counties, cities and special districts. The state in return increased by a comparable amount its direct aid to schools. The proportion of the total property tax statewide distributed to school districts thus declined to 33 from 44 percent.

In the following years, as Table 2 summarizes, California made numerous changes in local government funding through legislation, constitutional amendments, and the courts. Continual tinkering with the state rules governing local revenue yields and authority produced diverse effects. In some cases the state added to local government income and discretion, while other changes took away revenue and powers. The changes affected several types of local fiscal patterns: (1) Tax and other revenue-raising powers; (2) Property tax coverage; (3) Shared state-local revenues; and (4) State aid to counties for mandated programs.

(1)Revenue Authority. Local revenue powers were expanded several times during the 1980s. The state permitted the use of parcel taxes (taxing real estate according to some basis other than ad valorem or market value) to fund development-related services and improvements (1982), gave general law cities taxing powers comparable to those only available previously to charter cities (1982), and allowed counties to increase countywide sales taxes for transportation and other purposes (1987 and 1990) and to use several municipal taxes (1990). By and large, however, these changes did not enlarge directly and unambiguously the discretion of elected governing boards. Implementing the added revenue authority in most cases required the city councils and other local legislative bodies to seek voter approval under the letter of Proposition 13. Indeed, a 1982 court interpretation of Proposition 13, that permitted governing boards to impose certain "general purpose" taxes without local voter approval, was reversed by an initiative sponsored by taxpayer groups and passed in 1986.

(2) Property Tax Coverage. Adding to the limitations on property tax assessments given by Proposition 13, a later series of seven constitutional amendments in 1980-86 provided exemptions from reassessment for specific categories of real estate. Included were replacement housing for disaster victims, seismic safety and fire prevention improvements, and homes transferred from parents to children. Resulting decreases in statewide property tax yields were estimated at that time to be minimal, reaching $17 million annually in the case of one exemption.

(3) Shared Revenues. City and county shares of revenues collected and disbursed by the state were revised several times. The biggest local revenue gain of all in the post-13 era occurred in 1986, when a constitutional amendment guaranteed cities and counties all income from the motor vehicle license fee, less state administrative costs, confirming allocation changes made by the Legislature in 1984.[5] Earlier, in 1981 and 1983, the Legislature had sharply reduced local allocations from this source. Local governments permanently lost their portions of the liquor license fee in 1981 (a total loss of about $15 million statewide) and of the cigarette tax in 1991 and 1992 (a statewide loss of about $50 million). An action that indirectly protected levels of state aid to local government was the legislative repeal in 1984 of the "deflator", an AB8 provision that allowed the state to reduce local assistance if state revenues were reduced by certain amounts (Smith, 1991, 66-68).

(4) County Aid. County governments were especially buffeted by the changes in state fiscal rules, as assistance for their mandated programs fluctuated often in the years after

Table 2: AFTER PROPOSITION 13: CHANGES IN STATE FISCAL RULES AFFECTING CALIFORNIA LOCAL GOVERNMENT REVENUES, 1979-1993

Type of Change	Details--Year, Source[1]
REALLOCATION OF PROPERTY TAX	1. Shift of portion of property tax from schools to counties, cities, and special districts, combined with increased state aid to schools (1979)--Legis 2. RESTRICTIONS ON PROPERTY TAX	1. Exemptions from reassessment for various categories of property, including replacement housing for disaster victims, seismic safety and fire prevention improvements and parent-children transfers (1980-86)--Const
NEW OR ADDED REVENUE AUTHORITY	1. Special taxing districts for development-related services and improvements, using parcel tax (1982)--Legis 2. Local boards can impose "general purpose" taxes without voter approval (1982)--Judic 3. General law cities given tax powers of charter cities (1982)--Legis 4. Property tax increase permitted for GO bonds approved by 2/3 of voters (1986)--Const 5. Countywide sales tax, with voter approval, permitted for transit projects and other purposes (1987, 1990)--Legis 6. Counties allowed to use several municipal taxes (1990)--Legis 7. Counties allowed to charge city fees for booking and tax administration (1990)--Legis
OTHER REVENUE ENHANCEMENTS	1. Increased aid to counties for health and welfare (1979)--Legis 2. Earmarking of motor vehicle license fees for cities and counties (1984)--Legis, (1986)--Const 3. Repeal of state aid "deflator" (1984)--Legis 4. One-time grants to counties (1984-88)--Legis 5. Stabilization of mandate funding for counties (1987), Trial court funding for counties (1988)--Legis
OTHER REVENUE RESTRICTIONS	1. Repeal of local allocation of liquor license fees (1982)-Legis 2. Declining state aid for mandated-programs in county government (1982-83)--Legis 3. Reduction of motor vehicle license funds (1981 and 1983)--Legis 4. Majority voter approval required for "general purpose" taxes, reversing 1982 court ruling (1986)--Init 5. Elimination of cigarette tax revenue (1991 and 1993)--Legis 6. Reduced state funds to counties for mandated programs (1989-93)--Legis 7. Repeal of city and county share of the cigarette tax (1991, 1993)--Legis

[1] Source of change: Legis--statute enacted by the legislature; Const--constitutional revision placed on the ballot by the legislature and approved by the voters; Init--constitutional revision or statute approved by the voters as a result of the initiative process; Judic--state court ruling.

Proposition 13. Several developments illustrate these up and down trends. In 1982 the state shifted full responsibility for administering medical aid to indigent persons (the MIA program) to the counties, with state funding amounting to 70 percent of local costs. By 1990, however, the state was providing only 45 percent of MIA costs. In several other program areas, including trial court funding and special aid to counties with sharply increasing mandate costs, the state in 1987 and 1988 established new assistance formulas intended to provide permanent funding increases. Also in the 1984-88 period, there were one-time infusions of cash to "distressed" counties. But this generosity ceased by 1990, when county aid was cut by more than $780 million, including for programs that had been promised stable funding (Simpson and Jung, 1990, 76).

What drove these changes, more than other factors, were the varying conditions of state finance. The Governor and the Legislature were generous to local governments primarily in the late 1970s and in 1984-88, periods of relatively flush state budgets. At other times after the passage of Proposition 13, in the early 1980s and the early 1990s, California experienced economic difficulties and declining state government revenues. Searching for ways to relieve the pressure on their budgets, the Governor and the legislature in these years dipped frequently into local government aid and the local portions of shared revenues.

The result for local governments, counties more so than cities, has been a fiscal rollarcoster ride. With the state rules changing in important ways virtually every year, there is little stability in California local government budgeting. Furthermore, the sense of local control in fiscal matters has severely declined. Annual budgets adopted by county boards of supervisors, city councils, and other local governing boards are as much a product of state as of local decisions. California cities were told by their state association in early 1993:

> "Your city council has grown by at least two members--your representative in the California Assembly and your state senator. Decisions are being made or at least agreed to by these state elected officials which have a direct and immediate effect on the services your city can provide. As a matter of fact, the decisions of the state Legislature and the Governor in the near future may have more important implications for local services than decisions made in city hall" (Steinbakken, 1993).

Finalizing Property Tax Centralization: The Tax Shifts of 1992 and 1993[6]

If California local officials still believed that they had some control of the property tax and a significant measure of fiscal discretion, those perceptions were shattered by state government in 1992 and again in 1993. Facing very large and continuing budget deficits,[7] Governor Pete Wilson proposed and the Legislature approved in both years substantial

reallocations of the property tax. School districts gained and all other local governments--counties, cities, special districts--lost in the shift of $1.3 billion in property tax revenues statewide in 1992 and a doubling to $2.6 billion in 1993. But the shifts enabled the Governor and the Legislature to reduce direct state aid to school districts by the same amounts, thus providing a significant amount of budget relief.

It was a reversal of the reallocation that had shifted property taxes from schools to other local governments 13 years earlier, under the ostensibly "permanent" formula of AB 8 of 1979. The state then was flush; in the early 1990s it was broke.

The new reallocations represented about 8 percent of total property tax revenues statewide for the 1992-93 budget year and about 16 percent for 1993-94. For individual local governments, they were the largest revenue decreases since Proposition 13 itself. County governments took the largest hit in the property tax reductions for each year:

	1992-93	1993-94
Counties	$ 525 mill	$2.2 bill
Cities	200 "	245 mill
Redevelopment Agencies*	200 "	65 "
Special Districts	375 "	90 "
Total Reduction	$1.3 bill	$2.6 bill

*Most redevelopment agencies are operated by city governments.

State Options and Local Reactions. Local government funding lost out to other, more pressing state priorities. Politically, tapping the property tax was a relatively easy option for the state to help solve its fiscal problem. Republican Governor Wilson was firmly opposed to tax increases, closing tax loopholes, and to cutting into prison operations, the most rapidly increasing area of state spending. There were legal as well as political reasons for maintaining support for K-12 education at current levels, since a 1988 initiative approved by the voters required spending a minimum of 40 percent of the state's general fund on this purpose. For their part, majority Democrats in the legislature were especially interested in limiting spending cuts in social services and other areas of state government. In 1993 they were pushed into reaching an early agreement with Wilson's fiscal proposals, including the

property tax shift, to avoid a repeat of the embarrassing impasse of the earlier year that had delayed enactment of the 1992-93 budget for a record two months beyond the constitutional deadline.

Local and state government views about the choice obviously differed. To distressed county and city officials, the property tax shifts were an unconstitutional grab of local funds. They violated what had been assumed to be the permanent arrangement under AB8 of 1979 for allocating property tax funds. Furthermore, it was morally wrong for the state to dip into local funds to solve its fiscal problems, when state government agencies had not matched the painful program cuts carried out by local governments in recent years. Emphasizing this comparison, an editorial in the monthly journal of the League of California Cities lectured state government on creative techniques for downsizing operations (Benninghoven, 1993).

According to the Wilson administration, on the other hand, state government had the constitutional authority to shift the tax allocations. The property tax was not a guaranteed entitlement for local governments, in the state's view. And while local agencies for many years had enjoyed the post Proposition 13 "bailout" provided under AB8, the Governor's staff maintained that this was a form of largesse that the state could no longer afford.

Local governments were sorely angered by the property tax shifts, more so than in response to earlier state rule changes. Largely spared the fiscal problems experienced earlier by counties, city governments joined with the counties in 1993 to battle the shifts. This effort produced the May demonstration on the capital steps. It also led to the work of a statewide committee of county administrative officers and city managers that prepared a set of state budget alternatives. Boards of supervisors of most counties in the state passed ordinances or resolutions ordering their county auditors (a dubious instruction since the duties of the elected auditors are defined in state law) not to transfer the property tax funds to school districts. Explained one Sacramento County supervisor:

> "We want to send a message to the state that we believe they are unlawfully diverting funds that are rightfully ours. Our intention is to withhold funds. We are strong in our resolve." (Sacramento Bee, 5/17/93)

Several county governments filed suit against the state in early 1993, arguing that the legislation improperly used local funds to satisfy the state's general fund obligation to maintain support for K-12 education. Unfortunately for the local litigants, the first court decisions on the matter, in May and July, rejected the general fund argument and affirmed the state's constitutional authority over the property tax.

New State Promises. Local government lobbying and litigation did not block the property tax shifts, but it caused the state to promise some fiscal relief. Late in the 1993 budget process, Governor Wilson presented a revised budget that included the possibility of a half-cent sales tax increase for county and city governments. This would continue a temporary statewide half-cent that had been imposed in 1991 for earthquake relief and that

was due to expire on June 30, 1993. Earlier in the year Wilson had rejected proposals to extend the half-cent tax to help solve the state's fiscal problem. The plan now was to make it a "local option" tax--to put the decision about continuing the tax in the hands of local voters and county boards. As approved quickly by the legislature, the relief measure continued the half-cent for another six months (through the end of 1993) and provided for a special election in November at which voters statewide could, by majority approval, make this a permanent increase in the sales tax for local programs.

For an individual county government and the cities within the county to benefit from the extension, however, the rules had a complication. Local approval would be required in one of two ways: (1) A resolution by the county board of supervisors placing the item on the ballot, or (2) Majority approval by the county's voters in the November election.

Lest there be any doubt about how much discretion local governing boards would have in spending the revenues from the additional half-cent sales tax, Wilson insisted that the funds be devoted entirely to public safety programs. With a group of county sheriffs and district attorneys at his side in a press conference, the Governor proposed a constitutional amendment to make public safety the top spending priority for counties and cities. He warned local governments not to engage in a "shell game" to shift funds to other programs, a reference to extensive reductions then being made in the budgets of sheriffs and district attorneys.

In his 1993 budget revisions, Wilson also promised to repeal a number of state mandates on counties and cities that were not directly related to public safety. The list included optional Medicaid benefits, school crossing guards, mental health programs, and retirement benefit levels for public employees.

Local government reacted with hostility to the sales tax and mandate promises. Four major criticisms of the plan were expressed by local officials:

(1) The Governor was merely passing the political buck, asking local governments to make unpopular tax decisions that he and the legislature were not willing to take on.

(2) The constitutionality of permitting a simple voter majority to extend the half-cent tax could be challenged in court by taxpayer groups, based on the two-thirds requirement established by Proposition 13 for "special" taxes. Certainly this would be the scenario if the revenues were to be earmarked for public safety purposes as the Governor was insisting.

(3) Taken together, the half-cent sales tax and mandate relief would not match the $2.6 billion reduction in property tax revenues. A half-cent sales tax statewide would produce only $1.4 billion annually. And the administration's projection of an annual $500 million savings in mandate relief was excessively

optimistic; some local officials saw in the plan only about $50 million in savings.

(4) Indeed, some county officials argued that a number of the mandates proposed for elimination ***should be continued***. The relevant community service needs and demands would not disappear, and in some cases the courts would probably require the continuation of the mandates. (A surprising local reaction perhaps, according to the conventional local view of the burdensome character of intergovernmental requirements, but one suggesting that some California local government leaders over time had accepted the value of certain mandates.)

The additional sales tax revenue and mandate relief then were not seen by local governments as effective solutions to their fiscal and control problems. Local officials would bear the political costs of implementing these rules. And even if implemented, the changes would only partially offset the property tax loss. Certainly, there would no gain in local revenue discretion.

Again, state rulemaking left counties and cities hanging in the wind. But what other short-run options existed for local fiscal assistance? Seeing none in the summer of 1993, most county boards of supervisors in California dutifully followed the new state rule and voted to place the sales tax extension on the November ballot.

Policy and Organizational Consequences

Losing control of the property tax had far more than fiscal consequences. It greatly affected the behavior and policies of California local governments, even before the property tax reallocations of 1992 and 1993. Proposition 13 in 1978 scored a direct hit on the policy discretion of city councils, county boards of supervisors, and other elected governing boards at the local level. Without the revenue authority implicit in control over the property tax rate, their ability to translate constituency priorities into policies and programs became tightly circumscribed. Elected officeholding in California local government became a more frustrating and onerous experience. A common response to constituents' demands these days, especially from county and school boards, is to plead either lack of funds or local control. A veteran county supervisor, who was first elected in the early 1970s, noted the enlarged gap between expectations and capacity:

"After Proposition 13 there was a significant shift in power from the county to the state. I think that many Californians have grasped this shift intellectually, but they haven't accepted it emotionally. Our constituents still want us to be do everything that we could do before Proposition 13. They want us to fund new and innovative programs. They want us to have our county offices open

> all day, every day, and to open new branch offices in the cities. They want us to provide health care to all the people who cannot afford it, using county-owned and -operated facilities...We no longer have strong, independent local government that can respond to these citizen interests." (Hahn, 1988, 39.)

In policy terms, the most striking change in local government was a more aggressive promotion of community growth and development during the 1980s. Now that the property tax no longer provided a steadily increasing income stream for local budgets, hungry local governments--cities much more so than counties--turned to growth as the principal generator of new revenue.

This strategy substituted one kind of control for another. With the property tax fading as a flexible tool for revenue production, entrepreneurial local governments turned to their arsenal of nonfiscal powers. State rules give California cities and counties considerable control over planning and land use matters. Increasingly in the 1980s the most aggressive governments used their general plan, zoning, land division, and infrastructure powers to influence the rate, type, and location of development within their borders. The goal of such actions was to transfer private development into public dollars.[8]

Local pro-growth policies were made possible by the state's extraordinary population and economic expansion of the 1980s. California added six million new residents during the decade, a 25 percent increase. A frenzy of development converted thousands of acres of rural land to homes, businesses, and urban parks. The hottest growth regions of the state were the eastern fringes (Riverside and San Bernardino counties) of the Los Angeles metropolitan area, the Sierra foothills, and the agricultural Central Valley.

It was not new of course for California communities to pursue urban development. But in the post-13 era, the chase for development and public revenues took on a greater urgency and intensity. Many municipal officials saw this strategy as a virtual imperative for fiscal survival.

Several new twists separated the local pro-growth policies of the 1980s from earlier versions: (1) Local governments became much more selective about the type of development to pursue. The reduced significance of the property tax as a revenue-generator increased interest in the sales tax. Residential development, especially low- and moderate-cost housing, became less attractive and the attention shifted to commercial development--especially regional shopping centers, auto malls, and factory store outlets (Detwiler and Sanders, 1991; Senate Local Government, 1989, 3). (2) The tendency increased on the part of city and county governments to make land use decisions according to their revenue consequences rather than according to environmental and quality-of-life considerations. Some observers refer to the "fiscalization of land use" or "zoning for dollars" to characterize the widespread practice of using planning and other land use actions to carry out fiscal policy (Misczinski, 1986; Detwiler and Sanders, 1991). (3) Local government fees imposed on new development grew substantially in the years after Proposition 13. By the late 1980s,

development fees of as much as $15,000 per residential lot were common in California communities (Brooks, 1988). It had long been standard policy to have new construction pay for some of its immediate public costs, but the added fees in some places also were used to help fund communitywide improvements--thus shifting public costs from established property owners to new homebuyers and businesses. Stimulated by post-13 obstacles to borrowing for capital improvements,[9] this strategy also helped to preserve diminished general fund revenues. (4) As a major part of their expansionist policies, California cities annexed vast amounts of land in the 1980s, most of it farmland or otherwise unoccupied acreage slated for development. The pressure to secure revenues for local services in the post-13 era also generated a large number of new city incorporations throughout the state--41 alone in 1978-90 as compared to 26 in the comparable period of 1965-77. These municipal formations reflected the desire of urbanizing communities to capture from county governments local revenues and control of development. The 1978 property tax restrictions actually helped the cause of cityhood in many places by eliminating the tax increase argument that opponents in earlier years had used to block incorporations (Sokolow and Martin, 1983).

Of course not all communities or local governments can profit from such pro-development strategies. Even California has a limited number of shopping center, office park, and other major development opportunities. County governments generally are less successful than municipalities in luring growth to their unincorporated areas. They tend to be less aggressive in promoting economic development and many have land use policies that direct growth to cities in order to protect rural lands. And private developers often prefer to locate their projects within city boundaries where infrastructure is more readily available (Sokolow, 1993). Wide variations in the ability to generate revenue from private development also exist among cities in California, with a few extremely entrepreneurial municipalities capturing the lion's share of commercial projects.[10] What serves to widen the revenue gap between economically successful and unsuccessful local governments local governments is the zero-sum nature of the sales tax and other public dollars generated by development. Under California law they are in-situ revenues, accruing only to the jurisdictions where development occurs, regardless of the costs imposed on nearby locations (Chapman, 1991).

The pro-growth strategies of the 1980s had major intergovernmental effects--particularly the escalation of city-city and county-city conflicts over land and revenues. Pressured by Post-13 revenue needs, cities and counties competed more vigorously than before for the limited public revenues and development opportunities in their regions. The competition most often centered around municipal annexation proposals, since such territorial adjustments produce a substantial transfer of sales and other taxes from county to city governments--an example of the zero-sum game. But the specifics of the revenue shifts can be negotiated, as a few counties have attempted. In the most notable instance, Fresno County held up the annexation efforts of its 15 cities for three years in the late 1980s before securing a comprehensive set of revenue-sharing agreements with the municipalities (Sokolow, 1993). Other fiscal considerations also contributed to the growing intergovernmental tensions of the 1980s. As a means of funding capital improvements, cities

greatly increased their use of redevelopment financing in the years after Proposition 13, thus capturing from counties and other local governments all or most of the future growth in property tax increments in the redevelopment areas (State Senate Committee on Local Government, 1989). Reversing the benefit-cost ratio, the Legislature in 1990 gave counties the authority to charge municipalities for jailing their arrestees and for tax administration--a rules change strongly opposed by cities.

Despite their widespread use to promote development, the controls over planning and land use are not as powerful as a discretionary tool for counties and cities as was the previous authority over the property tax rate. General plan policies and zoning changes do not produce revenue directly. Yet they share one important element with the old tax rate--a great deal of visibility and a certain degree of public accountability. City and county growth policies generate enormous controversy. They are the most volatile political disputes in many California communities, dominating local agendas much as the property tax did in the years before 1978. Growth issues take top billing in electoral campaigns. Citizen groups frequently use the ballot to challenge local policies, either through the inititiative process or by attempting to recall incumbent officials. More than 450 growth-control or growth-management measures were legislated through the ballot in California communities during the 1984-89 period (Glickfeld and Levine, 1991).

Conclusions: The Centrality of the Property Tax

Revenue authority is critical to local government discretion, this paper argues. And central to any strong measure of revenue authority is local control over the property tax. More than its productivity as the leading own-source revenue for local governments throughout the nation, it is the local rate-setting variability of the property tax in most states that gives it value as an element of local government discretion.[11] Representative democracy is enhanced by this process. For when elected local governing boards are able to control the rate, they have the capacity to use their budgets to represent community priorities and pressures.

California's abandonment of local control over the tax when Proposition 13 effectively established a fixed statewide rate thus was a remarkable action. Few if any other states in recent years have taken away so much local revenue authority.[12] The 1978 constitutional change altered fundamentally the ways in which California local governments operate, in policy as well as fiscal terms. It also substantially revised the state-local relationship, making local governments more vulnerable to frequent state changes in the rules governing local finance. The property tax shifts of 1992 and 1993 merely demonstrated how the California property tax had lost its local character and had become a tool of state fiscal policy.[13]

A revealing aspect of the changed relationship was the different reactions of local and

state officials to the property tax shifts. While upset county and city leaders saw them as an unprecedented usurpation of traditional local authority, the Governor and legislative leaders viewed the shifts as entirely within the scope of state power.

To replace the reduced income of the property tax, California counties and cities turned to larger amounts of other revenue sources--increased state assistance, sales taxes, service charges, and local taxes on business and utility use. However, no other single source or combination of sources was an equivalent substitute for the old property tax as a discretionary and accountable fiscal tool. Other local revenues lack the flexibility previously available to elected governing boards in California when they were able to set annual property tax rates.[14] Also they do not generate the same degree of citizen attention and oversight that property tax rate decisions would stimulate, because the other revenue sources have less widespread an impact on taxpayers and typically are not subject to annual changes.

What also limits the discretionary nature of most non-property local taxes in California is the voter approval requirement--two-thirds for "special" and a simple majority for "general" taxes. (Ad valorem property taxes, fixed by the constitution at one percent, lack even the potential for voter-approved increases, with the exception of general obligation debt.) Subjecting virtually all local legislative decisions to increase or impose new taxes to extraordinary or simple voter majorities gives a different twist to the concept of home rule. Certainly it undercuts the authority of elected boards, the key figures in representative democracy. Local electorates are not corporate bodies like city councils and other elected governing boards. Rather, they are ad hoc collections of individual voters who are motivated by self-interest. Whether a majority electorate can speak for a community or home rule interest is an intriguing question deserving further contemplation.

Notes

1. Municipal law specialists still detect some important implicit differences in that charter status is specified in the California constitution and that "municipal affairs", referring to the scope of charter city powers in relation to state control, remains a cloudy concept subject to continuing interpretation. See Sato, 1984; and Strauss, 1986.

2. Some of the details about California law in the ACIR report seem inaccurate as to current patterns. . For example, California does not classify cities for legislative purposes (p. 22) , does not have a minimum area requirement for city incorporations (p. 22), and does establish methods for local property tax assessments (p. 40).

3. Projections of the annual "tax relief" for property owners (and tax losses for local government) provided by Proposition 13 were prepared through the mid 1980s by the California Legislative Analyst and the Department of Finance. In 1984-85, the estimated total relief (and total loss for all local governments--schools and special districts, as well as cities and counties) was $11.8 billion. For the entire seven-year period since Proposition 13, the cumulative relief then was $63 billion (California Tax Foundation, 1985) .

4. Annual property tax collections essentially were allocated among the different local governments (county, city, special districts) operating in a specific tax area according to their pre-13 shares of the total property tax. School districts were given smaller shares than before as a result of increased state aid. One consequence of this reallocation was to eliminate the meaning of property tax rates for individual governments. With a statewide cap of one percent of market value applying statewide, individual local governments actually receive different shares of the total property tax in different tax areas according to the mix of governments operating in each area. For an analysis of the consequences of such varied allocations, see Smith, 1991.

5. As a result, total county and city revenues from this one source increased by about $600 million in 1984-85. In recent years the motor license fee has returned annually about $1.2 billion to counties and $800 million to cities, making it the third most productive revenue source for counties (after property taxes and service charges) and the fourth top source for cities (after sales taxes, property taxes and service charges).

6. The following summary of state budgeting in 1992 and 1993 is largely draw n from accounts published by the *Sacramento Bee* and several *California Journal* articles.

7. Anticipated deficits at the start of the state budgeting process were $6 billion for 1992-93 and $8.6 billion for 1993-94. Total annual state spending was in the $50-$60 billion range. Coping with large deficits has been a feature of each legislative session since 1989, when declining state revenues and increasing spending demands signalled the start of a recession in California. The largest anticipated deficit during this period was the $14 billion projected for 1991-92.

8. At least one commentator sees the land use impacts of Proposition 13 as more significant in the long run than its fiscal effects (Chapman, 1991).

9. When enacted in 1978, Proposition 13 removed from local governments the ability to raise the property tax to repay bonded debt. This power was restored by constitutional amendment in 1986, but the requirement that general obligation bonds had to approved by two-thirds voter majority remained as an obstacle to local governments.

10. An illustration is provided by the contrasting fiscal experiences of the nearby cities of Fairfield and Vallejo, both located in northern California's Solano County. Fairfield (1990 population--79,000) in the 1980s was more aggressive than the older Vallejo (1990 population--112,000) in obtaining commercial development, including a large regional shopping center that shares profits with the city. Per capita sales tax revenue was $117 for Fairfield in 1990 and grew by 154 percent in the 1980s, as compared to the respective numbers of $84 and 106 percent for Vallejo.

11. In defining fiscal flexibility, Cigler emphasizes the variability of revenue production: "Flexibility results from having authority over sources of significant revenue potential than can be varied over the years in response to changing demands for services and new circumstances" (Cigler, 1993, 16).

12. A 1984 national survey of procedures for enacting or increasing local taxes found that California was the only state with a constitutionally-imposed maximum rate for the property tax. In four other states (Mississippi, New Hampshire, North Dakota and Wyoming) the rate was controlled by the legislature. In all other states, local elected officials or local voters controlled the rate--35 in which local legislative bodies had this power

unilaterally (California Tax Foundation, 1984).

13. Smith makes a different and more technical argument about how local discretion is harmed by the legislative implementation of the property tax restrictions of Proposition 13. Instead of emphasizing the effects on representation and community priority-setting, he notes a disruption of the tax situs and uniformity provisions of the California constitution that require the taxes paid by individual property owners to fund only the programs of local governments that serve them. The allocation under AB8 of property taxes among different units violates these provisions, according to Smith, because it varies the proportion of total property taxes received by an individual government from one tax area to another. A portion of the taxes paid by an individual property owner, consequently, may be received by a government that does not serve him (Smith, 1991).

14. While the sales tax is considered a "local" revenue source, the basic rate for cities and counties is set at one percent by state law; countywide sales taxes of one-half or one percent can be added with voter approval. A service charge is generally limited to the cost of providing the specific service. Other local taxes, including the business license fee and utility tax, are usually based on fixed rates that are seldom changed.

Is This the End? Biracial Coalition in the 1993 Los Angeles Mayoral Election

Raphael J. Sonenshein
Department of Political Science
California State University, Fullerton

Prepared for delivery at the 1993 annual meeting of the American Political Science Association, The Washington Hilton, September 1-4, 1993. Copyright by the American Political Science Association

The John Randolph Haynes and Dora Haynes Foundation graciously provided a grant that allowed me the time and resources to conduct this research. The Center for Governmental Studies at California State University, Fullerton, provided additional support. I am also grateful to polltakers Richard Maullin and Arnold Steinberg, Riordan campaign chairman Bill Wardlaw, Los Angeles Times Poll assistant director Susan Pinkus, Michael Barclay of the Los Angeles Chief Legislative Analyst's office, and to Patrick Reddy. Pam Singh organized the census tract analysis of voting, and Corecia Davis provided research assistance.

Introduction

The prospects for interracial coalitions - political alliances among minorities and whites - remain the subject of intense debate. The view that, except under very strictly defined conditions, such coalitions are likely to be undesirable and unsuccessful was championed by Carmichael and Hamilton in their classic Black Power (1967). Their view was challenged indirectly by Browning, Marshall and Tabb's study of minority power in ten northern California cities (1984). Browning et al. found that minority political success depended on a combination of minority unity and mobilization and alliance with liberal whites.

Those who follow the Black Power school focus almost entirely on alliances of self-interest, and disdain coalitions based on shared liberal ideology. Those who admire biracial coalitions focus largely on shared beliefs, and tend to underplay the role of self-interest either as a source of alliance or a cause of conflict. Few on either side pay much attention to how leaders can shape interests into alliance or conflict, or to how coalitions change over time.

But the prospects for interracial coalitions are not quite so black and white. Coalitions are dynamic phenomena. They can rise and fall, even in the same city over time. Mollenkopf's analysis of New York City (1990) has shown that the "rollback" of minority gains is always a possibility. As moderate or conservative mayors begin to supplant Black mayors in Chicago,

Philadelphia, Los Angeles, and perhaps soon in New York City, the question of rollback has moved from the theoretical to the urgently practical.

I have been exploring the conditions that make interracial coalitions succeed and fail (Sonenshein 1990). My research calls attention to three critical factors, and the interplay among them: ideology, interest and leadership. While ideology provides the fundamental grounding for biracial coalitions, interest plays a very important and often unrecognized role. Powerful interest conflicts can override strong ideological predispositions. But the reverse is seldom true: barriers of racial ideology can rarely be overcome by common interests strong enough to create a coalition.

I further argue that interests are not simply objective; their shape can be greatly influenced by leadership over time. Following Hinckley's view (1981) that the human element is crucial in coalitions, and that coalitions have a history that both constrains and empowers them, I study the historical evolution of coalitions.

The outcome of this debate is extremely important in the practical world of politics. Theory influences practice. Those who take the interest perspective tend to prefer rainbow coalitions, in which the role of whites is highly limited and coalitions of color and class are emphasized. The best known examples are, of course, Rev. Jesse Jackson's presidential campaigns. Those who prefer the ideology model promote biracial

or interracial coalitions, in which whites have a more prominent role than in rainbow coalitions. The path chosen helps determine the tactics adopted, and in turn the tactics adopted help shape the success or failure of the coalition.

Rising multiethnic populations in major cities have added a new wrinkle to the debate. The increase of Latino and Asian-American populations has seemed to augur a new type of politics. Which model - rainbow or biracial - would be the best way to incorporate new groups into urban politics?

This debate has been largely conducted within the progressive camp. In the midst of this lively interchange, it is all too easy to forget that there is a third model waiting in the wings, and increasingly finding its own success - the conservative coalition. The conservative coalition, unlike either the rainbow or the biracial models, begins not in the African-American community, but among whites. It seeks to win power by holding a majority of whites and picking off pieces of various minority constituencies - the mirror image of the progressive coalition.

The case of Los Angeles has become increasingly important in the debate over interracial politics. The second largest city, Los Angeles has been home to a durable and powerful biracial coalition - the twenty year alliance that sustained Tom Bradley's mayoralty. Principally built by African-Americans and liberal Jews, the Bradley coalition grew to encompass business and labor, Latinos and Asian-Americans. In a debate dominated by the polarized experiences of New York City and Chicago, the Los

Angeles case offers a different, western perspective of crossover politics (Sonenshein 1993). The inclusion of Los Angeles in the debate on interracial coalitions allows a broader view of the prospects for biracial coalitions.

But Los Angeles itself has changed dramatically in recent years. In the wake of devastating civil violence in 1992, the Bradley coalition - already deteriorating - fell from power with the election of a conservative Republican as mayor in 1993. The Black and white populations of the city were challenged by a huge rise in other groups, particularly Latinos and Asian-Americans. Thus, Los Angeles has now moved from the model of biracial politics to the more problematic center of multiethnic political theorizing, severe social conflict, and the rollback of minority gains.

What does the 1993 election have to say about the prospects for biracial coalitions in a city like Los Angeles? What does the Los Angeles case have to tell us about the prospects for such coalitions in other communities? How might they relate to the ongoing mayoral campaign in New York City and to the rise of urban conservatives in other cities?

In this paper I will analyze the 1993 election from three perspectives: ideology, interest, and leadership. The specific research incorporates several different methods. The voting analysis includes the examination of <u>city council districts,</u> preliminary results of a more elaborate ecological analysis of <u>census tracts and precincts</u>, and <u>public opinion polls.</u> <u>Los</u>

Angeles Times Poll reports have been analyzed along with information graciously provided by polling consultants for both the Riordan and the Woo campaigns. Finally, I have relied on newspaper articles and attendance at candidate debates. The research is still in progress, and this paper represents an interim report.

Background

The context for the 1993 elections was the inexorable decline of the Tom Bradley coalition that had ruled Los Angeles since 1973. While the coalition had been in failing health since 1985, events moved more quickly after the 1991 videotaped beating of Rodney King. Bradley's support steadily fell - especially among whites - as he sought to remove Police Chief Daryl Gates from office and to institute police reforms. These victories were extremely costly to Bradley among white voters. Table 1 shows the decline in Bradley's popularity over the two-year period between the beating of Rodney King and the runoff election in May 1993.

Table 1.

Bradley Approval, 1991 - 1993, LA Times Poll

March 1991 (a)	61
March 1991 (b)	57
April 1991	53
July 1991	48
May 1992 (a)	44
May 1992 (b)	38
February 1993	39
May 1993 (a)	33
May 1993 (b)	38

An indication of Bradley's political problems was that in the second May 1993 poll he was supported by only 26% of whites, 43%

of African-Americans, and 39% of Latinos. By the time of the 1993 election, Bradley's political capital was virtually exhausted.

To the surprise of very few people, Bradley announced in September, 1992 that he would not run for re-election to a sixth term. For the first time in over 50 years there would not be an incumbent in the mayoral race. For the first time since 1957, there would be a mayor who was neither Sam Yorty nor Tom Bradley.

Under the nonpartisan rules of California city elections, an open primary would be held for all candidates on April 20th, 1993. If no candidate received a majority, a runoff would be held between the two leading candidates on June 8th. There had been no mayoral runoff in Los Angeles since Bradley's 1973 defeat of Sam Yorty.

A huge field of mayoral candidates appeared, but a number of very strong candidates remained out: Latina county supervisor Gloria Molina, Jewish city council member Zev Yaroslavsky, and city attorney James K. Hahn among them. The leading contenders among those who did enter were city council members Michael Woo, Joel Wachs, and Nate Holden, state assembly member Richard Katz, deputy mayor Linda Griego, attorney J. Stanley Sanders, and millionaire businessman Richard Riordan.

Woo was the early favorite. A Chinese-American elected in 1985 to represent Hollywood's 13th district, Woo was the natural successor to Bradley. He was young and liberal, a crossover minority candidate, and had built bridges to the African-American

community through his public calls for Gates's resignation. Woo also had substantial financial resources, drawn in significant part from the growing Asian-American community. As an Asian-American, he seemed the perfect vehicle to take the biracial coalition into the multiracial era. To all appearances, it was his race to lose.

Wachs and Katz were centrists, cut from similar cloth - Jewish moderates with bases in the San Fernando Valley. Holden and Sanders, African-Americans, were only moderately well known, although Holden had run for mayor in 1989. Griego was the best-known Latino in the race, but was still barely recognized.

The great unknown factor was Riordan. A venture capitalist with an estimated $100 million fortune, Riordan had long been a familiar figure at city hall. He had given campaign funds to a wide range of politicians, with the largest amount going to Tom Bradley. Bradley had appointed him to the Recreation and Parks Commission. Known as a business conservative, Riordan was not particularly ideological. With his ability to place unlimited funds into his campaign, he could not be ruled out even with his extremely low name recognition.

The 1993 election seemed likely to introduce Los Angeles to a new rainbow age. The population was now two-thirds minority. But when it came to the voters, the image of a rainbow Los Angeles evaporated. Eligible voter proportions had stayed stable, while demographics changed rapidly. Although Los Angeles has become more multiethnic than ever before, the electorate

constitutes virtually a different city from the population (see Table 2). Two-thirds of the city's residents are minorities; two-thirds of the voters are white. One third of the city's adults are not citizens (Pactech 1992).

Table 2. Population vs. Registration

	Population	Registration (est.)	Perc of Votes in 93 prim	93 gen
Whites	37.3	65	68	72
-- Jews	7.0 (est)	15	16	19
Blacks	14.0	15	18	12
Latinos	39.9	11	8	10
Asian-Amers	9.2	4	4	4

Sources: Population, U.S. Census; registration, summary of various estimates; vote in 1993 from LA Times exit polls

To show how this dynamic plays out with actual voters, Table 3 displays the highest and lowest participation city council districts: the First, a Latino district on the eastside; and the Fifth, the westside liberal Jewish district (Table 3)

Table 3.

The Mobilization Gap, 1992-1993

	Population	18+ Pop	Citizen 18+	Reg Vot	Cast 4/93
1	228,695	160,576	58,547	36,804	10,118
5	236,423	203,451	174,199	151,020	53,018

Source: Pactech Consultants, report to the Los Angeles City Council 1992; votes cast, from city clerk election division.

Table 3 clearly shows the hole in the electorate. Age opens up an important gap; the Latino community is much younger. But the huge drop is citizenship, reducing the potential voting bloc in the First district to only one-third of that in the Fifth. Then registration and voting bring it to only one-fifth of the Fifth district's vote per population. Standard turnout figures obscure this difference. While each district had about a one-third turnout of registered voters in the April primary, there were more than five times as many voters in the Fifth.

Indeed, despite the enormous demographic changes in Los Angeles, the political community today looks remarkably similar to what it was when Tom Bradley fought Sam Yorty in 1969 and 1973: a white majority, a stable one-sixth Black base, and a significant but surprisingly small Latino sector.

Whoever won the mayoral election - whether the older white businessman or the young Asian-American council member - would be elected by a majority of a minority in the new Los Angeles.

Ideology

Riordan did exceptionally well in the primary, finishing first with 32.0% of the vote. Woo finished second with 24.5%, and Wachs and Katz finished third and fourth, evenly splitting another 20.2% of the vote. In the general election, Woo and Riordan faced off, and Riordan was the solid winner, taking 54% of the vote.

There was significant evidence of damage to the Bradley coalition even in the primary. Woo failed to hold key areas of coalition strength. The results showed some interesting changes from previous patterns, as well as some continuity. I have examined four key council districts in elections covering several decades (Sonenshein 1993). They are presented below in Table 3 and on the accompanying map of the city:

Table 3.

Four Key Council Districts, 1992

	White	Black	Latino	Dem Reg	Med Inc	CollGr
5	81.0	3.3	9.8	61.4	62743	41.1
8	4.6	64.1	31.4	87.7	23317	10.2

Of the four districts, two are white and affluent, but are very different politically. Among white majority areas, one is the most liberal (#5) and the other the most conservative (#12). The Fifth district is 30-40% Jewish, by far the largest Jewish bloc of any council district. The other two districts are heavily minority, poor and working class. The 8th is a good predictor of Black voting because so many of the Latinos who live there are not citizens. On the other hand, the 14th is a more tentative measure of Latino voting, since there is a large white population with a higher registration/population ratio than Latinos. Votes from the 14th district tend to underestimate Latino Democratic identification and liberal voting.

The primary vote in the four key council districts is shown in Table 4. I joined together the Wachs and Katz vote as "centrist".

Table 4.

Primary vote by key council district

	Riordan	Wachs + Katz	Woo	Votes	Turnout
5 White Liberal	29.8	33.9	18.5	53,018	35.1
8 Black	4.3	4.1	47.6	26,818	24.9
12 White Cons	48.9	23.0	11.2	48,028	37.6
14 Latino	28.6	15.4	27.7	17,512	27.7

The Los Angeles Times exit poll for the primary presented another view of the vote (Table 5).

Table 5.

Times exit poll, primary

	Riordan	Wachs/Katz	Woo	% of votes
White liberals	11	34	30	16
White moderates	42	32	11	24
White conservatives	78	11	2	19
Blacks	4	5	52	18
Latinos	20	19	30	8
Jews	21	52	14	16

Woo fought his way into the runoff with a very solid showing among African-Americans, a respectable bloc of Latinos, but with relatively few Jewish backers. Most Jews were drawn to Wachs or Katz. Woo did well with white liberals, but shared that bloc with the "centrist" candidates. The implication was clear - a rainbow alliance would not be nearly enough to win a majority without substantial support from whites drawn to centrist politics. It was also disturbing news for Woo that the turnout was so low in the minority neighborhoods, but was vibrantly high in the San Fernando Valley. The stakes were being seen as much higher in Riordan territory than in Woo's strongest areas.

Woo's electoral weaknesses were deepened in the battle for general election endorsements. J. Stanley Sanders shocked political experts when he backed Riordan in the runoff. Riordan also claimed Joel Wach's endorsement, and the support of Latino council member Richard Alatorre. Thus he was heavily backed by a

political figure from the African-American, Jewish, and Latino communities. City council president John Ferraro not only supported Riordan, but derided Woo as "a snot-nosed kid."

Woo won the important endorsement of county supervisor Gloria Molina, but failed to gain the backing of Congress member Maxine Waters - perhaps the most influential Black elected official in the area. After heavy lobbying, Woo finally gained President Bill Clinton's endorsement, but Riordan's close ties to the administration led to a tepid presidential statement of support. Richard Katz and Zev Yaroslavsky, Jewish elected officials who could have helped Woo substantially, remained neutral.

In the June runoff, Riordan trounced Woo with 53.8% of the vote. He swept the Valley, where turnout was high, broke even among Jews and Latinos, and lost only Blacks decisively. Results in the four key council districts are displayed in Table 6.

Table 6

General Election

	Riordan	Woo	Votes	Turnout
5 White lib	57.0	43.0	66,016	45.8
8 African-Am	14.1	85.9	34,669	34.4
12 White cons	75.3	24.7	61,527	49.9
14 Latino	46.3	53.7	23,607	39.2

Riordan and Woo percentages are calculated as share of two-candidate vote; votes cast are all those who came to the polls including a small number who did not vote for mayor.

How do these results compare with long-standing patterns in Los Angeles? There were major changes in each of the four areas. First, the conservative Valley simply exploded. It had always been the most conservative, most anti-Bradley, most anti-tax area of the city, but it was way above its usual levels of conservative support - a crest not seen since Sam Yorty's 1969 defeat of Tom Bradley. The long years of political marginality under the Bradley coalition had generated a furious, highly mobilized charge.

The Latino Fourteenth district had become a bastion of Bradley's political strength, but Riordan was nearly even with Woo there. The district's councilman, Richard Alatorre, was a strong backer of Riordan. The Black percentage for Woo was very respectable - although lower than Bradley usually received - but the turnout was substantially lower than would be expected. For the first time in a generation, the Valley conservatives outmobilized the minority communities and their white liberal allies in a mayoral election.

The most striking, indeed shocking development was Riordan's victory in the bastion of white liberalism, the Fifth council district. The Fifth is heavily Democratic, about one-third Jewish, and has long been the most reliable white liberal area in the city. In every mayoral election between 1965 and 1989, the Fifth backed the liberal candidate (Table 7). It has always been very far from the 12th district's conservative position.

Table 7

The 5th vs. the 12th

	The Fifth's Choice	5th	12th
1965	James Roosevelt	48.0	19.5
1969	Tom Bradley	50.7	30.6
1973	Tom Bradley	58.0	44.0
1977	Tom Bradley	61.7	40.3
1981	Tom Bradley	68.7	44.3
1985	Tom Bradley	71.6	49.4
1989	Tom Bradley	51.8	39.1
1993	Michael Woo	43.0	24.7

The loss of the Fifth council district doomed Woo's candidacy. Riordan's ability to carry that district, usually the highest turnout area in the city, undid the Bradley coalition at a crucial juncture. Because of the pivotal role of the Fifth district, I have performed some preliminary analysis of the mayoral vote within its borders, with the assistance of Pam Singh.

The Fifth district can be divided into four areas: the San Fernando Valley, the affluent hillside, the urbanized Westwood/Cheviot Hills area and the older Fairfax area. The map on the next page shows the rough division. Demographically, the hillsides are the wealthiest, and Fairfax the least affluent.

Fairfax	71.4	49.1	39.8	20.1	43.1
West/Chev	58.2	76.8	52.4	18.7	51.6

Source: calculations based on data from Pactech, op cit, 1992; Riordan percent from city figures.

Riordan's strongest vote in the 5th district was in the affluent, well-educated hillside, followed closely by the Valley. Westwood/Cheviot Hills broke even, and Woo won a majority only in heavily Democratic Fairfax. What is striking is that the affluent, Jewish movers and shakers who live in the hillsides were pillars of the Bradley coalition (Sonenshein, chapter 8). Perhaps what we see here is the self-interest of business-oriented upper-status people who found Riordan an acceptable alternative in a way that Sam Yorty's gritty urban conservatism was not.

But why did Woo do his best in Fairfax, where fear of crime is pervasive, and there is an older, more traditional Jewish population than in Westwood/Cheviot Hills? Did Riordan's business ties bring forth a working-class liberalism among Jewish voters in Fairfax that tends to be obscured in city elections with racial overtones? Or are there more political liberals in

the Fairfax area than in the hills? The answers must await a more detailed census tract analysis that is being presently conducted.

The evidence thus far points to a major shift in mayoral coalition strength, as the conservative alliance of whites, some Jews and Latinos defeated the minority-liberal coalition of minorities and liberal whites, including Jews. Because the two candidates so neatly portrayed the left and right in Los Angeles, no new ground was carved out for a third type of coalition. It was a defeat of the liberal coalition by the conservative coalition rather than the creation of a new coalition.

In that sense, there was substantial continuity with the past. The white conservative area was the heart of the Riordan victory, and it was some distance from the white liberal area. Woo's polling showed persistent and large differences between Jews and white Gentiles (Maullin interview). Riordan's polling showed a very large gap between Jews and white Protestants (Steinberg interview). The Times exit poll showed the same type of liberal-conservative gap (Table 9). What seemed to appear was a general shift rightward by everybody but African-Americans, who listlessly held up an unenthusiastic left end.

Table 9.

Ideological Differences Among Whites

White Catho.	78	22	14	61	12	15

Source: Los Angeles Times exit polls

Table 9 reveals that left-right differences among whites endured. Jews still were distinctive from other whites; Jews cast their votes as a group in between liberal and moderate ideology.

Other studies indicated that Jews were geographically divided. More than two-thirds of westside "urban" Jews voted for Woo; the same proportion of Valley Jews voted for Riordan (Meyerson 1993). And the overall range of Jewish voting still needs to be determined. The Times found an even split between Riordan and Woo, but Riordan's polling found Woo receiving a majority of the Jewish vote by the end of the campaign. Riordan's polling also showed that Jews were divided by gender, with men evenly split and Woo carrying Jewish women by substantial margins (Steinberg interview).

The mayoral race then, seemed to indicate a collapse of the biracial coalition as an electoral majority, but patterns of group behavior showed remarkable consistency with previous elections. With the exception of the African-American community, there was a general shift to the conservative candidate. While the white liberal and white conservative vote remained far apart, both were very far from the African-American position.

Rainbow politics, a potential alternative to minority-white coalitions, did not prosper either. Riordan's success in carrying a significant share of the Latino vote was very much out of line with the steady support among Latinos enjoyed by Tom Bradley since 1973. The only other minority group to vote heavily for Woo were Asian-Americans, but that support most likely arose from ethnic loyalty and might not have been available to a different liberal candidate.

On the surface the Riordan coalition looks like the Yorty coalition that won in 1969 (Pettigrew 1971; Hahn, Klingman and Pachon 1976; Halley, Acock and Greene 1976; Maullin 1969). In that race, Jews split, and Latinos strongly backed Yorty, together ensuring Bradley's defeat. Yorty's victory was part of a major conservative backlash to liberal politics locally and nationally. A number of ballot measures for public expenditures were defeated in the 1969 primary, and school board races favored conservatives (Sonenshein 1993, chapter 6; Halley, Acock, and Greene 1976; Hahn, Klingman, and Pachon 1976). So was 1993 really 1969 redux? The evidence suggests that it was not.

Riordan's conservative victory in the mayoral race, striking as it is, appears more anomalous than was Yorty's in 1969. For example, in June 1992 - only two months after the civil disturbance - city voters approved a very strong police reform measure (Proposition F) with over 60% of the vote. In November 1992, the city voted 62% for Bill Clinton. On the same ballot, over 60% of the voters agreed to pay higher property taxes to fund more police. In each case, the conservative Valley was outvoted by an alliance of inner city and white liberal voters. Table 10 shows the vote pattern in the four key council districts - and it is a very familiar pattern in the history of the Los Angeles coalition (Sonenshein 1993).

Table 10. Key Races in 1991, 1992

	Prop F	Clinton	Prop N
5 White liberal	71.1	67.6	65.3
8 African-American	92.0	85.4	71.0
12 White conservative	46.3	43.8	52.4
14 Latino	65.4	61.5	57.8

Private polling (Fairbank, Maslin and Maullin) on both Proposition F and Proposition N reveals some interesting patterns. Support for Proposition F did not erode after the civil unrest. Indeed it remained completely stable throughout the year. Support for Proposition N was very solid - even though it fell short of the needed two-thirds majority.

By contrast, Woo never had a solid foundation. In a baseline poll taken for Woo in January 1993, 33% of voters said they would vote against him, and another 18% probably would. Only 32% said they would vote for him. Riordan's polling showed Woo with a 25% negative rating at the start of the campaign. As Riordan's pollster Arnold Steinberg noted, "It was really remarkable to run against a candidate who had so many people who from the start would not vote for him." (interview) As Hollywood's councilman, Woo had made many enemies during battles over the area's redevelopment.

In other words, there are a lot of people in Los Angeles who backed Bill Clinton for president, voted for police reform in the face of conservative and police opposition, and supported higher taxes for public services - and then went out and voted for Richard Riordan for mayor over liberal Mike Woo. That was quite a bit different from what happened in 1969.

Even if the Riordan election was a sort of ideological anomaly, it was nonetheless very important. It marked a powerful shift at city hall from a westside-minority coalition to a Valley-centered regime with limited minority power. A feature of the Bradley years had been the dominance of city commissions by liberals from westside and minority areas (Sonenshein, 1993: chapter 9). Riordan was in a position to change the direction of the government, and more important, to establish the leadership credibility of the conservative side. If he were to succeed, he would place progressives in a weakened position for some time to

come. And in time this might lead to a more conservative electorate.

It was not the general end of progressive ideology that doomed the biracial coalition. What then was it?

Interest

As a factor in the rise and fall of biracial coalitions, "interest" reflects a more practical view than ideology. Racial ideology is a lens that helps interpret political events in a particular way regardless of their actual impact on self-interest. Interests are concrete, such as jobs, money and power.

Conflicts of interest can create severe, nearly unsolvable coalition problems. For example, Black-Jewish coalition politics in New York City suffered nearly irreparable harm from the 1968 school strike (Harris and Swanson 1970). African-American parents supporting community school boards were in direct and open opposition to Jewish teachers and their union. Both jobs and power were crucially at stake, and this workplace struggle quickly drew in wider constituencies outside the schools.

By contrast, the Los Angeles biracial coalition was greatly assisted by a strong alliance of interest between African-Americans and liberal Jews, both alienated from the conservative Los Angeles political system. As political outsiders, forcefully attacked by Sam Yorty, the two groups had excellent practical reasons for joining forces - in addition to a powerful ideological affinity (Sonenshein 1993).

But interest is not always quite so clear. Ideology can be measured by opinion polls and electoral behavior. Leadership is a matter of careful analysis of elite actions. There is always a temptation to posit interest after the fact, to suggest that interests are real when they may not be. It is even trickier to

make assumptions about how people and groups perceive their interests. But interests are too important to avoid trying to specify them.

Finding a clear interest explanation for what happened in the June election is not a simple matter. One place to start is the perception held by various groups of the condition of the city, and by implication their sense of their interests being attended to. The Los Angeles Times Poll regularly asks its respondents to assess the condition of the city. Subtle differences between African-Americans on one side and other groups emerge from this question.

Table 11 presents this question at three crucial moments: shortly after the Rodney King controversy erupted in 1991; immediately after the civil unrest of 1992; and just before the 1993 general election. By the election, only 21% said that things were going well; 76% said things were not going well. The negative attitude was remarkably multiracial; 79% of whites, 78% of Blacks, and 76% of Latinos picked the negative view.

Table 11 suggests that the civil unrest had a huge impact on citywide perceptions of the state of the city in a way that the Rodney King case itself did not. After the King beating, African-Americans were more negative about the city's condition than other groups. The biggest shift toward the negative came after the civil unrest, first from whites, then from Latinos, two groups whose ambivalence cost Woo severely. In other words, the Rodney King beating did not lead an electoral majority to see the

whole city going down, but the civil unrest did. Even a year after the violence, the negative results had barely improved on the eve of the mayoral election - not good news for the liberal candidate to succeed the incumbent progressive regime.

Table 11.

How do you feel things are going in Los Angeles these days?

	March 1991		May 1992		May 1993		Change
	Well	Badly	Well	Badly	Well	Badly	in Well
All	40	55	13	85	21	76	-19
Whites	44	51	11	88	18	79	-26
Blacks	28	66	11	88	21	78	- 7
Latinos	39	56	19	79	19	76	-20

Source: Los Angeles Times polls, #247, #281, #311.

By 1993, the public's perception of life in Los Angeles had reached critical lows, moved steadily along by fear of crime and disorder, and then exponentially by the civil unrest of 1992. Los Angeles was a very unhappy city, not just in the inner city where unhappiness was well documented but in the mid-city areas and certainly in the suburban San Fernando Valley. White disaffection with the status quo was less visible, but given the white dominance of the voter rolls, it carried a great electoral kick.

Interminority conflict had been growing as well for a number of years, as the city became more crowded, grittier, more crime-

ridden, and as groups contended over spaces that had previously been separate. Approximately 400,000 more people lived in Los Angeles than a decade before. The engine driving the population increase was immigration by Latinos and Asians. Suddenly the immigration issue became explosive.

All this took place in the midst of a blistering recession that hit Los Angeles and all of California extremely hard. A major proportion of all jobs lost nationally were lost in California, and particularly in Southern California. The exodus of jobs and future prospects were devastating, and set the stage for anti-immigrant rhetoric and intergroup hostility.

South Central Los Angeles, once the Black bastion, is now contested among Blacks, Latinos and Korean-American storekeepers (Oliver and Johnson 1984). Koreatown is now divided between Korean-Americans and Latinos. The near San Fernando Valley, once all-white, is now heavily Latino. The notion that Los Angeles was living a charmed urban life immune from the difficulties of other big cities was destroyed in the violence of April 1992. African-Americans attacked Korean-American stores in South Central, and Latinos attacked Korean-American stores in Koreatown.

Blacks and Korean-Americans fought bitterly over liquor stores in South Central los Angeles, virtually a life and death struggle (Sonenshein 1993a). Blacks and Latinos fought over construction jobs in the rebuilding after the civil unrest, and the immigration issue was never far from the surface. These were

truly conflicts of interest. Some Latinos - such as councilman Richard Alatorre - were amenable to Riordan's blandishments. Would Asian-Americans, increasingly concerned about the problems of Korean-American storeowners, have voted so heavily for the liberal candidate if he had not been Asian-American?

Numerous criminal trials - the LaTasha Harlins, the Rodney King, and the Reginald Denny cases - raised sensitivities to a high pitch. The increasingly crowded city was becoming more intense and uncomfortable. There was no escape from gunfire, whether in your neighborthood or on the evening news, and gang graffiti sprang up everywhere. The line between real fear and symbolic issues became obscured, as local television news was dominated by crime stories.

The civil unrest added to the feeling of despair and threat. Unlike the geographically confined Watts uprising of 1965, the 1992 violence spread wildly, and news reports showed no real barriers to its expansion. Self-protection became a major concern in a city threatened and insecure.

Ironically, this feeling of general threat coexisted with a more progressive set of attitudes than in 1965. After the Watts uprising, Chief William Parker received overwhelming support from whites and Latinos, and almost total dislike from Blacks (Sears and McConahay 1973). By contrast, few in any group felt that the acquittal of the police officers in Simi Valley had been justified, and Chief Gates was widely disparaged citywide. Near the end of his tenure, his disapproval rating reached 81% in the

Los Angeles Times Poll (Los Angeles Times, 15 May 1992).

Jews were particularly ambivalent about the violence. There were significant efforts within the Jewish community to provide aid to the South Central community after the violence (Rubin 1993). Jews had been among the strongest opponents of Daryl Gates from the start, and were very strong supporters of police reform. But the plight of Korean-American storeowners raised unavoidable parallels with an earlier generation of Jewish shopkeepers burned out in 1965, and the fear of civil violence added to the fear of street crime to make the Jewish community edgy.

Latinos were also ambivalent. While much was made of the "rainbow riot", the main Latino community on the eastside was not a part of the uprising. Its leaders were careful to make that known within the city. In the aftermath, the great attention paid to South Central Los Angeles detracted from the problems of the eastside, and opened up further possibilities for conflict.

In the aftermath of the civil disturbances of 1992, there was a widening potential for interest conflict among potential allies. Conflicts among African-Americans, Latinos and Asian-Americans were widely discussed, but few were aware of the growing alienation of the group most able to make it count at the ballot box, namely whites. At the same time, the city was ideologically more progressive than it had been in the past. What had developed was an opening for leaders to bridge the interest conflicts and offer reassurance and practical solutions.

In the troubled Los Angeles of 1993, such leadership was hard to find.

Leadership

The 1993 mayoral election coincided with the sudden disappearance of a whole generation of leaders. Within a very short span, Mayor Tom Bradley, Police Chief Daryl Gates, District Attorney Ira Reiner, and county supervisor Kenneth Hahn left office. Those who remained in power were either too raw and new, or too tied to their own communities to yet build coalitions. Others made their deals with Richard Riordan. Few who would lead at the grass roots had the clout or the interest in building citywide coalitions. Never in the 30 year span of biracial politics had there been so few well-known people trying to do this work.

Beyond the fall of these leaders, there was the loss of confidence that was created by the devastating violence of 1992. The Watts uprising of 1965 brought confidence to progressives. They were out of power, and could view the violence as a failure of the conservatives in power. No such view could be credible in 1992, after nearly twenty years of biracial liberal rule. The fiasco of turning over the reconstruction of South Central to businessman Peter Ueberroth bespoke a sense of weakened legitimacy at city hall. And would that not be indirectly an argument for the election of a businessman like Riordan a year later?

The loss of power and confidence by citywide leaders allowed others more attuned to confrontation to take center stage. Xavier Hermosillo of NEWS for America, a conservative Latino

political organization, generated publicity with comments that offended many African-Americans. Danny Bakewell played a similar role in the African-American community, forcing contractors to replace Latino workers with Blacks after the civil unrest. Indeed, they took each other on publicly.

During the height of the Bradley coalition, such ethnocentric leaders tended to be left in obscurity, but now there was nothing to impede their messages. In this empty space, the question of leadership came down to the choices presented to the voters in the runoff election in June.

Surprisingly for a winner, Riordan was not a great candidate. He had a personal fortune but commissioned television commercials that were at best silly, and at worst embarrassing. He was a Princeton graduate, a lawyer, and by all accounts a bright and inquisitive man, but as a public speaker he was turgid and uninspired, leading the listener to wait in agony for the completion of his thought. His staff had little confidence in his ability to answer questions and shielded him from the press.

He had numerous liabilities, including building a fortune in association with Michael Milkin, giving money to pro-life groups, and a series of drunk driving arrests that nearly derailed him at the end. He had a tendency to issue blanket denials of all charges some of which later had to be admitted.

But his strengths were more than enough to win the election. Had he been a better speaker and communicator, he might have won a crushing victory. He had business experience, an open and

friendly manner, unlimited money to produce and deliver a wave of first-rate direct mail, an outstanding absentee ballot effort, and a simple slogan that dominated his campaign: "Tough Enough to Turn LA Around."

Riordan's long experience in Los Angeles politics gave him a legion of friends in politics, including a number of city council members and a raft of liberal Democrats to whom he had given campaign money. He was user-friendly in a city that would be reluctant to back a right-wing ideologue.

In his own awkward and choppy way, Riordan spoke to people's real and media-induced fears - of being a crime victim, or random violence, of communities out of control. In one debate, I heard him recite the list of urban fears, all of which seemed to come from a summary of the local TV news: drive-by shootings, gang violence, ATM murders, drugs in the schools. It was a very effective recitation.

But unlike Yorty, Riordan did not cast the choice ideologically, or as an assault on liberal policies, only at city hall policies. His slogan provided an ideologically neutral connection to the alienation so many felt from the condition of Los Angeles on election day. This gave people a way to vote for him to turn the city around without turning themselves around ideologically. While his ideas often seemed impractical, such as leasing the airport to hire more police, the focus on proposed policies contrasted with Yorty's cavalier disdain for government when all he needed was demogoguery.

The conservative victory was made possible in no small part by the weakness of the liberal candidate. Arnold Steinberg, Riordan's pollster, commented that "we were blessed to be running against Michael Woo...any one else would have been more difficult." (interview) One journalist noted (Meyerson 1993) that the Woo campaign "can establish an institute on how not to run for mayor." Among other sins, Woo failed to expend all of his campaign money by election day (Ibid.)

In the key area of leadership, Woo was never as close to Riordan as the final results indicated. The Woo campaign's late May tracking poll found some very disturbing results. On many key measures of leadership, Riordan was swamping Woo. The gap was much greater than the horse race indicated. Those results suggested that many people were sticking with Woo out of liberal habit, without feeling positively about his leadership ability.

Table 12

Selected leadership indicators, Private Poll

	Woo	Riordan
looks and acts like a mayor	20	43
will divide LA	30	33
tough on crime	21	46
attract jobs/industry	25	46
good for my community	36	35
will get things done	28	42
will expand LAPD	21	40
out of touch with working people	21	37

Woo's key appeal was that he could hold the city together, but he reached only a virtual tie with Riordan on this issue. The only place where Woo might have made progress was by tying himself to working people - but it was middle class people who dominated the electorate. This may help explain why Woo's campaign devolved into declaring Riordan unacceptable.

Woo lost the edge of racial harmony by his lackluster attempts to appeal to white voters. He was well-regarded among Jews, but he failed to match Riordan's warm concern for that community (Marks 1993). Few in his campaign had a sense of Jews as a community separate from other whites, or even from white liberals. Caught up in the rainbow model of progressive politics, Woo's campaigners were much less effective than Riordan's at massaging subtle differences among whites.

His campaign spokesman uttered perhaps the truest expression of the campaign's sloppy underlying assumption: "Los Angeles will never elect an old rich, white Republican as mayor." It was as close to a slogan as Woo ever came, and the campaign's most appropriate epitaph.

An indefinable aspect of Woo's campaign was the poor impression he made in public. I attended a public hearing during the primary sponsored by Congress member Maxine Waters, primarily aimed at the African-American community. While this should have been Woo territory, he faced numerous hostile questions without any change of expression or variation of his voice. Later I heard him at a candidate debate in the Jewish community where he

used numerous opportunities to make personal attacks on Riordan. These charges, while effective, made him look petty and harsh in comparision to the calm, mature, avuncular Riordan. Even for those who shared his philosophy, Woo was not an easy candidate to enjoy.

Riordan's pollster found "when I went to parties and did not tell people I was polling for Richard, I would ask liberal Democrats about the election. They had a lot of negative feelings for Riordan, but they had a very high discomfort level with Woo as well. They often said they didn't like the way he talked...His chemistry didn't work." (interview)

As a coalition builder, Woo was extraordinarily successful in bridging serious conflicts between African-Americans and Korean-Americans, two pillars of his campaign. This took place in particular in the liquor store controversy (Sonenshein 1993b), and he deserves major credit for brokering some agreements between these highly opposed groups. In a conflict in which there seemed to be no middle ground, Woo helped push through city hall funding for the conversion of some liquor stores to laundromats.

But the crucial Black-Korean conflict was only one element in coalition politics, and fell far short of a citywide majority. Woo needed two other groups with whom he was much less successful: Latinos and Jews. The narrowness of seeing coalitions as settling inner-city minority conflicts failed to reach to the heart of success: cross-racial citywide coalition

building. While the progressive candidate slipped between rainbow and biracial strategies, the conservative candidate made his way more clearly along a very different coalition path.

For progressives to have prevailed in post-violence 1993, they would have needed a very different sort of candidate. Steinberg said that the ideal person to beat his candidate Riordan would have "a Valley base, be Jewish, a Democrat, moderate and for the death penalty." He perceived both Wachs and Katz to be serious threats. The only minority candidate that he felt could have beaten Riordan was maverick county supervisor Gloria Molina because of her "crossover" appeal as a reformer (interview). In each case, a new sort of liberal/moderate coalition would have been created to challenge the emerging conservative base.

Centrist candidates, however, failed to capitalize on their opportunity. Wachs and Katz neutralized each other, and with two in the race, neither could set out a powerful identity. Katz held back his resources until after Riordan had already established his own name recognition. According to Woo's polltaker, as a result of "this major strategic blunder," Katz could not gain similar recognition after that opening closed up (Maullin interview).

On the leadership front, then, two things were happening. Those leaders with experience at building citywide crossracial coalitions - people like Tom Bradley, Ira Reiner, James K. Hahn - either left the scene or stayed out of the race. Dynamic

candidates who could have learned to do so stayed out - Gloria Molina and Zev Yaroslavsky. The candidates who remained looked great on paper, but did not campaign effectively. For many voters, who might well have remained in the moderately progressive camp, there was no choice from the progressive side that appealed to them. Many voted for Woo out of ideological loyalty, others went over to Riordan, and many others stayed home.

In the short term, the leadership problem for biracial politics in Los Angeles is likely to get worse. Riordan's victory presents a dilemma, for its very moderation, that Sam Yorty's did not. Yorty was a clear enemy, and even though he won in 1969, the progressive forces couldn't wait to get at him in 1973. He excluded the minority and progressive forces very effectively, helping to build their morale and unity for another battle and, eventually, for governing.

Things are quite different today. Riordan has not acted as a hard-core conservative, and he has brought in a number of progressive people along with his conservative white and Latino allies. Shortly after his election, he marched in a gay rights parade and was photographed hugging a participant. When California Governor Pete Wilson launched a demogogic attack on immigrants, Riordan spoke up against denying services even to illegal immigrants. He has built a base on the city council, and has brought potential foes like Yaroslavsky into the budget process at a high level. Despite the crowing of national

Republicans over his victory, Riordan went to Washington to jog with President Clinton.

Riordan may have a tin ear for minority concerns. During the campaign, he drew derisive laughs at a Black church when he tried to decide what to label the violence of 1992. He needlessly provoked a council revolt when he tried to appoint Xavier Hermosillo to the important Fire Commission. After the lenient federal sentence given to the police officers in the King case, he said the justice system had worked and that healing should begin. But there is no comparison to the hateful, vitriolic anti-Black words of Sam Yorty or Police Chief Parker in the 1960's.

Operating as he does, Riordan is likely to provide nothing like the unifying symbol that Yorty was. In that way, he is likely to be somewhat like the new breed of conservative/moderate mayors of both parties running Chicago, Philadelphia, Cleveland, and perhaps even New York City after November. That rising group may alter some of the discussion about minority politics in coming years.

In the longer run, the leadership gap in Los Angeles coalition politics may be filled not only by politicians, but by activists at the grass roots level. Union activists organizing janitors in Century City; African-Americans trying to reach agreements with Korean-Americans about liquor stores in South Central Los Angeles; ministers and rabbis seeking to build cross-racial understanding; college students meeting in small groups to

puncture stereotypes and build more positive images of each other; Latinos seeking to advance citizenship and political mobilization within their community. Perhaps the next stage for Los Angeles's urban progressives is not to win elections, but to solve community problems.

Such meetings are going on all around the city, and their very obscurity provides a ray of optimism; perhaps people will feel less bound to take confrontational stances if they are not publicly appealing to their own constituencies. Xandra Kayden has called these people "translators", and notes that while they cannot yet deliver their communities, "they are L.A.'s best - maybe only - hope." (Kayden 1993). Even these leaders will have to work through the pros and cons of rainbow and biracial coalitions, as well as the best balance between human relations and conflict resolution.

Conclusions

The 1993 election of Richard Riordan was a powerful defeat for biracial coalition politics in Los Angles. Already fading as the new decade came in, the coalition lost its way completely after the civil unrest of 1992. With its leaders aging or leaving office, with an electorate disenchanted with government policies and with the state of their city, circumstances favored the conservative outsider with unlimited funds and a simple message.

But the meaning of the election was much more complex than a shift to the right. The ideological basis of coalition politics remained intact, and in that sense the Riordan campaign represented an accomodation to the overall liberal/moderate nature of the city's voters. Even an ineffective liberal candidate got 46% of the vote. That ideological potential also counted for less than in the past, now that the city was filled with interest conflicts and uncertain leadership. After Yorty's 1969 defeat of Tom Bradley, liberalism was weaker as an electoral base than it is today but leadership and interest were far stronger in the direction of successful coalition and victory.

In theoretical terms, the "rollback" of minority gains in Los Angeles politics was not due to the breakdown of ideological alliances between minorities and whites. It was the result of growing interest conflicts and profoundly weakened leadership in the face of an effective and timely conservative challenge well positioned to create that rollback.

The defeat of the coalition was hastened by a progressive campaign that failed to energize either the rainbow or the biracial potential of the progressive coalition. The result was the victory of the conservative coalition - one that isolates the African-American community and the working-class base of the Latino community. The persisting debate between rainbow and biracial coalition politics finally led to the defeat of both. And if progressives concede the white vote to the conservatives, then they will be facing defeat for a long time to come.

While people on the progressive side debate which of these two coalition models is better, the conservative model has snuck right in, and promises to continue to do so. Conservatives profit from this philosophical confusion among urban progressives. That is what Riordan did in Los Angeles, and it is a nationwide trend.

Los Angeles progressives have reached a very important turning point in political history. That which was is dead and gone. The new governing establishment is moderately conservative, but unlikely to mobilize constituencies in clear opposition. It is probably time to go back to the drawing boards and ask what government can and should do in Los Angeles, to propose ideas, to organize the grass roots, to build new unions, and to forge alliances even in the absence of an immediate electoral target.

Is this part of a national trend toward the end of an era of minority politics and biracial coalition? With the New York City

elections coming up in September and November, urban progressives need to be concerned that urban conservatives have been threatening to take hold of the center - an area thought long gone - in urban politics.

White candidates have begun to learn how to play the coalition game against Black opponents. In the old days, the Sam Yorty and Frank Rizzo style was to brazenly stir up white racism. But in the 1990's there is less tolerance for openly divisive campaigns and - not to be forgotten - the long decades of racial polarization have made them sadly unnecessary. Those voters who intend to oppose the African-American candidate no longer require anyone to light a fire under them.

Nowadays, against a minority candidate, a white candidate will have the conservative vote already locked up. White conservative or moderate candidates are freer to spend their time courting Latinos and white liberals. They preach harmony, and reach out to leaders of these swing groups. They present themselves - as Black mayoral candidates once did - as models of competence and efficiency. They go after two edges of Black mayoral candidates - managerial capability and healing - while resting comfortably on the crime and disorder issues.

This approach makes them a devastating threat to take control of the center. And the center matters again in urban politics; if progressives want justice, and conservatives want peace, the balance of power increasingly rests with those who want both justice <u>and</u> peace.

To hold power, progressives need to realize that the other side is more formidable than in the past. Conservatives have gone beyond trashy demogoguery - or they do not need to prime the pump anymore - and are arguing that they can govern. They seek a political more than an ideological victory.

In New York City, Rudolph Guiliani is running the modern conservative campaign. He is avoiding the old-fashioned appeals to racial feelings, although he still has a harsh edge that appears in spite of himself. He is picking up endorsements from enough groups to start isolating the African-Aemrican community. Herman Badillo, possibly Ed Koch, and other Democrats give him a centrist edge he lacked when he lost to Dinkins in 1989. And, of course, the Crown Heights violence and the report of Governor Cuomo's commission place Dinkins's leadership credentials at serious risk. His Jewish support - already less than Bradley enjoyed in Los Angeles - is in serious jeopardy.

It is possible that the era of Black mayors and the biracial coalitions that sustained them is drawing to a close after a 25 year run, just as their rise marked the end of the old-style political machines. If that is so, then minority politics will soon be at a major turning point once again and the whole question of coalition politics will be rethought. Urban politics could change dramatically if Clinton-style Democrats - white or minority - run from the center, rather than beginning with the African-American community and then branching outward.

In the broadest sense, the 1993 Los Angeles election shows

the importance of the debate between biracial and rainbow models of minority politics. If both ideology and interest matter greatly, then the search for a single winner of the debate needs to be replaced by a deeper examination of how coalitions actually rise and fall. In the long run, the cost of unexamined assumptions on this question may be profound - the rollback of hard-won minority political gains.

CIVIL-MILITARY RELATIONS IN THE U.S.

AFTER THE COLD WAR*

CIVIL-MILITARY RELATIONS IN THE U.S. AFTER THE COLD WAR

At the end of January 1993 many who wore the uniform of the U.S. military began to privately express some real concerns about their new president, the first since World War II to have never worn their uniform. He had reportedly expressed anti-military sentiments, and was now promising to reduce the defense budget by record amounts. He introduced plans to integrate homosexuals legally into the military for the first time. For the military professional, four long years loomed ahead with a president whose attention seemed focused on everything but the military, who had not filled senior Defense Department posts months after his inauguration, and was now freezing military pay just like his most recent Democratic Party predecessor. It was little wonder that some mistakenly referred to him as "Carter."

The American military's initial negative reaction to President Clinton is hardly unique, though. The Constitution and its provisions for civilian control of the military almost guarantees that tensions will exist between the Commander-in-Chief and the soldiers who serve under him. Those tensions can be different in wartime than in peacetime, though. War and peace have their own similar potential for civil-military tensions - uniformed abidance with civilian strategic decisions, control over weapons acquisition, and so on. But peacetime can bring about its own set of stresses, including differences over the adequacy of defense

spending, the type and quality of personnel eligible for military service, and alternative duties outside traditional bounds for military personnel. This paper focuses on the potential dynamics of post-Cold War civil-military relations in the U.S. The particular emphasis is on the contest for authority on the making of "military policy" in the areas of personnel and weapons acquisition, and in the assignment of roles and missions.

APPROACHING CIVIL-MILITARY RELATIONS.

The field of civil-military relations is rich in paradigms, ranging in spectrum from military control of the polity to civilian control over the making and execution of military policy. The former field has received most of the attention as an area of study, producing what has now become classic scholarship. Yet the potential for civilian intrusions into the making of "military policy" has been a significant political issue, particularly in recent decades, but it has not received as much scholarly attention as has the first area.

During the bulk of the twentieth century, military regimes were relatively common, and it is unsurprising that so much attention has been devoted to studying them. But as the twentieth century draws to a close, so does the book on military regimes. They exist today only in a few nations (Myanmar, and Ghana, for example) which are poor, violently unstable, and lacking traditions of civilian rule. It may be that a generation's worth of

scholarship has paid off and now is no longer needed. Instead, the concerns about encroachment run in the other direction - civilian encroachment into what is regarded by military professionals as "their territory." It is the latter area that this paper will focus on. Several questions can frame the inquiry:

1) Where are the boundaries between "political" and "military" policies?

2) Where does the authority of the president and his civilian agents start and stop on the making of military policy?

3) Does this line of authority differ in wartime from peacetime?

Tensions between the military and the civilian political leadership structure seem an endemic part of American political history. They are intertwined with a long-standing tradition of civil supremacy over the professional military, which has worked to set the parameters of the debate.

INSTITUTIONAL ENCROACHMENT INTO TRADITIONALLY EXCLUDED ARENAS.

One way to think about civil-military relations is through a framework of institutional boundaries. There are two types of boundaries, formal and informal, where formal boundaries are

established by law or contract, and informal boundaries are established by tradition and by professional identity. Formal boundaries are almost always codified in some way (though not always specific in what they do and do not allow), while informal barriers are rarely so specific. The very uniform of the military professional is one boundary -- so is the habit of the Joint Chiefs of Staff of meeting in what is known as "the tank" -- a secure room in the Pentagon. There are in fact many secure rooms in the Pentagon, but the tank allows the JCS to meet privately without the presence of the secretary of defense. When the secretary (or some other ranking civilian official) tries to meet with the chiefs, they suddenly have nothing important to discuss, as McNamara found out when he arrived there without an invitation.

There are several reasons for the formation of institutional boundaries, whether formal or informal. One basis for institutional boundaries is to wall out incursions against organizational autonomy. Organizational "turf" may be protected by boundaries generated from within, or established by outside authority, but the presence of perimeters helps to protect self-rule and noninterference from outside.

Boundaries circumscribing institutional power are established traditionally in liberal democracies to prevent the concentration of institutional political power. Constitutionally-imposed limits on the scope and functions of political institutions one example, where the boundary prevents institutional power from spreading outside certain confines. Presidential spending power, for example,

is restricted by both the Constitution and by legislation (i.e. the Congressional Budget Act of 1974) that clarifies those limits.

Institutions can also establish their own boundaries in less formal ways. Those boundaries may be less tangible than in the formal case, but they can also be just as salient to the limits on power. Such boundaries are frequently established under conditions of institutional competition for governmental resources. It can be argued that in a world of scarce resources, institutions will seek a greater share of the resource base by gradually expanding their authority to appropriate such goods. In some cases the expansion may be sudden and dramatic, resulting in the wholesale capture of one institution by another -- a successful military coup, for example. But perhaps more common is the gradual pushing out from the institutional parameters to gradually poach into another institution's territory of responsibility. The CIA, for example, was prohibited by its founding statute (the National Security Act of 1947) from encroaching into domestic law enforcement, the traditional province of the FBI. But the CIA was able to gradually push beyond its formal statute limitations to penetrate U.S. college campuses in the 1960's. The Joint Chiefs of Staff came to a temporary agreement in 1948 on post-World War II roles and missions, but shortly after the agreement was reached the Air Force and the Navy began competing for air power capability that continued on throughout the Cold War period.

Sometimes clear delineations exists between institutional boundaries. But more often a gray area exists between boundaries,

in ways that obfuscate control over resources. Figure I shows a concept of "political territory" with a gray area between strictly defined boundaries. There are some clear lines of authority between each sector -- the military has authority to make decisions on tank maintenance policy; and Congress has authority to pass legislation on federal income tax rates. But the existing situation is not quite as neat as Figure I implies. While Congress may be able to legislate conditions under which tanks are maintained (through contract civilian maintenance, for example), the military cannot pass tax legislation. Each side may engage in forays into the "gray area" to try and locate the limits of intrusion.

This example highlights another aspect of civil-military boundaries - what might be called "asymmetrical intrusions." Civil authority can reach much farther into the arena of military policy making than the military can reach into civil policy making. When the President of the United States selects specific targets to be bombed as Johnson did in Vietnam, he is reaching into the core of what the military strongly regards as its turf. It would be, however, almost inconceivable for the military to engage in the making of "civilian policy." So forays by civilian political leadership have penetrated far into what the military regards as its territory, largely because the military has few avenues of response when poaching occurs. They may leak negative information about the officials involved in the excursions into their policy territory, or even protest directly to the officials involved. But even such limited behavior can carry costs -- when Chief of Naval

Operations Admiral George Anderson protested McNamara's close control over naval operations during the Cuban Missile Crisis, he was not given what otherwise would have been a normal reappointment to the post.[1] Even an single unseemly remark can quickly terminate an otherwise distinguished career -- witness the firing of Air Force Lieutenant General Charles McDonald over what he thought was a private critical description of President Clinton in 1993.

Can all this help in understanding civil-military relations in the post Cold War era? Perhaps, if civil-military relations can be viewed as involving the potential for conflict over the boundaries of authority between political civilian leaders and military professionals. The tension areas are not over keeping the military in the barracks, but over keeping the civilians out of them.

ISSUE AREAS

There are a number of issue areas involved in the civil-military area, but three will form the focus of this paper. They are 1) Control of military weapons acquisition, 2) Control over military personnel acquisition, and 3) control over the formation of policy on roles and missions.

1) CONTROL OVER WEAPONS ACQUISITION.

The weapons acquisition policy area has probably invoked more

tension between civilians and the military than most other issue areas. The agreed upon positions by both groups are clear -- weapons must fit the national security strategy, which is determined by civilian political leadership. On the other end of the spectrum, most military would argue that they should control the details of procurement. The problem is defining and agreeing upon exactly what those details might be. It is generally agreed that civilian leadership has the ultimate authority to determine the fit between weapons and the national strategic objectives of the nation. But traditionally the military have participated almost exclusively in determining the requirements for, and the number and types of military weapons purchased. The actual authority to purchase supplies and equipment has shifted between civilian and military authority for most of the nation's history. A reform of the Army's organization in 1821, for example, placed purchasing authority in the hands of a civilian, who reported directly to the secretary of war, a situation which produced some resentment by line officers because of such independence and lack of accountability to them.[2] Since that time the authority has shifted back and forth. After World War II, though, uniformed officers negotiated directly with the producer on such matters as performance, cost, and delivery schedule. While this has not been the case, and not all military professionals have stated that it should be the case (Alfred Thayer Mahan claimed that civilians should direct the Navy's bureaus).[3] But in general the practice has been to leave acquisition in the hands of the users. In 1946,

for example, the Air Force had almost sole authority to purchase aircraft. Three Air Force organizations, the Strategic Air Command, the Air Material Command, and Headquarters Air Force made the most critical decisions, for example, on the design, capability, price, contractor, and delivery date for the manned strategic long-range bombers that were deployed in the 1950's. When a choice was made, the Secretaries of the Air Force and Defense simply initialed their approval. There were exceptions -- President Truman canceled the Navy's request for the carrier USS United States in 1948, but those exceptions were so unusual that in this case the Navy leadership "revolted" in a public attempt to get the carrier reinstated.[4] Congress too did not influence the military's role in acquisition either. Congress did not appropriate procurement funds by line item attached to programs, so Congressional control over acquisition was largely limited to occasionally holding hearings after some public procurement scandal and recommending reform measures. This is not to imply that Congress was a passive spectator on the sidelines of acquisition. Congress has periodically issued acquisition guidelines in the form of legislation practically since the first cannon was bought. But the day-to-day decision making involving procurement was largely left to the uniformed services.

Before service unification under the National Security Act of 1947, each service maintained its own development and acquisition bureaucracies. The Army maintained an arsenal system for the production of weapons, and the Navy maintained a bureau system for the same purpose. After the development of military aviation began

to revolutionize modern warfare, each service created new organizations to develop and purchase air power. The Navy's Bureau of Aeronautics and the Army Air Corps Air Material Command served as focal points for two functions - the development and acquisition of service aircraft and as mechanisms for military aviators to try and wrest resources from the other service bureaucracies.

But beginning in the early 1960's, control over the military acquisition system passed from military to civilian control, and now an entire layer of civilian acquisition bureaucracy at the Department of Defense level lies over the uniformed military. The process had begun even earlier, in 1958, as the Defense Reform Act increased the authority of the Secretary of Defense to oversee procurement.[5] McNamara used that authority to greatly increase the sweep of authority that the Secretary of Defense had over acquisition. He did it by a combination of extension of authority through expertise and criticism of what was argued to be a highly parochial service-led acquisition system. McNamara's lieutenants were experts in the social sciences who acknowledged that while they were not infallible, they did not carry the preferences developed by long military service careers.[6] The consequence of this intervention in weapons acquisition was the wholesale cancellation of a number of military programs (primarily those developed by the Air Force) and the introduction of some new ones favored by McNamara. Some of these decisions were made on the grounds that McNamara's new management techniques justified the program changes, but others were in fact ways to change military

doctrine; something that had previously been left to the military for the most part. The most interesting case was McNamara's decision on the F-111, which was made for two reasons - first to force the Air Force and the Navy to adopt joint fighter/attack aircraft procurement and, second, to get the Air Force to adopt McNamara's ideas of close air support.[7]

The Nixon administration did decrease somewhat the procurement authority captured by McNamara, but at the same time cut back real growth in procurement, so there were fewer dollars and new programs to direct. It has been suggested by Perry that Secretary of Defense Melvin Laird agreed to interfere less with the work of the services (including acquisition) if the JCS members in turn would support a policy withdrawing forces from Vietnam.[8] President Carter, though, increased presidential control over acquisition when he canceled the Air Force B-1 bomber and several ships for the Navy, including a nuclear powered carrier.[9] The Reagan Administration increased to a degree the extent to which civilians influenced the acquisition process, particularly after the release of the Goldwater-Nichols defense reform act of 1986. The Bush Administration further increased civilian oversight of weapons procurement by enforcing the authority of the "acquisitions czar" (officially the Under Secretary of Defense (Acquisition)) and the role of the Under Secretary of Defense. The Clinton Administration appears to be continuing the practice of strengthening civilian control over acquisition. Acting Air Force Secretary Michael said recently that "Several trends...are emerging in the civilian personnel arena even

as we downsize. The first is the potential for civilians to take on a few of the roles and responsibilities currently held by uniformed members."[10]

Congress has always been involved in acquisition, but before the 1960's congressional influence came largely from two sources - acts of Congress mandating certain performance (such as more competition in contracting) or the private wishes of members of congress wishing to support their states and districts. But in general Congress was willing to leave the details of procurement to the services. But beginning in 1962 Congress began to require annual authorizations over the five major components in the defense budget. In 1961 Congress required that only two percent of the defense budget be authorized, but by 1983 all of it required authorization.[11] This means that in addition to the appropriations committees in both sides of Congress, the legislative committees now have line-item scrutiny over the defense budget, permitting them much greater control over the details that were previously left to the services.

It is debateable whether or not growing civilian involvement in weapons acquisition has in fact led to a better acquisition process. A thorough analysis remains to be done, but a cursory cut suggests a mixed record at best. In the military aircraft area (one of the most controversial) the Air Force bought some of the most successful aircraft it operates under a system largely under military control. Those included the B-52, the C-130, the F-86, and the A-1 (bought jointly with the Navy). The "post-McNamara" period

was marked by the problems of the F-111 (grounded repeatedly in Vietnam), the B-1B (grounded now, even after being in the force for 9 years) the C-5A, and the C-17. It is true that the Air Force uniformed procurement officers also bought some less than adequate aircraft (the "Snark" cruise missile, the B-58 bomber, the F-89 fighter, for example) and the later civilianized acquisition system bought some success stories, such as the A-10, the F-15, and the F-16. It can probably be concluded that there is no hard evidence that civilianization of defense acquisition has produced a acquisition system or better weapons.

Nonetheless it is likely to continue to tilt towards more civilian control in the post Cold War era. If in fact the present administration and its successors want to push the military towards more "nontraditional" missions (see below) they will want to push the weapons acquisition system in that direction. That will mean fewer aircraft carriers, fewer heavy tanks, fewer advanced fighters like the F-22, and more systems that can support post-Cold War missions. Those would include more strategic lift (transport aircraft and ships), more weapons suitable for counter-terrorist or counter-drug operations (like the AC-130 gunships or a reduced version of the AWACS aircraft), and more small naval vessels capable of coastal patrol. Professional senior military officers whose careers were largely formed during the Cold War will probably find such missions as a distraction rather than a primary objective, and resist therefore a new weapons agenda. These same officers tended to resist strategic lift capability for years since

it could be seen as drawing resources from fighters, bombers, and destroyers -- weapons they tended to prefer.

2) CONTROL OVER PERSONNEL ACQUISITION.

"Each service has the right to choose its own enlistment policies," wrote Bernard Trainor in the August 13 1993 issue of the New York Times. But, in fact, this is an area where there is considerable debate over where the boundaries are between political and military authority. It can be argued on the one hand that there are some personnel acquisition decisions that are political in nature, and as such fall under the purview of the president. If, for example, in 1948 the federal government is no longer prepared to defend racial segregation, then it cannot tolerate at the same time a racially-segregated military. If in 1993 the federal government is prepared to eliminate barriers to persons based on sexual preference, then an arm of the federal government cannot at the same time bar admission to homosexuals. So President Truman's 1948 decision to racially integrate the U.S. military and President Clinton's 1993 decision to drop the prohibition on homosexuals in the military were based on the same argument -- it is the president's duty as the nation's chief political officer to implement and enforce what he regards as political priorities.

Having said this, the decisions of both Presidents Truman and Clinton ran against another tradition. Normally the military has had almost exclusive power to determine the type of person who was

eligible to join the military, and has considerable leeway over their treatment once they are in the military. In 1948 that precedent was initially broken when President Truman ended racial segregation within the military. Truman's action was met initially with some resistance within the military, but the policy took hold, and racial integration in the military was successful enough to become a model for the 1954 Brown vs. Board of Education case.

The desegregation of 1948 was an exception to the normal practice of allowing the services considerable leeway in determining admissions and retention standards. The services continued to exclude women from combat roles, and homosexuals from service at all. Such exclusions continued under both Democratic and Republican administrations without much challenge until 1993, when combat limits for women were dropped by the Navy and Air Force, and the policy on barring homosexuals was modified. In a compromise with the military, the Clinton Administration dropped a campaign promise to integrate homosexuals into the military, and instead agreed to allow the services to continue to define homosexuality as incompatible with military service.

That compromise on the homosexual issue puts civil-military relations on personnel admissions at a crossroads. On the one hand the Clinton Administration positioned itself to alter admission standards set by the services, and on the other it compromised with those standards. The controversy that the issue created may serve as a deterrent for further civil encroachment into service admissions policy, and the Clinton Administration appears to have

withdrawn some of its early impulse to enter into the policy area. But a brief skirmish occurred in mid August 1993 when Commandant of the Marines General Carl Mundy announced that as of September 1994 the Marines would no longer accept married persons as recruits. He was promptly overruled by Secretary of Defense Les Aspin, though the issue has not been laid to rest. In fact Trainor's quote above related to this issue, where he argued that there is no room for married junior enlisted personnel in the Marine Corps (or any other service) and that service requirements should prevail. But that is unlikely to happen, and in fact there may be more incursions by civilian leadership into this area. It is possible that this leadership may require the military to accept physically handicapped individuals for limited duty, using the same line of argument that accompanied the racial desegregation of the military decades ago. The military should not be a bastion for exceptions when the rest of society is now being asked (or required) to accept persons regardless of -- among other things -- physical handicap. After all, it could be argued, such people could be assigned specific and limited duties that would keep them from combat but allow them to work in an office environment.

The military may find itself under pressure to accept persons from other groups as well. For example, it has become fashionable for states and municipalities to create "boot camps" for juvenile offenders as an alternative to prison. Whether or not such camps will produce better results than the penal system for the long term probably remains to be determined. But the system has become

popular with members of the Clinton Administration, and the President's annual crime message called for federal funds to assist states in establishing and maintaining juvenile boot camps.

Some if not most states, however, may find it difficult to build and run juvenile boot camps. A number of states have been hard hit by recession, and, not surprisingly have higher crime rates on a lower tax base. So it may fall to the federal government and the military to operate these facilities, and, given the investment in them, the military might come under pressure to induct their "graduates" into the service. After all, basic training costs could be saved, and, moreover, it could be argued that sending these ex-offenders back to their neighborhoods would only increase the probability to their returning to crime. It might be seen as safer to send them to, say, Korea instead for several years.

The prospects for such a policy may seem remote now, but it should be recalled that Secretary of Defense Robert McNamara pushed "Project 100,000" onto the military in the 1960's, which would have taken economically disadvantaged youth and placed them into the military for "rehabilitation." It could happen again, particularly from an administration that appears to be committed to battling both crime and poverty while trying at the same time to cut the federal deficit and justify some minimum size for the military.

If the military finds itself having to take in persons with low skills and levels of education, it might not be simply because of a policy decision to engage the military in "youth retraining."

Rather it could happen as an unintended consequence of military personnel policies now being pursued. The Clinton Administration has tried to freeze pay for a year, and limit pay increases subsequently for all federal employees, including of course the military. While the policy may be challenged by Congress, it seems clear that the large pay increases of the Reagan years that are supposedly responsible for the end of the "hollow army" of the late 1970's are over. This, combined with a belief that the military may not want many new recruits (it in fact needs over 200,000 per year) and the sense that the military is no longer very important may keep otherwise talented potential recruits from joining. Then the potential quality slide may begin, and perhaps already has. The percentage of high school graduates accepted by the military has dropped from 99 percent in 1992 to 95 percent in the first months of 1993. Now 95 percent is still pretty good, but if the trend accelerates there could be trouble for the military. More importantly the "premier" recruits (high school diploma plus a score in the top fifty percent on the intelligence test) have dropped from 85 percent in 1992 to 76 percent in 1993. It is quite unlikely that the military will return to the disasters of the 1970s (which were probably a function of Vietnam, civil disorder, drug acceptance, and so forth) but it is quite likely that the military will attract more persons from low income groups lacking enough formal education than they did in the Reagan years. There may then be some pressure from civilian leadership for the military to provide these persons with the kinds of skills and education

that were also the goals for Project 100,000. This pressure could come in particular from Congress, and from the Chair of the House Committee on Armed Services, Ronald Dellums (D-CA), who has made a career of looking out for disadvantaged blacks in the military.

3) CONTROL OVER DETERMINATION OF ROLES AND MISSIONS.

Some of the more important conflicts in civil-military affairs have occurred over determination of roles and missions. With many of the traditional roles and missions of the Cold War in disrepair and disuse, there is ample opportunity for a re-engagement of this conflict.

The concept of roles generally referred to the medium of conflict (i.e. the Army fought on the ground, the Navy at sea, the Air Force in the air, etc.). Of course it has not been so simple, especially since the development of combat aviation. But even up to and including World War II, there was surprisingly little disagreement over roles. It is true that the Army contested with the Navy in the 1930's over coastal defense (where two mediums come together) but the most significant disagreements came after World War II with the advent of nuclear weapons. The Army, Navy and Air Force all equipped their forces with a variety of nuclear weapons for a assortment of roles, but the mission dispute was the fiercest between the Air Force and the Navy. The Air Force wanted to dominate the nuclear mission by delivering them by long range bomber, while the Navy wanted to sail its carriers close to the

Soviet homeland in order to have carrier planes in range of Soviet strategic targets.[12]

Military missions usually refer to the mechanism of combat: close air support versus air superiority, for example. The disagreement over missions surfaced most dramatically at the time of the Korean War. The Truman Administration had defined the conflict as "limited" in terms that violated the professional sense of most senior military officers of the time. While General Douglas MacArthur was most vocal and visible in his opposition to the limits Truman imposed, almost all the top military leaders disagreed with the principle of limited war as applied to Korea.[13]

It could be argued that Truman was acting within the traditional framework of civil-military relations in that he was making a strategic decision about conflict objectives in Korea. It is true that after the Chinese Red Army intervened in Korea in November, 1950, Truman not only monitored but controlled the tactics that his theater commander was allowed to employ[14] and thus crossing the boundary into an area of authority traditionally controlled by the professional military.

How will roles and missions debates unfold in the post-Cold War era, and how will they effect civil-military relations?

Who controls the assignment of tasks? And what tasks are appropriate for the military to perform? There is nothing unusual in assigning the military to "non-traditional missions. In the early to mid-point of the nineteenth century, the Army in

particular provided planning, coordination and often labor in the construction of a national economic infrastructure. Roads were built, canals dug, and railroads laid across wide expanses of wilderness.[15]

The military had also played roles as enforcers of domestic tranquility. Frequently throughout American history they were called upon to intervene between hostile forces, sometimes as a neutral party -- and sometimes as advocates. For example, some soldiers began to assume protective postures against Native American tribes people who were being victimized by white settlers. As one officer put it, "Who will say that it is not the duty of the American people to do all this and more for these helpless remnants of races which we have slaughtered, oppressed, and driven off from all the best of land..."[16] From that point on the military has been used in a variety of domestic peacekeeping duties, including the breaking of strikes and control of urban disorder. It has also been used for disaster relief and law enforcement (integration of the University of Mississippi, or riot control in Detroit, for example).

These non-traditional roles are not popular with professional military leaders, and for understandable reasons. They detract from preparation for more conventional missions in a number of ways. Training missions cannot be accomplished by troops performing hurricane relief, for example. In fact the normal peacetime accomplishment of a myriad of tasks (maintenance of equipment, filing of reports, cleaning latrines, and so on) cannot be

completed by the distractions of nontraditional deployments.

Such missions also cannot make use of the array of modern weapons and the supporting equipment that the military has invested billions of dollars on. An F-117A is of little use in south central Los Angeles, nor a Los Angeles class submarine much good against drug smugglers. The Defense Department has a long list of weapons improvements waiting in the wings, including the B-2 bomber, the F-22 fighter, the C-17 transport, roll-on/roll off sealift vessels, and lots of smaller programs. None of these weapons systems, all of which cost billions of dollars to procure and maintain, can play much if any role in the conduct of nontraditional missions. It is little wonder that the military leadership is less than enthusiastic about such tasks.

It is also important to note that long drawn out deployments of forces in the conduct of nontraditional missions can sap military morale. So of course can combat missions, but there is a special problems associated with nontraditional missions. Peacekeeping in particular can be a dangerous mission that runs counter to military training and doctrine for combat. Combat requires, under normal conditions, that forces must take the offensive, and the advantage goes usually to the force that strikes first. The rules of engagement for peacekeeping usually prevents troops from taking the offensive, and rather requires them to take defensive positions and take no decisive action unless or until attacked. The results of such rules was brutally demonstrated in Beirut in 1983, and U.S. forces have looked at that event ever

since as a model of the downside of peacekeeping rules. More recently the U.S. did apply firepower against hostile Somalian forces, but only after those forces had killed 23 Pakistani peacekeepers. Only if the ROE can be changed to allow preemption against potentially hostile forces will U.S. military leaders consider peacekeeping as a potentially viable mission. This is especially true when there is little peace in the region to keep. It is one thing to send troops in to maintain an already established peace agreement, as was the case in Cyprus and in the Sinai desert after 1973. But the events in Somalia and Bosnia are different in that there is no peace agreement in place at the present time, even though peacekeepers are on duty in those nations. In Somalia they are increasingly caught in a cross fire between rival warlord armies, and in Bosnia between three ethnic groups with a centuries-long history of enmity. In Somalia the role of peacekeeping has turned to peacemaking as UN troops find themselves in pursuit of a warlord leader believed responsible for attacks against peacekeepers.[17]

There are other problems with peacekeeping as well. Long deployments in hostile or remote areas can lead to boredom and loss of morale. Such seemingly small problems can accelerate into health problems that may debilitate the force.[18] Bunking down in areas filled with a hostile or indifferent population, few if any amenities, and surrounded by dust, insects and heat is not conducive to good esprit de corps. The dangers of chance bad encounters with the population are reasonably good; in an

unfriendly area troops are more prone to shoot first if they suspect trouble. The Marine Corps sergeant who shot a young Somali for trying to steal his sunglasses was only one case in point. Surrounded by a mob of Somalis, the Marine claimed that he truly believed that his life was in danger, and probably followed the pattern that he had been trained for under such circumstances. As more armed peacekeepers are interjected into unfamiliar populations the probabilities of such tragedies will increase considerably.

Of course peacekeeping tours of duty can be shortened by more frequent rotation, but that in turn means higher costs of transport, record-keeping, premium pay, and perhaps an even greater pool of troops who have been put off by peacekeeping and whose attitudes may not be healthful for the service that they return to.

Civic Actions

There are other nontraditional roles and missions that could be assigned to the military. They include what have been labeled "civic action" missions, and generally involve the military acting at the domestic level. Such missions include disaster relief, crime prevention/restoration of civil order, and even civil engineering and construction. There have been ample cases of such activities recently -- troops deployed to south central Los Angeles during racial turmoil and troops sent to Florida and Louisiana in the aftermath of Hurricane Andrew in 1992. Still there is an inconsistent pattern of deployment here -- while a considerable force was sent to South Florida after Hurricane Andrew, relatively

few federal forces were sent into the flood-ravaged Mid-West in the summer of 1993. A recent editorial in one of the area's leading newspapers asked directly why so few troops were sent to Iowa and Missouri and so many sent to Somalia.[19]

The establishment of domestic order through police work or riot control is another dimension of civil action. These duties are normally shunned by the professional military for several reasons. First they fall within the realm of Posse Comitatus and are probably illegal unless ordered specifically by the President. Second they involve the military in what could be construed as political actions, particularly if the group they are attempting to control is advocating a political cause. The military not only shy away from political causes because of their professionalism, but also because they are aware that political currents can change and they could find themselves serving under civilian leaders who espoused the very causes that the military were trying to control previously.[20]

The role of the military in the so-called "drug war" is instructive. It is one thing for the military to use its equipment in an effort to locate and capture drug smugglers. It is another thing for the military to develop methods of dealing with drug abuse itself through strategies of prevention and rehabilitation. As Peck noted a few years ago, there could well be a shift in priorities so that the military reaches beyond rehabilitating its own abusers (far more then than now) and use that knowledge and experience to rehabilitate abusers outside of the military.[21]

Who Should Determine Roles and Missions?

There is a final point about post-Cold War civil-military relations and roles and missions that must be made, lest the above be interpreted as a plea for less civilian involvement over what are "military affairs." It is true that civilians can direct the military down policy paths that can have the consequences of weakening the military's capacity to perform traditional military missions. It is also true that the military's own conceptions of its traditional missions can become a substitute for national policy if there is no clear national policy direction from civilian leadership. That danger may exist today.

It has been widely noted that the U.S. entry into the Spanish-American war came not at the instigation of President William McKinley, who opposed it, but rather through a aroused public through a lurid press. There was at that point no political "grand strategy" for the military to follow. The "strategy" that ultimately led in particular to the Battle of Manila Bay and the U.S. conquest of the Philippines came instead from a naval disciple of Alfred Thayer Mahan, the pre-eminent naval theorist. But as Hendrickson has noted, "..."once the military was in possession of the Philippines it proved impossible to leave, and thus the United States came to hold a piece of territory that immensely complicated the strategic equation in the Western Pacific for the next four decades.[22] The problem was that "naval strategy" had substituted

for "national strategy," yet the two were not compatible. For the Navy, control of the sea and in particular the naval bases that allowed it was critical to naval victory, according to Mahan. But what was holding the Philippines (at some considerable cost) worth to the United States? The problem was that in 1898 there was no real answer. In a similar sense the same could be said to be true of the strategic bombing strategies developed by the U.S. Air Force in the late 1940's. In 1946 the Air Force began designing the B-36 and B-52 bombers that would play such a preeminent role in U.S. strategy. But before April 1950 and the creation of NSC-68, there was no national strategy on how such weapons might be used. Containment had not been finalized in terms of why or where, or even how. NATO had not become a reality. But the Air Force, in absorbing lessons learned at the tactical level over the skies of Europe and Japan, was already developing strategic bombing in ways that would bind the U.S. later to a heavy reliance on bombing.

The point that might be taken from these cases is that military doctrine can replace strategy where there is either no strategy, or where there is one which is so weakly and abstractly articulated that it becomes impossible to link doctrine to.

There was a set of strategic objectives for the Cold War -- deterrence through graduated threats against Soviet penetration of areas considered vital to the U.S. was a means to enforce containment of Soviet power. The military could and did disagree about how to best deter Soviet power, but they could also agree on the national strategic objective. That objective has now expired

along with the Cold War, and yet no new national debate has engaged policy makers, leaders, and citizens as did the debates on strategy that marked the beginning of the Cold War. In the absence of a consensus on a new set of strategic principles for the U.S., the military can again bring to bear its own doctrines as a substitute. That may not be any more desireable now than it was after the Spanish American War, for the same reasons.

At the same time it should be noted that there are lines between areas of responsibility, but they are difficult to locate. As Hendrickson correctly observed, Huntington drew the line too high when he argued that military professionals have the right to determine strategic considerations, and McNamara drew it too low when he interfered with tactical details.[23]

CONCLUSIONS.

The end of the Cold War has already signaled changes in civil-military relations in the U.S. Civilians can be expected to increase their present authority in some traditional areas of military responsibility, such as in weapons and personnel acquisition and in the determination of roles and missions. The consequences of this incroachment should not be over-estimated. It is unlikely to bring about resignations in protest from more than a handful of military professionals. It will probably not bring much public comment from either the professional military themselves, or their supporters. But such involvement by civilian

leaders can still have some negative consequences.

Acquisition policy making in its ideal form should involve a partnership between the military operators and civilian acquisition specialists. But as military operators get increasingly squeezed out of the acquisition process (as happened in particular under McNamara) the danger increases that weapons systems will become less responsive to their needs. If personnel acquisition becomes more reflective of some of the priorities of the Clinton administration or of certain key members of Congress, military efficiency and morale can suffer. And finally, if the military is pressed into even more non-traditional roles and missions, military readiness for more traditional conflict may decline. These consequences in and of themselves will probably not push the military into condition critical, but coupled with the other problems the military is facing as a consequence of the end of the Cold War, they will be potentially serious enough to hopefully limit civilian excursions into what the military understandably regards as its own decisional territory.

"The President and the Bureaucracy: Strategies for Influence"

By Frank M. Sorrentino, Ph.D.

St. Francis College

Delivered at The American Political Science Annual Meeting in Washington.D.C. September 1993.

Introduction

The purposes of this paper are: 1) to present a framework for the understanding of Presidential-Bureaucratic relations; 2) to develop a meaningful threefold typology of Presidential strategies in dealing with bureaucratic power; 3) to evaluate the costs and benefits to the President in the employ of each strategy; and 4) to raise the question to what degree is the President responsible and accountable for bureaucratic activity.

The paper begins with an overview of the essential characteristics of bureaucracy and its relative advantages and disadvantages. This will be followed with a discussion on how the American Political environment affects these positive and negative attributes. The first two sections are for establishing the background on the theory. They may be read quickly if one wants to move to the new elements of the model.

In the next section, a systems framework will be established using the functional requisite analysis that was developed by Talcott Parsons. This framework establishes the need for organizations to respond to changes in their environment while at the same time attempting to maintain their existing patterns of operation and their own goals.

The concept of rationality will then be introduced which will lead to the proposition that individuals, and as a consequence organizations, prefer the status quo to change. This is because change can be and very generally is, both costly and highly disruptive

The paper then attempts to establish a meaningful threefold typology of Presidential Strategy in dealing with bureaucratic power. This typology's purpose is to facilitate the analysis of Presidential-Bureaucratic relations and the potential impact of the Presidency on bureaucratic behavior.

Lastly, the paper recapitulates the essential aspects of the model and evaluates the costs and benefits to the President in the employ of each strategy.

THE BUREAUCRACY

The term bureaucracy is one that immediately evokes a negative response in the United States. In the land of Horatio Alger and the rugged individual, the bureaucrat is no hero. However, the concept of bureaucracy is central to any discussion on organizational behavior and it becomes imperative to offer a definition.

Max Weber, the German sociologist, believed that the goal of Western societies is to achieve social and economic goals with the greatest degree of efficiency. He saw the development of rational legal bureaucracy as the ultimate mechanism of rational thought.

Weber constructed an ideal-type model of bureaucracy. The ideal type is not intended to mirror the real world or to prescribe a specific way of creating an organization, it simply extracts the key components of a given phenomenon for analytical purposes.

The key elements of Weber's model are:

1. division of labor, with areas of competence legitimized as official duties and powers;
2. hierarchical arrangement of offices or positions;
3. written rules for carrying out assigned tasks;
4. impersonality - officials are to act according to established norms of conduct in their contact with others inside and outside the organization;
5. the selection and assignment of officials on the basis of technical competence and not on considerations such as social status or political affiliation (Weber 1946, 185).

Bureaucracy is, therefore, an organization having these characteristics to a greater or lesser degree and exist in "large scale private organizations in parties and armies, as well as in the state and church" (Parsons 1960, 310). According to Weber, "[Bureaucracy] was the most rational known means of carrying out imperative control over human beings" (Weber 1946)

The positive dimensions of bureaucracy were explained by Weber:

> It is superior to any other form in precision, and in its reliability. It thus makes possible a particularly high degree of calculability of results for the heads of organization and for those acting in relation to it. It is finally superior both in intensive efficiency and in the scope of its operations, and is formally capable of application to all kinds of administrative tasks (Weber 1946, 330).

Although bureaucracy does provide advantages, it also creates its own disadvantages. The two basic disadvantages or problems which will be discussed in greater detail are: one, the problem of control of organizational behavior; and second, the problem of effective internal decision-making.

The problem of control is central to any organization. How do the leaders of an organization get its members to act in ways consistent with the goals of the organization? For this to occur the individuals should be totally cognizant of the expectations that are placed on their performance. Members should know how they are to carry out their tasks, how their roles relates to others in their subunits and how the function of the subunits relate to the overall goals of the bureaucratic structure. The goal of any organization then is to limit or narrow as much as possible the discretionary freedom of its members. However as an individual's responsibilities increase and become more complex, it becomes more difficult to limit his or her discretion. This leads organizations to proceed along a second path of control, to socialize the member into the correct organizational preferences. This can only be

accomplished if:

1. The individual has a clear concept of what is preferred;
2. He clearly perceives the resources available to reward or punish him;
3. He is convinced that the risks involved in deviating from his expected behavioral pattern outweigh any advantage that may be incurred (Gawthrop 1969, 12).

In reality this state is never achieved, the individual is, therefore, more loyal to the subunit rather than the organization. The individual perceives the rewards and punishments as coming from the subunit.

In addition, in any large complex bureaucracy, organizational goals can rarely be stated in precise terms. Organizational goals are generally broad generalizations which are ambiguous in content, and easily applicable throughout the organization such as "quality education." It is the task of each subunit to translate these broad goals into specific meaning. Therefore, one could conclude that the perception of a large bureaucracy being rigidly controlled is a distortion of reality. A large organization is controlled by its subunits and forms a composite of them.

The second major problem is that of effective internal decision-making. It was once believed that decision-making was the exclusive domain of the top level elected official and that the bureaucrats provided a value free, impersonal, expert objectivity.

However, bureaucrats have become important participants in decision making because of the complexity and sophistication of the tasks to be performed, and the need for information to perform these tasks. Yet communication of this information requires definite cost (Blau and Scott 1962 116-139). Anthony Downs expands on this point:

> Every message involves the expenditure of time to decide what to send, time to compose the message, [and] the resource cost of transmitting the message. Also if the message passes over a channel operating near capacity, it may cancel or delay other messages. Since the time of each official is limited, the more time he spends in searching or communicating, the less time he has for other types of activity (Downs 1957, 112).

To achieve reasonable efficiency:

> The communications network in any organization must not normally load any individual beyond his saturation point. If he becomes overloaded, he will be unable to comprehend

> the information given to him well enough to screen it efficiently or to use it.(Downs 1957, 112).

Since information must be filtered upward, there must be a discretionary judgment of what information should be passed on. So potentially important information may be considered trivial or it may be synthesized to the point where its true significance is lost or distorted (Gawthrop 1969, 18). Furthermore, there are many individuals who are not trusted subordinates and therefore do not share all the same goals of the one immediately on top. All large organizations are not teams, but coalitions. A team is a group of persons working together who have identical goals. A coalition is a group of persons working together who have some but not all goals in common. They need not give their common goals the same weight in their individual preference structures. Each official in a bureau has a set of specific goals connected with his or her own self-interest. Therefore, the goals of every bureau member are different, to at least some degree, from those of every other member. Thus according to Gordon Tullock, the greater the hierarchical structure the greater the distortion (Tullock 1965, 137-141).

One can see that keeping information channels open to the top of the organization is a fundamental problem facing every complex structure, and therefore must be considered a major disadvantage of bureaucratic organizations.

The Political Environment of American Bureaucracy

In terms of democratic theory, it is usually conceded that the bureaucratic structures should be accountable to the elected political authorities. However, the very nature of bureaucracy prevents absolute control. In addition, the American political structures create an environment that exacerbate this inherent disadvantage of bureaucracy.

The Constitution has had a significant affect on the structure of American bureaucracy. It explains the major differences between American bureaucracy and those of many other societies.

First, the Constitution was actually ambiguous as to who was to control the executive branch. The ambiguity stems from the general separation of powers, rather than the specific provisions designed to fragment control of the executive branch.

Alexander Hamilton, in "Federalist 72," believed in the concept of presidential responsibility.

> The persons, therefore, to whose immediate management these different matters are committed, ought to be considered as the assistants or deputies of the chief magistrate, and on this account, they ought to derive their offices from his appointment, at

> least from his nomination, and ought to be subject to his superintendence. This view of the subject will at once suggest to us the intimate connection between the duration of the executive magistrate in office and the stability of the system of administration (Hamilton).

This has usually been translated to mean that the president is to be responsible for administrative action as long as he is in office. However, the Constitution has also given Congress significant powers in relationship to bureaucracy. It can create and destroy agencies and determine where they are to be located. It has the power to determine its general jurisdiction and appropriations. Furthermore, it has the power to confirm presidential appointments and to oversee its operation. Clearly, the Congress can and does play an integral part in the administration of the American Bureaucracy.

In addition to the Separation of Powers, Federalism has had a profound effect on the bureaucracy. The central government frequently cooperates with state agencies to implement national goals. This cooperation has fostered a decentralized federal bureaucracy and an emphasis upon federal field organizations. Due to distance and the need for political support for program implementation that may not accord with central directives and policy, this has led to autonomy. "The effect of the Constitution is to fragment the bureaucracy. Lines of control are blurred and organizational patterns are diverse and in general unity is absent" (Woll 1963, 52).

In addition to the Constitution, there are political factors that have affected bureaucratic structure. Some of these political factors derive from the Constitution, but others are independent. According to Peter Woll:

> The Constitutional system discourages the development of any unified source of political power in the form of disciplined political parties, with the ability to control the entire governmental system. This enables portions of that system to be governed by "factions" or political interest groups. Federalism and the separation of powers have prevented the creation of disciplined national parties by giving primary strength to state political organizations and by preventing any kind of effective cohesion at the national level (Woll 1963, 27).

This situation is aggravated by the fact there are a great variety of interests throughout the country and this is reflected politically, which results in the exertion of diverse pressures on the bureaucracy by groups of all kinds. This kind of pressure is

more significant because of the lack of administrative unity and because the bureaucracy is deeply involved in the policy process. There is no single focal point of control for the administrative branch, and the way is clearly for disjointed control by interest groups in proportion to their political power (Woll 1963, 53).

According to Kenneth J. Meier:

> Politics, the unifying force in English government and American cities with political machines is not a unifying force in American national government...American parties are broker parties; that is they are broad coalitions more concerned with winning office than enacting specific policies...Without the disciplinary authority to purge mavericks and deny pary nominations, the parties remain loose coalitions incapalbe of unifying the fragmented American policy process (Meier 1993, 51).

This political environment contributes significantly to the first major disadvantage of bureaucratic structure. Since he or she receives contradictory demands the bureaucrat does not have a clear concept of what is preferred. Also since there appears to be no unified majority that can manipulate the rewards and punishments of the Federal structure, he or she is willing to take risks in deviating from the pronounced behavior expected by various groups.

This situation does not exist for every bureaucrat; but generally for the bureau chief. For a small subunit, the lower level bureaucrat has a clear concept of what is expected, and perceives the resources available within the subunit to reward and punish. He or she is convinced that the risk involved in deviating from his or her subunit superior outweighs any advantage that may be gained. Therefore, one can understand the paradoxical development that freedom or discretion for a bureau is actually freedom for its chief, and simultaneously, a system of repression for the subordinates within the bureau. As a result, the loyalty of the members of particular agencies are to the subunit and not to the entire bureaucratic structure.

One must keep in mind that this is a general tendency. There may be other circumstances that may change this tendency in a particular situation.

ln terms of effective decision making as a major problem in bureaucratic structure, one must be concerned with two major variables: the size of the organization; and the level of specialization.

The size of the organization is usually related to layers of hierarchy, and as Gordon Tullock has demonstrated, the longer the hierarchical chain the greater the distortion in information. Furthermore, the size of the Federal bureaucracy creates a scope beyond the capability of control by an individual at the apex of

the system. There are fourteen department secretaries who report directly to the president in addition to the Vice President, the Director of the Office of Management and Budget and the Director of Central Intelligence. This results in a minimum of seventeen people reporting directly to the president; in reality no president has been able to reduce his direct supervision to seventeen individuals. Thus, the communication system becomes overloaded easily. Furthermore, each of the fourteen departments are huge entities unto themselves, on a level with the large corporations in America.

Within each department the Secretary has one or in some instances, two immediate subordinates who are ranked as either Deputy or Under Secretaries. The next lower level in all departments is filled with varying members of Assistant Secretaries who may be responsible for the operations of a major departmental subunit, or who may have overall departmental responsibilities (Gawthrop 1969, 51).

> The bureau chiefs are, for the most part, thoroughly competent and proficient specialists who direct the vital subunits of the various executive departments. However, because of the civil service status and or their extensive seniority they must be viewed in dual perspective as being both part of and apart of the President's executive team (Gawthrop 1969, 67).

Bureau Chiefs may be either career civil servants or political appointees depending on the legal requirements. In actual practice, however, three types of persons become bureau chiefs. Approximately one-third are politicians who are appointed by the president. Another one-third are career civil servants, although many hold positions that are designated as political appointments. The remaining one-third of the bureau chiefs may be termed "professionals." The professional pursues a scientific or technical career outside of government. After establishing reputations in their professions, these individual are appointed to top level bureau positions, moving up to bureau chief in a few years. (Meier 1993, 24).

The political appointees appear to lack the expertise, the reputation and the civil service protection and are usually less effective in establishing a policy impact. In addition, the average politician spends less than two years in the top position. During the Reagan administration, the average political appointee served only 12 months as a bureau chief (Ban and Ingraham, 1990).

The relationship then between the bureau chief and the political superiors is delicate. In order to receive and interpret the information effectively, the nominal superiors must be competent in those areas. Operating effectiveness within any organization is directly related to the degree of stability evidenced within a bureaucratic structure. Stability, experience, and cohesiveness are important functions of any organizational structure.

While the average tenure of an American president compared to a corporation executive is not significantly different, two important distinction exist. First, the president of a corporation has generally come from the ranks of the organization and is usually familiar with the operation of the organization. The likelihood is that the executive may have held several bureau chief positions before assuming the top position. Second, his or her chief aides are generally thoroughly familiar with the organization, and are able to interpret and assimilate information at a higher rate of efficiency. Of course, in the American governmental system, this is not the situation. The President and his cabinet come from outside the Federal Bureaucratic structure and therefore, as a result, never achieve the same level of efficiency.

It can, therefore, be concluded that the political environment in which the governmental bureau operates exacerbates the two disadvantages of bureaucracy, namely, the problem of control over bureaucratic behavior and efficient and effective decision making.

This is not to say there is no control over the bureaucratic subunit. What this means is, that if the Chief Executive or his or her subordinates attempt to impose regulations that the subunit considers inimical to its best interest, it has other alternatives beside reluctant acceptance or delay. It could employ the services of an external group which could intercede on its behalf.

The two major external groups are the Congressional Committees or subcommittees that have jurisdictional oversight, and interest groups who are part of the subunit's constituency that is those who benefit or suffer directly by th functions of the bureau.

The relationship between a bureau and the Congress is extremely complex (Cater 1964; Freeman 1965). There are jurisdictional and appropriation committees in each house that directly affect the activities of a bureau.

The members of a Congressional committee benefit from a close relationship with the bureau by obtaining the necessary substantive information that allows them to perform their Congressional role competently, without a significant investment of the scarce resources of time and energy by Congresspersons who have heavy demands; and by obtaining various services that contribute to their effectiveness as constituent representatives (Gawthrop 1969, 67).

The Congresspersons seek to form an alliance with the subunit. A relationship with a Departmental Secretary or Deputy Secretary is more authoritative, however, these administrators lack expertise and their tenure is temporary. Therefore, a more productive relationships would be with the bureau chief. The bureau chief is a high level civil servant who has authority, expertise and long-term security. In return, the bureau chief expects a certain amount of political protection and other considerations.

The second major external group are interest groups which are concerned with the various policy outcomes or decisions that affect their business or movements. In exchange for these desired policy outcomes, the bureau receives access to various publics that can be mobilized on its behalf by these various groups, a move that the

bureaucratic subunit would find difficult to do legally and politically by itself.

Together congressional subcommittees, interest groups and bureaus have all the necessary political resources to satisfy each other's needs, as long as other political actors acquiesce. Bureaus supply services or goods to organized groups but need resources to do so. Congressional committees supply the bureau with resources but need electoral support to remain in office and political support to members of Congress. The interest groups provide political support to members of Congress but need government services to satisfy members' demands. The result can be a tripart relationship that has all the resources necessary to operate in isolation from politics if other interests are not adversely affected. The subsystem, therefore, can continue to satisfy each member's demands only if extensive political interest is not focused on the policy area. It is, therefore, in the best interest of all subsystem participants that they resolve all disagreements within the subsystem and limit the scope of any conflict (Meier 1993, 52).

The openness of subsystems to outside influences is a key variable in policymaking. The structure of these subsystems have changed over the years because a variety of political actors have become interested in subsystem decisions. Hugh Helco has termed this involvement as an "issue network," which includes state agencies, journalists, other federal agencies, academics-policy analyst, key executive branch personnel such as the OMB and congressional staff members (Helco 1978). This conceptional approach suggest that there are likely to be several points of view on policy questions within the subsystem.

The question is which characterization is more accurate. It appears that policy subsystems are more likely to dominate because of the increase in decentralization by both the Congress and the entire policymaking process tends to produce an homogenization of policy views. In addition, the requirement of consultations by the bureau allow it to develop a coalition of groups with interests similar to its own. The net result is more likely to be a policy subsystem than an issue network (Meier 1993, 53).

Thus one can conclude that there a high degree of cohesiveness between the executive subunit, the Congressional subcommittees and the interest groups.

Bureaus are thus able to utilize several political strategies which allow them greater flexibility. They can engage in a form of political entrepreneurship which allow them to create various coalitions. This flexibility keeps each member of the group capable of the coalition, somewhat reluctant to antagonize the bureau for fear of being left out.

Other avenues of independence open to the bureau will be developed later in this paper.

Systems Framework

In the preceding two sections bureaucracy was analyzed first in its generic form, and secondly, within the American political environment. With this essential background established, it is now possible to develop the theoretical aspects that this research will employ.

The model will posit a systems framework which is defined as "Any set of variables with regularized patterns of interrelationships" (Easton 1965, 22). Within this framework, the theoretical underpinnings of Talcott Parsons' functional requirements for organizations will be utilized.

Parsons stated that every organization must meet four basic functional requirements. They are:

1. The ability to maintain, preserve, and reproduce the organization's basic patterns of behavior (pattern maintenance).
2. The ability to adapt to environmental change (adaptation).
3. The ability to achieve organizational goals (goal attainment).
4. The ability to minimize intra-organizational disruption and conflict and to maximize intra-organizational stability and cooperation (integration) (Parsons 1961, 30-79).

Thus, there are two forces of change: integration and adaptation. They will be discussed in greater detail.

> Every organization, no matter how hard it may try to maximize internal stability is forced to respond to certain forces of change simply to survive as an organization. One reason for this is the rather obvious fact that no organization is able to exert complete control over its external environment and second, the external environment of all organizations are themselves in a constant state of change. Thus the changes that occur in the external environment create pressures on the organization to respond in the form of organizational change (Gawthrop 1969, 175).

In addition, if it is to survive as an organization, every bureaucracy, no matter how hard it may try to stabilize its internal structure and operations, is forced to respond to certain forces of change originating in its external environment. The extent to which an organization is able to respond successfully to changes in its external environment shall be referred to as its adaptation ability. As Louis Gawthrop explains:

> Similarly, it may be stated that no organization can prevent changes in its own internal hierarchal structure, and as a consequence the same internal forces of change applies when one is considering internal aspects of change; namely every organization, no matter how hard it may try to stabilize its internal structure and operations is forced to respond to certain forces of change originating within its internal environment if it is to survive as an organization (Gawthrop 1969, 173).

There are two internal causes of change. The first is inevitable internal turnover. Every organization is constantly adjusting its allocation of personnel to organization roles. Because new members and younger people replace older ones, impersonal relationships replace personalized friendships. Thus, the simple process of maturation and subsequent aging causes adjustments which lead to major changes in organizational behavior. No two people have exactly the same capabilities, personalities and friends, so the shifts in role players alter the performance of roles. Since power tends to be concentrated disproportionately in a few key roles, the precise ways in which they are performed may have profound consequences for the whole bureau. As Kenneth Boulding explained:

> The inevitable succession of persons in the top roles brings changes to the character of an organization that are the result of the personality of the occupant rather than that of the role structure itself...Where the occupants of top roles are drawn from a small, self-perpetuating oligarchy, the character of the organization is likely to be fairly stable ...where, however, the occupants of top roles are selected by the processes in which change plays a large role, it is quite possible for the role to be occupied by a succession of very different personality types, each of which will give his distinctive stamp to the role and therefore to the whole organization (Boulding 1963, 156-157).

One could demonstrate this point by investigating the FBI under J. Edgar Hoover (Sorrentino 1985) and comparing it to the time when L. Patrick Gray became Acting Director (Proveda 1990).

The second internal cause is the development of internal technical changes. New ways of performing the tasks assigned to a bureau may cause profound changes in its behavior, rules structure and goals (Downs 1967, 192). For example, the development and the

deployment of nuclear weapons have significantly changed the goals and operations of the United States Military Establishment. The size of the Armed Forces has significantly declined as an asset, while the technological sophistication of the military personnel has significantly risen. This point can be further buttressed with the development of Smart weapons as demonstrated by the Gulf War and the subsequent attacks on Iraq by the Bush and Clinton Administrations, which allow a great degree of accuracy in targeting an enemy. This may increase the demands placed on the military by political leaders who might perceive fewer risks in terms of American and civilian casualties by using these weapons.

It has been established that within a systems framework, a bureau must react to changes in both its internal and external environments. However, in responding to change precipitated by either external or internal actions, some degree of internal organizational conflict is virtually inevitable. It will occur because even the most insignificant change will elevate the degree of personal anxiety and tension for those individuals who will be affected by the change. Perceived in this context, it can be stated that the extent to which the organization can effectively avoid the development of an internal conflict situation while adapting to the forces striving for change shall be referred to as its integrative ability (Gawthrop 1969, 177).

The successful organization, therefore, must be able to keep these two interrelated variables at some equilibrium point. In order to survive, an organization must adapt to changes from both external and internal sources. While the demands from these sources may be inevitable, so will be the internal response to this adaptation. Thus an organization must adopt to change and must minimize the degree of intra-organizational disruption and resistance that is associated with change. To do this it must be able to integrate the new with existing behavioral patterns (Gawthrop 1969, 177).

Two of Parsons' functional requisites - adaptation and integration - must be accomplished by every bureaucratic organization. The degree may vary but no organization can refused to either adapt or integrate.

To understand how an organization behaves, it is necessary to describe how the constituent elements of the organization behave. It is at this point that the concept of rationality will be introduced. Its central premise is that bureaucratic officials are significantly - though not solely - motivated by their own self-interest. The model will borrow Anthony Downs' three basic assumptions about bureaucratic behavior. They are:

1. Bureaucratic officials (and other social agents) seek to attain their goals rationally. They act in the most efficient manner possible given limited capabilities and the cost of information.
2. Bureaucratic officials in general have a complex set of goals, including: power, income, prestige, security, convenience, loyalty (to an idea, an institution, or the

nation), pride in excellent work and a desire to serve the public interest.

3. Every organization's social function strongly influences its external behavior and vice versa (Downs 1967, 2).

With the introduction of the concept of rationality, it becomes easier to explain why large organizations and bureaus are notorious for their inertia.

The first major cause of inertia is that self-interest motivates officials to oppose any changes that cause a net reduction in things that they personally value. Change will represent a "cost" to the individuals involved and not to the society as a whole. Most of the items personally valued by officials are related to the amount of resources under their control. These include personal power, organizational power, income, prestige, and security (Downs 1967, 196). There are few situations where these values can be enhanced by a decrease in the resources available. One can conclude, therefore that officials are not going to recommend changes that adversely affect their resources and there is an active constituency that will fight any change.

While there are forces and incentives for change, such as the desire to do a good job, the desire for aggrandizement and the desire for self-defense, these forces must contain significant benefits not only to an organization but to key personnel within the bureau. Decisions are made on a cost-benefit analysis based on the utility or benefit to the individuals involved and not for the organization as a whole. While a bureau may adapt changes that have strong negative incentives, it is only done when there is a consensus of its external agents (interest groups, Congressional subcommittees and the Executive); however, this seldom occurs. Therefore the task of the bureau is to promote change that maximizes the positive effects. The tremendous inertial forces in bureaus make this particularly difficult, for every change generates negative incentives by forcing officials to develop new formal and informal arrangements (Gawthrop 1969, 177).

Adding to the difficulty of bringing about change is the likelihood that the proponents of change are not always aware of all the effects of their proposals. Many of the proponents are at a lower level at the operation level or external agents and are thus unable to observe all of the repercussions of their suggested changes upon other bureau sections. Furthermore, officials usually promote innovations that are designed to improve their own section or themselves, since these are the ones they most care about.

James Q. Wilson concludes:

> To the proponent of change, the perspective benefits are direct and easily conceived; the costs are remote, something "the organization" will deal with. To organization members who will be affected by the change, the costs to them are likely to be directly and immediately

> felt; the benefits are something that will accrue remotely to "the organization" (Wilson 1963).

Therefore, one can conclude that the proponents of change often fail because they do not consider the entire cost of their proposals.

In addition, a significant reason for this inertia is that the established processes represent an enormous previous investment of time, effort and money. This investment constitutes a "sunk cost" (March and Simon 1958, 173) of tremendous proportions. It has generally taken years of effort, many decisions, and wide experience to undertake the behavior patterns that the bureau is presently utilizing. In addition, it took a significant investment to get the bureau's members and clients to accept and become habituated to its behavior patterns (Downs 1967, 201). Therefore, if one could demonstrate that the proposed manner of doing something is superior to the status quo arrangement, it could still not be in the interest of the bureau to adopt it. The benefits must outweigh the cost of change incurred in retraining and internal discord. This could lead to lower productivity.

One could therefore, see that the proponents of the status quo represent a function, similar to Parsons' first functional requirement, pattern maintenance, which is viewed by top level organization officials as an all important goal to achieve. The proponents of change represent a characteristic similar to Parsons' third functional requirement of goal attainment, since the establishment of goals satisfied both internal and external demands by key organizational officials. It has thus been established that bureaus prefer the status quo to change.

Presidential Strategies

It has now been established that the federal bureaucracy is an integral part of the American Political System with independent sources of power. Consequently any attempt to alter bureaucratic behavior would require a use of power, a scarce resource, on the part of the President. Presidents, if they are to be successful in achieving those political objectives that require bureaucratic cooperation, must develop strategies which will maximize their power resources. Professor Richard Neustadt states, "The power of the Presidency is the power to persuade," and "that this is no place for Amateurs" (Neustadt 1990, 3). This is a strong admonition to those who undertake this challenge.

I will develop a three fold typology of Presidential Strategies in dealing with bureaus. They are namely: 1) President as Politician; 2) President as Balancer of Power; and 3) President as Ideologue. it must be stated that this typology is not exhaustive but merely suggestive of the different techniques that may be used in Presidential-Bureaucratic relations.

President as Politician

This is the traditional prototype in which the President engages is various quid pro quo arrangement with the bureau whose behavior the President seeks to change or the Congressional Committee members who have oversight jurisdiction over the bureau. The traditional tools involve patronage, vote trading, negotiation, veto and reorganization. The president can exert some leverage against the bureau if he utilizes these resources to the maximun. The basic problems with this strategy are that it is expensive. The President has only 5200 patronage positions and many are needed to satisfy the electoral needs of the President. The veto power can cost the President many political enemies and could be diluted if various unrelated bills are combined because of the absence of the item veto. Reorganization is generally too cumbersome and is only done periodically and it generally involves change across several agencies. In addition, it is subject to Congressional approval. Negotiations, which may include several of the above techniques in the addition to the exchange of interests. The President may concede on one policy in exchange for cooperation on another policy. President Nixon sought the cooperation of the Department of Defense for Salt I and in exchange was willing to support a higher defense budget. President Clinton sought the support of the Department of Energy and Western Congresspersons for his budget proposals and quickly reversed his proposal for a BTU tax. This cost Clinton $50 Billion in revenues which had to compensated by additional taxes and spending cuts. In addition, this compromised his goal of using the tax as a policy tool for energy conservation and environmental improvement.

Vote trading is also a common technique in which Presidents seek to influence bureaucratic behavior through legislative measures. Here a President will support measures that are of importance to members of Congress in exchange for budget or other measures which impact on the bureau.

Presidents who follow this traditional strategy find that changing bureaucratic behavior requires highly selective system of priorities and a very expensive expenditure of scarce power resources. While this strategy may be successful, the benefits may be less than the costs, particularly if the bureau believes that it is involved in a vital interest and decides to use the resources at its disposal to challenge the President.

President as Balancer of Power

The President in this strategy chooses his priorities on the basis of when bureaus and their control agents, such as Congressional Committees and Interest Groups, are in disagreement or when two or more "subsystems" are fighting each other. An example of the first instance would be the Environmental Protection Agency which had several interest groups that were in policy disagreement. The environmentalist saw the role of the agency to reduce air and water pollution while many industrialists saw its role in light of deregulation to decrease industry's cost and thereby increasing the nation's competitiveness in the

international marketplace.

President Reagan's Administration attempted to side with industrial interests particularly in the area of toxic dump sites and the Superfund regulations. According to this strategy, one is selective in the political battles that are to be fought. The President should choose to fight in only those instances where a moderate use of power resources can tip the balance of power in his policy favor.

An example of the second situation is when two "subsystems" are conflict can be manifested by the rift between NASA and the Department of Defense. NASA desires a monopoly on all space exploration including defense, commercial and scientific activities. The Defense Department seeks greater control over its operations and more flexibility, such as the use of unmanned rockets to propel satellites and other defense related paraphernalia.

According to this strategy, Presidents must be selective in their political priorities. They realize the limits of their political power and chooses which battles are to be fought largely on the basis of where few resources will be most efficacious. The benefits of this strategy are obvious, one gets more milage out of limited political power resources that are available to the President.

However, there are serious drawbacks to this strategy. First, the President does not choose his political priorities on the basis of national needs or his personal agenda. Second, Presidents may appear in the public eye as an opportunist and as inconsistent. Presidents could loose a significant amount of their moral authority. Lastly, Presidents need excellent political intelligence to make sure that the forces that are fighting each other are of roughly equal political strength. In the example of the E.P.A., the Reagan Administration overestimated the willingness of industry to make this a political priority and wage an all out battle. The Administration had to engage in a strategic retreat. It wasted its resources and did not achieve its objectives. In addition it was perceived as ineffective and anti-environmental. It had achieved the worst of all political worlds.

<u>President as Ideologue</u>

Presidents in this strategy stake out an ideological or philosophical position. This ideology will reflect the value priorities of the President. In addition, it will contain certain characteristics: 1) it will emphasize the positive benefits that can accrue from the President's program and de-emphasize the cost of achieving it; 2) the ideology will emphasize the benefits for the society as a whole or for large numbers of the citizens, rather than those benefits provided for special interests; 3) the ideology must remain rather general; and 4) the ideology should be easily be translated into symbols. This symbolization allows for the general public to become psychologically dependent on the President.

The conversion of ideology into symbols is an important

dimension of this role. As Murray Edelman states:

> Men dwell on lore about the state what it is and what it should be. This includes much that is vague, yet comes to have a powerful emotional pull. it includes much that is plainly contrary to what we see happening. Yet the myth is all the more firmly believed and more dramatically passed on to others because men want to believe it and it holds them together (Edelman 1972, 1).

Men, therefore need to develop symbols to cope with the complexities and the dangers of the modern world which he does not understand. He has to develop techniques of orientation which may be fallacious or crude that help him find his way through the dark. The manipulation of symbols makes it possible for members of the society to believe that they live not in a jungle but in a well organized society (Sorrentino 1985, 7-37).

Presidents performing this role seek not to persuade, rather they seek unambiguous alignment with one group or set of ideas. The function of such alignment is to polarize and not to persuade. If there were no differences on the threat or the method of copping than there would be no issue. It is the polarization that pits dogma against heresy that enables Presidents to play their role the greater the polarization the more convincing the role.

The Presidents seek to become symbols. The perception of the Presidents as leaders who are willing and able to cope against the forces of evil allows them to play the roles of righteousness and stability. As Hugh Duncan states, "A leaders's dramaturgical joust with public problems make the world understandable and conveys the promise of collective accomplishments to the masses who are bewildered, uncertain, and alone" (Duncan 1953, 107).

Presidents in this strategy actually take on bureaus. They will put their policy preferences as truth and the bureaus preferences as heresy. When successful in employing this strategy, Presidents are able to move a significant portion of the population into intense opposition to the bureaus in question.

This strategy has been used by many Presidents in recent year. President Reagan used this approach in dealing with many welfare programs and with housing programs. He attacked them as anti-family and as anti-American. President Carter attacked the CIA for its covert activity as an enemy of American democracy. President Clinton attacked the Department of Defense for its ban on homosexuals in the military as a violation of basic liberties. He later retreated from this strategy.

Presidents who engage in this strategy have significant leverage against a bureau or a series of bureaus whose policies they seek to change. The Presidency is the greatest and most visible symbol of American society. The opportunity of a President for influencing public opinion is unmatched by any other political actor or organization in the American political system.

The problems with this strategy are many. First, it tends to oversimplify problems which make them more difficult to solve. Second, it raises expectations that can rarely be met. Third, this strategy employs a sledge hammer approach which does not allow for fine tuning in the compliance area. The bureau is either evil or its personnel are misdirected, there is no middle ground.

Presidents who engage in this strategy may find that they will get little if any cooperation from bureaus in any other area. This would force the President to redirect other pet programs to other agencies which in turn will increase their political power in relationship to the President. This strategy while effective can not be used alone, rather it must be used in conjunction with the other two.

Conclusion

Bureaucracies are powerful political institutions based on their own qualities particularly their power of expertise. This factor is exacerbated by the decentralized nature of American politics. Bureaucracies have two legal authorities, the President and the Congress. The President's power is furthered weakened by decentralized political parties making the President one of the weakest Executives vis-a-vis the bureaucracy in the world's industrialized democracies.

Presidents if they are to be successful must engage in strategies to at least partially secure compliance by the bureaucracies to their policy priorities. I have developed a threefold typology which attempts to analyze the various Presidential strategies in dealing with Bureaucratic power. They are namely: President as Politician, President as Balancer of Power and President as Ideologue. Each of these strategies has its strengths and weaknesses. However, each recognizes the fundamental weaknesses of the Presidency in dealing with the bureaucracy. Each strategy is based on maximizing the effectiveness of the scarce resources available to the President.

This typology is suggestive in nature, others may enlarge it or come up with a different set of qualities for each. The underlying question of this paper is to what degree is a President responsible and accountable for the actions of the bureaucracy. The preliminary conclusion is that Presidents can not for the most part be held accountable for the actions of the Bureaucracy. It could be argued that the most incompetent, misdirected or egregious actions of a bureau should require Presidents to use their scarce power resources to seize control them during their watch. This, however, does not deal with the overwhelming amount of bureaucratic behavior which operates within a medium range. This important question, however, will require more inquiry.

Abstract

This paper argues that existing research on divided government has ignored the intergovernmental dimensions and implications of this phenomenon. We address the intergovernmental case by exploring the historical rise and micro-level foundations of divided outcomes among same-state U.S. Senator and governor pairs. The electoral results for senator-governor pairs lie at the intersection of state and national-level divided government, and are subject to the same historical and electoral forces that have shaped these other divided outcomes. We trace the historical rise of split outcomes in these contests, outline the theoretical and policy implications of these results, and offer an analysis of individual-level voting behavior intended to test three competing explanations for divided outcomes: the "party decline model," the "party balancing model," and our own "comparative informational relevance model."

We would like to thank John Coleman, Charles H. Franklin, Charles O. Jones, Herbert M. Kritzer, and Wendy M. Rahn for their helpful comments on earlier drafts of this paper.

It is ironic that in the field of political science issues that are often emphasized in introductory courses as central to any understanding of American government are promptly overlooked in published research. Unfortunately, such an approach has, until quite recently, characterized scholarly treatment of the implications of federalism in the United States. Empirical researchers have generally overlooked the importance of federalism when framing research questions -- not only in their explorations of the policy process [see Hamilton and Wells 1990, 1; Krane 1993], but also (and to a greater extent) in their inquiries into political institutions and mass political behavior. Such omissions ignore the fact that the government of the United States must be understood as one in which power is fundamentally divided -- not only "horizontally" among institutions, but also "vertically" between the state and national governments comprising the federal system.

As students of American politics have long recognized, a central consequence of these divisions of power is that policy making and administration in the U.S. are characterized by continuous, and often complex, processes of cross-institutional and intergovernmental communication. Indeed, it is precisely this necessity of cooperation and communication in U.S. politics, and the difficulty of its attainment, that underlies recent concern over the rise of divided government. In short, control of institutions by opposing political parties must be of central concern in any polity that depends so heavily on the cooperation of those institutions. The recent outpouring of research on this subject has provided contradictory accounts of the complex policy consequences of divided government [Sundquist 1988; Mayhew 1991; Jones 1991b; McCubbins 1991; Kernell 1991; Ginsberg and Shefter 1990]. In addition, scholars continue to debate the implications of divided government for democratic theory and the potential for governmental accountability [Fiorina 1992b; Jones 1991a; Sundquist 1988; Petracca 1991; Cutler 1988, 1989].

However, research on the origins and implications of divided electoral outcomes in the U.S. has thus far followed the broader pattern of research on U.S. politics by treating this phenomenon as if it were devoid of implications for intergovernmental relations and their policy consequences. In response to this omission, we explore the rise and origins of divided senator-governor pairs in electoral politics in the United States. Same-state senators and governors lie at the intersection of state and national-level divided government, and have been subject to the same historical and electoral forces that have shaped other divided outcomes. In this paper, we chart dramatic changes over the course of the twentieth century in the incidence of divided senator-governor pairs, and outline the importance of this electoral development for intergovernmental relations. In response to these historical patterns and theoretical concerns, we then assess several micro-level explanations for the origins of these divided outcomes. Our empirical analysis of this question draws upon theoretical frameworks inherited from existing works on divided government, and offers a new framework for understanding divided outcomes based on the comparative informational relevance of party cues. We conclude that future discussions of the origins and consequences of divided control in the U.S. must address its intergovernmental features, and must do so in light of more realistic portrayals of the political thinking and action characteristic of voters.

The Rise of Split Senator-Governor Pairs

Since the mid-1960s, American elections have become increasingly likely to produce divergent partisan pairs of important elected officials: presidents and congressional representatives [Sundquist 1988], governors and state legislators [Fiorina 1992b, ch.3; Key 1956, ch.3], and U.S. senators from the same state [Shapiro, et al 1990]. Morris Fiorina has recently argued that these trends must be viewed as

connected, and has urged scholars to examine divided government in a more integrative manner. He concludes, "...divided government is not a simple phenomenon. It is a condition that occurs on the state as well as the national level, it is correlated across the two levels, and it may be related as well to such things as the increasing party splits in Senate delegations" [1992b, 44]. Interestingly, Fiorina also points out the possibility that this logic may be extended to U.S. senators and governors representing the same state, noting that, "United States senators are chosen in state-wide elections to serve in the national Congress. As such, one might expect them to have something in common with other statewide elections, such as those for governor" [1992b, 41-42]. Indeed, senatorial and gubernatorial elections are characterized by concurrent campaigns and simultaneous vote choices for national and state-level offices representing identical state-wide constituencies. Consequently, while the federal system itself may be divided, there are quite logical reasons to expect the results of same-state senatorial and gubernatorial races to be linked. As V.O. Key noted, "The governmental system is federal but the voter in the polling booth is not. Evidently great upsurges of sentiment are not often accompanied by widespread popular differentiation between state and federal politicians" [1956, 33].

Indeed, recent research has provided strong empirical evidence that gubernatorial and senatorial elections are often driven by the same national forces rather than being distinguished on the basis of state and national issues. For example, John Chubb [1988] finds little evidence that voters hold state politicians responsible for state economic performance -- rather national forces are seen as central. Robert Stein [1990] finds that economic variables have nearly the same impact on senatorial and gubernatorial elections;[1] and Tom Rice concludes that "essentially the same forces impinge on statewide primary competition" in gubernatorial and senatorial elections [1985, 444]. Hence, elections for senators and governors not only share common temporal and geographical contexts, they also are characterized by vote choices that are responsive to similar motivating forces. Based on these characteristics alone, there is little reason, a priori, to expect vote choices in these simultaneous elections to diverge along partisan lines. It is not surprising, then, that for most of U.S. history these paired electoral contests have been characterized by consistently unified partisan outcomes. However, as we demonstrate below, during the most recent "era of divided government," voters have increasingly cast split ballots producing divided outcomes consisting of a governor and a senator from opposing political parties.

The paired offices typically understood as constituting the broader pattern of divided government in the U.S. (president/House, governor/state legislature, and split Senate delegations) share a distinguishing historical trend: Electoral outcomes for these offices that were predominantly of the same party in the pre-1960 period exhibit a dramatic shift after the early 1960s toward divided partisan results. To explore the extent to which such a pattern might also be characteristic of the inter-governmental case, we calculated the proportion of states with divided senator-governor outcomes in each election between 1914 and 1992.[2] Table 1 shows the clear differences between the pre-1960 and post-1960 periods. In

---

[1]See especially Table 5, p. 43. Once the elections are disaggregated by party (Tables 6 and 7), differences between the offices are evident. However, given the inconsistent question wording for the two offices, similarities in the determinants of vote choice are striking.

[2]Proportions are based only on those states holding both gubernatorial and senatorial elections. The year 1914 was chosen as the beginning point because it is the first year in which all senators were popularly elected. Data for elections from 1946-1992 were compiled from the Guide to U.S. Elections and Congressional Quarterly Weekly Reports. Data from 1914-1944 came from DeVries and Tarrance [1972]. The results from states that hold their gubernatorial elections in odd years (currently there are

fact, the distribution of the proportion of states with split outcomes from 1914-1960 barely overlaps with the distribution from 1962-1992. Overall, only 18% of all elections produced split senator-governor outcomes in the earlier period, but since 1962 the average proportion is nearly 47%! The difference between these two periods is statistically significant ($t = 8.58$, $p < .0001$), and hence, the hypothesis that the later period has not experienced a higher incidence of split senator-governor outcomes may be rejected. It is also interesting to note that the distributions around these mean proportions of the two periods are very similar. As Table 1 indicates, the ranges (i.e. the maximum proportion minus the minimum proportion) and standard deviations from the two periods are nearly the same despite the dramatic rise in the average proportions.

--- Table 1 and Figure 1 about here ---

These historical patterns are difficult to reconcile with the argument that recent divided outcomes are merely electoral "accidents" [Sundquist 1988]. If this argument were true, one would expect a transition from homogeneous unified results to an era of heterogeneous results which occasionally happened to produce larger numbers of split senator-governor outcomes. On the contrary, the evidence presented here indicates that after 1960 the American polity experienced a consistent and dramatic increase in the frequency of these divided outcomes. We interpret this evidence as being more consistent with the assertion that something systematic has changed in the American system that goes beyond mere volatility, and most likely cannot be "cured" by constitutional reform or erased by the occasional election of a unified government at the national level.

The Significance of Split Senator-Governor Pairs

Based on these empirical results, split senator-governor pairs appear to be a dramatic recent electoral development that may be linked in systematic ways to the more general phenomenon of divided government. However, the policy implications of this intergovernmental dimension of divided government remain less than self-evident. Does it matter that voters produce governors and senators of different parties? While this paper follows existing research on divided government by focussing on the description of and explanations for this phenomenon, the novelty of the intergovernmental case requires that we briefly indicate theoretical reasons for concern over the rise of split senator-governor pairs. We argue that such divided pairs have consequential implications for the policy making process and may undermine accountability.

The significance of divided senator-governor pairs flows directly from the dispersion of power within and across levels of government under our federal system. The framers hoped that the "double security" of the federal system would control majority tyranny and the "violence of faction." As Madison argued in a famous passage in Federalist 51:

> In the compound republic of America, all the power surrendered by the people is first divided between two distinct governments, and then the portion allotted to each subdivided among distinct and separate departments. Hence a double security arises to the rights of the people. The different governments will control each other, at the same time that each will be controlled by itself [Madison et al. 1981, 161].

---

four such states) were coded as if they occurred in the following "normal" election year. The individual-level model presented below only includes simultaneous senator-governor elections.

Significantly, the framers envisioned a system in which the states might exert a check over the national government -- and specifically, a system which included a strong relationship between state governments and the U.S. Senate. In this regard, Federalist 62 argued in favor of the selection of senators by state legislatures because this practice could be understood as "giving to the State governments such an agency in the formation of the federal government as must secure the authority of the former, and may form a convenient link between the two systems" [Madison et al. 1981, 182].[3] Federalist 39 makes clear the significance and intentional nature of this linkage. While the House of Representatives "will derive its powers from the American people," the Senate "will derive its powers from the States, as political and coequal societies" [Madison et al. 1981, 115].

As one might expect, divided senator-governor pairs were extremely unlikely under this constitutional process of selection. State governments (the state legislature and governorship) were typically controlled by a single party, which in turn selected a senator from their own party. During this period, however, unified partisan teams did not translate into control of national government by the states. After 1860, state legislatures were far less able to control their senators, though they routinely instructed them to take specific positions [Riker, 1955, 456].[4] Moreover, the popular election of senators further weakened the linkage between the Senate and the states. Most importantly, however, under the system of "dual federalism" *state and national governments simply had relatively little to do with each other*.[5]

Thus, during the first 150 years of U.S. history, divided senator-governor pairs were not only an extreme rarity, they were also relatively inconsequential in a system of dual federalism in which senators and governors had little incentive to interfere with one another's sovereign spheres. However, beginning with the New Deal legislation of the 1930s [especially in the area of labor law, see Kincaid, 1993, 173-75], and accelerating with the explosion in grants-in-aid to the states during the 1950s and 1960s [Howitt, 1984, 8-9], cooperative federalism emerged as the dominant mode of intergovernmental relations [Elazar, 1962]. Relationships between elected officials across the state and national levels have closely followed the relationships between state and national governments; and in the current period, as one close observer recently pointed out, "interdependence among governments, always great, constantly grows" [Derthick, 1992, 674]. Within this interdependent system, governors have seen the need to assert themselves more forcefully in national politics.

There is an irony in the simultaneous historical evolution of intergovernmental relations and rise of divided outcomes in our federal system: *when senators and governors were elected from the same*

---

[3]Charles Jones [1991a, 151] notes that the Founders were so strongly committed to the division of power in the political system and to the "diffusion of responsibility" that they may have been comfortable with modern divided government, something the critics of recent patterns of governing often overlook.

[4]We thank Charles Jones for bringing this article to our attention.

[5]This is not to say that the states never attempted to influence the national government. There are many examples of such attempts. Jefferson and Madison's battle against the Alien and Sedition Acts in 1798 and 1799, attempts to control the national bank, John C. Calhoun's ideas of nullification and concurrent majorities, and of course, the secession of the Confederate states, are all prominent examples. However, the interdependence of the states and the national government during this period was not nearly as great as in recent times; and attempts by the states to exert their power over the national government (such as those listed above) generally failed.

party, this fact was largely irrelevant because of the distinct boundaries between levels of government under dual federalism. However, now that state and national governments are more interdependent, and the policy-making process requires greater intergovernmental communication and cooperation, more senator-governor pairs are elected from opposing parties. In short, historical developments may have simultaneously produced a greater need for intergovernmental communication and more significant partisan obstacles to its achievement. In this era of cooperative federalism, the significance of split senator-governor pairs has been further enhanced by recent actions taken by the courts, the institutionalization of intergovernmental relations, and the importance of communication and negotiation in intergovernmental relations. Taken together these factors point to the increasing interdependence of state governments and the U.S. Congress, and to the possibility that states with senator-governor pairs from the same party may have substantial institutional advantages over states with split pairs.

In a series of decisions beginning with *Garcia v. San Antonio Metropolitan Transit Authority* (1985) [also see *South Carolina v. Baker* (1988) and *South Dakota v. Dole* (1987)], the Supreme Court has made it clear that the states must pursue their interests in Congress rather than the courts [Zimmerman, 1993, 178; Kincaid, 1993, 175-76].[6] However, Congress has not been a particularly hospitable climate for the states, as the "preemption revolution" has slowly eroded state power, even amidst the continuing rhetoric of a "new federalism" intended to do precisely the opposite [Zimmerman, 1993, 178]. Between 1970 and 1991, Congress enacted more than half of all the federal preemptions of state law in the nation's history (53%, or 233 explicit preemptions in this period; Kincaid, 1993, 173, citing Zimmerman, 1991]. In fact, according to Michael Reagan, this trend has ushered in a new era of "permissive federalism," in which the states exercise power at the permission of the national government [cited in Walker, 1991, 105].[7]

In response to this pattern of congressional activity, and to judicial decisions directing them toward congressional politics, the states have increased their presence in Washington and pursued greater institutionalization of intergovernmental relations. Beginning in the 1960s, governors attempted to increase the "size, capability, and versatility" of the National Governors Association staff in Washington [Beyle, 1988, 149]. This growth provided governors with greater leverage over the increasing array of

---

[6]This does not imply that the courts have become minor players in the battle to define the boundaries of federalism. Indeed, the number of preemption cases decided by the Court and the number of local, state, and federal laws struck down exploded between 1970 and 1990 [Kincaid, 1993, 173]. Derthick [1992] claims that the courts have been the primary beneficiaries of recent developments in federalism.

[7]It is interesting to note that cooperative federalism emerges in the 1930s during a period of unified party control at both the national level of government and among senator-governor pairs. With the shift to permissive federalism and federal preemption of state laws in the late 1960s, the relationship becomes more conflictual precisely as greater numbers of split senator-governor pairs appear. While we do not investigate (or claim) a causal relationship here, the pattern of covariation remains striking. It is certainly possible that senators (and members of Congress generally) are less likely to delegate power to the states if the governorship is controlled by the opposing party. The literature on roll call voting in Congress on federalism issues reveals that party and ideology are the primary determinants of votes [Hero, 1987; Malaby and Webber, 1991; Webber, 1989]. However, no one has examined the impact of divided government in our federal system on the willingness of Congress either to delegate power to the states or to preempt existing state powers.

federal programs that affected their states. As a result, governors have played important roles in shaping national policy in at least nine different issue areas [Wright, 1988, 275, cited in Krane, 1993, 187; Howitt, 1984, 24]. In addition, regional governors' associations were also formed to tackle specific issues, such as agriculture in the Midwest and economic development in the South. These organizational efforts were accompanied by greater collective attempts by governors to cultivate and utilize lines of communication with members of Congress. As Beyle concludes:

> . . . the governors of the fifty states and the several regions did band together and become part of the national policymaking process in order to overcome the decisions (or lack of decisions) made by those who supposedly represented their states in the Congress, namely their U.S. senators and representatives. In a word, the governors have had to undertake new and innovative steps to provide their states with representation in the national policy process [Beyle, 1988, 149].[8]

Within this new era of intergovernmental relations, the quality of communication between governors and members of Congress has become a matter of critical importance. Zimmerman supports this conclusion, noting preemption relief for a given state is more likely if the governor is an effective lobbyists: "The current system of preemption relief appears to be based upon a leadership-feedback model with Congress leading by enacting new preemption statutes and amending them on the basis of adverse feedback, if any, from the states [Zimmerman, 1993, 179]. More generally, states rely heavily on federal money for programs in many important policy areas including health, welfare, and transportation. Consequently, governors frequently lobby Congress to save programs or to argue for more generous support -- and the offices of same-state congressional representatives often provide the first and most important points of access and communication for a governor seeking to represent her or his state's interests. In fact, interviews with staffers for Gov. Tommy Thompson (R-WI) revealed that the governor contacts U.S. Senators Kohl and Feingold on a weekly basis in the peak of the legislative season, and staff members are in constant contact when the need arises.

Such communication between governors and senators is hardly surprising if one views the federal system as implying not only relationships between the national and state governments, but also power relationships among the states in the context of scarce national resources. As Krane points out, "policy models that assign federalism to a contextual role which only creates complications or obstacles to action miss the fundamental fact that subnational officials [i.e. governors] are actors whose preferences embody the interests of a particular jurisdiction. Put more simply, American federalism is more than maze of institutions; it is a matrix of reciprocal power relations." Indeed, within this matrix of power relations, communication and cooperation between same-state governors and congressmembers may be a crucial link determining the articulation and representation of state interests at the national level. As Derthick notes, "Under federalism, advantage flows to those interests or institutions that are able to collaborate

---

[8]Interestingly, while governors increased their presence in Washington in the 1980s, Congress was scaled back its commitment to intergovernmental relations. In 1985, Congress phased out general revenue sharing, cut the appropriations to the Advisory Commission on Intergovernmental Relations by 52% over four years, and realigned subcommittee jurisdictions to give intergovernmental relations a less prominent role [Kincaid, 1993, 176].

across the intergovernmental divide" [1992, 673].[9]

Our argument is simply that students of the policy process must seek to understand how these "leadership-feedback models" and "reciprocal power relations" characteristic of modern federalism intersect with political parties and the partisan outcomes of electoral contests. Put simply, political parties matter in American politics -- and there is little reason to expect intergovernmental politics to be an exception to this rule. In the current period of federalism, it also appears that senator-governor relations are important. It requires only a very small effort at integration to conclude that there are theoretical reasons to suspect that the partisan composition of senator-governor pairs may be consequential in the policy-making process: Senators may simply be more willing to listen to governors of their same party -- and they certainly are more likely to share similar policy views. In addition, communication between the two offices may also be facilitated by their linkage in the political career structure; governors frequently run for the Senate and occasionally the reverse occurs [Schlesinger 1966, chap.6; Canon 1990, 50-53]. As such, there may often be extensive cross-fertilization of senators' and governors' staffs, which would aid communication, though we know of no studies that demonstrate this point.

Finally, divided intergovernmental outcomes are not only important for their potential impact on the policy making process, they also may undermine democratic accountability in a federal system by obscuring responsibility and confusing voters. As Martha Derthick argues:

> ... [T]he dominant pattern of policy making in our federalism of pervasively shared functions seems to me, not so much checking and balancing by design of the people, but opportunistic cost shifting and benefit distribution by design of elected officeholders in the context of a general obfuscation of responsibility and the constitutionalization of everything. The upshot is that the electorate can have no idea who is in charge, and is caused either to cease caring and lapse into "universal silence and insensibility," or, if it dares to care, to become disillusioned ... [Derthick, 1992, 675].

Thus, like more traditional examples of divided outcomes, split senator-governor pairs may not only be products of the electoral system, they may also have important implications for the nature of that system itself.

In sum, (1) in contrast to earlier periods in U.S. history, the current era of federalism places a premium on relations between state and national governments; (2) recent court actions and institutional developments have combined to make communication and cooperation between same-state governors and members of Congress especially consequential in the policy process; and (3) there are strong theoretical reasons to suspect that communication between governors and U.S. senators from the same party may encounter fewer obstacles than communication between split senator-governor pairs. In light of these arguments and the historical rise of split senator-governor pairs described in the previous section, we consider an investigation of the origins and consequences of divided intergovernmental outcomes in partisan elections to be overdue. The remainder of this paper takes up the first of these two challenges.

---

[9]She argues that intergovernmental linkages are more important for judges and administrators, but clearly the observation holds for governors who would like to be more successful in the national arena.

Explaining Split Senator-Governor Outcomes

One obvious place to seek out explanations for split senator-governor pairs is the rapidly growing body of literature seeking to account for the origins of divided government. Unfortunately, many of these explanations are intended to address only the single case of divided government at the national level, and hence, are extremely difficult to adapt to the intergovernmental case. For example, some observers have argued that the Democratic party's heterogeneous national coalition [Petrocik 1991] may pose few obstacles in congressional elections, while placing them at a disadvantage in presidential races because of the potentially divisive nomination process [Polsby 1983]. Alternatively, other commentators have asserted that redistricting by predominantly Democratic state legislatures may create a Democratic bias in congressional elections that prevents the Republicans from gaining unified control of government. In addition, incumbency advantages flowing from campaign finance, constituency service, and congressional perquisites may insulate predominantly Democratic congressional incumbents from national trends [Erikson 1972; Mayhew 1974; Bauer and Hibbing 1989; and Ansolabehere, et al. 1992], and hence, similarly frustrate Republican strength in the electorate. Finally, Gary Jacobson [1990] has suggested that divided government at the national level may result from voters engaging in purposive "party-institution matching" -- voting for Republican presidents on the basis of collective goods such as a strong economy, foreign policy leadership, and lower tax burdens, while voting for Democratic members of Congress on the basis of responsiveness to local constituencies, preservation of government services, and a tendency toward more equitable distributions of costs [see Alvarez and Schousen, forthcoming, for micro-level evidence].

Regardless of the relative merits of these structural, institutional, and purposive theories at the *national* level, none of them offers a satisfactory account of the *broader patterns* of divided government. These idiosyncratic explanations can account for neither the frequency of divided outcomes at the state level nor the increases in and persistence of divided Senate delegations [for extended critiques, see Jacobson 1990; Fiorina 1992b]. As Fiorina notes, "Explanations tailored for specific cases fail to generalize convincingly to the larger set of cases" [Fiorina 1992b, 62]. More importantly for our purposes, however, none of these explanations appear to offer any theoretical leverage on the origins of split senator-governor outcomes.

By contrast, Morris Fiorina provides a more promising general explanation for divided outcomes [1992a 1992b]. His purposive theory of voter behavior, the "policy-balancing model," ascribes divided outcomes to moderate voters' attempts to secure moderate government in an era of perceived party polarization. The model assumes that voters are minimally aware that policy outcomes are the products of compromise between institutions, and are interested primarily in the final products of such bargaining [Fiorina 1992b, 75]. While Fiorina admits that the model makes some assumptions about voters that are "unlikely to be satisfied in large numbers," he nevertheless asserts that "the electorate in the large seems to behave as if it were balancing the policies or ideologies of the opposing parties by placing them in control of different institutions" [1992b, 73].

The policy-balancing model is part of a long line of spatial models [e.g. Downs 1957] which place voters and parties on a single left-right dimension, and assume that the relative proximity of parties and candidates to a voter's ideal point is a central determinant of voting choices. In addition, the model assumes that vote choices for different offices do not occur in isolation from one another. As a result, voters perceptions of the positions of the parties relative to their own may, under some circumstances, lead to rational split-ticket voting intended to achieve preferred final policy outcomes. Figure 2 below

illustrates the basic logic of the model [see Fiorina 1992b, 74].

--- Figure 2 about here ---

According to this model, spatial placement relative to the positions of the Democratic (D) and Republican (R) parties is the central determinant of the likelihood of any given individual splitting his or her ballot between candidates of the two opposing parties. Voters with ideal points to the right of the "cutting line" (CL) perceive themselves as closer to the Republicans, while those to the left of CL perceive themselves as closer to the Democrats. For voters with more extreme preferences than either party (V1 and V4 in Figure 1), rational voting will yield a unified ticket in favor of the more proximate party (i.e. for the party on the same side of CL). However, for those voters lying between the positions of the two parties (V2 and V3 in Figure 1), rational decision-making will yield more complex vote choices.

These more moderate voters prefer some positions advocated by each of the two major parties, and ideally prefer an outcome that is more moderate than that which is offered by either party taken alone. Based on Fiorina's assumption that voters possess a minimal comprehension of institutional compromise, it follows that these voters possess a rational motivation to split their tickets: the desire to moderate and mingle the positions advanced by the two polarized parties. Fiorina argues that this model is quite robust, providing explanations for divided outcomes at the state level as well as for divided Senate delegations. Across a variety of electoral contexts, rational moderate voters located between the parties will vote for overall tickets that reflect their moderate ideological preferences, and hence, will split their ballots between the two parties. Fiorina concludes that, in an era of polarizing candidates such as Goldwater, McGovern, and Reagan, when "activists tried to impose principled programmatic government, voters responded with divided government" [1992b, 78].

Researchers thus far have found little micro-level evidence supporting the model at the national level [see e.g. Alvarez and Schousen, forthcoming]. However, the policy-balancing model can be adapted quite easily to provide a purposive explanation that is both less demanding of voters and a potential explanation for split senator-governor pairs. If one leaves aside the image of voters seeking specific final policy outcomes, we are left with a quite plausible model in which moderate voters perceiving themselves to confront polarized partisan choices opt not to identify themselves completely with one party or the other. Whether their motivations spring from policy goals or simply from personal political identity, moderate voters in what we might call a general "party balancing" model may respond to polarized choices by rejecting the "choice" itself: they may split their ballots rather than choosing between the polarized options. In this manner, the balancing model is easily extended to provide a potential explanation for senator-governor pairs.

A second potential explanation for divided senator-governor outcomes may be derived from the writings of more severe critics of divided control in U.S. politics. Observers such as James Sundquist [1988], have argued that there is little mystery at all in the rise of divided outcomes: such arrangements are simply "accidents of history" in an era of declining partisan loyalties. According to this "party decline" thesis, the historical rise of divided outcomes may be ascribed to the general demise of political party organizations and loyalties during the twentieth century. The voters producing divided outcomes are simply those identifying less strongly with either of the parties; and there is little beyond this fact that is systematic (let alone, purposive) in the voting patterns producing divided control.

In addition to the inherited "party balancing" and "party decline" models, we offer a third explanation for divided senator-governor outcomes -- the "comparative informational relevance" model.

Literature on split-ticket voting since the 1950s has traditionally emphasized the ways in which voters lacking strong partisan ties may rely on alternative sources of information to structure their voting choices. While more pessimistic views of these citizens emphasize the unpredictable nature of these influences in contrast to presumably more desirable partisan cues [see eg. Campbell and Miller, 1957], observers holding more optimistic impressions of split-ticket voters have also emphasized the ways in which divided ballots result from the influences of information sources beyond partisanship. For example, DeVries and Tarrance conclude that ticket-splitters are more likely to "draw their attitudes about candidates and their positions on issues from the media (principally television) and interpersonal relationships (family and friends)" than from political parties or group affiliations [1972, 115].

Both of these approaches to ticket-splitters share an orientation toward the *comparative relevance* of party labels as cues for voters surrounded by a diversity of information sources. Not surprisingly, these works indicate that while partisan cues are extremely relevant to the decision-making of straight-ticket voters, they are far less relevant to the voting choices of split-ticket voters. From these patterns it is possible to speculate that split ballots result when voters do not perceive party labels to carry information that is relevant for the vote choice. In fact, such an explanation is largely consistent with the historical trend toward more frequent divided outcomes in the post-1960 period. As Wattenberg [1990] has persuasively argued, the declining partisanship of this period has been characterized not so much by dissatisfaction with (or negative affect toward) the parties as by growing numbers of voters for whom the parties appear to be irrelevant. Put simply, as the number of voters perceiving party labels as less relevant has increased over the past three decades, so too have the numbers of split ballots and divided outcomes.

However, what these patterns of perceived party relevance lack as an explanation for divided outcomes is precisely an account of *when and why* voters perceive party cues as less central to their voting decisions. The comparative informational relevance model transforms the question of "when do we get split ballots?" into the prior question of "when do voters perceive party labels as less relevant to their vote decisions?" In this sense, the model is really an extension of the simpler "party decline" model: it accepts the importance of party decline as an underlying source of divided outcomes, yet rejects the conclusion that there are no systematic factors beyond partisanship which can distinguish voters who cast unified and split ballots. Specifically, this model asserts that voters are more likely to produce split ballots not only when they have weaker loyalties to the parties, but also when they perceive only minimal partisan elements to the choices which confront them: *when voters perceive few ideological differences between the parties, or perceive local candidates' ideological positions to be unrelated to these parties, they may become more likely to disregard party labels when casting their ballots.* In this regard, the comparative informational relevance model provides an account of the origins of divided outcomes that is the inverse of the party balancing model: while the latter model asserts that split ballots are responses to salient information about party polarization, the informational relevance approach asserts that they are a product of voter decision-making in which partisan information has become less salient. The next section of the paper presents empirical tests of these three theories: the simple party decline model, the party balancing model, and the informational relevance model.

Testing Explanations for Split Senator-Governor Pairs

Data and Variable Descriptions

The data used in the following analyses are taken from the 1990 Senate Election Study.[10] The sample includes 495 respondents, all of whom voted in both the senatorial and gubernatorial races in their states.[11] Of these 495 respondents, 171 (.345 of the sample) split their tickets, while the remaining 324 respondents cast unified ballots. Among the 171 voters casting split tickets, 89 voted for a Democratic governor and a Republican senator, while 82 voted for a Republican governor and a Democratic senator. Although a number of cases were lost due to missing data, the sample of voters used in the following analyses is closely representative of the larger sample. Appendix A provides more detailed information on the characteristics and representativeness of this sample.

The dependent variable is whether or not the respondent split their votes for governor and senator between the two major political parties. This variable, SPLIT, is coded 0 for unified ballots and 1 for split ballots.

PARTY WEAKNESS is constructed from the standard seven-point (0-6) party identification scale, "folded in half" so that independent voters take on a maximum value of three and strong partisans take on a minimum value of zero.

PARTY DISTANCE is a measure of each respondent's subjective perception of the ideological distance between the Democratic and Republican parties. It is computed as the absolute difference between the respondent's placements of the Republican and Democratic parties on identical seven-point ideological scales ranging from "extremely liberal" to "extremely conservative." Hence, a maximum value of six indicates a perception of extreme party polarization, while a minimum value of zero indicates a perception of identity in the ideological positions of the parties.

BETWEEN is a dummy variable that is coded one for respondents who locate themselves between the parties on the seven-point ideological scale and zero for respondents who locate themselves outside one or both of the parties or the same as one or both of the parties on the seven-point scale.

---

[10]Miller, Kinder, Rosenstone, and the National Election Studies, American National Election Study, 1990: Senate Election Study (Ann Arbor: University of Michigan, Center for Political Studies). Inter-University Consortium for Political and Social Research (distributor).

[11]Because previous research has ignored the intergovernmental aspects of divided government, scholars have missed a unique opportunity to explore both the contours of split-ticket voting and the origins of divided government. In the elections examined here, voters are required to make *simultaneous* choices for an executive office and a legislative office for the *same state*, thus connecting the vote choice in both time and space. Other categories of divided government exhibit linkages on one of these dimensions but not the other. Unlike research exploring divided outcomes for the presidency and Congress (or for a governorship and state legislature), investigations of split outcomes with regard to senator-governor pairs are able to control for the confounding effects of constituency differences. While analyses of split-Senate delegations also possess this feature of congruent constituencies, these investigations suffer from a lack of simultaneity in the choices made by voters.

BETWEEN*DISTANCE is an interaction term that takes on maximum values for moderates perceiving greater distances between the parties, and takes on minimum values for ideologues perceiving less ideological difference between the parties.

The four variables labelled ___ ___ DISTANCE are measures of each respondent's perceptions of the ideological distances between the candidates in the races confronting them and the national party associated with each candidate. The party of the candidate (Republican or Democrat) and the office sought by the candidate (governor or senator) are indicated by abbreviations in each of the four variables. For example, DEM GOV DISTANCE represents the absolute distance between the respondent's perception of the ideological position (on a seven-point scale) of the Democratic gubernatorial candidate in her state and this same respondent's perception of the ideological position of the Democratic party.

The four variables labelled ___ ___ MODERATE extend the logic of the previous four variables by offering indicators of the direction in which candidates are perceived to differ ideologically from their parties. Once again, abbreviations indicate, respectively, the party of and office sought by the candidate. These four variables are all coded 1 for candidates perceived as more moderate than their party, 0 for candidates perceived as ideologically identical to their party, and -1 for candidates perceived as more ideologically extreme than their party.

Theoretical Expectations

We test the three theoretical models by estimating the following equation using logistic regression (due to the dichotomous nature of the dependent variable, unified ticket or split ticket).[12]

$$\text{Log}[\Pr(\text{SPLIT}=1)/\Pr(\text{SPLIT}=0)] = \alpha + \beta_1\text{PARTY WEAKNESS} + \beta_2\text{BETWEEN} + \beta_3\text{PARTY DISTANCE} + \beta_4\text{BETWEEN*DISTANCE} + \beta_5\text{REP GOV DISTANCE} + \beta_6\text{REP SEN DISTANCE} + \beta_7\text{DEM GOV DISTANCE} + \beta_8\text{DEM SEN DISTANCE} + \beta_9\text{DEM SEN MODERATE} + \beta_{10}\text{DEM GOV MODERATE} + \beta_{11}\text{REP SEN MODERATE} + \beta_{12}\text{REP GOV MODERATE} + \epsilon$$

As outlined above, the "party decline" model makes the straightforward prediction that voters with weaker loyalties to the parties will have a greater likelihood of splitting their ballots ($\beta 1 > 0$), and that the remainder of the variables should have no systematic relationships with the likelihood of split ballots ($\beta 2$ to $\beta 12 = 0$). By contrast, the party balancing theory predicts that ticket-splitters come from the central, moderate range of the ideological spectrum. "More extreme voters cast straight tickets, while moderate voters are more likely to split their tickets" [Fiorina 1992b, 77]. Specifically, it is the intersection of moderate voter preferences (lying between the parties) with the "crucial" [Fiorina 1992b, 82] ingredient of polarized party positions. Thus, the theory predicts that voters who locate themselves between the two parties will be more likely to split their tickets than those who locate themselves on or outside the parties' ideological positions ($\beta 2 > 0$). Furthermore, it predicts that split-ticket voting will be more likely to result from perceptions of greater party polarization, especially among moderate voters. Hence, we would expect the combined coefficients for PARTY DISTANCE and BETWEEN*DISTANCE to reveal a positive main effect for perceived party polarization ($\beta 3 > 0$) and/or for party polarization

[12]For a more comprehensive discussion of this method see Aldrich and Nelson, 1986, 115-155.

for voters who locate themselves between the parties ($\beta 4 > 0$).[13] While it is not a central variable for the party balancing model, the theory is consistent with the expectation that PARTY WEAKNESS should be positively related to split ballots ($\beta 1 > 0$).

Our equation also includes the eight candidate-based variables tapping the voters perceptions that candidates may be "atypical" of their party label. The party balancing model makes no prediction with regard to perceptions of absolute distance between candidate and party (i.e. no prediction for $\beta 5$ to $\beta 8$). However, to the extent that candidates are relevant to the vote decision, a balancing model would lead us to expect that, if anything, perceptions that candidates are more extreme than their parties should be positively associated with split ballots ($\beta 9$ to $\beta 12 < 0$).

Finally, several specific empirical predictions may be derived from the comparative informational relevance model as well. Insofar as party cues may be expected to be less relevant for voters who have weaker loyalties to the parties, this model predicts that weak partisanship should be associated with a higher likelihood of splitting one's ballot (ß1 > 0). However, the emphasis of this approach on the *choices* confronted by voters, rather than on the relative self-placement of the voter, implies that being an ideological moderate and/or being between the parties should have no bearing (direct or indirect) on the likelihood of a split ballot (ß2, and ß4 = 0). With regard to the variable PARTY DISTANCE, the comparative informational relevance model makes a prediction exactly opposite to that of the party balancing model: voters will perceive party cues as less relevant information, and hence will be more likely to split their ballots, when they perceive the parties as presenting less ideologically distinct choices (ß3 < 0). Furthermore, this model predicts that voters will be more likely to split their tickets if they perceive the candidate choices in local elections as failing to reflect the "actual" ideological positions of the parties -- greater disparities between local candidates and national parties simply makes the party label less relevant information for the vote choice (ß5 to ß8 > 0). This relationship is expected regardless of the direction of the candidate deviation (i.e. no prediction for ß9 to ß12).

Empirical Results

Before considering logistic regression results, we can arrive at a rough assessment of the party balancing model by considering some simple descriptive statistics. Table 2 divides our sample of 495 respondents into three categories: those voters placing themselves at an ideological position *between* the locations they attribute to the two parties; those placing themselves at an ideological position *identical* to one of the two parties; and those who place themselves *outside* of both parties. The policy-balancing theory, of course, predicts that the first group of voters should be most likely to split their ballots; it makes no predictions with regard to the second category; and it predicts that the third category of voters should be least likely to split their tickets. The results do not support these predictions. In fact, the proportion of split-ticket voters in each of the categories barely deviates from the proportion of split-ticket voters in the entire sample (34.55%). The Pearson's Chi-square test statistic shows that the data

---

[13]This might occur in any of several ways. For example, the coefficient for PARTY DISTANCE might imply a strong positive relationship with split-ticket voting, with the interaction of this relationship with ideology proving not to be significant. Alternatively, the overall effect of PARTY DISTANCE might "wash out" (due to the inclusion of non-moderate voters in this main effect), with the interaction term indicating that the expected relationship does obtain for moderate voters. Either of these results could be interpreted as supporting the predictions of the model.

presented in Table 2 do not even begin to approach patterns that would allow rejection of the null hypothesis of no relationship. Voters perceiving themselves between the ideological positions of the parties are no more likely to split their tickets than voters who place themselves outside the parties.

--- Table 2 about here ---

However, while this simple comparison is revealing, a multivariate analysis is needed to control for potentially confounding influences, and to allow for a systematic comparison of the three models. Table 3 shows the estimates for the multivariate equation outlined in the previous section. Taken as a group, the estimates for this equation are easily significant, with a model chi-square of 73.39 (12 df, $p < .0001$). As predicted by all three theoretical models, weak partisanship appears to be something of a "necessary condition" for split-ticket voting. Indeed, the exponentiated coefficient for PARTY WEAKNESS indicates that the odds of an independent voter (PW=3) splitting her or his ticket are 5.74 (i.e. 1.79^3) times greater than the odds for a strong partisan (PW=0). Stated in terms of probability, if strong partisans have a .25 probability of splitting their tickets, then the expected probability of a split ticket for an independent voter would be about .65.[14]

--- Table 3 about here ---

However, the overall results presented in Table 3 do not support the party balancing model. To begin with, the coefficient for BETWEEN does not even approach significance (p=.74). In other words, once the effects of partisanship and the other variables in the equation are taken into account, voters who locate themselves between the two parties are no more likely to split their tickets than those who are right on or outside the parties. While this result is consistent with the party decline and informational relevance models, it is inconsistent with the expectations of the party balancing model. More damaging to this theoretical perspective is the following result: perceptions of party polarization have a significant effect on the likelihood of voters splitting their tickets (p=.022), but the sign of this coefficient is *in the direction opposite to that predicted by the party-balancing model*! A person who sees the parties as maximally polarized on the seven-point ideology scale has odds of splitting her or his ticket that are actually only .15 (i.e. $.73^6$) times the odds for a person who sees no difference between the two parties. In other words, to obtain the odds of casting a split ballot for a person perceiving maximal party polarization, we would need to divide the odds for a person perceiving no difference between the parties by 6.67.

While these results are certainly not expected from the standpoint of the party balancing model, it is possible that the predicted effects of moderate ideology and perceptions of party polarization may be entirely captured by the interaction term. That is, party polarization may only matter for those voters who locate themselves between the parties. However, this variable also fails to achieve statistical significance (p=.61). The negative main effect for perceptions of greater party polarization on the likelihood that a voter will split her or his ticket is not diminished for voters placing themselves between the parties. Furthermore, the more candidate-centered balancing hypothesis (i.e. that voters may split their tickets in response to perceptions of polarized candidate choices) also fails to receive support, as the four ___ ___ MODERATE variables reveal generally insignificant and minimal relationships with the dependent variable. Only one of the four coefficients for these variables is statistically significant, and

---

[14]Odds = P/(1-P), so when P = .25, Odds = .33. Thus, the odds of an independent splitting his or her ticket is 0.33*5.74 = 1.894. Solving the equality 1.894 = P/(1-P) yields P = .654.

its sign is in the wrong direction. Thus, the overall pattern suggests that, if anything, perceptions that candidates are more moderate than their parties may even increase the likelihood that voters will split their ballots. Consequently, these empirical results taken as a whole offer little support for the party balancing theory.[15]

Similarly, the simple party decline thesis does not fare well in our empirical analysis. According to this theory, the significant results of the overall model should be driven by a single variable -- strength of partisan identification. Indeed, as noted above, this variable has a strong and significant effect on the likelihood of a split ballot. However, a more exacting test for this thesis is provided by a comparison of the overall model to a baseline model containing only PARTY WEAKNESS and a constant term. When tested against this constrained model, the estimates for the full model still improve the fit provided by strength of partisan attachment alone (Improvement chi-square=36.19, 11 df, p=.0002). In short, there are systematic relationships underlying split ticket voting that go beyond its covariation with strength of partisanship. Moreover, the variables included in this equation appear to capture at least some of these systematic relationships. While weak partisan loyalty certainly accounts for some of the variation in split ticket voting, we cannot conclude that such ballots are merely "accidents of history" that defy further explanation.

In contrast to the party balancing and party decline explanations, however, the informational relevance approach receives some support from these empirical results. As noted above, weak partisanship is positively related to the likelihood of a split ticket; and the ideological location of the voter relative to the parties appears to be unrelated to split senator-governor ballots. More importantly, the fact that perceptions of greater ideological difference between the parties have a strong negative impact on the likelihood of a split ticket not only undermines the party balancing model -- it supports the informational relevance explanation. The negative coefficient for PARTY DISTANCE is consistent with the interpretation that voters perceiving minimal differences between the parties treat party cues as less relevant information in the vote choice, and hence, become more likely to split their ballots.

In addition, removal of the four variables measuring perceived ideological distances between candidates in state-wide races and their national parties (___ ___ DISTANCE) significantly diminishes the fit of the overall model (Improvement chi-square=19.21, 4 df, p=.0007). The coefficients for all four of these variables are positive, with two of the four measures of candidate-party ideological difference proving significant (and one other that nearly reaches significance). This pattern indicates that voters who perceive their state-wide candidates as deviating from the ideological positions of their national parties appear to be more likely to split their ballots. In other words, voters are less likely to restrict themselves to voting for a single party when they do not perceive the candidates in their state to be meaningfully connected to the ideological positions of the parties whose labels they carry. Hence, this

---

[15]It might be objected here that our model does not truly test the balancing thesis insofar as it includes only a measure of placement between the parties rather than a measure of moderate ideology per se. Since a voter could presumably be between the parties yet still remain quite extreme in ideological placement, a model including the main and interaction effects for actual ideological self-placement might be viewed as desirable. Results for such a model are not presented here for two reasons: (1) Inclusion of this variable and its interaction with PARTY DISTANCE, both in lieu of BETWEEN and in a model containing both variables, proved to yield no significant effects and/or changes in our conclusions. (2) We feel that the variable BETWEEN is slightly more faithful to the theory itself. Hence, given the irrelevance of the choice for our conclusions, we have opted for this variable.

set of coefficients is consistent with an informational relevance perspective arguing that split ballots result from perceptions which diminish the salience of party cues as information relevant to vote choices.

In sum, then, the logistic regression results presented here fail to support party decline and party balancing explanations, yet are quite consistent with our expectations based on an informational relevance perspective. However, the validity of these findings rests, as always, on the quality of the model used to generate them. Before concluding that this model provides a proper test of the theories, it should be compared against alternative specifications. A variety of different specifications show that our model is remarkably robust.[16] The inclusion of several demographic characteristics in the equation does not significantly improve the overall fit of the model (Improvement chi-square=5.81, 4 df, p=.214). Similarly, variables measuring affect toward the four state-wide candidates do not significantly improve the overall fit of the model (Improvement chi-square=2.29, 4 df, p=.683). Finally a battery of seven variables measuring whether or not respondents saw either of the parties as superior to the other on specific policy issues also failed to significantly improve upon the fit provided by the basic model (Improvement chi-square=6.22, 7 df, p=.514).[17]

That none of these modifications significantly improve upon the fit of the model enhances our confidence in the adequacy of the equation presented here as a test of these explanatory theories. *Moreover, none of these alternative specifications produces any changes in the signs, magnitudes, or significance levels of the coefficients that could be classified as more than trivial.*

Discussion and Conclusions

In this paper we have offered empirical evidence and theoretical arguments indicating the historical rise and potential political significance of split outcomes among same-state U.S. Senator and governor pairs. During the first half of this century, senators and governors from a given state were usually members of the same party. However, since the early 1960s, voters have increasingly tended to split their vote for these two offices -- sending divided partisan representatives to the governor's seat and the chambers of the U.S. Senate. This historical pattern parallels closely the historical rise of divided government at the state and national levels, and like these other developments, may be cause for some concern. Indeed, we have outlined a number of contemporaneous developments that have led to a policy system in which intergovernmental relations are crucial, and in which senator-governor relations may be of some considerable importance to state government influence at the national level. While an empirical exploration of the consequences of split senator-governor pairs is beyond the scope of this paper, we have also indicated some preliminary reasons why one would expect important differences between the

---

[16]It is also worth noting that because many of the variables included in the model are based on respondent ideological placements, we tested for possible multicollinearity. These diagnostics were negative.

[17]The demographic variables included age (v517), education (v521), family income (v541), and race (v547). The candidate variables included the "feeling thermometers" (v84, v85, v93, and v94) for each of the four state-wide candidates. The policy variables included the following issues: inflation, unemployment, social security cuts, tax increases, the federal deficit, foreign affairs, and environmental policy (v192 through v198). Only one of individual coefficients for these variables reached statistical significance (race was significant at the .10-level; minority voters were more likely to vote straight tickets than white voters).

relationships of unified and divided partisan pairs in these offices. We conclude that research on divided government, like many other subfields in political science, has overlooked the existence and potential consequences of the intergovernmental dimensions of this phenomenon. We urge researchers to address the importance of the federal nature of our political system in future research on the origins and consequences of divided government.

A second goal of this paper has been to assess three competing explanations for the origins of divided outcomes in the intergovernmental context. Two of these models are inherited from existing literature on divided government: the party decline thesis and the party balancing model. Our empirical investigation finds little support for either of these theories. The party decline thesis is contradicted by our findings concerning the systematic relationships between split-ticket voting and voter perceptions concerning the nature of electoral choices. The party balancing theory does not fare any better. Voters locating themselves between the perceived ideological positions of the parties appear to be no more likely to split their ballots than voters locating themselves outside of the ideological positions of the parties. Moreover, the evidence presented here indicates that perceptions of party polarization are associated with increased odds of *unified* voting. In short, our findings not only fail to support the policy-balancing theory, they contradict it.

By contrast, the results presented here offer encouraging evidence for a comparative informational relevance perspective on divided outcomes. As this model suggests, perceptions of greater partisan ideological *similarity* are associated with split-ticket voting behavior and this pattern is no less characteristic of voters who locate themselves between the parties than of voters who locate themselves outside the parties. In addition, we find that the likelihood of split-ticket voting is enhanced by voter perceptions of ideological differences between state-wide candidates and their political parties. In both instances, perceptions which one would expect to be associated with a diminution of the relevance of partisan labels in electoral choices turn out to be positively related to the casting of a split ballot.

The perception that parties are irrelevant is not held by all voters. For many, parties and party stereotypes continue to function as crucial informational shortcuts and cues simplifying and structuring the voting decision [see Rahn, 1993]. For others, partisanship remains a long-term psychological attachment capable of consistently guiding vote choices. However, this reliance on partisan cues and attachments is simply not characteristic of all voters. For a critical segment of the American electorate, the relevance of party labels as sources of information in voting decisions is not a foregone conclusion. The evidence presented here implies that, for many of these voters, the relevance of party cues is somewhat context-specific.[18]

---

[18]In this regard, our comparative informational relevance model is consistent with dual-processing models of social and political cognition [for a review of such models see Fiske and Taylor, 1991]. Dual-processing models imply that party stereotypes may be expected to have diminished effects on information processing and decision-making by voters when either party labels are less available or information about parties and candidates is extremely inconsistent [see Rahn 1993, 477]. Our informational relevance model similarly relies on the availability of meaningful stereotypes (i.e. perceptions of the parties as "typically" differing) and the consistency of information (i.e. perceptions of candidate-party ideological differences) as factors guiding the relative likelihood of party stereotype-based voting. For this same reason, our model is also consistent with findings that split ballots are positively correlated with higher candidate visibility [see Beck, et al, 1992] -- insofar as greater candidate visibility may be expected to enhance perceptions of differences between the candidate and the party stereotype.

When voters perceive the parties as offering divergent ideological choices, and perceive candidates on their ballots as accurately reflecting these differences, they appear to be willing to make simplified choices in favor of one of the two parties. However, voters perceiving few differences between the parties are left to grapple with their electoral duties in the absence of such a simple and meaningful cognitive rule. Similarly, voters who perceive the candidate choices confronting them to be decoupled from the ideological agendas of the national parties also possess few informational or motivational directives to use party labels. In short, when voters perceive their immediate electoral decision-making tasks to be grounded in real partisan differences, they make these choices based on partisan lines. However, when they perceive only "echoes," or perceive candidate choices to be unrelated to partisan ideological positions, they respond with divided control.[19]

The "comparative informational relevance" model is consistent with historical trends, and capable of providing a plausible explanation for micro-level differences between split-ticket and straight-ticket voters on the basis of understanding when party cues are meaningful guides to vote choices. This type of explanation is neither as elegant as a rational party-balancing model nor as apocalyptic as pronouncements that voters cut loose from partisan moorings now provide us with what appear to be "electoral accidents." The image of voters presented in this theory is neither one of heroic capacities, nor one of cognitive incompetence. Rather, it relies on a portrait of voters as uncertain individuals confronting consequential decisions in an all too distant area of social life in which they frequently possess little interest and even smaller quantities of meaningful information. When party labels are readily available and perceived as impinging upon the decisions at hand, they may provide just the sort of information needed to orient voters toward a simplified path of action. However, when these cues are perceived as less meaningful or relevant, they may be ignored by a critical minority of voters in favor of alternative sources of information which are less likely to facilitate unified electoral outcomes.

One must consider the possibility that the electoral dynamics underlying divided control may be considerably less dramatic than many of the theories used to explain them. It is likely that the recent patterns of voting that have produced more frequent divided outcomes are neither wholly random nor wholly rational. On the contrary, they may simply reflect the fact that political action is based on "meaningful information"; and what information is "meaningful" varies across both citizens and electoral contexts.

---

[19]It is worth noting here that this point has interesting implications when combined with arguments made earlier about the possible implications of divided control for electoral accountability to the citizenry [Derthick, 1992, 675; Fiorina, 1992, 109-111]. Typically, critics argue that obscuring effects of divided control pose obstacles to citizens' attempts to hold their government accountable. When combined with a comparative informational relevance perspective, this argument implies the possibility that the relationship may be circular: Voters under divided government may have greater difficulty distinguishing which policies are linked with which parties. This lack of differentiation may decrease the relevance of party cues to the vote choice, and hence, increase the likelihood of the split-ticket voting which leads to divided outcomes. The pattern may then repeat itself until some external shock (e.g. a polarizing national candidate) differentiates the two parties once again.

SOCIAL INFLUENCES ON POLITICAL ATTITUDES:

THE ROLE OF IMAGINED COMMUNITIES

SOCIAL INFLUENCES ON POLITICAL ATTITUDES: THE ROLE OF IMAGINED COMMUNITIES

Abstract

This study is designed to investigate an important, yet poorly understood form of social influence on political attitudes. In contrast to social influences that occur through interpersonal discussion or group identification, this form of social influence derives from people's perceptions of imagined communities, that is, large-scale collectivities that exist outside the realm of interpersonal contact (see Anderson 1983). After outlining the social and historical bases for the importance of social influences of this kind, we link these concerns with an empirical exploration of the social psychology of this phenomenon. In addition to investigating the extent of social influence that stems from imagined communities, this study is explicitly designed to tap the underlying psychological processes responsible for such effects.

SOCIAL INFLUENCES ON POLITICAL ATTITUDES: THE ROLE OF IMAGINED COMMUNITIES

An important force in contemporary political life derives from people's perceptions of others' attitudes, beliefs or experiences. "Others" in this case refers not to the close friends and acquaintances that concerned the authors of classic works such as The People's Choice and Personal Influence, but rather to groups of anonymous "others" outside an individual's realm of personal contacts. Anderson (1983) has termed these impersonal, nontraditional groups "imagined communities." Imagined communities are perceived only at the distant end of what Calhoun (1991: 101) terms "regions of increasing anonymity." Influences that derive from imagined communities are impersonal in two important respects: they are generally mediated social influences that do not involve face-to-face interpersonal communication; and they involve information about the attitudes, beliefs and experiences of collectives outside of an individual's personal lifespace.

As early as the 19th century, Tocqueville observed that "the more equal the conditions of men become . . . the more easily do they give way to the current of the multitude, and the more difficult it is for them to adhere by themselves to an opinion which the multitude discard" (Tocqueville 1835: 205). Rather than aspire to the opinions of a higher social class, Tocqueville suggested that people would look instead to the opinions held by large numbers of others. Over a century later, Riesman and colleagues (1950) expressed similar concerns about "other-directed" people whose "contemporaries are the source of direction for the individual -- either those known to him or those with whom he is indirectly acquainted, through friends and through the mass media" (p. 37). This same idea persists today as a major concern in the scholarly study of public opinion, particularly with respect to media-generated representations of mass opinion (see, e.g., Marsh 1984; Noelle-Neumann 1974).

Despite this tradition of concern over the influence of generalized others, scientific investigations of social influence primarily have focused on the level of personal acquaintances and group influence. The research program on personal influence carried out at the Bureau of Applied Social Research in the 1940s and 50s touted social influences close to home as the primary influence on political attitudes and behaviors. The legacy handed down by Personal Influence (Katz & Lazarsfeld 1955) and related work was that trustworthy sources of information in the individual's own personal lifespace -- friends, relatives and acquaintances -- were paramount to the formation and change of political attitudes. People's perceptions of the attitudes of more distant, anonymous others were considered to be of little theoretical or practical interest.

Nonetheless, a variety of contemporary theories and research findings point to impersonal others as an important influence on political attitudes and behavior (see Mutz 1993a for a review). While this shift may partially reflect internal changes in academic interests over time, more socially significant underpinnings of this transition lie in dramatic social and historical developments that have occurred during this period. Although such concerns were apparent to some 19th century social observers, as the end of the 20th

century draws near, the political and social climate of the United States comprises a confluence of conditions ripe for imagined communities to play a substantial role in influencing political attitudes and behaviors. As a consequence, impersonal social influence processes are now especially worthy of attention, both because of their impact on current political processes, and because of their potential to expand the boundaries of our understanding of social influence processes.

THE GROWTH OF IMAGINED COMMUNITIES & IMPERSONAL SOCIAL INFLUENCE

Two large-scale social transformations have facilitated the growing importance of imagined communities. Impersonal social influence requires both mediated social relationships and the communication of social information across boundaries of traditional social interaction. Two parallel 20th century social trends, the proliferation of indirect relationships and changes in the structure of social interaction, have contributed greatly toward these two requirements (see Calhoun 1991) and hence toward the enhanced importance of imagined communities in the formation and change of political attitudes.

The proliferation of indirect relationships. Impersonal social influence is only possible when political communication is mediated, and thus indirect. For this reason, it is significant that 20th century western societies have been characterized by a proliferation of indirect relationships (Calhoun 1991; Habermas 1984, 1988; Coleman 1980). In fact, most theorists of 19th century social transformations note a shift away from communal, person-to-person relationships toward such indirect associations with others (see Beniger 1987 for a review). These indirect relationships differ from relationships involving face-to-face interpersonal communication insofar as they involve the mediation of communications technology, markets, or other complex organizations. Whereas political and economic affairs used to be organized on the basis of local community and face-to-face economic exchange, direct interpersonal relationships now organize less of American public life (Calhoun 1991).

As people increasingly interact through these mediated systems, their need for information about systemically remote and anonymous others also increases. Media and markets provide two prominent examples of such systems. The decision-making practices of citizens participating in politics through a mediated system have become similar to those characterizing traders engaging in economic exchange through a market system; "The right price, after all, depends primarily on what other people, not just you yourself, think that price should be" (Heilbroner 1991: 70; see also Keynes 1936). In both politics and markets, people are now more likely to communicate through impersonal means than they were a century ago. And just as indirect economic signals representing the collective behavior of others communicate crucial information in markets, characterizations of the opinions of imagined communities may communicate information that guides those who observe them in the political arena. Just as some traders may "free ride" on better-informed traders by watching stock prices, citizens may also "free ride" on those more politically informed by relying on representations of the collective opinions and experiences of others.

In addition to facilitating greater dependence on representations of distant others, indirect relationships may also have enhanced the importance of impersonal social influence by attenuating the linkages between personal experience and political behavior. While it is clear that people continue to have meaningful interpersonal relationships, the proliferation of indirect relationships in this century has been accompanied by a growing gap between the worlds of direct and indirect experience. Calhoun (1991), for example, argues that distinctions between "everyday life" and "the big picture" used in common parlance are indicative of "divergent ways of trying to understand the social world" and "an experiential and intellectual split": "We contrast the quotidian no longer with the extraordinary days of feasts and festivals so much as with the systematically remote, with that which 'counts' on a large scale" (p. 96). Thus the impersonal has not replaced the personal as *gemeinschaft* is said to have replaced *gesellschaft* (Tonnies 1940); rather an increase in the number of indirect relationships has made the worlds of direct and indirect relationships more compartmentalized. Social theorists such as Habermas (1984), Coleman (1980) and Calhoun (1991) concur that a fundamental characteristic of modern social life is this increased split between the world of direct interpersonal relationships and large-scale social systems, or what Habermas refers to as "the systemworld and the lifeworld."

In political science, a large body of empirical evidence supports the existence of a gap between personal experience and social judgments. Surprisingly, even people's personal financial experiences and perceptions of national economic conditions are maintained largely independent of one another (e.g., Kinder 1981; Kinder & Kiewiet 1981). In addition, while personal experiences tend to be disconnected from the political world, people's perceptions of collective economic conditions reliably influence their political attitudes (e.g., Kiewiet 1983; see Monroe 1979, or Kiewiet & Rivers 1985 for reviews). Consistent with these findings, a large accumulation of evidence across a variety of issues shows that personal experiences are rarely connected to political judgments (see Sears & Funk 1990 for a review).

Some evidence suggests that by providing a technological means by which indirect relationships can be conducted, mass media may contribute to widening the gap between personal and social levels of judgment (see Mutz 1992; Weatherford 1983). Cross-national evidence supports the idea of a linkage between the rise of mediated communication systems and the compartmentalization of personal experience and political attitudes: while citizens in countries with less well-developed national media systems exhibit a consistent link between personal sense of well-being and attitudes toward government (e.g. Hayward 1979), in many western democracies with well-developed national media systems there is a split between personal experience and perceptions of collective experience (e.g. Eulau & Lewis-Beck 1985).

Influence that flows from imagined communities may or may not reflect the dominance of the impersonal systemworld. It is possible that such information is simply more highly valued when it comes to orienting one's self in the political arena. This argument might be seen as an individual-level analogue for what some postmodernist

observers of history have termed the "death of the social," in which the lifeworld is annihilated as a real and consequential referent for social thought and action (see e.g. Baudrillard 1983). Alternatively, the influence of imagined communities may arise out of an interaction between systemic information and information gleaned from everyday life. While information from personal experience may be less important for political evaluations than collective information, individuals may still draw on their previous experiences and prior knowledge to give meaning to representations of the impersonal collectivity. Shils argues that "direct relationships are extremely important in the constitution of imagined communities" (1991, p. 129). According to this view, people do not passively accept system-level information, but rather actively construct and reconstruct these messages in light of their own experience.

In sum then, the 20th century has witnessed a proliferation of indirect relationships, and the mediated systems through which these relationships occur contributes to the rising importance of impersonal influence in two ways. First, these systems have established both the possibility and need for steady flows of information about distant others. Second, these systems have contributed to a cleavage between the personal and political worlds which further enhances the potential effects of imagined communities.

Change in the structure of interaction. Media tend to influence social behavior "by changing the 'situational geography' of social life," rather than through content (Meyrowitz 1985: 6). However, media content may also contribute to widening the gap between personal and social levels of judgment by providing information about distant and impersonal others. The existence of media alone probably would not alter perceptions of the social environment unless their content included fairly large quantities of non-local social information. Thus change in the structure as well as the type of social relationships has been central to the creation of a social context open to impersonal influence. Indirect relationships are different from direct ones not just in the sense that they are mediated; they also transcend locality in a way that is typically not possible with direct interpersonal relationships. A shift in the structure of interaction has thus furthered the potential for social influence from imagined communities.

In the 1920s, 30s, and 40s, the structure of social interaction shifted from an emphasis on the local and personal, to one centered on impersonal, national interactions. Coleman (1980: 340) describes a variety of trends that contributed to this change, including the transformation of manufacturing from a local to a national basis and the emergence of national media that lent themselves to the marketing of goods manufactured on a national basis. World War II further encouraged rural-urban migration, breaking down ties to local communities by moving people away from their place of birth. The sum total of these changes "shifted the nation from a set of local communities, largely internally focused, to a nation in which the focus was no longer local, but national" (Coleman 1980: 335).

These changes in the nature of social interaction have been further facilitated by nationalization of the structure and content of mass media. The structure of mass media

has changed substantially since the days of the penny press that was locally based and geared to parochial interests (e.g., Bagdikian 1983, 1987). As locally-based media organizations have become giant corporations and conglomerates, the audiences to whom they direct their information have become increasingly national. The development of electronic media has led the nation to communicate on an ever more national, mass basis since it eliminates the need to physically transport information, and thus makes it easier to reach populations distant from the original news source. More importantly, centralization of ownership has changed the conceptualization of news from one that was locally dominated to one that is national and international in scope (Abramson et al., 1988). The local community focus of the past has been largely displaced by a focus on imagined communities that are less geographically or interpersonally bounded.

In addition, during the 20th century the norm for mainstream journalism has moved toward a more objective style of reporting (Schudson 1978; Roshco 1975) and this shift has encouraged greater homogeneity of media messages. Even across media, most studies find high levels of homogeneity in the presentation of news (Patterson 1980; Graber 1980; Patterson 1989). Under a system of competing partisan newspapers, journalists had incentives to differentiate their reporting from the competition. These same incentives do not exist in single newspaper markets. The current emphasis on non-partisan, professionalized news is more congenial to presentations of the opinions and beliefs of mass others. Coverage of this kind distances the reporter from the opinions expressed since they are not the reporter's opinions or those of some particular individual, but rather those of some objectively-defined mass collective. In its most extreme form, such information may take the form of a generalized representation of consensus among impersonal others -- with little or no differentiation of this imagined community into identifiable groups characterized by contrasting attitudes or behaviors.

The changing nature of social interaction is particularly relevant to social influences on political attitudes because social theorists have generally assumed a trade-off between population size and the degree of social control (Beniger 1987). Interpersonal communication in small communities was assumed to afford a high degree of social control, while mass communication networks linking large populations produced less control. However, to the extent that mass collectives are perceived and responded to as imagined communities, population size may no longer be as relevant as it once was. These forms of social influence are not constrained by population or geographic boundaries, nor do they require interpersonal social contact. In fact, the sheer size of the collectives may even contribute to furthering their power and influence (e.g., Mutz 1992a).

The potential persuasive influence of imagined communities can be seen in countless contemporary political controversies, both national and international in scope. For example, what effect, if any, did people's perceptions of so-called "world opinion" have in shaping American attitudes toward the Gulf War? While the potential for influence is clear, the extent of influence, the processes through which it occurs, and its normative implications are not. In order to fully understand the implications of these phenomena for the political

system, it is essential to understand the actual mechanisms by which such influence occurs.

THE SOCIAL PSYCHOLOGY OF IMPERSONAL SOCIAL INFLUENCE

A primary goal of this paper is to explore the social-psychological rationale for the influence of imagined communities on the formation and change of political attitudes. Why is it that people are often influenced by their perceptions of the opinions of diffuse and anonymous collectivities? Past research has been geared toward understanding social influence in primary group contexts, or the effects of positively or negatively valenced reference groups (e.g., Kiesler & Kiesler 1969). But theories of social influence grounded in the world of direct interpersonal contact adapt poorly to the impersonal contexts suggested by the theories outlined in the previous section. In early studies of the effects of representations of mass opinion, a link was forged with studies of majority influence in small group settings. However, many of the key factors influencing the extent of conformity in laboratory contexts are missing from the situations in which these influences occur. In fact, most small group research suggests that this kind of influence should not be sustained with the vast and undifferentiated reference public suggested by mediated reports of mass opinion. The "group" in this case is not particularly attractive, cohesive, nor interdependent as is typically necessary for normative social pressures to operate (Ross, Bierbrauer & Hoffman 1976).

In short, studies of group influence provide little guidance in understanding shifts that result from representations of the opinions of the psychologically distant and anonymous others that comprise imagined communities. There remains, however, tremendous potential for informational, as opposed to normative, social influences upon individual judgment. While normative social influences stem from a desire to conform with the positive expectations of others, informational social influence occurs because people accept the opinions of others as information about social reality (Deutsch & Gerard 1955). Informational social influence should be particularly likely in the case of political judgments: since no basis in physical reality exists for the establishment of the validity of one's belief, people should be more likely to rely on guidance from social reality, that is, the beliefs or experiences of collective others (Festinger 1950).

Information about the opinions of mass collectives is ideally positioned to create informational social influences on political judgments. News of this kind is widely disseminated by the mass media. Furthermore, journalists perpetuate the existence of imagined communities by reifying these concepts by writing extensively on topics such as what the American public thinks, where world opinion stands on various issues, and so forth. These concepts are amorphous and ill-defined from a social scientific perspective, but they are a widely accepted part of contemporary political discourse.

The notion of informational social influence better fits the context of social influence derived from imagined communities, but it does not provide an explanation for such effects in and of itself. In this study we draw on closely-related research in social psychology to

examine two potential explanations.

Cognitive Response Theory

One important reason people may respond to information about the opinions of distant, impersonal others is because of the thoughts people generate in response to learning what others think (see, e.g., Petty & Cacioppo 1981, 1986). What is alternatively referred to as persuasive-argumentation or cognitive response theory suggests that one reason attitudes may shift when people learn of others' views is because knowing the opinions of others induces people to think of arguments that might explain those others' positions. By rehearsing these arguments, people engage in a process of self-persuasion whereby their own attitudes move in the direction of the arguments that have been primed by others' views -- arguments that would not otherwise have come to mind (Burnstein & Sentis 1981, Burnstein & Vinokur 1975, Burnstein, Vinokur & Trope 1973).

For example, when individuals hear that "most people" now support a constitutional amendment to prohibit flag burning, they are likely to mentally rehearse the possible reasons that would have led "most people" to support that position. If a person is not strongly committed to a particular view, the thoughts that then pass through the individual's mind are likely to be supportive of the position held by the imagined collective. By means of the pro-flag burning amendment thoughts generated by information about consensus views, information about mass opinion influences the development of the person's own viewpoint; arguments in favor of a flag burning amendment are now more salient and well-rehearsed in the person's mind than those in opposition.

Evidence for this theory comes primarily from experimental studies in which people are systematically exposed to information about the positions of others, and then either distracted from generating thoughts in response to these cues or allowed to cognitively elaborate. Only when respondents both knew and thought about others' positions did the manipulations have any effect. Furthermore, the more arguments that came to mind explaining why others might have taken the positions they did, the more likely the individual was to revise his or her own attitude accordingly (Burnstein, Vinokur & Trope 1973; Burnstein & Sentis 1981; see also Tesser 1978, Tesser & Conlee 1975; Perloff & Brock 1980).

The attitude shifts suggested by cognitive response theory are not unidirectional; the model predicts movement both toward and away from the direction of others' opinions, based on the extent to which an individual is committed to a pre-existing position. When exposed to the contradictory opinions of others, a person strongly committed to his or her viewpoint would be most likely to generate counter-arguments defending his or her initial position. By rehearsing these arguments, the person's own opinion polarizes, intensifying in the direction of the original viewpoint and away from the opinions of others (Petty & Cacioppo 1979b, 1981).

The predictions of cognitive response theory jibe well with evidence from

experimental studies in which the impact of knowing the opinions of others is contingent upon the level of commitment to an issue position. Shifts in the direction of majority opinion are most likely among citizens with little information or commitment to their positions, while boomerang or underdog effects are more likely when people are strongly committed to their views (see, e.g., Kaplowitz et al. 1983; Geer 1989; Patterson 1980).

This interpretation also provides a potential explanation for the consistently inconsistent findings in research on so-called "bandwagon" effects. Cognitive response theory suggests that information regarding majority views could result in movement in the direction of majority or minority opinion, depending upon the intensity of people's views on a given issue or candidate, and on the availability, direction and persuasiveness of the pool of arguments speaking to each alternative (Burnstein & Sentis 1981). In short, cognitive response theory does not suggest that attitude change should result from perceptions of consensus views in all situations. The amount of change that results from cognitive elaboration depends upon characteristics of both individuals and the political environment. In the aggregate, these effects may even cancel one another out so as to create the impression of no influence at all (e.g., Marsh 1984; Henshel & Johnston 1987).

The "conversations with ourselves" implied by cognitive response theory suggest a process whereby individuals actively give personal meaning to impersonal information; although the consensus cue may trigger attitude change, that influence is entirely dependent upon the meaning the individual gives to the new information. This interpretation is analogous to Gamson's recent conclusion that interpersonal discussions of political issues are often characterized by "integrated strategies" which blend media discourse with experiential knowledge (1992: 129). Likewise, the intra-personal discussion of political issues may also involve the active integration of mass mediated information about the opinions of distant collectives with more personal, experiential knowledge.

The Consensus Heuristic

Although the cognitive response explanation for impersonal influence fits the accumulation of findings to date quite well, there are other possibilities that offer somewhat simpler explanations. Most notably, the heuristic model of persuasion suggests that information about consensus views may trigger a socialized tendency for people to associate the popular with the good or intelligent choice (Chaiken 1987; Axsom, Yates & Chaiken 1987). This is also the logic behind the reasoning that if so many people support some candidate or issue, surely all those people cannot be wrong (see Bartels 1988). Contextual cues indicating a consensus surrounding a candidate or issue may serve as simple cognitive shortcuts indicating that a viewpoint is probably valid.

While both cognitive response theory and the consensus heuristic have the potential to account for impersonal influence, the consensus heuristic accounts for it through a more direct psychological mechanism. According to the consensus heuristic, people are socialized to use information about consensus views to make decisions, mainly under

conditions of high uncertainty and little information. These cues are quick, efficient mechanisms that do not require any additional cognitive processing to take place. By contrast, cognitive response theory suggests that additional processing must transpire; the consensus cue must trigger thinking about reasons to support or oppose a political position which in turn alter the person's attitude.

Evidence documenting a consensus heuristic is admittedly sparse (see, e.g., Nisbett & Ross 1980; Axsom, Yates & Chaiken 1987), particularly in political contexts. Although the absence of evidence does not necessarily lead us to conclude that no such heuristic exists, evidence to date is generally more consistent with a cognitive response interpretation, particularly in that it is better able to account for evidence of backlash or boomerang patterns of influence, whereas the consensus heuristic cannot. Moreover, the larger problem is that cognitive response and heuristic processes are very difficult to distinguish on the basis of the evidence available in traditional survey data. In this study we use a hybrid survey-experimental design that makes this distinction possible.

METHOD

There are two general advantages to the methodology used in this study. First, the survey-experimental design allows much stronger causal inferences to be drawn than is typically the case in non-experimental research. Random assignment to experimental conditions controls for most plausible rival hypotheses that must be individually identified and ruled out in more traditional survey designs. This advantage is particularly important for assessing the causal relationship between people's perceptions of imagined communities and their own views. In this area of inquiry, the traditional problems of causal inference associated with cross-sectional survey research are exacerbated by an inability to distinguish impersonal influence from "false consensus" -- the well-established tendency to project one's own views onto others. Our design incorporates direct manipulations of opinions ascribed to imagined communities rather than relying on the more ambiguous relationship between respondents' issue positions and their perceptions of collective opinion (see e.g., Fields & Schuman 1976; Mendelsohn & Crespi 1970; Marks & Miller 1987).

A second advantage to the hybrid design concerns the external validity of findings. Over four decades ago, Campbell (1951) advocated experimental designs to disentangle processes of projection and influence. While experimental approaches have allowed for considerable progress in establishing causal relationships, they have also brought their own difficulties. Many experimental studies have sacrificed generalizability by relying on college student subjects. Student samples may be a useful population for studying some psychological processes, but levels of student political interest and involvement make them problematic for studies of public attitudes. Our research combines the rigor of an experimental design with a representative national population by embedding our experiment within a rolling cross-sectional telephone survey conducted by the Letters and Sciences Survey Center of the University of Wisconsin-Madison.

The design of the study is a fully crossed 3 by 3 by 2 between-subjects experiment. A three-level factor was used to manipulate awareness of collective opinion within imagined communities. Respondents were divided into three groups which respectively received no cue (control condition), a positive consensus cue, or a negative consensus cue for the relevant issue.[1] A second three-level factor randomly assigned respondents to one of three different issue controversies. These issues included (1) whether girls should be allowed to join the boy scouts, (2) whether federal laws should require affirmative action programs for women and minorities provided there are no rigid quotas, and (3) whether there should be a constitutional amendment making it a punishable offense to burn the American flag.[2] Since the persuasiveness of cues is often moderated by the extent to which people have strong pre-existing commitments to their issue positions, the policy issues were chosen to represent a range of levels of issue commitment based on a pretest including a variety of issues.

A third experimental manipulation randomly assigned respondents to one of two conditions in which they were either given no instructions prior to receiving an issue question or were instructed to "feel free to take a moment or two to think about it before answering." The purpose of this manipulation was to systematically induce greater thinking on the part of the respondent before answering the question. If cognitive response theory is correct, greater attitude change should generally results when respondents have more time to mentally elaborate. After the experimental manipulations, respondents were asked for their own issue preferences.[3] This was immediately followed by a question asking for the level of commitment to their issue preference.[4] Pre-test evidence on the range of levels of commitment to these issue positions was corroborated by a manipulation check. In both instances, the flag burning issue elicited the highest levels of commitment; the boy scout issue elicited moderate levels of commitment; and the affirmative action issue had the lowest levels of commitment of the three. These differences in issue commitment were statistically significant ($F(2,679)=15.76$, $p<.001$).

Since the processes through which individuals arrive at opinions often are difficult to discern from conventional survey data, we extended a technique from laboratory settings for use in this survey. By incorporating a question similar to the "thought-listing" items commonly used in psychology experiments (Brock 1967; Greenwald 1968; Petty & Cacioppo 1981), we gathered considerable information on what was passing through respondents' minds during the survey interview. Thought-listing procedures are typically administered with paper and pencil, but a recent study suggests that they adapt well to the constraints of a telephone interview (see Mutz 1993). Immediately after eliciting an issue position, interviewers asked open-ended questions inquiring of respondents, "As you were thinking about whether _____, what kinds of thoughts occurred to you?" Interviewers then recorded responses verbatim.

Later these responses were "unitized" (Meichenbaum, Henshaw, & Himmel 1980) into individual units of cognitive response by dividing the verbatim comments into individual thoughts or ideas. These units were then further coded into ideas or arguments

(1) consistent with the public opinion cue received by the respondent, (2) inconsistent with the public opinion cue received, i.e., counter-arguing, (3) neutral with regard to the issue, or (4) irrelevant thoughts and arguments. Message-irrelevant responses were not included in the analyses presented here. One summary measure was calculated for the total number of thoughts generated by each respondent, and a second that represented whether the balance of cue-consistent thoughts minus cue-inconsistent thoughts was positive or negative.

Two additional items were included in the study because of their hypothesized connection to the extent of cognitive response. After issue preference and elaboration questions, we also asked respondents to assess their own level of knowledge concerning these issues.[5] We deemed self-perceived knowledge more important than a measure of actual knowledge since whether one turns to external cues ought to be more closely related to how self-confident a person feels about a given issue position than how much actual information he/she has.

The second item hypothesized to be related to the extent of cognitive elaboration is an individual trait known as "need for cognition." This individual difference refers to a personal tendency to invest greater thought and mental energy in tasks (Cacioppo and Petty 1982). Four questions which had already been extensively evaluated by others for reliability and validity were adapted from a larger battery of items designed to efficiently measure need for cognition[6] (see Cacioppo, Petty and Kao 1984).

Finally, a series of demographic questions also included measures of education and party identification which were included in the analyses of issue preferences. By controlling for variance due to these individual differences, we were able to get a closer look at differences brought about specifically by the experimental manipulations.

To summarize our hypotheses specific to each manipulation, first, the induced pause in the survey is expected to generate greater cognitive elaboration on the issues. According to cognitive response theory, greater cognitive elaboration should, in turn, generate greater attitude change. The direction of that attitude change will depend on whether the elaboration is predominantly cue-consistent or whether counter-arguing takes place. On the other hand, to the extent that those who do not elaborate are most influenced by the cues, the evidence may be seen as indicating the use of a cognitive shortcut, and hence, as supporting the consensus heuristic.

If a consensus heuristic is being used by individuals when responding to representations of imagined communities, the consensus cues should have a direct impact on issue preferences. By contrast, cognitive response theory suggests that these cues should interact with measures of cognitive elaboration in influencing political preferences. While measures of cognitive elaboration are also likely to have significant direct effects due to rationalization of issue preferences, according to cognitive response theory, the interaction should be a significant predictor even after controlling for direct effects.

Cognitive response and heuristic interpretations also suggest differing hypotheses with respect to the manipulation of issue commitment. According to the consensus heuristic, the greatest influence on issue preferences should occur for low commitment issues. For these issues, individuals should not have strong or well-informed positions, and hence, should be more likely to rely on the opinions of others as a shortcut. According to cognitive response theory, greater influence should occur for the moderate or high commitment issues since individuals must have pro and con arguments in mind in order to self-persuade in response to consensus cues.

RESULTS

Table 1 confirms that the pause manipulation did in fact prompt respondents to rehearse a greater number of thoughts than in its absence. On average, people in the Pause condition generated 2.05 thoughts relative to 1.69 in the No Pause condition. As expected, those with a higher level of Need for Cognition generated a greater number of thoughts, as did those who perceived themselves to be highly knowledgeable. But even after controlling for Need for Cognition and Issue Knowledge, those in the Pause condition still generated a significantly greater number of total thoughts.

Table 2 shows the means for each experimental condition. To distinguish systematic patterns, we conducted a multivariate analysis of variance. Four factors were included in the analysis including the three experimental manipulations, plus the variable representing whether cognitive elaboration was predominantly cue-consistent, predominantly counter to the cue, or whether there was no elaboration at all. Two covariates, education and party identification[7], were also included in the analysis in order to absorb some of the error variance due to individual differences.

Table 3 summarizes the major experimental findings. The main effect for Issue simply indicates that the extent of favoring and opposing views differed by issue, and hence, is of little theoretical interest. Similarly, and as hypothesized, Cognitive Elaboration also had a significant main effect. Not surprisingly, people who favored an issue position were more likely to list thoughts consistent with that position than thoughts inconsistent with it.

Of greater interest, however, is the finding that the favor and oppose cues had modest but statistically significant direct effects on issue preferences. On average, those who received favor cues were more favorable toward the issue ($x=2.43$) than those who received oppose cues ($x=2.30$). The main effect indicates that the representations of consensus had some direct influence on attitudes, and thus is consistent with the use of a consensus heuristic.

Nonetheless, the hypothesis suggested by the cognitive response model is also confirmed by the strong interaction between direction of cue and cognitive elaboration. As illustrated in Figure 1, the favor cues produced greater movement in a favorable direction

when people generated cue-consistent thoughts, but greater movement in the opposing direction when accompanied by counter-arguing. The same pattern obtained with the oppose cue: it produced movement in that direction only when accompanied by cue-consistent thoughts, and produced movement in the opposite (favorable) direction relevant to control conditions when accompanied by counter-arguing. Those who did not elaborate at all fell in between and were not significantly different from the control group means. This pattern of interaction directly contradicts the expectations derived from the consensus heuristic. Rather than relying on consensus cues in the absence of other information, it is precisely those individuals with additional thoughts in mind who appear to be most influenced.

Finally, the significant three-way interaction in Table 3 indicates that the relationship illustrated in Figure 1 works differently for different issues. Table 4 breaks down the interaction separately for each issue in order to observe these differences. As shown in the third column of Table 4, the largest differences between favor and oppose conditions and the control means were for the high-commitment, flag burning issue while the smallest differences were for the low commitment, affirmative action question. This pattern is again consistent with a cognitive response explanation for persuasive effects.

DISCUSSION

Several methodological concerns need to be addressed before evaluating these findings. Foremost among these is the validity of the measures of cognitive response. How confident can one be that the thought listing measures truly tap respondents' internal dialogue that occurs before expressing an issue position? Past research on the use of thought-listing measures has examined both reactivity and rationalization as potential problems with measures of this kind. In this study, issue preferences purposely were assessed before eliciting cognitive responses in order to prevent possible reactivity (see Cacioppo & Petty 1981). It is still possible, however, that the cognitive responses represent post hoc rationalizations of issue positions: mass opinion cues could influence feelings toward the issues which, in turn, influence cognitive responses as respondents attempt to construct a line of reasoning after the fact. In fact, the main effect of Cognitive Elaboration does suggest that some rationalization is taking place, but that is clearly not the whole story.

Path analytic studies of cognitive response generally have concluded that cognitive responses mediate affective responses rather than the other way around (e.g., Cacioppo & Petty 1981; Insko et al. 1974; Osterhouse & Brock 1970). Findings specific to this study also suggest a mediating role for cognitive responses in influencing attitudes toward candidates; the interaction between cognitive elaboration and the direction of the experimental cue indicated that the cues were far more effective when accompanied by the rehearsal of cue-consistent thoughts. If rationalization alone were at work, it should be equally likely across all experimental conditions, thus producing strictly main effects. The

direction of experimental cues had only moderate direct effects on issue positions in this study, but very pronounced effects in interaction with cognitive elaboration.

One final methodological concern involves the generalizability of this research setting. The subject pool and setting of this study make its findings more generalizable than most found in experimental research, but the manipulations occur directly before issue preference is assessed. The immediacy of the cues may have created significant short term changes that evaporated shortly thereafter. On the other hand, these quick, one-shot cues had to compete with an ongoing stream of information about these issues in the day-to-day political environment.

The most straightforward point to be made about the evidence presented here is that the results of this study suggest that imagined communities may play an important role in the formation and change of political attitudes. As the first section of this paper indicated, the 20th century has been characterized by a proliferation of indirect relationships and changes in the structure of social interaction which have combined to create an environment which is more conducive to the influence of undifferentiated collectives on political attitudes. The results of this study offer empirical support for this proposition: representations of consensus in imagined communities had significant influential effects on political attitudes in our sample.

Nevertheless, the processes underlying the influence of imagined communities remain less clear cut since findings provide some support for both consensus heuristic and the cognitive response explanations. The moderate direct effects of the consensus cue indicate some support for a consensus heuristic explanation. When other factors are held constant, information about diffuse consensus does appear to offer some guidance to individuals articulating political attitudes.

However, evidence for the cognitive response process remains comparatively stronger and more consistent. Consensus information had strongest effects on attitudes when accompanied by issue-relevant thoughts. Moreover, the direction of effects elicited by the cue depended heavily on the cue-consistent or cue-inconsistent nature of the thoughts produced by the individual. Finally, the effects of this interaction of consensus information and cognitive elaboration is considerably enhanced for higher commitment issues. All three of these results are consistent with a cognitive response interpretation of the role of imagined communities in political attitude formation and change, and cannot be reconciled with a consensus heuristic explanation.

The main effect for direction of cue indicates a minimal baseline effect of consensus information. However, further evidence directly contradicts the expectation derived from the consensus heuristic that the greatest effects should occur for low commitment issues and/or respondents who did not elaborate. One would expect to see this pattern if consensus information is used by individuals as a cognitive shortcut in situations of low information or involvement. Thus while the main effect is not predicted by cognitive

response theory, it is evidence of a consensus heuristic only by default, in the absence of alternative mechanisms to explain direct reactions to consensus cues.

Perhaps the important implication of these results is that people's political attitudes are not dominated by their perceptions of imagined communities. The image of the citizen offered by a consensus heuristic explanation is one in which largely passive individuals are first socialized to value consensus information and then led in sheep-like fashion to adopt attitudes characterizing the imagined community. On the other hand, the picture that emerges here is one of citizens actively interpreting these cues rather than passively accepting them as information about social and political reality.

Clearly, perceptions of imagined communities are consequential for the dynamics of political attitudes. However, strong effects tend to result from this information only when individuals actively respond with thoughts of their own. It is tempting to interpret these results as indicating that individuals respond more "rationally" to consensus information than is often implied by popular "bandwagon" theories. Alternatively, one might be tempted to conclude that information concerning generalized consensus is only effective when it resonates with more personal experience -- that the influence of imagined communities arises out of "integrated strategies" (Gamson 1992) in which individuals blend mediated and experiential knowledge. Without attempting a normative evaluation of the quality of citizens' thoughts, the evidence nonetheless indicates that the influence of imagined communities arises out of active processes of interpretation rather than passive submission to the consensual attitudes of anonymous others. In fact, citizens exhibit considerable abilities to reflect, integrate, and even contradict when they perceive consensus within imagined communities.

ENDNOTES

1. Respondents were told, "Recent evidence indicates that most citizens (favor/oppose) _____". See endnote 2 for wording for each specific issue.

2. Exact wording of favor/oppose cues was as follows: "Recent evidence indicates that most citizens (favor/oppose) (allowing girls to join Boy Scout and Cub Scout troops/ federal laws requiring affirmative action programs for women and minorities provided there are no rigid quotas/ a constitutional amendment that would make it a punishable offense to burn the American flag)."

3. "How about you? Do you favor or oppose (allowing girls to join Boy Scout and Cub Scout troops/ federal laws requiring affirmative action programs for women and minorities provided there are no rigid quotas/ a constitutional amendment that would make it a punishable offense to burn the American flag) ? Would you say you strongly (favor/oppose) this or only somewhat (favor/oppose) it?" Responses were coded on a four-point scale from strongly oppose (1) to strongly favor (4).

4. "When you say you (favor/oppose) (randomly selected issue), how committed are you to your stand? On a 1 to 10 scale where 10 means completely committed and 1 means not at all committed, how committed would you say you are?"

5. "How well informed would you say your opinion is on this issue? Would you say you are extremely well informed regarding this issue, fairly well informed, not very well informed, or not at all informed?" Responses were used to form a four-point scale.

6. These items were as follows: "Please tell me how well each of the following statements describes you: a) I really enjoy a task that involves coming up with new solutions to problems. Would you say this statement describes you very well, somewhat, not very well, or not at all well? b) I only think as hard as I have to. (Scale repeated as needed.) c) It's enough for me that something gets the job done; I don't care how or why it works. d) I like tasks that require little thought once I've learned them. The four items were used to form an additive scale where question a) was reverse coded.

7. In order to include party identification in the model, the direction of coding for one of the issues -- flag burning -- needed to be reversed so that a high score was consistent with a partisan direction. Thus favoring allowing girls in the boy scouts, favoring affirmative action, and opposing a constitutional amendment to ban flag burning were expected to be consistent with Democratic partisanship.

APPENDIX A

Survey Sampling Procedures

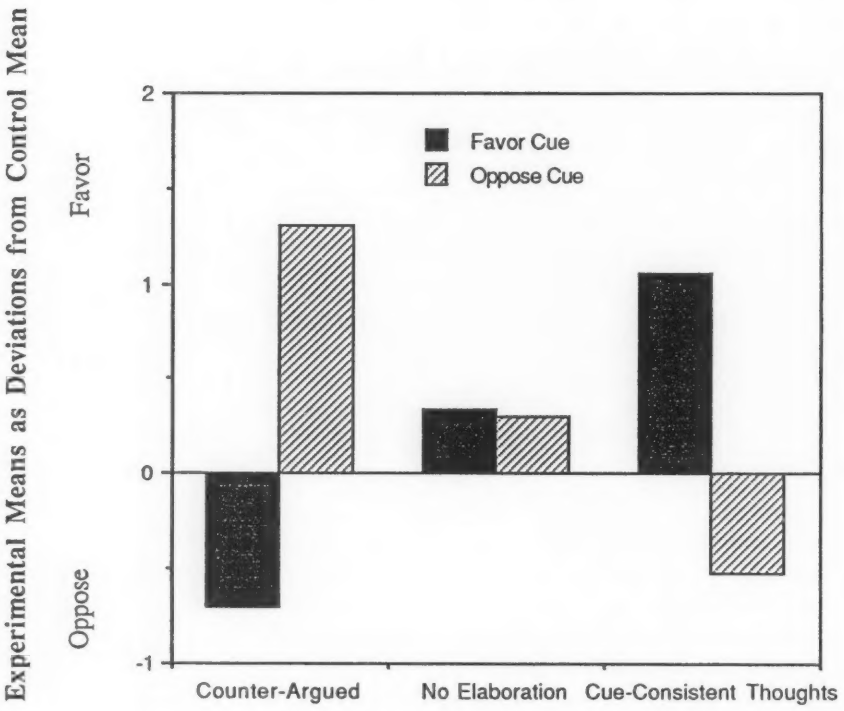
The Letters and Science Survey Center (LSSC) at the University of Wisconsin-Madison runs a continuous national telephone survey that begins with a sample of telephone numbers representative of currently working residential telephone numbers in the continental United States (including both listed and unlisted numbers) purchased from Nielsen Media Research.

One person is selected at random from among the adult (age 18 or older) members of the sample household. The interview is conducted using a Computer-Assisted Telephone Interview System. Each sample number is called up to ten times, using a "day of the week" calling strategy. Each day's interviews constitute a random sample of the population on that day. This requirement means that it is necessary to deal with the problem of nonresponse in a special way, using a procedure first suggested by Kish and Hess (1959) and elaborated upon by Madow, Hymann and Jessen (1961). The procedure depends on replacing current not-at-homes with not-at-homes saved from previous sample draws. Because the kinds of people not home on one day of the week may be different from those not at home on another, the replacement scheme is day-of-the-week specific. Some measure is added to the variability of the resultant estimates. Nonetheless, each day's interviews can be aggregated with those for other days to produce a probability sample for arbitrary contiguous blocks of time.

To assess the quality of the survey, the distributions of social and demographic characteristics of the Survey Center's respondents were compared with those of the CPS and the National Survey of Families and Households. The Letters and Sciences Survey Center's response rate is approximately 52% if one includes both refusals and unresolved numbers in the denominator. This is considerably lower than the CPS and the NSFH; however, comparisons suggest that distributions of respondents are quite similar with respect to major demographic variables including household size, region, age, sex, household income, marital status, religious preference, unemployment and church attendance. Differences result from the fact that LSSC is a telephone survey which consequently under-represents minorities. Educational comparisons are difficult because the LSSC uses educational classifications based on the 1990 census concept; however, it appears to under-represent those with less than 12 years of education, again due to the prevalence of telephones.

Figure 1

Effects of Mass Opinion Cues by Cognitive Elaboration



Means are shown as deviations from the control mean so that positive scores indicate more favorable views than the control mean, and negative scores indicate more negative views relative to the control mean.

Table 4. Effects of Cognitive Elaboration and Issue Commitment on Reactions to Mass Opinion Cues.

High Commitment Issue (Flag Burning)

Cognitive Elaboration:	Favor Cue	Oppose Cue	Mean Difference
Counter-arguing	-.71	1.73	-2.44
No elaboration	.43	.47	-.04
Cue-consistent	1.40	-.22	1.62

Moderate Commitment Issue (Boy Scouts)

Cognitive Elaboration:	Favor Cue	Oppose Cue	Mean Difference
Counter-arguing	-.77	1.37	-2.14
No elaboration	.17	.11	.06
Cue-consistent	.91	-.60	1.51

Low Commitment Issue (Affirmative Action)

Cognitive Elaboration:	Favor Cue	Oppose Cue	Mean Difference
Counter-arguing	-.23	.77	-1.00
No elaboration	.16	.20	-.04
Cue-consistent	.74	-.66	1.40

Note: Cell entries represent the mean for each experimental condition as a deviation from the control mean for that issue. Control means were 1.96, 2.30, and 2.76 for flag burning, boy scouts and affirmative action, respectively. The mean difference is the difference between means for the favor and oppose conditions.

The News Media, the Executive Branch, and the Gulf War: An Institutional Perspective

B. H. Sparrow
Department of Government
University of Texas, Austin
August 1993

Abstract

The news media's coverage of Desert Shield and Desert Storm has come under considerable criticism. This critism is misplaced: the production of news by journalists and media organizations requires the use of institutionalized practices in order to counter the uncertainty pervasive in newsmaking. The presence of these patterned behaviors and set constraints automatically and consistently affects the political communication of news concerning the executive branch of U.S. government. This paper explores three institutionalized practices present in the production of news on the Gulf conflict.

The News Media, the Executive Branch, and the Gulf War: An Institutional Perspective

> Generally, when it comes to matters of national security and matters of war and peace, basically it is what the government says is happening [that] is the predicate and subject of the story.[1]
>
> Charlton Heston commenting on CNN's Bernard Shaw's claim to neutrality: "Who does he think he is—Switzerland?"[2]

The *Saturday Night Live* television show of February 9th, 1991 was a test of sorts for the Bush administration, one it passed with flying colors. Neither the Bush administration nor the Defense Department, for that matter, needed to worry about the unprecedented restrictions being put on the news media during the U.S. and allied attack on Iraqi positions in Kuwait: journalists—and not the military's public affairs officers—were the target of *SNL*'s ridicule (DeParle, in H. Smith 1992, 381). Yet the late-night skit reflected a sober reality for journalists, civil libertarians, and advocates of the news media: the vulnerability of the news media vis-a-vis a White House, State Department and Department of Defense intent on running as popular a war as possible.

By many accounts, the news media poorly served the American public and the cause of democratic government in the period between the Iraqi invasion of Kuwait (August 2, 1990), and the declared allied victory (February 27, 1991) (Dennis et al., 1991; Fialka 1992; Kellner 1993; MacArthur 1992; H. Smith 1992; J.E. Smith 1992; Taylor 1992; Yant 1992). Crucial stories were either overlooked, presented one-sidedly, or wrong. Consider that it was not until well after the war, on March 18, 1991, that the *Washington Post* reported the fact that some 70 percent of the 88,500 tons of bombs dropped on Iraq and Kuwait missed their targets. Despite the prowess of the precision-guided weapons that were shown repeatedly on video—weapons that went down chimneys, into hangers, and through doorways—only 7 percent of allied ordnance was of this type (Gellman, in H. Smith 1992, 197-98; MacArthur, 172; Taylor, 220; Yant, 212).

[2] Katherine Seelye and Dick Polman, "Hindsight: Can the Press be Free in Wartime?" in H. Smith, 371.

Consider also that the news media grossly underplayed the horror of the war. The ground war was almost invisible; the Mutlah Gap slaughter was not publicized until days afterwards (and days after the ceasefire); and there was virtually no coverage until Saturday March 2nd of the killing of another 2,000 Iraqis attempting to flee Kuwait (Taylor, 259-63; Coll and Branigan, in H. Smith 1992, 204-09). With estimates of Iraqi dead varying between 40,000 and 250,000 persons (compared to the loss of 322 Americans lives) the Gulf conflict was hardly a war, it has been suggested, but a massacre.[3]

The news media failed yet again in their overestimation of the threats posed by Iraq. All the major news media—the *New York Times, Washington Post, Wall Street Journal* and the AP, the three major newsmagazines, and the three main television networks plus CNN—missed out on the *absence* of a quarter-million Iraqi army in southern Iraq (conscripts supported by the "elite" Republican guard) (MacArthur, 172-78; Armstrong, in H. Smith, 294; Yant 91-92; Freedman and Karsh 1993, 390).[4] In addition, all the major news media accepted the story of Iraqi soldiers killing Kuwaiti babies in their incubators, even though the first three supposed witnesses to the killings did not give their last names and five of seven witnesses at a U.N. hearing gave false names. Neither did the news media report that the public relations firm of Hill & Knowlton was orchestrating the publicity campaign, on a $5.6 million retainer from the Kuwaiti government (via the U.S.-based Citizens for a Free Kuwait). The myth went unchallenged until a January 17 story in the *Los Angeles Times* (MacArthur, 46-77; Yant, 54-61).

Then there were other stories missed: the various initiatives for Iraq's negotiated withdrawal from Kuwait as proposed by Jordan's King Hussein, by Gorbachev, and by the U.N.'s Perez de Cuellar (Armstrong, in H. Smith 1992, 294-95; MacArthur, 203-04; Taylor, 85); the intention of the Bush administration from almost immediately after the Iraqi invasion of Kuwait (from August 4) to destroy the Iraqi military (J.E. Smith, 92-93, 222; Taylor, 270-71); and the intimate relations between Saudi Arabia and its Washington ambassador, Prince Bandar, and senior Bush administration officials (MacArthur, 3-7; Armstrong, in H. Smith 1992, 235-36, 294; J. E. Smith 1992, 78-79; Woodward 1991). There were still others (Ahmad in H. Smith 1992, 277-81; Kellner 1993).

Political communication clearly and critically affected American foreign policy: war was more palatable if it could

---

[3] The U. S. Department of Defense, wanting to avoid the parallel "body counts" of Vietnam, refused to release estimates of killed Iraqis.

[4] I adopt this list from Stephen Hess's list of "inner ring" newspapers, while adding the Associated press, the major newsmagazines, and the television networks in addition to CNN (Hess 1981, 24-27).

be presented as being neat and sterile; war was more acceptable if American and allied technology could lead to a quick victory; and the use of military force was more attractive if Iraq appeared to be a formidable foe and if Saddam Hussein could be likened to Adolf Hitler. Little surprise, then, that many have written about the crucial role played by the news media in the Gulf war (Dennis et al.; Kellner; MacArthur; H. Smith 1992; Schwartzkopf 1992; Taylor; Yant).

What various critics of the media have not made sufficiently clear is that individual journalists and the separate news organizations cannot have been expected to act any different. That is to say that the defects that a Hedrick Smith, John MacArthur, Philip Taylor, Martin Yant or others find in the news media's coverage of the Gulf war are not the result of the deficiency or incompetence of reporters, editors, producers, publishers and news executives, but the matter-of-fact outcome of the news media's institutional practices. These institutional features of the production of the news precluded the news media from operating other than they did.

This paper explores three institutional features of political communication. The argument here is that the operational conventions of journalists in combination with the constraints experienced by journalists in reporting news from the executive branch accounts for what has been viewed as the news media's deficient coverage of the Gulf war.

Research on political communication has curiously neglected what is the first half of a two-stage process. Most research has focused on political communication once it has been printed or broadcast—the second stage of political communication—instead of on the process by which news is collected and fashioned into stories prior to publicization—the first stage. The evidence of the emphasis on this second part to political communication can be seen in the voluminous research on agenda setting, the different effects of the various news media, and the effect of political communication on public opinion, individual voters, and democratic government (e.g., Iyengar and Kinder 1987; McCombs 1992; McCombs and Shaw 1993; Iyengar 1991; Lichtenberg 1990; Neuman, Just and Crigler 1992; Noelle-Neumann 1984; Patterson 1980; Zaller 1992).

This has meant a relative lack of study of the first stage of political communication, however: the collection and production of news about national politics and American government. Doris Graber's chapter in *The State of the Discipline* is exemplary of this neglect. While Graber herself is cognizant of the biases and silences of research in political communication [Graber 1993, 306, 312, 316]), there is scant discussion of the actual construction of political communication through human and organizational actions. Leon Sigal's and Ben Bagdikian's work are mentioned

only very briefly, and Mark Hertsgaard's (1988) and Mark Fishman's (1980) studies are not cited at all.

The argument at present is that there is sufficient coherence to news media's behavior to warrant the application and further examination of the term "institution."[5] While "institution" can of course mean many things, the focus here is on institutions as sets of rules (generally defined) by which humans and associations of individuals overcome uncertainty (March and Olsen 1989).

Because of uncertainty—the condition of being without a basis with which to calculate probable outcomes (to be distinguished from risk, where only the probability of a fixed set of outcomes is unknown)—individuals are unable to optimize means-end calculations for the realization of their preferences, rather, they do what is appropriate. Said differently, individuals so not so much exert their preferences on other individuals and organizations as individual preferences are themselves formed by human socialization among others and within organizations. Individual preferences are not exogenous to organization and circumstances, but endogenous to organizations and circumstances (March and Olsen 1989).

What institutions do in conditions of rampant uncertainty is to offer a basis for individual and organizational action. Institutions reduce the comprehensiveness of an individual's and an organization's world; they condense complex and diverse data into distinct and pre-set categories; they prevent individuals (and organizations) from collapsing under the complexity, confusion, and conflict otherwise present in daily life (March and Olsen 1989). Institutions may be organizations, but institutions may also span organizations or connect individuals both in and out of formal organizations. Institutions are both structural and phenomenological. Ronald Jepperson gives the examples of capitalism and Catholicism (Jepperson 1991).

The news media manifest such institutional features. They operate under conditions of pervasive uncertainty, uncertainty not only about making deadlines, getting headlines, and improving bottom lines—the professional norms, organizational constraints and business of newsmaking—but also about what the news in fact is. In the myriad changes in day-to-day political life, what qualifies as "news"? What turns political information into a news story? This fundamental uncertainty for journalists is qualitatively distinct from the uncertainty faced by real estate agents (who know homes and commercial property), stockbrokers (who

---

[5] Even those who do refer to the news media as an "institution" do not explain what they mean by the term (Halberstam 1971, 1979; Wicker 1975; Powe 1987; H. Smith 1988; Evensen 1992; Squires 1993).

know share appreciation and futures options), or baseball players (who know hits and runs), for instance.

As Leon Sigal noted in *Reporters and Officials,* the uncertainty of political communication elevates the importance of organization in the production of the news and of the given practices that "yield certified stories," "authenticate the news," and legitimate "their procedures for obtaining" the news. Thus it is that the routines, values and standards of newsmaking—however "insular and self-reinforcing"—are "precisely what newsmen need" to "provide them with a modicum of certitude that enables them to act in an otherwise uncertain environment" (Sigal, 181). The rules, routines, and processes of newsmaking, as well as the news organizations producing political communication, may be considered institutions.

Yet the pervasive uncertainty (and thus the institutional label) does not apply equally to all political communication, for the simple reason that political information is unequally distributed and controlled. Uncertainty is greatest in the production of news concerning the "golden triangle," as Stephen Hess calls it: the domain shared by the White House, State Department and Pentagon. Here, political communication is centralized, "discussed behind closed doors" and restricted. Political information on presidential political strategy, diplomatic affairs and national security is typically monopolized by only a few actors—who may or may not cross organizational lines—and most of this information is classified or held confidentially. The political information of other federal agencies and of the members of Congress is, in contrast, dispersed (rather than being concentrated), discussed in open rooms and hallways (not behind closed doors) and is generally accessible (as opposed to kept secret) (Hess 1986, 104-07; Hess 1991; Wicker 1975, 76-77).

This paper uses "executive branch" (as in its title) to refer to the political communication of the White House, State Department, Defense Department and related agencies—recognizing that the following generalizations do not extend across all federal bureaus or in all policy domains.

The News Media, the Executive Branch, and the Gulf War

This paper focuses on three institutional features of the production of political communication: the competition for news stories; the dependence of journalists on executive branch officials; and the ambiguity of the news. In each instance, reporters, editors, producers and news executives engage in consistent patterns of behavior—professional and organizational rules—in order to mitigate uncertainty. In each instance, these institutionalized processes are both structural (based on organization or tangible practices) and phenomenological (based on intersubjective norms, meanings,

and expectations). Incidents supposedly exemplifying defects of the news media's performance in Desert Shield and Desert Storm are consistent with the institutionalized processes of news production, based on the requirements and constraints of the news media producing the news.

1. News Competition

Most elementally, the journalists and organizations of the news media are tremendously competitive. Job promotions, revenues and prestige go to the winners in the competition for stories among reporters and their news organizations, whether newspapers, newsmagazines, or television networks. As James Reston put it, "the question on the minds of scores of newspaper correspondents" at the end of the day is not "'what fresh insights into the endless adventure of government did I bring to my readers today?' but 'did I make page one?'" (Reston 1966, 81).

Hard and fast measures of the quality of news reporting are elusive and the standards for judging the quality of reporting are not agreed upon, given the uncertainty of what news is and what makes a good story. As a result, "editors and producers and consequently reporters themselves tend to fall back on an index of reporting skill: who gets stories first" (Sigal, 72; Hertsgaard, 340-41). As David Wise has it, "reporters seek to excel for reasons of pride, recognition, and financial reward....There is great self-generated pressure on a reporter to break the big story, to get the news *first*, and to gain recognition by, if not the Pulitzer jury, at least the public, his peers, and his employers" (Wise 1973, 453).

With the exclusive based on information that the journalist "alone receives," reporters and their editors "are tempted to print it before its source dispenses it to their rivals as well. They have little time and less inclination to check the story with other sources" (Sigal, 72). The pressure to break the exclusive—to be first with the news—may make reputations and win prizes, but it also inhibits the ability of journalists to digest the avalanche of information available, analyze the mass of incoming political information or get the big picture (Wicker, 172; Salisbury 1980, 441-42).

The *New York Times*'s Tom Wicker testifies to this behavioral pattern. Wicker observes that "producing a good story, covering different sides, and getting quotes, and pulling if off in due time is not the same as writing an in-depth story intelligently and thoroughly" (Wicker, 174). Wicker admits that "I have on too many occasion responded like one of Pavlov's dogs when summoned to the august presence of a White House official." Whatever was available, he confesses, "I usually grabbed and ran [with]—motivated more by the reporter's fierce desire for a good story, particularly if it was an 'exclusive,' than by any hard and objective judgment about the material thus foisted on me, or why it had been" (Wicker, 79).

But Wicker was only being more candid than most. Tim Crouse reports that the *New York Times*'s R. W. "Johnny" Apple so much wanted to be out front with the story that both Robert Kennedy's aides and Nelson Rockefeller's staffers were able to play him "like a yo-yo" (Crouse 1972, 73). Indeed, one *Boston Globe* reporter observed that "[i]t's so important for the *Times* to be first that they throw their standards out the window" (Hertsgaard, 59). But what holds for the *New York Times* probably applies only slightly less for those in other media organizations.

Media Competition in Wartime

So it was in the Gulf War. John Fialka of the *Wall Street Journal* describes the intense pressure in the print pool (and there was also a television pool, a photographer pool, a newsmagazine pool and a radio pool.) Everyone wanted to get out in the field, but all but about 192 of the 1,400 journalists in Saudi Arabia at the time of the start of the allied ground attack had to stay in the hotels: "There were 39 print reporters in the field, and at least twice that number wanted to go out. Editors of little papers were fuming. They had spent enormous amounts of money to get reporters to Dhahran, only to have them wait in hotel rooms" (Fialka, 39; Taylor, 52).[6] "Bitter cat fights emerged in Saudi Arabia among organizations trying desperately to land the few places on pools, something military press officers undoubtedly enjoyed watching" (Getler in H. Smith 1992, 167). One journalist concluded that all told, "reporters seemed to spend more energy fighting each other than fighting pool restrictions" (Taylor, 52).

Given the importance of the war—war being the ultimate news story (Dennis et al., 2-4, 45-50)—the competition in the news media was tremendous.

- All but one of a group of 13 media representatives accepted the Pentagon's pool system and news restrictions—no doubt because they were being treated as major players by the Bush administration and the Pentagon, and were thereby at a comparative advantage vis-a-vis other journalists and other news organizations. But when the Defense Department expanded the select group by more than fifty (less eminent) journalists, the atmosphere grew heated and journalists got angry (MacArthur, 29-30, 152-56). It was not that reporters were coming under greater restrictions, however, or that they now being subject to tighter controls by the military.

- Robert Fisk of the London *Independent*, a "unilateral" (out in the field but not assigned to a pool), reports how he was told off by an NBC pool reporter, Brad Willis, when he

---

6 The major news organizations making up the "Sacred Ten" and then the "Sacred Sixteen"—those in Saudi Arabia the longest—were able to exclude the newcomers from the combat pool assignments. But even the *New York Times* was put out because it could only have one pool representative, despite the "platoon of reporters" it sent over.

(Fisk) attempted to cover the battle of Khafji on January 31, 1991. Willis yelled at him: "You asshole; you'll prevent us from working. You're not allowed here. Get out. Go back to Dhahran." Willis proceeded to report Fisk to the marine public affairs officer (PAO) on hand, who told Fisk: "You're not allowed to talk to U. S. Marines, and they're not allowed to talk to you" (MacArthur, 181; Taylor, 142; Lapham in H. Smith 1992, 259-60).[7]

• Peter Arnett, one of the media heroes, went on the air on January 20 to claim that his CNN team of three were "the only western journalists still in the country." But a representative of Spain's *El Mundo*, Alfonso Rojo, was still in Bagdad. And Arnett refused to let Rojo use CNN's phone link for filing a story (Taylor, 102-03).

• When the coordinator of the print pool, Nicholas Horrock, had to forming a new print pool for the U.S. Marines, he put a *Chicago Tribune* reporter on the pool instead of a Pulitzer prize-winning reporter from the *Dallas Morning News*. But Horrock himself was already from the *Tribune* (Fialka, 42-43). This type of incident caused Bob Davis of the *Wall Street Journal* to note that the "incredibly competitive" news organizations working in the pools resulted in "clearly some disgusting self-dealing—with people in positions of authority favoring reporters from the own organizations. It was not journalism's finest hour at all" (cited in Dennis et. al., 29).

• A number of television network crews raced to be first to Kuwait City: one, CNN, was stopped on the Kuwaiti border by American forces; another, ABC, could only proceed after buying a diaper delivery truck off the street to replace their own truck (which had been refueled with an engine-ruining mixture of gas and sand); and a third, CBS, had to claim that they were a different network, ITN—and ITN was was being detained by Saudi Arabian forces at the time (Fialka, 49-53).

In short, the competition among wartime journalists in the pursuit of breaking stories resulted in behaviors that might seem destructive of media solidarity, deserving of the scorn of the military and the public alike, or merely absurd.

2. The Structure of Government-Media Relations

A second set of institutionalized practices arises from the structural relationship between journalists and executive branch officials. Journalists need the political information monopolized by just a few executive branch officials—their sources—since news from the executive branch is usually of national significance, but governmental officials do not equally need any one journalist or news organizations. In

---

[7] Willis would later say that the deal for setting up the pools "should never have been made....It was a mistake." Willis thought that the pool system was an "effort by the military to manipulate and control coverage in the name of 'operational security'" (Dennis et al., 28).

fact, executive officials usually want to keep their inside information, and they are able to put up legal obstructions blocking access to information for precisely that reason.

Government officials thereby have a decided structural advantage over journalists. They can release information to a number of media outlets (journalists not having alternate supplies of information on the executive branch) and they can resort to legal sanctions or coercion (legal tools that journalists have to a much lesser degree, especially in diplomatic and security matters). Executive branch officials array of tools available for getting the kind of political communication they desire ranges from offering the carrot of furnishing access to information or releasing material, to threatening the stick of denying access to information or imposing sanctions.

One aspect of journalists' dependence on information held by executive branch officials is the symbiosis that emerges between reporters and their sources. Because the beat reporter is in "direct daily contact with officials in one department and out of touch with other parts of government," he or she is easily coopted; the beat reporter "gradually absorbs the perspectives of the senior officials he is covering. This absorption is not as much due to the attitudes he brings to his job as it is necessary to his performance on it" (Sigal, 47).

This relationship "becomes particularly problematic for agency beat reporters whose stories have political implications. They can make news out of inside information that aids an agency in its competition with other agencies or helps it get its message into the White House, but they cannot so easily propose stories which can hurt an agency" (Sigal, 72). A reporter "may hesitate to take a critical view of regularly tapped sources for the very human reasons that he prefers to be greeted pleasantly when he walks into an office, rather than to be treated as though as he were poison" one Pentagon correspondent finds. "His vested interest is maintaining a pleasant atmosphere" and to "curry favor among sources on his beat, especially senior officials in the government," given the reporter's need for exclusives (Sigal, 46-47). Accordingly, "beat reporters must often practice self-censorship, keeping their most sensational stories to themselves, in order to protect their beat" (Gans, 133).

In short, the reliance of journalists on sources for new political information, the aversion of journalists to cutting off a supply of political information, and the need for journalists to be able to get along with those on their beats combine to result in "an institution-based press" of journalists who respond passively to political information coming from respectable sources (H. Smith 1988, 408; Fishman 1980). Contrary to myth, reporters are not the adversaries of government but their collaborators (Broder 1987, 149; Reston, 64).

A second aspect of journalists' dependence is that reporters are without the knowledge possessed by executive branch officials, and are thereby vulnerable to what top government sources decide to focus on and what news they want to avoid. Official sources are assumed right and given the benefit of the doubt, and journalists are rarely, if ever, in a position to establish the truth about an issue for themselves (Wise 1973; Wicker 1975; Fishman 1980). Lacking "the technical competence to evaluate evidence with any authority," they therefore "almost entirely dependent on self-interested 'sources' for the version of reality that they report"—for the "facts" (Epstein, 3, 7).

The result is that "[t]he whole method of news operation tends to give the government the advantage. Anything that is an institution gets quoted—government, or a corporation, or a university. But it's hard to get the other side" (Wise 1973, 452). As Wicker observes, a journalist "is far more likely to be sold a self-serving bill of goods in a White House interview, particularly one sought by an official, than he or she is to extract objective information—let alone anything damaging to or surprising about the president or the administration" (Wicker, 78-79).

Journalists can also be stonewalled, given their dependence on the executive branch. Government officials can simply withhold information that would otherwise remain confidential (Salisbury, 557). The Reagan administration, for instance, made "a consistent and organized effort...to reduce the flow of government information" says William Kovach, the former Washington editor of the *New York Times*. "There is no area of government where information is harder to get for us here, harder to get now than it was when I was here in the Nixon and Ford years" (Broder, 186).

Then there is the recourse to sanctions. Executive branch officials can leak to other reporters or news organizations in retaliation to stories they don't like; they can discredit news stories and thereby impugn the competence of reporters or news organizations; and they can revoke access or complain to editors and publishers (Sigal, 54-55; Wicker, 241).

President Kennedy was known to complain to CBS President Frank Stanton as well as to NBC if there were stories he did not like. And when Lyndon Johnson was president, CBS's Stanton received calls from Johnson "so often that if the phone rang after 7:30, Stanton's wife would say: 'It's Lyndon.'" NBC's John Chancellor says that he got "fifteen or twenty" phone calls from LBJ during the period when he was covering the White House (Wise 1973, 369-72). More recently, the Reagan administration regularly harassed the television networks, *CBS News* especially, in order to influence what topics were being covered as well as the networks' own views on a topic (Hertsgaard, 28-31).

Presidential administrations can try to remove offending reporters and their stories. President Kennedy tried to convince *New York Times* publisher Sulzberger to pull reporter

David Halberstam from Vietnam and to get then-Washington bureau chief Reston to kill a story about Cuban exiles training in Guatemala (Halberstam 1979, 446-48). Nixon aides tried to get CBS executive Richard Salant to take Dan Rather off the White House beat (Wise, 1973, 379-82), and Nixon's communications director, Chuck Colson, did succeed in getting CBS's William Paley to cut the second part of television story on Watergate in half; the story subsequently lost much of its effectiveness (Crouse, 175; Halberstam, 656-57). The Reagan administration was able to get Raymond Bonner of *New York Times* pulled from El Salvador, transferred back to New York City; Bonner resigned from the *Times* shortly thereafter (Hertsgaard, 186-191, 196-200).

Government officials can retaliate against journalists who do not "go along" by restricting who goes in the White House press "pool." Wise tells of the *Los Angeles Times*'s Stuart Loory being bumped from presidential trips and of James H. McCartney of Knight newspapers also being systematically discriminated against by Nixon aides (Wise 1973, 353-56). They can retaliate in another way by impugning reputations. Top Kennedy aides and Pentagon spokesmen smeared the *New York Times*'s David Halberstam and Neil Sheehan for being politically radical and treasonous. Other reporters criticizing the Administration's policies on Vietnam were said to have no stomach for the grit of war—bursting into tears when shown pictures of Viet Cong bodies (Halberstam, 450).

Then there is legal coercion, as when the Internal Revenue Service is used against particular journalists and news organizations (Wise 1973, 324-25; Crouse, 225), or when criminal investigations are conducted against journalists (as the Nixon administration did against Daniel Schorr and the Reagan administration did against Navy official Samuel L. Morison).[8] But the government's ultimate power—over radio and television at least—"is its ability to take away a license at renewal time and give it to someone else. The fact that the FCC has rarely done so does not entirely diminish the threat," although Presidents Kennedy and Nixon both threatened to do so (Wise 1973, 369-70, 402; Wicker, 240).

As former NBC president Julian Goodman put it: "the government places pressure on a television network for much the same reason that a baseball player argues with the umpire: 'They don't expect to win the argument but they hope to make us think twice the next time'" (Wise 1973, 401). The

---

[8] Morison was arrested under the charge of espionage for the sale of classified satellite photographs of a Soviet aircraft carrier to *Jane's Fighting Ships* (where Morison worked as a part-time editor). It was not that Morison endangered national security (since the Soviets already knew of the capabilities of our satellites), it was rather that the White House wanted to use the case to deter other government officials.

government may affect political communication through intimidation.

Even when journalists get confidential information, however, "they become, in a very real sense, agents for the surreptitious source," as Edward Epstein comments. "Even if the disclosure is supported by authoritative documents, the journalist cannot know whether the information has been altered, edited, or selected out of context. Nor can he be certain what interest he is serving or what will be the eventual outcome of the leak" (Epstein, 13). It was precisely because Bob Woodward had the confidence of William Casey when writing *Veil*, for instance, that Woodward missed Casey's orchestration of the Iran arms deal and the diversion of funds to the Nicaraguan *Contras* (Hertsgaard, 304-05; Woodward, 1987).

Then there is the mystique of classified information on national security (Wicker, 187-99). Top government officials can appeal to the values and identities of journalists in writing stories; journalists are exposed to psychological pressure. For a journalist to print or broadcast classified information related to "national security" is to be unpatriotic and irresponsible; it is to risk the national well being or to abet treason or espionage (Wicker, 187). Sigal is to the point:

> The reporter's conception of himself as a patriot still inclines him to put consideration of national interest ahead of those of news. "We are, we believe, good citizens as well as good journalists," says the Washington bureau chief of *Time* magazine, John L. Steele. "There are some things you happen on you simply don't report." What these things are newsmen often let officials determine. (Sigal, 84)

Appeals to the citizenship, loyalty, and responsibility of reporters, editors and producers by government officials often preclude the need for more overt pressure.

The New York Times engaged in precisely such voluntary cooperation when it published its series on the CIA in the 1960s and when it was considering stories on U-2 flights, the Cuban missile crisis, and Operation Jennifer (the raising of a sunken Soviet submarine by Howard Hughes's *Glomar Explorer*). The editors and executives of the *Times* consulted repeatedly with White House and top CIA officials (Wicker, 217-35). More recently, Mark Hertsgaard tells how both NBC and the Associated Press suppressed stories on a space shuttle flight, how all networks (including CNN) obeyed government subpoenas for "outtakes" of coverage of hijacked TWA flight 847, and how the *Washington Post* withheld for six months and then "published a highly sanitized version of a story describing information given to the Soviet Union by accused spy Ronald Pelton" (Hertsgaard, 225-26). In consequence, both the FBI and CIA have been able to use the

news media for their own purposes (Wicker; Wise 1973, 1976; Salisbury).[9]

Suggested by the centralization of control by the executive branch over political information is that news will emerge only when top government officials disagree and are willing to go public with their disputes. Those in the know, happy with things as they are, want to keep the information loop small; those unhappy with the status quo and willing to act on that discontent seek to expand the loop (H. Smith 1988, 84; Schattschneider 1975). But the implication of the fact that dissenting officials can release information taken from behind closed doors is the dependence of journalists on the executive branch is not absolute.

Reporters, editors, producers, and news executives have advantages of their own in political communication. The news media can be an ally for those in the White House or elsewhere who, unhappy with the status quo, want to reveal formerly confidential information. Hence whistleblowing, embarrassing White House leaks, revelations of policy initiatives and disclosures of personality differences. Journalists themselves have some leverage insofar as the news media may be a resource for executive branch officials.

Furthermore, executive branch officials depend on the news media. As Stephen Hess remarks "[t]he national media—notably *The New York Times* and the *Washington Post*—become major movers of information around the golden triangle, almost like journalistic bumble bees spreading pollen from the White House to the State Department to the Pentagon to State to the White House" (Hess 1986, 106-07). Sigal similarly observes that the "*Times* and *Post* function something akin to house organs for the political elite....Washington's agenda becomes the newsman's headlines; its outlook, his news content" (Sigal, 47). The size and diffuseness of the federal government implicate the news media in the day-to-day political processes of government.[10]

In short, the need of government officials for additional resources (provided through publicity), the outlet

---

[9] Unfortunately, and particularly painful to journalists, is the recognition by journalists that they cooperated in their own deception by being insufficiently skeptical, by being unwilling to look behind official statements and claims, by readily linking the possession of office with responsibility and knowledge, and by assuming official virtue (Wicker 1975, 61; Wise 1976, 200-201).

[10] Conversely, when the White House wants to influence public opinion, it "concentrate[s] its efforts on the big-circulation outlets: the major networks, the wire services and the big papers. 'Anybody else," noted CBS White House correspondent Bill Plante, 'can whistle 'Dixie''" (Hertsgaard, 55). Bruce Evensen tells how President Truman concentrated on winning over *The New York Times* to his early Cold War policies (Evensen, 128); Truman, like any president, did not have to work with all of the news media to achieve his ends.

that the news media offers for unhappy officials, and the limited number of influential media outlets means that journalists are by no means completely dependent on official sources. Although governmental sources may "hold most of the chips," the news media are not unarmed. They have "the power to define reality, to say what was—and what was not—important at any given time," *Washington Post* executive editor Ben Bradlee comments. "The major television networks, in particular could cause big trouble for the White House virtually anytime they wanted simply by focussing sustained attention on any of the scandals, inequities, dangerous or bankrupt policies or other shortcomings common to every Washington administration" (Hertsgaard, 54). The threat is always there—at least in abstract.

Government-Media Relations in Wartime

News coverage preceding and during the Gulf war was indicative of the imbalanced relationship between the news media and the executive branch. The news media depended on sources inside the Bush administration, State Department and Pentagon for stories and access to stories. But given the executive branch's monopoly of information and its ability to use sanctions, journalists were the ones that had to adopt: they could choose between close cooperating with their sources or making challenges to U.S. officials. If they challenged, however, executive branch officials had the decided advantage.

Journalists were caught both ways. They depended on the government for securing visas, for transportation, for sending their stories off, and, most of all, for protection in combat (little turning out to be necessary, of course). At the same time, however, the Defense Department restricted media coverage by subjecting copy to "security review," by delaying transmission of stories two or three days until the news was stale (and less incendiary), and by severely limiting journalists' access to people and places.[11] The Defense Department had a great deal of discretion in its relationship with the news media; the reverse did not hold. The statement of a top Air Force official is apocryphal: "I am not a great fan of the press and I want you to know where we stand with each other. I suppose the press has its purpose. But one thing is certain: You can't do me any good and you sure as hell can do me harm" (Yant, 208).

The following were reflective of this asymmetrical relationship between the executive branch and the media:

---

[11] The pool system did not always operate as planned, however, and unilaterals scored some major scoops: they were the first to explain the fighting at Khadji; the first to show allied forces in action in the ground war; and the first to show the liberation of Kuwait City—beating pool reporters "by a full day—an eternity in the age of electronic journalism" (Fialka, 46). But even the scoops of the unilaterals were only bit pieces in the media coverage and possible only because the Pentagon did not enforce pool guidelines once the ground war progressed.

• The military briefers were professionally trained to handle the news media; most journalists had no prior combat experience or particular expertise on military matters. Indicatively, Pentagon officials referred to journalists as "tourists," and the sign in the Pentagon's press room read: "Welcome temporary war experts" (Denton in Denton, 36).

• General H. Norman Schwartzkopf used interviews with the news media as a lever of control: "reporters whose stories he liked got interviews. Those whose stories didn't pass muster with the general often found the opportunity postponed, sometimes indefinitely" observed John Fialka (Fialka, 33). And Schwartzkopf played favorites. He granted Joseph Galloway of *U.S. News & World Report* a combat slot where none existed and where Pentagon policy was to let the journalists themselves determine who was to be in the pools. Galloway's copy got back immediately from the front (when most correspondents had great trouble sending off their stories); Galloway found the performance of the Army's 24th Mechanized Infantry Division to be "miraculous," to be engaged in the war's "toughest mission" and to be leading "the greatest calvary charge in history" (despite the fact that another report found that the 24th encountered "few Iraqi tanks, troops, or bunkers" and no obstructions such as razor wire or mines); and Galloway wrote of Schwartzkopf as "a general who knows soldiers and loves them, who knows war and hates it" (Fialka, 34-35). Galloway explained his obvious violation of the pool system in terms of the news media's institutionalized competition: "a guy hands me this, and I'm not going to say no" (Fialka, 35).

• Susan Walker of Copley Newspapers was so favored by Maj. Gen. Paul Funk, commander of the 3rd Armored Division—"about whom she'd written several flattering reports—that [the Joint Information Board's] military coordinators couldn't pry her out. She even refused a summons from her editor to leave." In a separate case, Ronald Martz of Cox Newspapers "had a secret deal with the 24th commander, Gen. Barry McCaffrey," and was thereby also able to circumvent the pool system (Fialka, 41, 34-35).

• Two days after the invasion of Iraq, on August 4, 1990, the Bush administration leaked stories to the news media about Iraqi troops massing on the Saudi border. Both the *New York Times* and the *Washington Post* carried front-page stories that Iraqi forces were poised to attack Saudi Arabia, even though the evidence was by no means clear that Iraq intended to invade Saudi Arabia (Freedman and Karsh, 86-89; Kellner, 17-29; J.E. Smith 1992, 78-79). The two front page stories were all that were needed to make the news stick nationally.

• In late November 1990, only President Bush, National Security adviser Brent Scowcroft, other Administration spokespersons and "secret sources" spread the story about an imminent nuclear capacity by Iraq—despite the fact that the

best information pointed to Iraq being years away from such capability (Yant, 107-09; Dennis et al. 74). The claims being made by the President and his National Security Adviser went unchallenged in the major news media.

• Secretary of State George Schultz charged that Iraq used chemical weapons against the Kurds in 1988 and had it repeated widely in newspapers and on television, even though studies by the U. S. Army War College and an independent expert concluded that it was "impossible to confirm the State Department's claim" (Yant, 109; Lapham in H. Smith 1992, 261; Ahmad in H. Smith 1992, 280-81).

• American reporters were consistently prevented from doing their jobs. Tony Clifton of *Newsweek* said that in "twenty years, the only nation I've found to be more restrictive—and not much more restrictive—was Iraq." Clifton reported that he "certainly saw more action with the Iraqis [against Iran] than now with the Americans." And Mort Rosenblum, an AP reporter, said that he had "covered wars for twenty-five years and the first time I'm held prisoner is by my own military." A photographer with *Time*, Wesley Bocxe, was found to be taking pictures of a tank convoy and to be traveling without an escort. He was detained for 36 hours, was "spread-eagled across a Humvee and searched and blindfolded." MPs accused Bocxe of spying for Iraq and faking his press credentials. CNN's Christianne Amanpour noted that reporters were "barred from even the most basic access." They were not allowed to report the news, and what news was stumbled across could not be used because it had to be cleared (Yant, 31-34). And *Newsweek*'s retired Army Col. David Hackworth commented that the media "were like animals in a zoo, and the press officers were zoo-keepers who threw us a piece of meat occasionally." Hackworth said that he "had more guns pointed at [him] by Americans and Saudis who were into controlling the press than in all [his] years of actual combat" (Yant, 208-09).

• Pete Williams, speaking for the Department of Defense, said that it had been "the best war coverage we've ever had" (Taylor, 268; MacArthur, 205), worked both sides of the street. On the one hand, he had "candy in his suitcase" as John MacArthur put it, "come-ons, enticements, and rewards." Williams voiced sympathy for reporters, appeared to understand their concerns, and could offer access to others in the military. On the other hand, Williams provided "obfuscation, meetings and memoranda." Williams participated in the planning for and execution of the severe restrictions on print and broadcast reporters; he deliberately misinformed reporters; and he lied frequently (MacArthur, 24, 27).[12] When

---

12 Williams told numerous lies: that the news media would be able to cover the War without substantial impediment (MacArthur, 26); that news coverage would have three phases—even though the last phase of open and unilateral coverage was never to be realized; that there were 540,000 Iraqi troops in and around Kuwait as of early January 1991—the actual

members of the news media got mad at Williams for misleading them, Williams said, revealingly, that "he never considered them equal partners." Decisions on media coverage, as Williams put it, were not being made by committee (DeParle in H. Smith 1992, 26).

Journalists who challenged the military's and the Administration's version of the war were attacked.

• When *Army Times* photographer Steve Elfers found the body of an American soldier who was apparently killed by a U.S. Air Force antiradiation missile, the regiment's executive officer led Elfers away from the site with false information—saying that some Iraqis had been taken prisoner nearby. Elfers then had his film confiscated by the 1st Cavalry Division's top public affairs officer, Lt. Col. James Gleisberg. Not until four days after the event was Elfers able to get the pictures and story of the friendly fire casualty back to Dhahran (Fialka, 58-59). And when the *New York Times*'s Chris Hedges interviewed Saudi shopkeepers without escort (in a story about price gouging), U. S. military personnel grabbed him and took away his press credentials. At least 24 American journalists were forcibly detained during Desert Storm (Schanberg in H. Smith 1992, 49; MacArthur, 202).

• General Schwartzkopf (who had a photographic memory) made sure that Dan Rather paid for broadcasting a story critical of the allied commander in chief. Soon after troops started arriving in Saudi Arabia, Rather quoted Schwartzkopf as saying that laundry "isn't important." Rather reminded the General, however, that it is uncomfortable for infantrymen to "walk in filthy, sweat-permeated and salted fatigues that cut and chafe." The *CBS News* anchorman concluded that Schwartzkopf should do less storming and more thinking and doing. Schwartzkopf was outraged, according to accounts. So months later, when Schwartzkopf went to meet with the defeated Iraqi commanders in Safwan, he personally intervened to make sure that the *CBS News* team was initially included in the pool going to the historic meeting. But Schwartzkopf then pulled Rather and the CBS team out of the pool (Pyle in H. Smith 1992, 113-114).

---

number was in all likelihood less than half that (MacArthur 173-75); that it was "crazy" for the DIA to suggest that 100,000 Iraqi's died, while Williams himself gave an absurd figure of 457 Iraqi dead "because that's how many we buried" (MacArthur, 201-02, 245-46 n.1); that the military did not discriminate against stories that were embarrassing—even though stories were routinely delayed or altered because they disclosed soldier discontent, profanity, the use pornographic films for the relaxation of flight crews, and so forth (Taylor, 52; Yant, 29, 207); that when the Pentagon buried actual (and ugly) combat footage, Williams would say in "innocent forgetfulness" that "[t]hat's one that fell through the cracks" (DeParle in H. Smith 1992, 387).

• When John Balzar of the *Los Angeles Times* viewed an Army videotape filmed from the gun camera of an Apache attack helicopter, he wrote that "one by one [Iraqi soldiers] were cut down....Some were blown to bits by bursts of 30-millimeter exploding cannon shells. One man dropped, writhed on the ground, then struggled to his feet; another burst of fire tore him apart." After the story was published on February 24, however, "Balzar found the military far less cooperative" than they had been previously. Balzar would see "no more combat and spent much of the ground offensive sitting around in a tent." And top military officials steadfastly refused to release additional Apache footage, despite the repeated requests by print and broadcast reporters (DeParle in H. Smith 1992, 387; Fialka, 59; Hanson in H. Smith 1992, 133; MacArthur, 163).

• When AP photographer Scott Applewhite arrived at the site of the Scud hit on the Dhahran military barracks—the Scud missed by two nearby Patriot missile batteries—"15 U.S. and Saudi military officers descended upon him. He was handcuffed, beaten, and had one of his cameras smashed as he stood his ground, insisting that he was an accredited U.S. journalist and had every right to be there." When Applewhite asked why the press was being barred, a U. S. officer replied, "Host-nation sensitivities." But when Applewhite asked a Saudi official for a lift through the cordon around the building, the Saudi prince waved him into the car. It was American MPs who forced Applewhite out of the car and it was a U.S. JIB major who escorted him away (Fialka, 57).

• When CNN's Peter Arnett reported on the U.S. and allied bombing of a baby formula factory outside Bagdad, Marlin Fitzwater insisted that it was a biological weapons facility. The White House claimed that CNN was the dupe of Iraq, a conduit for propaganda against the United States. Later, Fitzwater stated that the Iraqis hid the true purpose of the plant as a form of disinformation: "they have fake buildings, they have fake weapons, they have fake production plants." The Chairman of the Joint Chiefs of Staff, Gen. Colin Powell, also attacked the CNN report, stating that "it is not an infant formula factory, no more than the Ratba chemical plant in Libya made aspirin. It was a biological weapons facility, of that we are sure—and we have taken it out."

Three different Administration officials, asking to remain unidentified, gave three different accounts of the camouflaged milk plant (most likely to obscure American intelligence operations): one said that the plant was converted last fall to a biological weapons facility; another said that it was a backup biological warfare plant; a third claimed that it made products that could later be used in the production of biological weapons (Kamen in H. Smith 1992, 354-55; Taylor, 112-116; Yant, 48-51).

The Republican National Committee also mailed preprinted letters denouncing the news media to half a million

contributors so that the letters could be then sent to the editors of local papers. But independent indicators (including a U.N. commission) pointed to the plant in fact being a baby milk factory; indeed, a former director of the Defense Intelligence Agency, Leonard Perrots, admitted to the mistake (Arnett in H. Smith 1992, 322-24; Taylor, 113-15, 179, 182-83; Yant, 49-50).

In sum, the news media more or less transmitted the Bush administration's version of Desert Shield and Desert Storm. "Despite the existence of well over a thousand journalists in the Gulf from a wide variety of news-gathering organizations with different editorial styles and journalistic practices," as Philip Taylor reports, "they were all essentially dependent upon the coalition military for their principal source of information" (Taylor, 268). The news media publicized what information was passed along by President Bush, National Security adviser Scowcroft, Defense Secretary Cheney, General Schwartzkopf, and General Powell.

But with the executive branch's monopoly of information, control of access and available sanctions, the news media had little choice: journalists could not get competing information from the Congress (members of which knew little), from dissident Administration officials (the Bush administration was good at keeping its secrets and at hiding any political dissension), from the military (there were set military-wide policies on handling the media), or even from individual soldiers (since troops were supervised and since journalists usually had escorts, individual soldiers and their commanding officers faced repercussions from DOD should they complain or openly question their mission [MacArthur, 167-68]).

The executive branch, not the news media, had the discretion about how pooled reporters would be treated. Journalists pooling with the U. S. Marines, for instance, were much better treated and had a much more easier time filing stories than did those pooled in Army units (Fialka 1992). The simple fact of the new media's subordinate position in terms of the possession of and access to information on the war goes far in explaining why the news media was so pliant and susceptible to manipulation (Dennis et al., 16-20, 26-33, 66-67).[13]

Consistent with the importance of national security issues and how the identity of journalists as Americans in times of war cross-cuts professional identity, news reporters were overwhelming loyal—despite Schwartzkopf's fear that "our own newspaper and TV reports were Iraq's best source of

---

[13] Explanations that the news media suffered in their relations with the government because of the contrasting journalist and the military cultures, as some contend, are insufficient (Allen in H. Smith 1992, 264-270). Explanations for the news media's coverage hinging on the war's brevity (which, if prolonged, would have been unsustainable) are also unnecessary for an explanation of the news coverage from the Gulf (Dennis et al, 70; Woodward 1991, 315).

military intelligence" (Schwartzkopf 1992, 381). There were only five stories that had to be referred to clearance in Washington among the tens of thousands of stories sent in from the Gulf (MacArthur, 192); journalists consistently censored themselves on matters sensitive to military planning and special concerns of Saudi Arabia, for example; they kept secret Schwartzkopf's "left hook" ground attack; and they were supportive of the war (about which, more later).

As for the claim that the military needed the news media more than the news media needed the military, this position seems amiss. *Newsweek*'s Jonathan Alter, for one, says that "[a]t bottom, the military needs TV to build and sustain support for the war even more than TV needs the military to build up ratings"—the argument being that TV networks could have shown scheduled entertainment programs instead (Taylor, 273). Yet not only do the TV networks need the credibility afforded by the professional coverage of wars (as a basis for present and future revenues), but as it was, the Pentagon easily fed its videotapes and its prepared briefings into news broadcasts and newspapers. As Taylor comments: "When the authorities can speak directly to the audience via live television, rather than indirectly via the interpretations with which journalists have traditionally informed their readers and viewers of what was going on, the gap between government and the governed is narrowed substantially. What role is therefore left for the media?" (Taylor, 272).[14]

3. Storytelling

A third feature of political communication is the media's creation of news stories out of an ambiguous, complex reality. Reporters and their editors and producers have to tell conventional and convincing stories about politics and political order, this in the face of masses of available information and ever-present change. "Of the strains that newsmen experience on the job," Sigal observes, "none is as poignant as their uncertainty about what news is and what it means" (Sigal, 92).

This storymaking has at least two dimensions. One is the shaping of an ambiguous and inchoate reality into coherent stories. News follows narrative forms (Gans 1979; Schudson 1982). These stories, or narratives, are divided into three phases: (1) the presence of an initial puzzle, problem or issue (the enigma); (2) the building up of tension and the development of possible resolutions to the problem (the suspension of the enigma); and (3) the conclusion or satisfactory settling of the problem (the resolution of the enigma) (Dobkin in Denton, 110).

---

[14] Neither did the threat by the *New York Times*'s R. W. Apple to have Defense Secretary Cheney fire JIB director Colonel William Mulvey (if Col. Mulvey did not get the *Times* a better combat pool slot) have any effect, despite the fact that Apple the *Times*'s bureau chief in Dhahran at the time (Fialka 15, 40).

The second dimension to storymaking is that the news stories have have to fall within known boundaries, build upon accepted meanings, or reinforce existing understandings. Key in filtering successful, publicized stories from rejected ones is what other journalists and news organizations accept as "conventional wisdom." As one international correspondent found: "Most reporters and policymakers quickly learn that they frustrate the expectations of their publics at their own peril. That is why a commonly held wisdom forms the boundaries within which reporter and policymaker comfortably operate....To be premature or late may be as deadly a sin as getting it wrong" (Evensen, 5).

The uncertainty of the news, especially with the potential stakes in terms of national politics and individual careers for stories on the executive branch, cause journalists to rely on each other for determining what the stories are. The psychological experiments of Asch, Sherif, and Festinger have shown with the impact of reference groups on individuals, and these findings become more compelling when individual subjects are deprived of objective standards and are unable to establish causal relationships. Journalists experience exactly such situations on a daily basis. Reporters, editors and producers, and news executives therefore seek a consensus when reporting on politically sensitive and complex topics (topics typical of information about the executive branch). In order to find such a consensus, they use external referents; they follow cues.

This consensus is led by the journalists and news organizations who, and which, have proven reliable in the past—the Johnny Apples, the Bob Woodwards, the Seymour Hershes (Halberstam, 679; Schudson, 110-111; Sigal, 40). Neither do many news organizations have the resources and experience to be dependable indicators of what the news story is, hence the particular importance of the *New York Times* and *Washington Post* among the news media organizations. As many have observed, if neither *The New York Times* nor the *Washington Post* carry a story, too often there <u>is</u> no story (Wicker, 179; Crouse, 73; Halberstam, 528; Gans, 180-81; Hertsgaard, 196, 339). Moreover, "[m]ost network news stories began their lives as a story that morning in *The New York Times* or *The Washington Post*" (Hertsgaard, 123).

Consider the importance of cue-taking with respect to Seymour Hersh's reporting in the *New York Times* on My Lai, Walter Cronkite coming out against the Vietnam war in 1968, and the *Washington Post* and Woodward and Bernstein taking on President Nixon. In each instance a individual journalist or single news organization was able to influence the course of U. S. political history. But it took widely respected journalists or prominent news organizations to break such stories. These stories that are taken up by other news organizations may be contrasted with many if not most of the stories—even extremely important ones—publicized by less prominent journalists or released in less prestigious news

organizations. These other stories die, never to reach the requisite Washington and national audience.

The corollary to this use of external referents is that few journalists, editors, producers or publishers want to be outliers, to feature stories that the rest of the news media can ridicule or ignore. The *Washington Post* was greatly relieved when others picked up the story, for instance, and when *Time* magazine was in the lead on chasing the Watergate story, it was "uneasy about being first and being alone on a story" (Halberstam 1979, 668).

But even the *New York Times* or the *Post* may have their stories shunned by others in the news media. When the *Times* published a series of stories about the CIA's activity in Chile and the CIA's domestic operations (domestic operations in clear violation of its mandate), for instance, Washington rumor had it that Hersh had overwritten the story and had not done his homework; the *New York Times* had gone out on a limb (Salisbury, 534). The Iran-*Contra* stories of summer 1987 by Walter Pincus and Dan Morgan in *The Washington Post* were also widely criticized by the Washington press corps. The *New York Times*'s Craig Whitney joked that "the *Post* often printed the same story three separate times on the front page in the same," CBS's Brian Healy said that the story of September 6th "came very close to being a made-up front-page story," and the *New York Times*'s Joseph Lelyveld believed the coverage "tendentious"—printing what the reporters thought had happened "rather than their knowledge of what did happen." The most common complaint was that the *Post* had overplayed the story (Hertsgaard, 338-39).

In short, the uncertainty of the news means that individual reporters, editors and producers will seek uniformity in the definition and handling of the news; few journalists will want to stand alone. Doris Graber's research on the 1968 presidential election found this to be exactly the case: "the study revealed an astonishing similarity in the campaign news presented to readers throughout the country by each of the twenty newspapers....The nature and distribution of stories, with few exceptions, varied within an extremely narrow range. This held true even for stories which were not taken from shared wire services of syndicated columnists" (Graber 1971, 171). More recently, Russell Neuman, Marion Just and Ann Crigler found consistent overall agreement in stories on SDI, South Africa, the stock market, drug research and AIDS (Neuman, Just and Crigler, 117). This convergence by the media on news stories—pack journalism—has been noted widely (Gans; Dennis and Mitchell 1984; Noelle-Neumann 1984; Sabato 1991).[15]

---

[15] These findings are further consistent with Edward Herman and Noam Chomsky's research on how the U.S. news media treated the assault and murder of a Polish priest far differently than their treatment of the

Storytelling in Wartime

The Iraqi invasion of Kuwait and the American responsibility for responding to that invasion was, as we might expect, made into an accessible story with a clear narrative form. First there was the enigma of whether or not the United States would respond to the invasion of Kuwait ("Would the United States go to war with Iraq?"); the invasion of Kuwait disrupted world peace, and the United States, as the world's lone superpower, had to stand guard and prepare its options.

Second, there was the suspension of the enigma, with speculations about when force would be used and about the various scenarios for military action. During the second phase, President Bush's steadfast qualities and international experience were contrasted with the tyranny and perversion of Saddam Hussein. Tension also increased over the possible fate of the father/mother/son/daughter/husband/wife/friend/neighbor/colleague serving in the Gulf.

Third and finally, the United States acted to convincingly and satisfyingly resolve the initial problem. And while the news media were criticized for being "cheerleaders," welcoming American attacks on Iraqi positions, Bethami Dobkin notes that television news casted U.S. military aggression in defensive rather than offensive terms: the United States was defending Kuwait, it was protecting innocents, and it would restore the Middle East to the *status quo ante*. Even the use of napalm by American forces was, according to CNN, a necessary response to the Iraqi ground forces (Dobkin in Denton, 111-17).

The following appear to be consistent with the Iraqi invasion of Kuwait and the American response to the invasion being put in a streamlined, narrative form:

- Many in the U.S. news media used the possessives "we" and "our" to report American and allied military actions (Seelye and Polman in H. Smith 1992, 372).
- At the beginning of Desert Shield, the *New York Times*'s Apple euphorically wrote of the nation's capital as it prepared to defend Saudi Arabia and show its force in the Middle East: "In news bureaus and Pentagon offices, dining rooms and lobbyists' hangouts, the fever is back—the heavy speculation, the avid gossip, the gung-ho, here's-where-it's-happening spirit, that marks the city when it grapples with great events" (MacArthur, 102).
- According to Fairness and Accuracy in Reporting (FAIR), "the three major TV networks devoted less than 1

---

murder of four nuns in El Salvador (Herman and Chomsky 1988). The priest story fit into a prevailing frame (the Cold War) far more easily than did the rape and murder of the nuns in Central America.

Herman makes the same point in a comparison of the *New York Times*'s treatment of the Nicaraguan and El Salvadoran elections, and in documenting the difference between how the U.S. news media handled Cambodia and how it treated Indonesia and East Timor (Herman 1985).

percent of their airtime to organized popular opposition to the Bush administration's Gulf policy" during Desert Storm. Between August 8, 1990, and January 3, 1991, only 29 minutes out of a combined coverage on ABC, NBC, and CBS dealt with organized dissenters, and no foreign policy experts associated with the peace movement appeared on any network TV news during this period. Neither did any TV network quote the Rev. Jesse Jackson upon his return from his peace mission to Iraq (La Marche in H. Smith 1992, 119; Ruffini in H. Smith 1992, 283).

• On the first day of bombing, CBS's usually serious Dan Rather gushed during a basketball half-time update: "The allied fast-break offense is running, gunning and going good" (Yant, 45-46). Later, on the fourth day of U. S. and allied bombing, Rather asked broadcast-partner Connie Chung to join him in a salute to the troops watching, whereupon Rather "raised his right hand to his forehead in a slightly awkward but unmistakable earnest military salute" (Lapham in H. Smith 1992, 257). ABC's usually surly Sam Donaldson enthused over the accuracy of the Patriot missile: "Bulls-eye! No more Scud" (MacArthur, 162). And NBC's Tom Brokaw warned American viewers (being easily misled) that "we must point out again and again that it was Saddam Hussein who put these innocents [i.e., Iraqi citizens] in harm's way" (Taylor, 45).

• With the start of the ground war "the networks paraded a veritable *Who's Who* of the Bush administration and congressional leaders to defend the massive military effort." But anti-war demonstrations being held during the war received negligible attention; the Military Families Support Network (critical of the war) could not get its 30-second spot on CNN or any of the three network stations in Washington, D.C.; and the Los Angeles chapter of Physicians for Social Responsibility could not place an anti-war commercial on CNN or the New York and Los Angeles affiliates of ABC or CBS. But a pro-war commercial was allowed to run on 17 stations ranging from New York to Los Angeles (Ruffini in H. Smith 1992, 283-85; Yant, 46).

• After Desert Storm, Andy Rooney told some 19 million viewers of "60 Minutes" that "the war is over everywhere and we feel together....Our hearts beat faster. Our senses are sharper....This war in the Gulf has been, by all odds, the best war in modern history, not only for America, but for the whole world, including Iraq, probably" (MacArthur, 105).

Consistent with the imperative that the news media present a non-tragic, even romantic, narrative of the U.S.-Iraqi conflict, the news <u>was</u> presented in large part as a story of good versus evil, of "us versus them." The morally justified and technologically advanced United States was pitted against the totalitarian ruler of a barbaric and backward country, one who could resort to crude "weapons of terror" (Swanson and Smith in Denton, 185-88; Lapham in Smith, 258-63; Dennis et al., 41-42, 65-66).

Neither was there much divergence in how the major U.S. media handled Desert Shield and Desert Storm—the second dimension of storytelling under uncertainty:

• The major news media omitted serious discussion of the "containment" option in the months following the Iraqi invasion of Kuwait and before the subsequent United States-led offensive on January 17, 1991. The *Washington Post*'s Bob Woodward sat on a story that Gen. Colin Powell preferred to wait out the sanctions and not to use force. Woodward justified his non-reporting by saying that "if there was something that was so crucial that I felt that this had to be in the newspaper right away, I would have gone to the sources I have and said that. Happily, that wasn't the case." When pressed about the potential impact of the story that an expert, well-respected military man—the ranking military official in the country—was cautious on the use of force whereas the civilian President was spoiling for war—Woodward responded that unlike Watergate there were "no crimes. There's no portrait of somebody with their hand in the cookie jar or doing something illegal. There's a lot of emotion, there's a lot of debate and...anxiety, uncertainty" (MacArthur, 203-05). Yet Woodward was one of the few reporters who could singlehandedly influence other journalists.

• Of the twenty-five largest newspapers in the country, only one, Denver's *Rocky Mountain News*, generally opposed the use of American force in Kuwait (Ruffini in H. Smith 1992, 286; Dennis et al., 52-64).

• No news organizations would follow the lead of the *St. Petersburg Times* and talk about the Pentagon's inflated estimates of Iraqi forces. *ABC News*'s Mark Brender explained that to pick up the story, "you would be bucking the trend. If you were going to buck the trend you better be right. If you're going to stick your neck out and say that the number of Iraqi forces may not be as high as the Administration is saying, then you better be able to say how many there are" (MacArthur, 174). Sam Donaldson used similar grounds to defend ABC's decision in an interview with John MacArthur:

> "You keep citing the *St. Petersburg Times*," he said to me with annoyance. "I think it's a pretty good paper, but how many newspapers and magazines are there in the country? You summon as your witness the *St. Petersburg Times*, as against my judgment and the judgment of my colleagues at ABS. Where are the others? All of them are on my side." (MacArthur, 175)

The Associated Press twice turned down the story, and the Scripps-Howard News Service (of which the *St. Petersburg Times* was a member) also declined to run it. As a result, the story about the non-existent Iraqi forces "sank like a stone." Yet once the war was over, experts confirmed that the number of Iraqi troops in Kuwait were at levels far below

the figures that the Pentagon had given out (MacArthur, 175-78; Yant, 90-92).

• None of the television networks ran the video shot by Ramsey Clark (the former Attorney General) and Jon Alpert (a freelance video-photographer). Clark, a peace advocate, and Alpert shot the video in their tour of Iraq in order to document the actual extent of the war's "collateral damage" on civilian targets and on Iraqi citizens. Despite the news potential of Clark's footage, "American networks would not touch his film" (Taylor, 181-83).

• None of the major media would join in a lawsuit, filed on January 10, 1991, arguing the constitutional basis for overturning the wartime media controls. The lawsuit was filed by the Center for Constitutional Rights on behalf of 11 news organization and 5 writers, including *Harper's, The Village Voice, Mother Jones,* and *The Nation.* Neither did the major media even deign to report the existence of the lawsuit. Although the *New York Times* did mention the lawsuit in two paragraphs at the end of long piece datelined Riyadh, the citation misstated the lawsuit's purpose (Schanberg in H. Smith 1992, 55-57; Dennis et al., 20-21; MacArthur, 202).

In sum, given the uncertainty of the news and the stakes at play in the Gulf war, the news media played it safe. The leading news organizations did not want to run stories not being printed or broadcast by other news organizations. The result was an image of a clean, easy, United States victory. But as the BBC's Mark Urban noted once the war ended, it was "undoubtedly true that the greatest failure in the reporting of the war was the impossibility of showing the reality of what the air forces were doing to Saddam Hussein's armed forces, because that really was where the war was won, and that was the reality of probably 90-95% of the killing which went on" (Taylor, 277-78).

Conclusions

The circumstances of the news media's existence—in intense competition with each other for political information, in a structurally disadvantaged position vis-a-vis the executive branch, and needing to fashion news stories out of a complex reality and in the face of uncertainty about what stories will work—dictate that journalists and their news organizations have set practices and standardized procedures. The sections above show how the institutional features of the news media were manifest during the Gulf war, and thus how the criticized performance of the news media may be all too understandable. As the aggregate of individual journalists caught up in their workaday routines, career expectations, organizational obligations and structural

positions, the news media were essentially captive to the executive branch's propaganda.[16]

The presence of other patterned and persistent features of the news media strengthens the above contentions about the news reporting on the Gulf war being consistent with the news media's institutional qualities. They include the practices that emerge from the existence of news organizations as business corporations (Bagdikian 1992; Squires 1993); the personalization of the news, thanks television and video technology (Meyrowitz 1984; Masters 1990); and the status of leading journalists as political and governmental insiders (Broder 1987; Kurtz 1993; Parry 1993). In each instance, the various rules of media operations—whether for reasons of an economic, technological or social nature—have a consistent affect on political communication, away from questioning or critical reporting.

Economics may best explain the refusal of the major media to enter the lawsuit challenging the Defense Department's pooling system. Robert Ingle, executive editor of Knight-Ridder's *San Jose Mercury News*, explained that "newspapers all over the country, including the *New York Times*, the *Los Angeles Times*, and all the others, are terribly concerned about losing touch with the readers and losing the support of their readers...You have to keep in mind that this was a terribly popular war by all of the polls I've seen...I think the conflict between needing to stay relevant and in touch with the readers, and independent of those readers, is a terribly difficult one" (MacArthur, 21). The *New York Time's* Craig Whitney also notes that if you force an opinion or judgment on the public, "you risk losing the trust of people who hold differing views. We sell a million copies of this paper every day" (Hertsgaard, 340-41).

Although the television networks lost "tens of millions" on their coverage of the war (with NBC losing $55 million—$35 million in extra production costs and $20 million in lost advertising), CNN—the overwhelming winner among television news teams—experienced "a 500 percent increase over prewar audience shares; the company was charging $20,000 for the same 30-second commercial that went for only $3,500 before the bombs began to fall" (MacArthur, 220-21; Kamen in H. Smith 1992, 356). There was money to be gained. That CNN was perceived as the most credible newscaster led to better

---

16 "Propaganda"—a term derived from the Catholic Church's religious battles against Protestantism—is used neutrally here, to refer to a process of persuasion, a means by which political views are disseminated for domestic and international purposes. Propaganda may be contrasted with advertising (which has economic objectives) with overt coercion (propaganda is covert), with lying (propaganda is not necessarily untruthful), and with education (education is the instruction of how to think, propaganda is the instruction of what to think).

ratings, higher prestige, and millions of dollars in advertising revenues in the near- and intermediate term.[17]

Concerning the personalization of the news, consider the news media's lionization of Schwartzkopf. Schwartzkopf was the "biggest celebrity in the world" by the end of the war (MacArthur, 107-09), and the respondents to a Times Mirror poll gave him a 62 percent "very favorable" rating—the highest by far in the poll's history (Yant, 204). Likewise President Bush received the lion's share of news coverage stateside as Congress receded from view (Shaw and Martin in Denton, 50-51). Conversely, Saddam Hussein was transformed into another Hitler in a few days' times.

The insider status of elite members of the news media is exemplified in MacArthur's account of the White House Correspondent's Association dinner after the end of the war: holding court in the *U. S. News & World Report*'s hotel suite was none other than General Schwartzkopf—hero, celebrity, and sex symbol—the guest of *U.S. News* publisher Mort Zuckerman. Prominent journalists from *U. S. News*, the *New York Times*, and other news organizations paid their respects and even asked Gen. Schwartzkopf for autographs (MacArthur, 226-29). Another example of the insider status of prominent Washington journalists is the close tie between George Schultz and reporter Don Oberdorfer of the *Washington Post*.

It is not that any one personal tie (or business interest or personalization of an issue) necessarily results in a certain story or particular spin on the news, of course. But the scale of the financial interests of news organizations, the impetus for the personalization of the news, and the extent of social connections between top politicians, appointees and journalists have systematic effects on news production—away from news that threatens business interests, away from complex or slowly changing stories (unamenable to pictures), and away from news critical of executive branch officials and elected politicians.

These institutional features of news production (the three above as well as the three discussed earlier) are "institutional" to the extent that they mitigate the uncertainty of newsmaking: uncertainty about where individual journalists and news organizations stand in relation to each other; uncertainty about where and how closely guarded information on the executive branch is available; uncertainty about what the news is and what news stories will fly; uncertainty about the bottom line; uncertainty about the accessibility of the news; and uncertainty about the status of individual journalists in Washington.

---

[17] As a small example of the business of newscasting, CBS "reassured sponsors that war specials would be tailored to provide good lead-ins to commercials with 'upbeat images' prior to station breaks" (Denton in Denton, 32).

Consistent with the institutional quality of the news media—that individual preferences are formed endogenously by individual position and organization rather than exogenously—are two behaviors evident in journalists commenting on the news media's coverage of the Gulf war. One is the contrast between journalists' daily behavior and their later perspective on past action, where the behavior of many journalists on the job, covering the White House, diplomatic and Pentagon beats, was excused or even contradicted by their subsequent late-night, weekend or leave-time reflections on that coverage. A second and related contradiction was a tension between private and public action. Individual journalists frequently complained and even regretted the news media's coverage of the war when they spoke in private, even though these same individual journalists often defended their own performance and that of their news organizations when speaking in public (MacArthur, 152-62, 212-17; Dennis et al., 32-33, 65-66, 70-76).

Further consistent with this institutional perspective is that the combined behaviors of journalists covering the Gulf war secured the place of the news media (and of its attendant features) in political communication on the executive branch.[18] A *Newsweek* poll done after the war had it that 59 percent of Americans thought better of the news media than they did before the war, and an NBC survey found that 40 percent of Americans had a greater respect for the news media after the war—double the 20 percent with the opposite view. And a *Los Angeles Times* poll found that 62 percent of Americans believed the news media to be "unbiased" in their war coverage (Yant, 204). Per Jepperson's point that by enacting *institutions individuals reproduce institutions, the* operations of the news media facilitated its continued existence and presence in American national politics (Jepperson 1991). That is to say that while the behaviors of journalists bent to the exigencies and constraints of the moment, the institutions continued on, and the news media even thrived.

If the highly criticized performance of the news media in relations to Desert Shield and Desert Storm can be explained by professional norms and practices, organizational processes and structural conditions, why, then, do so many complain about the news media? Why do we expect differently? I think that here are two main reasons: one is Watergate; the

---

[18] This is not to say that the reproduction of institutions is assured. Political orders do not inexorably perpetuate themselves, and institutions do not exist for the sake of their own continuance: organizations may compete with each other, procedures and rules may conflict, and world views may be contradictory.

other is the newness of contemporary political communication.[19]

Watergate promoted the image of a skeptical and powerful news media, able to act independently in national politics and able to protect American democracy. Yet several factors suggest that Watergate raised undue expectations. One is Watergate's place in political time: coming after the disenchantment with Vietnam—indeed, Nixon was still involved in Indochina and himself contributed to the disillusionment about U.S. government—and coming on the heels of the idealism of the late 1960s. Watergate exemplified another betrayal of American government and democratic values.

Another reason for the false hopes raised by Watergate was the presence of the serious internal divisions within the White House (like the later years of the Vietnam war). As Edward Epstein (1976) and Len Colodny and Robert Gettlin (1991) point out, the success of the *Post*'s Woodward and Bernstein, cub reporters both at the time, was only possible through the cooperation of key White House actors (John Dean and Alexander Haig especially) and other government officials willing to leak information and to confirm or deny stories.

A final unique quality to Watergate was that the Nixon administration had succeeded in antagonizing most of the major news media. President Nixon, his Vice President, and his aides had made continual and heavy-handed attacks on the news media since first coming to office in 1968 (as mentioned above). The result was that from reporters to top executive, most in the news media had grounds for at least considering stories damaging to the President—in contrast with the gentle and enticing (and more successful) tactics of the Reagan administration (Hertsgaard 1989).

The upshot is that even while the news media (and popular culture) have extolled the place and importance of journalism in the protection of American government, Watergate was in fact a freak event, possible through a unique combination of distinct factors and highly unlikely to be duplicated.

The second reason for the undue expectations from the news media may be the result of the very newness and quick evolution of political communication. It is only recently that news corporations have been free from the direction of their founders (MacArthur, 138-45) and that news corporations and media empires have enjoyed anything like the scale they now reach (many are in the Fortune 500).

Corresponding with these organizational, economic and technological developments has been an evolving and increasingly sophisticated relationship between the government and the news media, with specific personnel and

---

19 I am grateful to Rebecca Schiff for stressing the singular importance of Watergate. Imagine someone today with a car bumper sticker reading: "And thank God for the *Washington Post*."

practices employed for handling public relations—that is, the news media. The Bush administration brought in Roger Ailes to sell the war, instance, and apparently did so successfully. Once the war started, "White House, Pentagon, State Department, and CIA officials" met every morning "before dawn to plot the 'spin' for the day. Administration officials understood that the United States is engaged in a PR battle as well as a real one." And every morning, the Administration settled on a "message of the day," and faxed out "talking points" to friendly party leaders, business executives, and religious figures (McDaniel and Fineman in H. Smith 1992, 154-55).

Similarly, the military learned from its Vietnam experience, borrowed from the British experience in the Falklands, and copied tactics used in invasions of Granada in 1983 and Panama in 1989 in order to execute the Gulf war (Dennis et al., 8-16, 41-42; Summers in H. Smith 1992, 84-87). Given the almost immediate impact of the news media on politics, government and public perception, the increasing political sophistication of political communication is to be expected.

The consequence of the increasing scale and sophistication of political communication and of the unique confluence of events leading to Watergate is the engendering of false hopes for the news media in maintaining accountable and democratic government. The reality is that the professional, financial and political stakes in reporting on the executive branch have become overwhelming, thus making mistakes more costly and independent and critical reporting all the more less likely. And the empire builders—the William Paleys, Henry Luces, Katherine Grahams, Arthur Sulzbergers and Colonel McCormicks who directly intervened in Washington politics in the past—are either no longer around or no more disposed to act on their own (MacArthur 1992).

Presidential Choice in Macroeconomic Policymaking

Constantine J. Spiliotes

The University of Chicago
Department of Political Science
5828 S. University Avenue
Chicago, IL 60637

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association. The author would like to thank John Mark Hansen, John Padgett, Lloyd Rudolph, Ann Lin, Michelle Welsh Spiliotes, and participants of the American Politics Workshop at the University of Chicago for their helpful ongoing commentary on the ideas presented in this paper.

Abstract

Politico-economic research studies the movement of economic aggregates as the basis for theorizing about the nature of presidential preferences in the macroeconomic system. Researchers hypothesize about patterns of movement in economic indicators and view their detection as evidence of strategic policy decisions by the president at the outset of the policymaking process. This paper argues that in theorizing backwards from economic outcomes, these empirical models do not provide an accurate gauge of the president's macroeconomic policy preferences. The paper employs a time-series of macroeconomic policy choices made by presidents during 1954-1984, in order to test two leading politico-economic theories, the partisan differences model and the political business cycle model, respectively. This analysis seeks to identify patterns of macroeconomic policy choice over time that are compatible with the patterns of outcomes uncovered in the politico-economic research. The test results lend support to the partisan differences hypothesis, but find little additional confirmation of the political business cycle model beyond the mixed results found in politico-economic research.

Introduction

Few policy domains are more complex and contentious in nature than macroeconomic policymaking. The president, as the nation's chief macroeconomic policymaker, faces competing ideological, electoral, and institutional imperatives when selecting (or "choosing") his macroeconomic agenda. These macroeconomic policymaking considerations are manifold; the president's desire to implement his ideological vision for the economy, his concern with winning reelection, and his need to shepherd legislation through Congress, all factor into the policymaking calculus. The president must balance responsibility to his party, to the electorate, and to other relevant institutional actors when making macroeconomic policy choices. The list of imperatives can be staggering for one institutional actor.

Not surprisingly then, there are almost as many approaches to the study of macroeconomic policymaking as there are presidential imperatives for that process. Scholars employ a variety of methods in focusing on specific components (e.g., president, legislature, bureaucracy, voter, economy) of this complex process, or on the numerous interactions between them. In modeling some component(s) of the process, scholars make working assumptions about each of the others. Thus, most models posit a function for the president as macroeconomic policymaker.

For one particular approach to the study of macroeconomic policymaking, referred to herein as "politico-economic," presidential policy preferences or "choices" are a primary input into the process and, as such, are assumed *a priori* into the models. The politico-economic rubric encompasses two well-known variants of the general model, namely the partisan differences and political business cycle models. Both variants hypothesize "rational" or "strategic" behavior by the president

as he pursues either ideologically or electorally favorable economic outcomes, respectively.

This paper will use the theoretical underpinnings of the politico-economic literature as the foundation for an alternative approach to understanding the link between presidential preference and economic outcome. Although politico-economic research assumes presidential policy choice into models of macroeconomic policymaking as an *a priori* signaling of rational goal-oriented behavior, the research, by virtue of its analytic structure, can make only tenuous causal claims about these choices, based upon analysis of aggregate economic indicators. Presidential choice of macroeconomic policy is hypothesized to be the catalyst for the process, but is relegated to the margins of most empirical analyses. As a result, it remains a largely untested theoretical construct

To this end, the paper will first offer a review and critique of the politico-economic literature to establish the rationale for an alternative approach to the study of presidential preferences. The paper will then test partisan differences and political business cycle hypotheses by attempting to identify the relevant patterns of macroeconomic policy choice by presidents over time. While in keeping with the spirit of politico-economic research, this approach represents a theoretical and empirical shift in focus from the former's study of aggregate economic outcomes as indicators of the strategic nature of presidential policy choices. Of course, how outcome is defined depends upon the goal posited for the policy choice. A presidential choice, itself, could be viewed as an outcome of some prior institutional or psychological process. Nonetheless, research in the politico-economic tradition views predicted movement in the economy as the significant outcome and draws a crucial

theoretical link between that outcome and the macroeconomic policy choices made by the president. Therefore, it is from this specific notion of outcome that the paper draws its rationale.

Thus, there is a need to model the macroeconomic policy choices made by presidents. The goal of this paper is not to discredit politico-economic research, but instead to adapt its basic logic to an alternative empirical test that might lend further credence to the macroeconomic system it describes. A closer analysis of presidential choice in macroeconomic policymaking over time would provide an improved theoretical framework for politico-economic scholars interested in furthering partisan differences and political business cycle research, by allowing them to critically assess whether presidential behavior concurs with the stories told by their models.

Politico-economic Models

A substantial body of empirical literature in the social sciences measures the causal relationship between fiscal and monetary policymaking and economic outcomes.[1] In general, these models (termed "politico-economic" or "politometric") hypothesize relationships between government, electorate, and economy, and econometrically estimate their magnitude. More specifically, the models posit an electorate which demands favorable economic outcomes from government as a requirement for perpetuation of the latter in office. The policymaker (or president, as he is modeled in the majority of U.S. cases) reacts by choosing the macroeconomic policy best suited to meet the demands of his electoral and/or ideological constituencies. Election returns, public opinion polls, economic policy

[1] See Frey and Schneider 1975; Nordhaus 1975; Hibbs 1977b, 1983, 1987; MacRrae 1977; Frey 1978; Tufte 1978; Beck 1982ab, 1987; Alt and Chrystal 1983; Alesina 1988; Woolley 1988; Williams 1990; notably, among many others.

instruments and indicators (relative levels of/changes in) gauge how effectively these needs are being fulfilled. Thus, this influential approach to the study of macroeconomic policy pinpoints presidential choice as the nexus of interaction between the electorate and the economy.

The politico-economic literature is both voluminous and highly technical in nature. Advances in this field have been complex and incremental over time. Its theoretical specifications and empirical results have been greatly contended over the past several decades with no particular viewpoint or scholar dominating the field. Thus, some care is taken below to develop its central tenets and major points of contention.

Two variants of politico-economic models dominate the literature, namely, the partisan differences (PD) and the political (or presidential) business cycle (PBC) models. The PD models are driven by an ideological incentive for presidential behavior, while the PBC models instead posit an electoral incentive. For the sake of clarity in exposition, the two models will be dealt with separately below, although they overlap significantly in the literature. Scholars often test both PD- and PBC-derived hypotheses by making small adjustments to the specification of a single politico-economic model.

To understand these models, one should be acquainted with a theoretical building block which the two share, that is, the vote as an economy-determined act.[2] Both the PD and PBC models implicitly accept this idea, clearly restated by Lowery (1985), that voters respond to changes in economic conditions when evaluating incumbent parties and officeholders. If voters do not evaluate parties/politicians in this manner, then there is little incentive to manipulate economic conditions,

[2] See Downs 1957; Kramer 1971; Stigler 1973, 1975; Arcelus and Meltzer 1975; Bloom and Price 1975; Meltzer and Vellrath 1975ab; Tufte 1975; Fair 1978; Fiorina 1981; Chappell 1983; Kiewiet 1983; Chappell and Keech 1985.

and both models break down (Lowery 1985:429).

It will be argued, following the literature review, that, although political incentives are integral to the idea of choice, the manner in which these incentives are analyzed in the literature does not offer an effective test of presidential preferences. Thus, while the notion of incentive-driven strategic behavior is theoretically fruitful, politico-economic models do not allow for valid empirical conclusions about the relationship between political incentives and presidential choice.

The Partisan Differences Model

PD models look for systematic differences in the aggregate economic behavior of political parties. The models hypothesize that the Democratic and Republican parties (in the U.S. case) pursue economic policies designed to serve the ideological and class interests of their respective constituencies, rather than the need for electoral advantage (which is the case for PBC models). Democrats, representing the working class, pursue economic policies designed to expand employment opportunities, even at the risk of increased inflation. In contrast, Republicans, responding to the investment-oriented behavior of the upper class, enact policies designed to check inflation at the risk of causing a rise in unemployment.

Scholarly debates in this literature are highlighted by the work of Hibbs (1977b, 1983, 1987), Tufte (1978), and Beck (1982ab). Employing the aforementioned notion that different parties serve different clientele, Hibbs finds that, for the U.S. and western Europe (in the postwar period), left-wing parties are associated with more inflation and less unemployment than are right-wing parties. He quantifies this relationship as a 2.36% two-term, inter-administration difference in government-induced

unemployment levels (1977b:1486).

Tufte (1978) takes an American party perspective, and further substantiates Hibbs' claim that the parties differ on the relative desirability of unemployment and inflation, and that these differences correspond to the preferences of their respective clientele (p. 347). The author provides documentation of this claim through an examination of party platforms, presidential statements, Council of Economic Advisor reports, and stated preferences of party rank and file. Tufte concludes that Republican ideology places a higher priority on low inflation and Democratic ideology on low unemployment (pp. 71-88); the two parties manipulate policy instruments available to them in accordance with these preferences (p. 348).

Beck (1982ab) offers a scathing attack on Hibbs (and indirectly on Tufte). He argues that although party affects the level of unemployment, the magnitude of that relationship is less than half that estimated by Hibbs. More damaging to the PD thesis, however, is Beck's finding that presidential administration (postwar) is a better predictor of the unemployment level than is presidential party. He estimates that intraparty, inter-administration differences in unemployment rates are often larger than inter-party differences in those same rates. As a result, Nixon looks like a Hibbs Democrat, and Kennedy and Carter look like Hibbs Republicans (1982a:84). Beck connects this result to a theory of politics as a series of impermanent coalitions between various sectors of society, with elections serving as a choice between temporary alliances. A president may manipulate the economy, but his party affiliation is not a good predictor of the outcome. (1982a:90-93).

More recent incarnations of the PD model generally confirm the model's central hypothesis, albeit with various refinements. Alt (1985)

strengthens the case for the PD model with a closer look at the timing of shifts in unemployment and by factoring in the constraints of an open economy (also, see Weatherford 1988 for this discussion). Woolley (1988), Alesina (1987, 1988), and Alesina-Sachs (1988), all find that the differences in levels of unemployment and output between parties are only significant during the first half of a given four-year administration; the parties are economically indistinguishable in the second half. Williams (1990) seeks evidence of partisan differences in the area of monetary policy, and finds sizable differences with respect to real income (Lowery 1985 does not find a similar PD effect for fiscal policy).

The Political Business Cycle Model

Unlike the divergent ideological/partisan economic goals of the PD model, the PBC model posits an incumbent solely motivated (in most cases) by the desire for reelection. The president, therefore, seeks to manipulate macroeconomic policy (showing scant regard for ideological consistency) with the goal of cranking up the economy just prior to the election. The PBC model is structurally more demanding than the PD model, for it leaves no theoretical doubt that the president, himself, is working the policy levers, rather than the possibility of other institutional actors within his party.

Nordhaus (1975) and MacRae (1977) present early systematic attempts at the PBC model. Both authors argue that unemployment affects money wages, which in turn affect prices. Given this lag in the tradeoff between unemployment and inflation, the short-run impact of macroeconomic tinkering will be seen primarily in increased economic growth and reduced unemployment, rather than in increased inflation (Nordhaus 1975:169). It follows, according to the PBC model, that the president will attempt to

expand the economy just prior to the election, since the deleterious inflationary effects of economic expansion will not be in evidence until his second term.

Nordhaus looks at annual unemployment rates for nine countries for the period 1947-1972. For the U.S., his data conform (in PBC fashion) to the elections of 1948, 1952, 1956, 1964, and 1972. Nordhaus concludes that the president's term in office has a predictable pattern of macroeconomic policymaking, beginning with relative austerity in early years, and ending with booming economic growth just before the reelection bid (pp. 185-187). MacRae, in contrast, looks only at the pattern of unemployment and inflation for the U.S. during the four presidential election periods from 1957-1972, and detects an effect similar to that estimated by Nordhaus for the second and third administration periods only.

Frey (1978), Frey and Schneider (1975, 1978a, 1979), and Tufte (1978), expand upon the original model. In Frey and Schneider (1978a), the authors test a PBC model with quarterly data for the U.S., from 1953-1975. They find that the likelihood of reelection is significantly reduced when the rate of unemployment and/or inflation rises, but that it is significantly increased when the growth rate of private consumption rises (all of this in keeping with an economy-determined vote). When the probability of reelection is low, the president tries to expand the economy in order to increase his chances of winning. Frey and Schneider's significant contribution to the literature is the idea that incumbents pursue ideologically-oriented policies (regardless of the popularity of these measures in the electorate) when reelection is likely (p. 174). This conclusion builds a useful theoretical bridge between the PD and PBC models.

Proceeding from the myopic voter assumption employed by both Nordhaus and MacRae, Tufte (1978) claims that PBC behavior has caused substantial macroeconomic fluctuations in the U.S., from 1948-1976 (with the exception of the Eisenhower administration). The author finds a two-year cycle in the growth of real disposable per capita income, with acceleration in even years and deceleration in odd ones. He also sees a four-year presidential cycle in the unemployment rate, with downturns in unemployment in the months before the presidential election and upturns in the unemployment rate usually beginning from 12-18 months after the election (pp. 26-27). Tufte posits that the modus operandi for these cycles is an increase in transfer payments (e.g., social security, veterans benefits, etc.) in the months preceding a presidential election; these transfers directly and immediately affect real disposable income. Giving credence to PBC theory, Tufte concludes that the years in which incumbent presidents seek reelection enjoy the most favorable short-run economic conditions. In addition, he notes that incumbents often undertake deflationary policies as their first priority after reelection (p. 27).

Golden and Poterba (1980) attack Frey and Schneider's model, arguing that a president would have to use more than $5 billion of additional spending to increase the probability of reelection by a single point (in terms of popularity) (p. 713). Golden and Poterba also estimate reaction functions for fiscal policy, monetary policy, and transfer payments, and detect no statistically significant effects on the electoral cycle. The authors argue that previous PBC work fails to consider the extent to which the president can have a causal impact on the probability of reelection through manipulation of macroeconomic policy. Golden and Poterba conclude that the policymaker's power to do so is probably quite limited (even if

his motivation is strong) within the overall scheme of macroeconomic policy (p. 713). Keech (1980) looks at similar empirical data and produces only ambiguous evidence that policymakers engage in a cyclical vote-optimizing strategy (p. 363).

Alt and Chrystal (1983) yield the often quoted conclusion that, "No one could read the political business cycle literature without being struck by the lack of supporting evidence..." (p. 125). The authors argue that the goals of different administrations, as well as the economic tradeoffs available, appear to vary considerably, contrary to all of the fixed-preference models (except Beck 1982a) mentioned thus far. Alt and Chrystal further claim that models of how macroeconomic policy targets (like the level of unemployment) move have not been empirically confirmed (p. 125).

More recently, due to the mixed results of the full scale PBC models, cyclical research has fragmented into fiscal and monetary policy branches. For example, Lowery (1985) uses budget surplus/deficit data from 1954-1983 to test for PBC activity, but comes up empty-handed (p. 428). Forays into monetary cycle research have proven more fruitful, since a limited number of institutional actors (mainly the president and the Federal Reserve Board) have access to the policymaking process. Beck (1987) concludes that, while there is a noticeable cycle in the money supply, there is no cycle in the use of specific monetary instruments. Beck adds that this circumstance probably results from the president's insufficient power to force the Fed to work actively for his reelection.

In contrast, Grier (1989) depicts a significant four-year cycle in growth of the M1 money supply, when controlling for the influence of interest rates, income, and budget deficits. He further claims that the electoral cycle produces the income and inflation movements associated

with the PBC, and concludes that presidential elections do significantly affect money growth. Williams (1990) finds economic activity that is consistent with a political monetary cycle; interest rates are expansionary as a result of elections. He concludes that the data generally suggest that elections enhance macroeconomic performance, and that the short-term reaction of money to approval shocks is consistent with a model in which the president uses monetary policy to try to manage public support (p. 789).

A Politico-economic Critique

Although these models describe the dynamic relationship between electorate, president, and economic outcome from a powerful econometric perspective, the review presented above demonstrates that they have responded to empirical tests with mixed results. One might argue that these models are somehow mis-specified, yet, as should now be evident, most of the scholarly effort expended over the past two decades has focused on re-specification of general parameters, without marked improvement in the results.

Instead, the empirical results generated by estimation of these models raise a fundamental conceptual problem. The models' three key components (vote, policymaker, and economy) receive biased treatment in the literature. As Lowery (1985:429) notes, political scientists (due, in part, to the constraints imposed by quantitative data analysis) have almost exclusively dedicated their energies to the first component (the vote), attempting to understand how and why voters respond to economic stimuli. Similarly, economists have focused on the third component (the economy), engaging in theoretical and econometric refinements of the relationship between macroeconomic instruments and aggregate economic

conditions.

As a result, the models constructed and tested in this research tradition are incomplete. Presidential choice of macroeconomic policy plays a central theoretical role in politico-economic models, yet it is difficult to find a true empirical test of the chief executive's behavior in the dynamic process which they describe.[3] The president's actual preferences are obscured; his choices are seen only as indirect reflections of the models' other parameters, or as part of the initial set of assumptions that scholars make in order to proceed with construction. Public opinion is registered, and movement in economic policy instruments and indicators is detected. Yet, the policy choices of the president, which are said to transform the models' electoral and ideological inputs into economic outputs, are scarcely visible, trapped inside the proverbial black box of social science. Although political incentives potentially are a central determinant of presidential choice, the models theorize about these incentives by looking only at movement in aggregate economic indicators, not at the choices actually made by presidents. A satisfactory understanding of the president's macroeconomic policy choices is sacrificed to the models' stringent demand for economic precision over political insight.

While the ideas of choice and outcome are interrelated, given the complexity of the policymaking process and the number of actors involved, the president achieves his intended policy outcomes only some of the time (thus, the PBCs' mixed test results, see Peterson 1990:118). Weatherford (1988:110-111) notes that, "...the institutional complexity and fragmentation of the policy process opens the outcome to claims and amendments by strategically important legislators, interest groups, party elites, and others," so that the resulting compromise policies may not

[3] Tufte 1978 probably comes closest to achieving this goal.

directly serve the actor's electoral, ideological, or legislative intentions. He concludes that this explanation is "... consistent with the weak and contradictory findings typifying the [politico-economic] literature to date."

By focusing only on aggregate economic outcomes, the research misses much of the variation in presidential policy choice, variation which never translates into the policymaking process. To understand presidential choice as strategic behavior, the focus instead should be on the president's policy preferences, even though the intended outcomes of those choices may ultimately not be realized. A president may select the option he believes will achieve a desired outcome, or he may choose a policy with little probability of enactment for other reasons (see Peterson 1990:43,178). Looking for patterns of choice that are consistent with these incentives is a more effective means of identifying strategic behavior than is studying the outcome of the entire process. Analyzing the outcome of the policymaking process, in order to draw conclusions about presidential preference at the time of policy choice, denies the complexity and uncertainty of that process, and makes causal statements about the relationship between incentive, choice, and outcome suspect. Thus, a rationale for presidential choice is established; the analysis will provide a more accurate gauge of presidential response to political incentives.

Presidential Choice

The logic underlying this paper's use of the politico-economic research to talk about the relationship between choice and outcome is as follows: if patterns of movement in aggregate economic indicators are evidence of strategic presidential policy choices made at the beginning of

the macroeconomic policymaking process, as is implied by the logic of the politico-economic models, then similar patterns should be evident in the initial macroeconomic policy preferences of presidents over time. While correlation between policy choice and economic outcome does not necessarily indicate causality, evidence of significant patterns of PD- or PBC-style choices over time would nonetheless strengthen the theoretical foundations of politico-economic models. Just as researchers employ a time-series of economic indicators for data, so too can the PD and PBC hypotheses be tested using a time-series of macroeconomic policy choices.

As a first step toward testing for presidential choice, the PD and PBC hypotheses must be adapted from the politico-economic literature and be restated in general form as:

H_{pd}: Presidents choose macroeconomic policies which reinforce their partisan and/or ideological orientation.

H_{pbc}: In election years, presidents choose macroeconomic policies with the intention of rapidly expanding the economy.

Drawing from the politico-economic literature, each of these general hypotheses has specific test implications. For the PD test, divergent patterns of expected choices can be specified for Democratic and Republican presidents. Under the PBC hypothesis, a distinct pattern of expected choices for all presidents should also be evident.

For the PD hypothesis to be accepted, the following patterns of macroeconomic policy choice should be identifiable over time for Republicans and Democrats, respectively. Republican administrations should prefer a mix a fiscal and monetary policy choices which check

inflationary growth at the risk of increased unemployment. More specifically, they should eschew stimulating economic growth through increased federal outlays, instead preferring to expand the economy through the creation of favorable economic conditions for private investment. This goal is accomplished primarily through supply-side tax relief, although demand-side reductions may also be employed, and through emphasis on policies affecting the cost and availability of private sector money and credit.

In contrast, Democratic presidents can be expected to prefer a mix of macroeconomic policy choices which expand employment opportunities at the risk of increased inflation. That is, they should promote economic growth through increased federal expenditures and demand-side tax relief, with a particular emphasis on support for public employment programs and entitlements. Democratic presidents are more likely to support monetary ease than their Republican counterparts, and to be active in credit markets (particularly mortgage markets), employing direct support through federal subsidies.

The PBC hypothesis generates a somewhat more straightforward test expectation for presidential choice than the PD hypothesis. In order to conform to the behavior hypothesized by the PBC, presidents, regardless of party, are expected to prefer macroeconomic policies which rapidly expand the economy in an election year. Both the type and timing of the choices are critical here, especially for comparison of election-year choices with policy choices made by a president during the prior three years of his term. For example, a sudden election-year switch in preferences to increased federal spending on entitlements and direct federal subsidization of home mortgage markets, after several years of fiscal restraint and tight money, may be interpreted as PBC behavior.

Data

Much research on the presidency, regardless of the policy domain under consideration, offers either sui generis depictions of presidential administrations (with an excessive emphasis on presidential character as an independent variable), or focuses on the policymaking continuity and conflict among several contiguous administrations (e.g., Hoover, Roosevelt, Truman or Kennedy, Johnson, Nixon). Research on the presidency and macroeconomic policymaking generally takes on a slightly broader temporal scope; the highly quantitative politico-economic literature usually runs its economic time-series data from Eisenhower to Reagan, or for some subset thereof.

In focusing on the actual macroeconomic policy choices made by presidents over time, this paper employs a substantial time frame (1954-1984) which closely mirrors the politico-economic time-series. The time-series of choices offers significant variation, in terms of number of years, administrations, and policy preferences. The test period covers seven presidential administrations (four Republican and three Democratic) and hundreds of macroeconomic policy choices. In this way, patterns of macroeconomic policy choice may be identified which are not readily visible within the tighter empirical confines of most presidency research. This research design somewhat diminishes the "small N" problem that has plagued presidency research in the past, thereby allowing one to theorize more convincingly about presidential behavior.

Presidential choice is measured as a series of discrete policy preferences, identified by year. To be considered a choice, the preference must be a recorded macroeconomic policy position of the president made at some point prior to any modification by other

institutional actors.[4] Choices, therefore, are official presidential policy statements, executive orders, and proposed legislation. These data were collected annually for 1954-1984 from the *Economic Report of the President, the Report of the Council of Economic Advisers,* and the proposed *Budget of the United States.* These documents offer a comprehensive record of macroeconomic policy preferences as they develop throughout a given year.

The data were sorted into five categories of macroeconomic policy choice by year. The categories include general federal outlays, entitlements, personal taxes, corporate taxes, employment policy, and money/credit (domestic and international). Testing was undertaken through comparison and contrast of policy choices over time, both within and across years. First, analysis was done across the five categories within each year to determine whether the macroeconomic policy choices for that year, on balance, conform to the expected behavior of the hypothesis being tested.[5] Using the results of the initial test, each year was assigned either a yes or no, depending upon whether or not it conformed to the expected behavior. Once this process was completed for each of the 31 years, the hypotheses were again tested across the time-series to arrive at a final result.

---

[4] For purposes of this paper, the Executive is treated as a unitary rational actor, who provides discrete choices as policy inputs for the macroeconomic policymaking system.

[5] The rationale for conducting a test within each year to make an initial determination of preference, rather than looking at each category of choice separately over time, is that administrations may use various combinations of macroeconomic instruments in responding to the same political incentives. Thus, it is not necessary for all five categories to fully conform to a particular hypothesized behavior during a given year for that behavior to confirm the hypothesis. Presidents often emphasize some aspects of their macroeconomic agenda over others. In looking across the five categories of macroeconomic choice, it was usually quite clear what the president's preferences were for a particular year, even if the particular mix of policies employed to pursue the same result differed from one year to the next.

Results

The findings for tests of the PD and PBC hypotheses for presidential choice are presented in the tables below. For the results of the PD test in Table 1, the "Yes" column indicates the number of years (by administration) that presidential choice conforms to the expected Republican or Democratic behavior. The "No" column indicates the number of years that choice deviates from the expected partisan behavior (those years are provided in parentheses). Also expressed in the totals is the percentage of years, out of the 31 years tested, for which the hypothesis is accepted.

For the PBC test results in Table 2, the "Yes" column indicates the total number of years out of the six reelection years included in the time frame in which presidents have engaged in a PBC-style pattern of choices. The relevant years are provided in parentheses. The "No" column reports the number of reelection years in which the expected PBC behavior was not detected. Also expressed in the totals is the percentage of reelection years during the period for which the PBC hypothesis is confirmed for presidential choice.

Table 1

Partisan Differences and Presidential Choice

Expressed in number of years conforming to (yes), or deviating from (no), expected behavior

	Yes	No
Admin. (Party)		
Eisenhower (R)	6	1 (1958)
Kennedy (D)	3	0
Johnson (D)	4	1 (1968)
Nixon (R)	4	2 (1971, 1972)
Ford (R)	1	1 (1975)
Carter (D)	2	2 (1979, 1980)
Reagan (R)	4	0
Total	24 (77%)	7

N = 31 years of presidential macroeconomic policy choices.

Table 2

Political Business Cycle and Presidential Choice

Expressed in number of years conforming to (yes), or deviating from (no), expected behavior

	Yes	No
All Administrations	2 (1972, 1984) (33%)	4

N = 6 years with incumbent running for reelection (1956, 1964, 1972, 1976, 1980, 1984).

Discussion

The results in Table 1 support the partisan differences hypothesis. Over three-fourths of the years tested conform to the expected patterns of macroeconomic policy choice for Republican and Democratic presidents. The only significant deviations from the expected behavior are clustered in and around the 1970s, a finding which suggests that economic imperatives specific to that decade are responsible for the breakdown in partisan behavior. A look across the choice time-series at the first two years of each administration confirms the more recent PD research; no deviations from the expected patterns of Republican and Democratic behavior are evident.

Eisenhower's policy choices are consistent with predicted Republican behavior, with the exception of 1958. In all other years Eisenhower preferred fiscal restraint in both federal expenditure and revenue policies, consistently seeking to balance the budget or run a surplus, in order to retire the national debt. With the exception of the tax cut package effective January 1, 1954, which he advocated only because decreasing federal expenditures after the Korean War allowed revenue reduction, Eisenhower chose macroeconomic policies geared to the creation of money and credit conditions favorable to states, localities, and private enterprise moving the economy. For employment policy, he preferred automatic stabilizers in the budget to cushion fluctuations in employment, rather than acceleration of public works, a common public employment fix utilized by presidents earlier in the century. Thus, 1958, while perhaps not as significant a deviation from partisan behavior as that represented by Nixon or Carter, nonetheless looks like a change in orientation. Faced with a rate of real GNP (1982 dollars) of -0.8% and an unemployment rate of 6.6%, Eisenhower chose an increase in federal

expenditures and substantial ease in monetary and credit markets, as means of stimulating economic growth. This deviation is in marked contrast to the president's swing back to fiscal restraint in the FY 1960 budget, and his strongly stated preference for higher interest rate ceilings on credit, in order to attract private funds in place of government subsidies.

Kennedy's macroeconomic policy preferences also conform to expected Democratic behavior across his three years of the choice time-series. To promote economic growth, Kennedy favored a policy mix of substantially increased federal expenditures, a liberalization of entitlements, monetary ease and a lowering of interest rate ceilings to increase the affordability of credit (including subsidizing mortgage markets). He also chose a Democratic employment program of federally-funded manpower training and accelerated federal aid for public works.* When Kennedy's preference for a large demand-side tax cut was actively pursued in 1963, his choice was to stimulate the economy as a means of generating additional expected federal revenues, rather than propose cuts in federal expenditures.

With the exception of 1968, Johnson's macroeconomic choices are consistent with the expected behavior for Democratic presidents, even in the face of a destabilizing exogenous event like the Vietnam War. After winning the Kennedy tax cut in 1964, Johnson consistently chose policies that increased federal expenditures, particularly in terms of entitlements and public employment programs (the Great Society/War on Poverty), and

* Although Kennedy was in favor of monetary ease, he was concerned at the time with outflows of capital due to higher short-term interest rates abroad. Thus, while advocating a lowering of long-term interest rates to increase private investment in plant and equipment, he preferred a policy of supporting short-term interest rates, in order to keep the balance of international payments problem under control. He also chose a policy of actively subsidizing credit in the mortgage markets through federal agencies such as the FHA and VA.

exhibited Democratic preferences on money and credit until 1968.[7] In that year, confronted with a tripling of the rate of inflation since assuming office, Johnson's choices deviate from the model. He moved toward fiscal restraint, choosing personal and corporate tax surcharges, a postponement of excise tax reductions, and increased social security payroll taxes to cool demand and thereby quell inflation. He also preferred monetary restraint, albeit with federal aid to mortgage markets, in order to avoid a repeat of 1966 (see footnote 7).

Nixon, Ford, and Carter can be placed in the same economic context; each had to choose policies in an economic environment which was greatly determined by exogenous shocks to inflation and unemployment, due to skyrocketing world oil prices, food shortages, and unusually low growth in productivity in comparison to earlier decades. Both Nixon (1971, 1972) and Ford (1975) chose pro-employment policy mixes (despite high inflation), which deviate from their typical macroeconomic preferences for restraint in federal expenditures, reduction of the tax burden, moderate restraint in money and credit markets, and moderate aid to federal employment and manpower training programs. After his adoption of mandatory wage and price controls to check inflation in 1971, Nixon's policy choices clearly resemble a pro-employment program through 1972 (more will be said on the timing of this program in the PBC discussion). He preferred economic growth through expansive fiscal policy, including increased federal expenditures (intentional deficit spending), liberalized entitlements, demand and supply-side tax stimuli, moderate ease in money markets, direct federal aid to mortgage markets, and increased funding for

[7] An exception to this statement is the sharp monetary restraint employed in 1966, during which Johnson allowed the housing industry to be severely affected, without stepping in to significantly subsidize it until subsequent years. Nonetheless, the bulk of his policy choices for that year conform to expected Democratic behavior.

public employment programs.

In 1975, Ford chose policies designed to ameliorate a whopping 8.3% rate of unemployment, temporarily foregoing battle with the 9.1% rate of inflation. He preferred a strategy of substantial revenue stimulus, coupled with monetary ease and an accelerated program of direct federal aid to public employment programs. Thus, both presidents chose countercyclical employment programs, while temporarily tolerating uncharacteristically high rates of inflation during recessions.

Carter, in contrast, adopted strong anti-inflation policy preferences in 1979 and 1980, despite persistently high unemployment (7-7.5% range), after two years of fairly typical Democratic pro-employment policies. He proposed austere restraint of non-defense federal expenditures, chose to postpone promised tax relief, and preferred monetary restraint. His continued commitment to public employment programs is, however, in keeping with the expected behavior of Democrats.

Taken as a whole, these three presidencies lend some credence, at least for the 1970s, to Beck's hypothesis that inter-party differences in macroeconomic policies are often less significant than intraparty inter-administration differences. To this end, one could argue that Nixon looks more like a Democrat than a member of Eisenhower's party, and that Carter fits better as a Republican than as Johnson's fellow Democrat. Still, the years highlighted above are largely an exception to a consistent pattern of partisan differences over the 1954-1984 period.

Finally, Reagan offers a set of macroeconomic policy choices that is

the picture of ideological consistency.* In all four years of his first term (although less so in 1984), Reagan favored a return to an Eisenhower-esque conception of government, in which the federal government's primary responsibility is to minimize direct federal intervention in the private sector, to focus its energies on influencing money and credit markets to expand private investment, and to foster increased economic capabilities for states and localities. Reagan consistently favored decreased non-defense federal expenditures, a reduction of entitlements, monetary restraint, and an exit from federally-subsidized credit markets and public employment programs.

Turning to a consideration of the PBC results, one finds that they do not differ significantly from the mixed results found in the politico-economic literature. PBC activity is clearly detected only for 1972 and 1984, a 33% rate of hypothesis confirmation. Given the timing of Nixon's expansive macroeconomic policy preferences, the bulk of which came after August 1971, one can convincingly argue (and many have) that his uncharacteristic policy preferences, in light of choices made in 1969 and 1970, are perfectly tailored to the political business cycle. His pragmatic policy choices for 1972 reveal no significant concern for consistency with Republican ideology, making a PBC-style manipulation of the economy his likely goal.

Reagan, while a more difficult PBC case to make, also appears to fit the general pattern of expected PBC behavior in 1984. Although he was ideologically consistent in his rhetoric of fiscal restraint, he

---

* One must keep in mind that presidential choice refers to policy preferences over time, not to economic outcomes during the same period. So even though the Reagan administration is often credited with offering scathing fiscal rhetoric, while simultaneously tolerating mounting budget deficits, it is the consistency of initial partisan preferences that is of interest here. However, the question of how Reagan was able to have it both ways raises interesting possibilities for the relationship between policy rhetoric and praxis.

nonetheless presided over a rapid increase of federal budget deficits during his first term. The evidence in favor of the PBC hypothesis, given his generally consistent conservative macroeconomic policy choices, is Reagan's preference in 1984 only, not to push for spending reductions or revenue increases to shrink the deficit that he publicly excoriated. In this sense, his behavior was strategically manipulative. If he had continued to aggressively make the same types of choices in 1984 that he made in 1981-1983, Reagan may have possibly choked off the rapid expansion that he rode to a landslide victory. Thus, he was strategic by virtue of his own of inaction.

Finally, some have argued that Johnson's election-year choices conform to PBC behavior. When one looks at his choices in 1964, however, one finds a set of preferences that are largely consistent with Kennedy's choices in 1963, and which are not substantially more expansive in terms of their expected impact on economic growth (remember that Kennedy pushed for the tax cut as well). Thus, while there may be PBC manipulation present in 1964, it is difficult to make that determination purely by looking at a time-series of choices. Such a determination would require recourse to other types of primary source evidence that further reveals underlying electoral motivations in detail.

Conclusion

This paper has shown that politico-economic models of the macroeconomic policymaking process do not adequately capture the presidential choices that initiate the process. It has attempted to demonstrate that a shift in analytic focus is required to adequately test for the strategic policy choices hypothesized by these models. The paper's utilization of a time-series of macroeconomic policy choices, in

order to test for patterns of presidential preferences that are indicative of partisan differences and political business cycle behavior, is a step in this direction. As a result of these tests, the underlying logic of the partisan differences model has been upheld, yet that of the political business cycle model still awaits further confirmation from other empirical tests.

Paper Presented at the Annual Meeting of the American Political Science Association, Washington, D.C., September 2-5, 1993.

Political Science Paper No. 214

INTRODUCTION

What impact do courts have on federal administrative agencies?[1] The judiciary exercises power over government agencies through judicial review of administrative actions. Theoretically, they use this tool to reconcile agency behavior with the rule of law; that is, courts ensure that agencies adhere to statutory mandates, provide due process, and engage in reasoned decision making. Courts can reverse and/or remand agency decisions that are substantively arbitrary, unconstitutional, without statutory authority, or procedurally improper.[2]

Judicial review injects courts into the very process of policy formulation and implementation. It often involves complex issues with profound economic, political, and social implications. Can the National Labor Relations Board (NLRB) regulate church-run schools (*NLRB v. The Catholic Bishops of Chicago* 1979)? Does the Equal Employment Opportunity Commission (EEOC) have authority to regulate age discrimination in employee benefit plans (*Public Employees v. Betts 1989)*? Is it an unfair labor practice for an employer, after bargaining to an impasse, to temporarily shut down plants and lay off employees for the sole purpose of imposing economic pressure on the striking workers (*American Ship Building Co. v. NLRB* 1965)? Can the Environmental Protection Agency (EPA) reduce congressional appropriations to states for combatting water pollution (*Train v. New York* 1975)? And are live human-made micro-organisms patentable subject matter (*Diamond v. Chakrabarty* 1980)?

Agencies are legally bound to comply with court decisions and implement them accordingly. Even so, bureaucratic implementation of court decisions is similar to the implementation of congressional or executive policies (Johnson and Canon 1984). It is a political process which can result in an imperfect translation of the courts' opinions into agency policies (Shapiro 1968; Johnson 1979a; Katzmann 1980; Baum 1976). That is, judicial policies are not self-implementing. Agencies must interpret and apply court decisions for them to have any meaning.

I seek to explain why, to what extent, and under what conditions courts influence agency policies. Put differently, what explains administrative agency responses to court decisions? I examine the Supreme Court's influence on federal administrative agencies' policies from 1954 through 1990.[3] I first present a brief review of the literature dealing with bureaucratic compliance with the courts. I then offer a theory explaining under what conditions I anticipate courts to influence agencies. Specifically, I present a bargaining game and argue that the courts' impact systematically varies by the preferences and resources of both courts

---

[1]I wish to thank Lee Epstein, Jack Knight, Bill Lowry, and Bob Durr for comments on earlier drafts of this work.

[3]This essay is part of my dissertation, which also examines the impact of the Court of Appeals for the District of Columbia.

and agencies. Finally, I provide my empirical findings and explain how they illuminate the strategic behavior of relevant actors.

PREVIOUS RESEARCH

The literature addressing judicial impact, though largely descriptive in nature, offers several conceptual approaches. In general, research finds that agencies sometimes comply with the courts, but sometimes the courts have little to no influence on government bureaucracies. While researchers agree that agency compliance is neither complete nor uniform, little consensus prevails for explaining why, under what conditions, or to what extent agencies implement court decisions.

This disagreement prevails, in part, due to the nature of past research. While providing some evidence of the judiciary's influence, they often provide modest theoretical frameworks and focus upon salient or isolated court cases or bureaucracies (for similar criticisms, see: Levine 1970, 592-600; Wasby 1972, 133-134, 141-145; Canon 1991). Their conclusions are therefore partly a function of the particular cases they explore. In fact, a recent review essay commented that:

> . . . the verifications are sketchy and we know little about exceptions, corollaries, and other refinements of the theories' relevance to organizational implementation. For that matter, our knowledge is largely confined to two bureaucracies, school systems and the police (Canon 1991, 455).

Most researchers suggest courts possess relatively few resources capable of compelling agency compliance. As Alexander Hamilton argued in Federalist Number 78:

> It proves incontestibly that the judiciary is beyond comparison the weakest of the three departments of power; and that it can never attack with success either of the other two . . . (Hamilton 1982, 394).

Judicial scholars commonly reiterate this theme in more contemporary discussions of judicial impact. Courts, they suggest, have limited ability to supervise implementation, develop incentives and sanctions, or provide political support for bureau change (Scheingold 1974; Rosenberg 1991; Levine and Becker 1973; Shapiro 1968).[4] Martin Shapiro (1968) argues that the Patent and Trademark Office (PTO) largely ignored the Supreme Court. While the Supreme Court's invalidation of patents increased over time, "the Office professed to see no change in the standard, and there was no observable tendency on the part of patent examiners to be less liberal in their treatment of patents" (Shapiro 1968, 181). Robert Birkby (1966)

---

[4]For other accounts noting that courts can not simply force change, see: Rabkin 1989, 167; Melnick 1983, 343-345; Horowitz 1977, 264; Levine and Becker 1973, 234-235.

surveyed Tennessee school superintendents' adherence to *Abington School District v. Schempp's* (1963) prohibition of devotional bible readings. Respondents indicated that 51 out of 121 districts altered their policies somewhat, but only one district eliminated the religious activities completely. In fact, 70 districts made no changes whatsoever (cf. Muir 1967). Similar findings relate to *Miranda v. Arizona* (1966) (Milner 1971; Medalie, Zeitz, Alexander 1973) and *Brown v. Board of Education* (1954) (Dolbeare and Hammond 1971; Rodgers and Bullock 1976).

Nevertheless, research demonstrates that the courts influence agency policies. According to R. Shep Melnick:

> One fact about judicial review of agency action is clear: of the thousands of regulations, orders, and other rulings announced by federal agencies, only a very small percentage are invalidated or modified by court decisions. This does not mean that court decisions are unimportant. By intervening at critical junctures courts can direct the flow of agency decisionmaking (Melnick 1983, 54).

In reaction to judicial decisions, some state agencies changed their policies (Johnson 1979b), some police departments adopted new search and arrest procedures (Canon 1977; Seeburger and Wettick 1973), some schools discontinued religious practices (Muir 1967; Way 1968; Patric 1957; Sorauf 1959; Birkby 1966), and some prisons and mental health facilities altered structures and practices (Marquart and Crouch 1985; Gilmour 1982). Likewise, R. Shep Melnick (1983) concludes that the judiciary influenced the Environmental Protection Agency's (EPA) regulation of air pollution (cf. O'leary 1989; Ackerman and Hassler 1980); and Martha Derthick (1990) and Susan Gluck Mezey (1986) argue that the federal courts influenced the Social Security Agency's (SSA) decision making.[5]

Interestingly, students of the bureaucracy present some of the most persuasive quantitative evidence of the courts' influence. The Supreme Court's formalization of an economic analysis for nullifying mergers decreased the number of Antitrust Division (Department of Justice) litigations against mergers and monopolies by 14 percent (Wood and Anderson 1993). The number of criminal restraint of trade cases filed by the Antitrust Division also responded to the courts: from 1970 to 1989 they decreased as the number of court dismissals increased (Wood and Anderson 1993). According to Terry Moe (1985), the proportion of labor to business victories at the NLRB is influenced, among other things, by the proportion

---

[5]Many of these authors fundamentally disagree about the desirability of judicial review. On the one hand, some argue that courts "usurp" agency authority, undermining the agency process and its products (Glazer 1975; Horowitz 1977; Melnick 1983; Rabkin 1989; Wilson 1989). On the other hand, other analysts believe courts are competent to review agencies, having beneficial consequences (Cavanagh and Sarat 1980; Greanias and Windsor 1981; Wasby 1981; Wenner 1982; Cooper 1985; Cooper 1990; Edley 1990; Robinson 1991).

of such victories in the courts.

What explanations have been offered for this variance in bureaucratic response to courts? Scholars provide four loose frameworks for understanding why agencies comply with court decisions: utility theory, communications theory, legitimacy theory, and organizational theory. These approaches are not mutually exclusive, and research often combines elements from each theory. Few rigorous empirical tests of their hypotheses have been performed, which means we have little evidence either confirming or refuting their explanatory power.

Utility theory is a rational choice explanation of behavior in which individuals or groups make compliance decisions based upon costs and benefits. A court's opinion will be implemented provided the expected benefits of the required behavior are greater than the expected costs (Stover and Brown 1975). For example, Harrel R. Rodgers and Charles S. Bullock (1972) present a cost-benefit framework for explaining compliance with school desegregation. They find that monetary penalties for noncompliance improved desegregation's implementation. As the school districts' costs of noncompliance increased, so did the pace of implementation.[6]

While there is no unified communications theory, some studies argue that a decision's transmission influences its impact.[7] To have any effect, a court decision must be communicated to agencies. The quality and quantity of this communication is predicted to influence the way agencies perceive the message (Baum 1976, 94-96). Decisions which are more clear and unambiguous are expected to be more faithfully implemented (Canon 1991, 442-443).

While communications theory has never been formally tested, various research is suggestive. Studying four Wisconsin police departments, Neal Milner (1971) notes that police attitudes toward and information concerning *Miranda v. Arizona* varied by the departments' communication processes, such as the number and sources of information concerning the decision. Other analyses propose that variation in elite support influences implementation. Compliance is unlikely to occur if top officials are not supportive of a court's policy, especially given that they are often the channels through which court-initiated policies are acted upon (Dolbeare and Hammond 1971, 23). Local elites', especially school

---

[6]See Giles and Gatlin, 1980, for a test of utility theory on consumers willingness to avoid desegregation. They suggest that the monetary costs of noncompliance are sufficiently high to persuade many individuals to comply.

[7]A more well-developed communications theory investigates lower court adherence to higher court precedent (see Johnson 1987a; Peltason 1961; Songer 1987; Songer 1988a; Songer 1988b; Songer and Sheehan 1990; Reid 1988; Baum 1980).

superintendents', responses to the Court's school prayer decisions help explain why some schools complied (Johnson 1967) and others did not (Dolbeare and Hammond 1971).

The third broad approach suggests that attitudes toward both a court's and a policy's legitimacy influence compliance behavior. In the *Dynamics of Compliance*, Richard Johnson contends that many school officials disagreed with the Supreme Court's ruling on school prayer but ". . . recognized a public obligation to bring their local practices into perceived congruence with Court policy" (Johnson 1967, 125). He argues that the school superintendent was able to convince people of the need for change by citing the Court as the authoritative policy source. Robert Birkby (1966) argues that psychological variables, attitudes toward policies and the Court's legitimacy, explain school districts' decisions to comply with *Abington School District v. Schempp* (1963). More generally, Harrel Rodgers and Charles Bullock (1972) suggest that the costs of complying with a Supreme Court decision are partly a function of its legitimacy. If a person (or group) rejects a law's legitimacy, the psychic costs of disobedience are lowered (Rodgers and Bullock 1972, 128, 188).

Fourth is organizational theory. Judicial scholars have adopted the theories of such scholars as Herbert Simon, James March, Anthony Downs, and Gordon Tullock to explain agency responses to courts (Baum 1976; Johnson 1979a). For example, Charles Johnson and Bradley Canon suggest that organizational inertia helps explain judicial impact (Johnson and Canon 1984, 214-217; cf. Canon 1991, 444). That is, organizations develop inertial forces behind their policies and procedures and are therefore slow to alter them (cf. Levine and Becker 1973, 233). Organizational theorists agree that agencies develop such tendencies. James Q. Wilson (1989) contends that organizations are, in part, created to reduce uncertainty. They therefore develop standard operating procedures to maximize stability and routine in their activities. New tasks, procedures, and other changes are resisted because they impinge on an organization's goals (Wilson 1989, 221-226; Katzmann 1980, 523). While no systematic tests of such hypotheses have been conducted, evidence suggests that inertial resistance can be strong. Southern school districts' defiance of desegregation is illustrative of such inertial tendencies (see Rodgers and Bullock 1972), as is the lack of change after the Supreme Court's school religion decisions (Dolbeare and Hammond 1971).

Charles Johnson (1979) offers an organizational theory explaining agency compliance with the courts. He hypothesizes that agency responses to courts result from two factors: "first, the agency's commitment to the existing policies *and*, second, the risk the agency perceives if it does not accept the authority of the court" (Johnson 1979a, 32). Agency choices occur in three stages. They interpret and evaluate the court decision, search for information and alternatives to it, and, finally, select one or more alternatives. Implementation of court decisions is a function of agency preferences--the distance between the court's position and an agency's commitment to the status quo--as well as the potential sanctions against an agency for not complying--the certainty of judicial enforcement and the severity of sanctions (cf. Baum 1976). Johnson (1979b) also reports case study evidence from five Pennsylvania Supreme Court decisions. Based upon interviews and review of agency records, he asserts

that state agency responses--interpretations, search processes, and programmatic adjustments--are explained by his theory.

Similarly, Robert Katzmann (1980) argues that courts should use organizational theory to understand the potential effects of their decisions. Judicial impact, he states, varies by internal organizational factors and external forces. If judges understand that the potential for bureaucratic change systematically varies according to these characteristics, then courts can be more effective forces for bureaucratic change. While Katzmann presents a normative argument, how courts should use organizational theory, it rests on the theoretical assumption that impact varies across organizational settings. His evidence consists of a counterfactual argument: If Judge Jack Weinstein had used organizational theory in his attempt to restructure an educational institution, then a more workable remedy would have been fashioned (Katzmann 1980, 525-536).

In sum, an immense body of research examines the influence of the courts on bureaucracy. These works variously conclude that courts sometimes do and sometimes do not influence bureaucracies, though much of it does not focus on federal administrative agencies. We know, for example, that the Supreme Court had some influence on public schools, police departments, the SSA, and the EPA. Generally speaking, these conclusions apply only to specific court decisions and to particular bureaucratic organizations. Several questions therefore remain unanswered. Chief among them is what *explains* why, under what conditions, and to what extent courts impact agency policies? While various theories have been proposed, little unified theory has been generated and relatively few empirical analyses have been performed.

JUDICIAL INFLUENCE ON AGENCIES

Agency implementation of judicial policies occurs within an organizational setting. Courts are hierarchically superior to agencies, but agencies can find ways of distorting or redefining their political superiors' directives (Baum 1976; Johnson 1979a). I argue the judiciary's impact on administrative agency policies is a function of two general factors: (1) the policy distance between agency actions and court opinions; and (2) the relative bargaining strength of the two government organizations. Agencies are bound to follow the law, but they may have preferences conflicting with court opinions and also possess resources providing them with feasible alternatives. I present an implicit bargaining game, in which I attempt to explain the agencies' responses to court decisions.[8]

The first element suggests that agencies respond to courts based upon whether court opinions comport with agency goals (Johnson 1979a). I argue that agencies are rational actors; they at least act intentionally in the pursuit of goals (Simon 1958; Rourke 1984; Niskanen 1971;

---

[8]The game is implicit in that no explicit give-and-take bargaining occurs.

Meier 1985, 14; Cohen, March, and Olsen 1972; March and Simon 1966, ch. 6; March 1986). They therefore respond to court decisions in order to protect and further their interests. If court decisions agree with agency interests, agencies will most likely comply. If, however, agency positions are not in agreement with court decisions, compliance depends upon the disparity between the court's orders and the agency's policy (Baum 1976, 97-101).[9]

I conceptualize this disparity in preferences as a policy space, in which agencies have "zones of acceptance." Within this policy area, they will allow some direction of their behavior (see Simon, 1958, 130-134, for a similar approach in a different setting). Court decisions beyond this zone encourage agencies to manifest varying degrees of noncompliance in that agencies generally wish to maintain autonomy over their jurisdictions (Wilson 1989, 183; Ferejohn 1989; Katzmann 1980, 524-525). Implementing court decisions also imposes costs on agencies in that they must alter policy goals, expend scarce resources, and the like. These costs vary according to the magnitude of the court-ordered changes (Baum 1976, 97-98). In sum, the distance between an agency's policy and a court's opinion influences the interpretation and implementation process (Bullock and Lamb 1984, 9-11; Scheingold 1974, 117-130; Johnson 1979a, 32-34).[10]

The second component suggests that agency compliance fundamentally turns on the relative bargaining strength of the two political institutions (Johnson 1979a; Katzmann 1980).[11] An agency may want to ignore or narrowly interpret a judicial opinion, but it must have sufficient resources--relative to the court's--to sustain such a choice. Organizational and institutional theory provide a useful way to conceptualize resources and to understand how they influence agency compliance with court rulings. Resources set limits on agency actions and the pursuit of goals and are a function of internal organizational factors and the external environment (Meier 1985; Meier 1988; Meier 1980; Rourke 1984; Wilson 1989, 138)[12]. In this sense, they help define an agency's zone of acceptance by narrowing or expanding the

---

[9]I assume that policy preferences are communicated by a court's and an agency's initial choice. Such a revealed preference approach is problematic in that actions do not automatically reveal preferences, as the prisoners dilemma illustrates. Nevertheless, I argue that policy distance is an adequate proxy for the policy preferences of both institutions, namely because it is the only available observation of their behavior I have.

[10]I model initial agency policies and court decisions as exogenous. Agencies and courts, though, may anticipate one another and act so as not to be overturned (see Spiller 1992; Gely and Spiller 1990; Shapiro 1968, 267; Wasby 1972, 140-141; Feeley 1973, 224-226).

[11]See the Appendix for independent variable operationalizations.

[12]It is not enough to simply show that someone or some group prevailed in decision making and infer that they were therefore the more powerful actor. For power to have an explanatory role it must be something that we can identify ex ante, not just an ex post description of events (Knight 1992, 41).

set of court decisions to which a bureaucracy is willing to acquiesce (see Simon 1958, 130-134, 149-152; cf. Pressman and Wildavsky 1984, 119-122).

While courts have limited control over implementation, they are not without resources. Court opinions can be conceptualized as formal rules, ". . . that define and limit the set of choices of individuals" (North 1990, 4). They represent constraints on agency behavior by guiding future courses of action. That is, court opinions provide a structure--a set of expectations about the behavior of various actors--within which policy is made and implemented. For example, in *Norfolk and Western Ry. v. Nemitz* (1971) the Supreme Court held that the Interstate Commerce Commission (ICC) had a duty to review the adequacy of conditions contained in collective bargaining agreements designed to protect employees after railroad mergers. The ICC's behavior is theoretically constrained in that it must investigate such protective conditions in future railroad mergers. Lower courts, railroads, rail employee unions, and other social actors therefore reformulated their expectations of the ICC's (and the judiciary's) behavior with regard to protecting rail labor in railroad mergers.

What is more, rules provide a structure within which benefits are distributed (Knight 1992). Court opinions are not neutral; they help structure social outcomes. Since agencies produce social outcomes with their policy choices, and courts write rules which constrain these alternatives, then courts potentially influence social outcomes. With regard to the *Nemitz* case above, the Court provided rail labor a strategic advantage vis-a-vis railroads in merger cases. It awarded rail employees a tangible benefit by obligating the ICC to protect rail employee interests when railroads merge. Consequently, the costs and benefits of railroad mergers are altered by the Court's interpretation of the ICC's statutory duty.

Courts therefore theoretically influence agency policy outcomes by devising rules that set parameters within which agencies choose policies. As Martin Shapiro argues: "the overall impact of the Supreme Court on other political agencies is largely a matter of the verbal propositions of the law it advances . . ." (Shapiro 1968, 43). I hypothesize courts can influence agency policies, but their impact varies by the prevailing resource environment within which an opinion is handed down. In a certain sense, a court's resources signal to an agency whether it represents a credible threat. If an agency perceives that noncompliance will be met with little punishment, then it will be unlikely to implement a court's decision very faithfully.

The resource most under a court's control, as I just argued, is the rule delineated in its opinion. But not all court opinions are created equal. Several opinion characteristics affect a court's ability to influence agency policies. These include the level of the court, the opinion's (rule's) clarity (Baum 1976, 92-94; Bullock and Lamb 1984, 5-6; Rodgers and Bullock 1972, 164-169, 198; Baum 1989, 212-213; Levine and Becker 1973, 232; Johnson 1979a, 34-35; Johnson 1987a; Krislov 1973, 343-344), consensus on the court (Levine 1970; Johnson 1987a), positive and negative sanctions (Baum 1976, 103-108; Johnson 1987a; Krislov 1972, 344-345), and reiterations of past rules (as opposed to new rules) (Levine 1970). The presence and degree of these factors are predicted to increase compliance in that

they reduce an agency's discretion.

I also suggest that several legal characteristics influence judicial impact. First, I anticipate fewer constraints on agency behavior when courts use rationale- or factual-based remands as opposed to law-based ones (Schuck and Elliot 1990, 1047). I also expect greater impact when they review rules as opposed to orders. The logic is that courts less vigorously review agencies' rules (as opposed to orders) and legal questions (as opposed to factual ones) (Bazelon 1976; McGowan 1979; Jaffe 1955; Jaffe 1956; Edley 1990; Robinson et al. 1986, 149-158).[13] Second, the scope of judicial review reportedly varies over time. It is commonly asserted that a fundamental shift took place in the 1960s and 1970s. The judiciary, it is often argued, undertook a more aggressive role with respect to agency activity by moving beyond legislative intent and procedural correctness to substantive review (Rabkin 1989; Shapiro 1988). But in the late 1970s the courts, especially at the prodding of the Supreme Court, returned to a more deferential review of agency cases (Morrison 1987; Wenner 1982; Gellhorn and Levin 1990; Starr 1986). Two Supreme Court opinions ordered federal appellate courts to scale back their judicial review of agency decision making: *Vermont Yankee Nuclear Power Corp. v. Natural Resources Defense Council, Inc.* (1978) and *Chevron, U.S.A., Inc. v. Natural Resources Defense Council, Inc.* (1984). If this characterization is true, we should witness more judicial impact prior to 1978 and less after 1984.

Agencies' internal resources include: legal expertise, party status, policy complexity, and organizational structure. Judicial scholars often suggest that party status and legal expertise influence judicial outcomes (Galanter 1974; Sheehan, Mishler, and Songer 1992; McGuire 1993; Songer and Sheehan 1992). Certain parties are expected to receive favorable judicial treatment because of "repeat player" and other resource advantages. That is, litigants appearing regularly before courts, having expert legal counsel, and holding financial and organizational resources are endowed with strategic advantages (Wheeler et al. 1987; Sheehan, Mishler, and Songer 1992; McGuire 1993). Resources allow litigants to appeal cases they are likely to win, obtain high quality legal representation, prepare more fully for cases, and pursue long-term policy objectives (Galanter 1974). Quantitative evidence shows that parties frequently litigating (George and Epstein 1992; Songer and Sheehan 1992), having experienced legal counsel (Wheeler et al. 1987; McGuire 1993), and possessing other organizational and resource advantages (Caldeira and Wright 1988; Epstein 1991; Segal 1991; Epstein and Rowland 1991) are often more successful in the courts.

Federal administrative agencies have repeat experience in the courts, status as part of the federal government, and substantive policy expertise. It is conventional wisdom that judges often defer to expert agencies, especially when confronting complex policies (Bazelon 1976;

---

[13]The "substantial evidence" test, used for formal agency proceedings covered under APA §§ 554 and 556 (although some statutes require it for informal rulemaking) is a stricter form of review than "arbitrary and capricious," used for orders.

McGowan 1979; Stever 1983, 51; Fesler and Kettl 1991). In fact, federal regulatory agencies have won approximately 70 percent of their Supreme Court cases since 1953 (Sheehan 1990). But not all agencies have equal expertise, legal counsel, or policy complexity (Rourke 1984, 92). It is therefore likely that agency expertise affects agency compliance with court decisions. Agencies with sophisticated and expert staffs of lawyers and policy makers are better able to present credible and convincing legal arguments as well as creatively interpret court opinions[14]. Likewise, the complexity of an agency's policy not only improves the chance of a court deferring to it, but complexity also makes an agency more likely to resist judicial oversight.

The expertise and resources of an agency's opponents also matter. I predict that agencies are more likely to implement court decisions the greater the resources of their legal opposition. Resources increase a party's ability to pursue litigation, withstand delay, and credibly make commitments and threats. That is, resources enhance a party's bargaining position vis-a-vis an agency. Litigants with resources can pursue agency compliance, and the likelihood of future court enforcement and the possibility of sanctions against an agency are therefore increased.

An agency's organizational structure conceivably influences the extent to which courts influence agencies' policies. Four basic structures exist: independent regulatory commissions (e.g. OSHA), department bureaus and agencies (e.g. Defense, Agriculture), independent agencies (e.g. EPA), and government corporations (e.g. Post Office, Tennessee Valley Authority) (Meier 1985, 17-29). One salient distinction between these structures is agency linkages with political principals. Independent regulatory commissions are independent of the president and report directly to Congress. Department bureaus and agencies comprise the thirteen executive departments and their bureaus, which report directly to the president. Independent agencies are independent of the thirteen major departments, but they too report directly to the president. Government corporations are theoretically the most insulated from political oversight by the president or Congress. The implication is that agency structure promotes or hinders oversight by Congress and the president, which influences the judiciary's ability to impact agencies. Agencies more closely tied to one of their political principals are presumably more responsive to that branch of government. Quantitative analyses lend support to this hypothesis (Wood and Waterman 1990; Wood 1990; Wood 1988; Moe 1985). Given a divergence in the preferences between the courts and an agency's "political" principals, I expect agencies to follow the Congress or president, given that they control needed resources.

One other structural feature influences agency responses. Many agencies' orders are not self enforcing. They are actually judicially enforced. For example, the NLRB must convert its

---

[14]While the Solicitor General's office often represents agencies (or is at least on their brief) at the Supreme Court, it is still the agencies responsibility to implement the Court's opinion.

unfair labor practice orders into judicial decrees by asking a court of appeals to enforce them. I expect an agency will be more likely to comply if the policy at issue must be judicially enforced in that the courts directly control the agency's ability to regulate.

Finally, the political environment influences to what extent court decisions are followed by agencies. It places opportunities and constraints on an agency's implementation of a court's decision (see Rodgers and Bullock 1972, 185-188; Shapiro 1968, 215; Levine 1970; Johnson 1979a, 45-46). That is, elite commentary can damage or improve an agency's credibility and, therefore, its ability to thwart a court's decision. If elites respond to a court decision in a unified manner, then an agency's bargaining position changes. Favorable commentary enhances an agency's bargaining position, while criticism decreases an agency's power. If responses are divided, however, such elites have less influence on the court-agency interaction. I consider four environmental factors: interest groups, Congress, presidents, and media attention.

To reiterate, I hypothesize that agencies and courts engage in an implicit bargaining game. Agencies respond to court decisions based upon their policy preferences and resources. Together, these two factors define the agencies zones of acceptance. I expect agencies to manifest less policy change and more noncompliance the larger the disparity between their decisions and the courts'. While agencies view less policy change (and more noncompliance) as better than more, the tradeoff between policy distance and policy change (and noncompliance) is a function of their resources. An agency's payoff for policy change (and compliance) changes with resource levels. That is, the marginal utility of not altering policies decreases less quickly under high resource conditions. It follows that an agency's ultimate response to a court decision will be a policy choice as close to its original decision as is consistent with available resources.

RESEARCH DESIGN AND DATA

I begin to address this question by examining every Supreme Court case which reverses and/or remands an agency's decision from 1954-1990.[15] I explore agency responses by comparing agency decisions both before and after the Court's opinions. I use numerous informational sources, including LEXIS, *The Federal Register*, *The Code of Federal Regulations*, agencies' bound decisions, personal conversations with agency personnel, and Freedom of Information Act (FOIA) requests. In so doing, I can measure compliance with the Court's rule and change to an agency's policy.

---

[15]I use the United States Supreme Court Judicial Data Base to identify every case (through the 1988 Term) in which agency action preceded the case or an agency was a litigant and lost; I code the remaining years. I then read the Court's opinions to learn if an agency lost on the merits.

I start my investigation with the Supreme Court for two principal reasons. First, I argue that much impact research suffers from selection bias (see Mohr 1988). Their conclusions are partly a function of the sample of cases they examine. Generalizability largely depends upon the extent to which a sample is representative of the population to which the researcher wishes to generalize. Strictly speaking, generalizations require that the causal relations hold for other times, settings, subjects, and the like. The generalizability of a study involving one agency or court decision is, thus, suspect. I therefore investigate every Supreme Court case from 1954 through 1990 to provide an unbiased sample of decisions. By eliminating selection bias, I can make generalizations with regard to the Supreme Court's impact during this time period.

Second, the Supreme Court is the judicial body most capable of motivating agency change. In terms of my theory, the Supreme Court controls greater resources than any other American court. First, its opinions are the law of the land. That is, the Supreme Court is the court of last resort. In fact, it theoretically needs only write one rule to influence an agency. Lower courts will presumably follow the Supreme Court's rule and reverse agency decisions falling outside of it. While a moral hazard problem certainly exists with regard to lower court compliance, the Supreme Court may write rules to maximize the uniform application of its opinions by federal appellate courts (see Strauss 1987).

Agency litigation also involves at least two repeat players--the agency and its opponent. Agencies are typically sued by corporations, small businesses, unions, trade associations, and public interest groups. These actors are repeat judicial players who typically possess some minimum level of legal and financial resources (see Galanter 1974). Such litigants face few start-up costs if they wish to take an agency back to court; that is, the marginal cost of relitigating the case is fairly small, even smaller than initially pursuing litigation. It therefore follows that such litigants will, in the face of agency noncompliance, quickly return to the judiciary. In short, if courts cause policy change, I expect to find it in this Supreme Court sample.

Agency policy is defined in a straightforward way: as rules, orders, and informal actions.[16] I operationalize it as two discrete scales measuring compliance and policy change. I

---

[16]The Administrative Procedure Act (APA) defines a rule as "an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy" (§ 551(4)). An order is a "matter other than rule making but including licensing . . . ," and is produced by an adjudicatory process (§ 551(6)-(7)). Informal actions are a residual category not mentioned in the APA (see *Citizens to Preserve Overton Park, Inc. v. Volpe* 1971). They include numerous agency decisions, such as selection of persons for grants or benefits, prosecutorial discretion, product seizures, and adjudications not required to have hearings (see § 554(a)).

conceptualize compliance as: defiance, evasion, narrow compliance, and compliance.[17] First, defiance is an agency's overt refusal to follow a court decision. Operationally this means: (1) an agency explicitly states that it is not bound by a court's decision; (2) an agency reaffirms its prior action without considering the court's opinion; or (3) it issues the same decision without a new administrative proceeding, even though judicially required to have one. Second, an agency evades a court decision when it attempts to avoid judicial-ordered change to its policy. For instance, an agency may initiate new hearings on a matter but simply reissue the same policy that was previously reversed. Third, narrow compliance represents situations in which an agency attempts to narrowly interpret an opinion. That is, an agency implements a court's rule, but it does so in a way that does not give full effect to the opinion. Fourth, agencies comply when they fully implement the rule delineated by a court.

Policy change is also measured as a discrete scale. I determine a court's influence on the substance of policy because agency compliance can yield varying amounts of policy alteration. For example, an agency may comply with a court's rule to grant a hearing, but this action may not translate into substantive policy change. The scale is the following: (1) no policy change; (2) minor policy change, such as new legal justification, new evidence, and small, but substantively meaningless, modifications; (3) moderate policy change, involving substantive policy change but not complete alteration; and (4) major policy change, meaning a complete or nearly complete transformation of the reviewed action.

While I ultimately intend to test directly my theory using statistical techniques, I do not do so here. Indeed, as the reader will soon see the nature of the agencies' responses somewhat precludes any rigorous statistical analysis. The agencies' responses--especially for compliance--largely fall within one category, which, statistically speaking, means there is not much variance to explain. Nevertheless, I include my independent variable operationalizations in the appendix.[18] Despite this finding, I think that my research offers several insights into the strategic behavior of agencies and courts.

---

[17]For a similar approach to higher courts' influence on lower courts, see: Songer 1988; Songer and Sheehan 1990.

[18]In a study of this nature, the validity and reliability of my measures are central concerns (Krippendorff 1980, 129-168; Weber 1990, 17-21). Political scientists typically use proxies for theoretical variables. As a result, such indicators conceivably contain measurement error. My measures are no different. They represent surrogates for the theoretical factors of interest. I therefore ultimately intend to furnish reliability statistics on stability and reproducibility (Krippendorff 1980, 129-154; Johnson 1987b; Songer and Sheehan 1990).

FINDINGS

COMPLIANCE

Administrative agencies frequently litigate. In fact, from 1954 through 1990, federal administrative agencies were litigants in 948 Supreme Court cases. If we include cases in which the United States was a party and represented an agency, then this number increases to 1220.[19] What is more, Figure 1 displays the percent of cases in which federal administrative agencies lost as litigants before the Supreme Court from 1954 through 1990. In the aggregate, federal agencies lost only 29 percent of their cases before the Court.

[Figure 1 about here]

But an agency loss does not necessarily mean that the Court attempted to direct any policy change. The Court may write a rule that has no direct substantive policy implications. It may simply state that a federal district court has the power to review an agency decision, decide that a party has standing, or pass on some other issue that does not reverse an agency policy choice. Figures 2 and 3 provide the number and percent of Supreme Court cases reversing agency decisions on the merits.[20]

[Figures 2 and 3 about here]

Agencies participate in numerous cases, but they are not often reversed on the merits. Between 1954 and 1990, the Court chose to reject an agency decision in 199 cases, involving 49 different federal agencies.[21] Table 1 lists the agencies which have had decisions reversed by the Supreme Court. On average, the Court annually reversed 5.4 decisions on

---

[19]Each Supreme Court citation is one observation. If a citation has multiple dockets within it, then I count more than one docket only if an agency truly won and lost separate cases.

[20]This latter value is the number of Supreme Court cases reversing agencies on the merits divided by the total number of cases in which agencies were either parties to the case or the United States was the party and at issue was an agency action (both exclude the Internal Revenue Service (IRS) in that I am still attempting to ascertain how to track their decisions over time).

[21]Again, this excludes the IRS.

the merits, or 19.6 percent of cases involving agencies. While the Court's willingness to reverse an agency's decision--both in the number and percent of cases--varies somewhat, there is a certain continuity running through all of these cases: the Supreme Court typically engages in statutory interpretation.

[Table 1 about here]

In 155 cases (78%) the Supreme Court overturned an agency's decision because it was based upon an incorrect interpretation of a congressional statute; and 21 more ruled that an agency action or a congressional statute administered by an agency was unconstitutional. In fact, the Court used traditional administrative law doctrine to reverse an agency in only 11 cases. In interpreting statutes, the Court outlined a specific rule, or the correct way to interpret a statute. This rule presumably guides agency interpretation and implementation, thereby constraining future policy choices. From a strategic point of view, this finding makes sense. If the Court wishes to influence policy outcomes, then the most effective way to do so is by interpreting the legislation agencies implement. The question, though, is how the Court actually influences agencies with this rather small set of opinions mainly interpreting various statutes?

[Table 2 about here]

Table 2 displays the agencies' responses to Supreme Court opinions as categorized by my typology.[22] First, in no case did an agency defy the Supreme Court. I found no agency response indicating that it would not abide by a Supreme Court opinion. Nor did I locate any cases in which an agency simply ignored the decision and did nothing or refused to grant hearings when judicially required to do so. Second, I also observed no evasion by federal agencies. In no case did I ascertain that an agency clearly failed to implement a Supreme Court decision.

Agencies did, in 9 cases, engage in what I term "narrow compliance." While these agencies did not flout the Court's authority, they interpreted the Court's rules to minimize policy change. For example, in *Hotel Employees v. Leedom* (1958), the Court rejected the NLRB's longstanding policy of not asserting jurisdiction in the hotel industry. In response, the Board stated:

> The Board is, therefore, required to exercise jurisdiction in cases arising in the hotel industry. However, this does not mean that the Board must assert jurisdiction in all such cases. . . . [and we] limit such jurisdiction to those cases involving hotel and motel enterprises, exclusive of permanent or residential hotels and motels, which receive at least $500,000 in gross revenues per annum (124 NLRB 261, 264).

---

[22]Nineteen cases are missing data. I have FOIA requests under administrative review.

The NLRB basically complied with the Court's rule in that it asserted jurisdiction. But the Court said little with regard to whether the Board could limit its authority. And the Board decided not to regulate small hotels. This response constitutes narrow compliance in that the agency attempted, within the parameters of the rule, to limit change to its original policy position.

In 164 cases (91% of those located), the agencies complied with the Court's rule in full. Within this category there are two types of responses--action and no action. Action means the agency actually issued a decision to comply with the Court (N=102). No action means an agency was simply required to drop a proceeding (N=61). The latter type of case is represented by NLRB unfair labor practice orders. If the Court refuses to enforce the Board's order against a company or union, then the Board complies by dropping the order.

Two examples suffice to give the reader a sense of what compliance looks like. In *Public Service Commission v. FPC* (1959), the Court vacated an FPC order (20 FPC 264) because it did not provide sufficient evidence that a certificate providing for an increase in prices producers could charge for gas was in the public convenience and necessity. The Commission admitted that its earlier decision was "erroneous" and that the record did not justify the producers' prices (27 FPC 482, 484). It therefore voided its past decision and lowered the price producers could charge for gas.

A second example is *Diamond v. Chakrabarty* (1980). The Court rejected the Patent and Trademark Office's (PTO) decision that man-made bacteria were not patentable, in this case a bacteria that breaks down crude oil. It ruled that such living organisms are "manufacture" or "composition of matter" and are, thus, patentable under congressional legislation. In response, the PTO issued a patent (patent #4,259,444).

Another measure of agency compliance (and Supreme Court vigilance) is the number of times the Court reviews an agency's direct response to one if its opinions. In only five cases in this sample did the Court do so. In two of them--*FTC v. Standard Oil Co.* (1958) and *NLRB v. Longshoremen Ass'n.* (1985)--it reversed the agencies' responses. And in three others it affirmed agency action. In *Communist Party v. Subversive Activities Control Board* (1960), the Court upheld the agency's decision on remand to order the Communist party to register as a Communist-action organization. The Court, in *Penn Central Merger Cases* (1968) also upheld the ICC's decision on remand with regard to a railroad merger (30 ICC 328). And in *United Gas v. Callery Properties* (1965) the Court upheld the FPC's decision on remand to recalculate and lower the price producers can charge for gas (30 FPC 283).[23]

---

[23]The Court also overturned one of its own decisions, *National League of Cities v. Usury* (1976) in 1985, which had the effect of reestablishing the Department of Labor's policy regarding the application of the Fair Labor Standards Act to employees of states and their political subdivisions.

An example of the Court twice reversing an agency is the following. In *NLRB v. Longshoremen Ass'n*. (1980), the Supreme Court remanded an NLRB decision (236 NLRB 525) that the Rules on Containers were illegal. The Rules on Containers are a negotiated contract between the International Longshoremen's Association and various employer associations representing east coast shipping lines. The agreement protects certain occupations against loss of jobs due to technical innovations in cargo transportation. Specifically, it requires that some cargo containers owned or leased by marine shipping companies that otherwise would be loaded or unloaded within local port areas instead by loaded or unloaded by longshoremen at the piers. The Court specifically ruled that the Board had incorrectly defined work as a matter of law. It also formulated a test for examining work performed by different employees to determine whether it can be protected by the agreement.

On remand, the NLRB found that the rules were not per se illegal but only illegally applied against two particular occupations--"shortstopping truckers" and "traditional warehousers" (266 NLRB 230). This decision was not "evasion" in that the Court did not find that the rules were illegal; rather, it remanded that decision to the Board. The NLRB used the Court's definition of work and applied the proper test. But it did so in such a way that these two occupations fell outside of the parameters of the Court's rule. It manifested narrow compliance.

The Supreme Court, in *NLRB v. Longshoremen Ass'n*. (1985) refused to enforce the Board's second order. The Court held that the Rules on Containers are a lawful work preservation agreement, even as applied to these two particular occupations. In response to this second Supreme Court ruling the Board complied, saying:

> We agree with the Respondents, the Intervenor, and the General Counsel that the Supreme Court decision holding that the Rules on Containers are a lawful work preservation agreement, even as applied to warehousing practices, disposed of all of the issues in this case (276 NLRB 162, 162).

Overall, 199 Supreme Court opinions reversed agency policies on the merits. In 164 cases (of the 180 located), the agencies fully complied with the Court. And agencies only narrowly complied in eight cases. If we conceptualize the Supreme Court's impact in terms of compliance, then it has a significant effect on federal administrative agencies.

POLICY CHANGE

While agencies may comply with the Supreme Court, this does not necessarily translate into substantive policy change. It is conceivable that the Supreme Court merely requires an agency to engage in an evidentiary hearing, provide a new rationale for a policy, or the like. It is therefore necessary to investigate how agency policies change as a result of Supreme Court opinions.

[Table 3 about here]

As noted in Table 3, the Court causes a considerable amount of policy change. In fully 89 percent of the cases (161 of 180 located), agencies somehow altered their policies. And in 128 cases (71%) agencies completely reversed prior decisions. Indeed, in only 18 cases did agency outcomes not change after the Court ruled. I present a few examples to give the reader a sense of the nature of these decisions.

A typical example of full policy change is the following. The Court, in *Zuber v. Allen* (1969), invalidated the Department of Agriculture's policy requiring milk distributors located in milk marketing areas to pay nearby farmers higher prices for milk than farmers located greater distances from such areas (29 Fed. Reg. 12236). The Department responded by deleting the regulations at issue:

> The provisions have now been struck down by the Supreme Court . . . [and] can no longer be considered as effectuating the declared policy of the Act and therefore should be terminated (35 Fed. Reg. 353, 353).

Another example of total policy change is *Train v. New York* (1975). The Court instructed the EPA that it could not allocate to the states less than the entire amount Congress appropriated for water pollution regulation. In a November 22, 1972, letter President Nixon had directed the Agency to "impound" the funds. The EPA, after the Court ruled, allocated the money it had previously withheld (40 Fed. Reg. 8349).

An illustration of moderate policy change comes from a case mentioned earlier. *Hotel Employees v. Leedom* (1958) required the NLRB to assert jurisdiction in the hotel industry. The Board did so, but it limited authority to hotels/motels with gross revenues exceeding 500,000 dollars. Thus, the policy changed but not completely. Another example is *FCC v. American Broadcasting* (1954). The Federal Communications Commission (FCC) promulgated a rule denying licenses to radio or television stations having "give away" programs in that they were lotteries (47 C.F.R. § 3.192, 3.292, 3.656). The Court reversed the Commission on statutory grounds, ruling that the distribution of prizes by random is not a lottery as defined by Congress. The FCC rescinded the regulation, but it kept in force the remainder of the program regarding proscribed lotteries (19 Fed. Reg. 3054). Thus, a partial policy change occurred.

American Textile Mfrs. Inst. v. Donovan (1981) caused minor policy change. The Occupational Health and Safety Association (OSHA) created the "Cotton Dust" standard, which sought to protect workers from "brown lung" disease (29 C.F.R. § 1910.1043(f)(2)(v)). The Court held that the wage guarantee requirement--guaranteeing no loss of wages for workers moved to avoid exposure--lacked sufficient justification. OSHA therefore initiated a new rulemaking and initially decided to delete the provision entirely. Ultimately, the agency retained ". . . a limited wage retention provision" to meet health needs (50 Fed. Reg. 51120, 51156).

Bill Johnson's Restaurant v. NLRB (1982) also caused minor policy change. The NLRB ordered the owners of Bill Johnson's Restaurant to withdraw a state court complaint against striking employees because it had a retaliatory motive. The Court held that prosecuting unmeritorious lawsuits for retaliatory purposes is not an unfair labor practice. The Court crafted a rule saying that the NLRB can enjoin retaliatory lawsuits only if they lack a reasonable basis in law or fact. On remand, the NLRB utilized the Court's test and determined that the lawsuit had a retaliatory motive and was without merit. The Board therefore accepted a settlement agreement which required the restaurant to drop its lawsuit and also pay the legal expenses of the employees (290 NLRB 29).

Finally, ***Weinberger v. Hynson*** (1973) caused no policy change. In this case, the Court upheld Health Education and Welfare (HEW) regulations requiring new drugs to prove their effectiveness. But it ruled that Hynson, Westcott, and Dunning was entitled to a hearing on its new drug application for Lutrexin. The FDA granted the company a hearing, and denied Lutrexin's application since it failed to prove its effectiveness (41 Fed. Reg. 14406). There was no change to HEW's initial rejection of Lutrexin's application.[24]

It is also instructive to get a sense of the direction of this policy change. I classified each agency decision as either liberal or conservative and then examined how it shifted after the Court ruled. The Supreme Court caused agencies to move from conservative to liberal decisions in 104 cases. It produced shifts from liberal to conservative in 46 cases. And it caused no ideological change in 22 cases--12 liberal and 10 conservative agency decisions.[25] When the Court caused change, it did so overwhelmingly in a liberal direction.

[Tables 4 and 5 about here]

But does this effect vary over time? Given that justices base their decisions upon policy preferences--even in cases involving economic regulation (Segal and Spaeth 1993; Spriggs 1992; Sheehan 1990)--then there should be variation in ideological effects over time. Table 4 shows the raw number of decisional outcomes during the Warren, Burger, and Rehnquist Courts. Warren Court opinions produced liberal agency decisions in 74 percent of the cases; and the Burger and Rehnquist Courts caused liberal responses in 50 and 83 percent respectively, for a combined percentage of 68. It is clear that the Warren Court caused agencies to move in a liberal direction, and that the Burger Court caused roughly equal

---

[24]There is enough variance on policy change to estimate a model. Unfortunately, gathering the dependent variables required much more time than I anticipated. I am therefore still gathering independent variable data. I suspect that most of the variance in policy change is explained by policy distance; and the simple correlation between policy distance and policy change is .51.

[25]The three numbers do not equal 199 because some decisions are not clearly conservative or liberal (and there are the 19 missing observations).

changes in liberal and conservative directions.[26]

Table 5 shows the difference in the average number of liberal and conservative agency responses during the Warren and Burger/Rehnquist Courts.[27] A test of means demonstrates that this difference is statistically significant at less than a .05 level of confidence. That is, it is unlikely that random error produced the distribution of agency responses in this sample of data. Rather, the relatively liberal Warren Court caused liberal change to agency decisions and the more conservative Burger (and Rehnquist) Court caused conservative change.

Finally, of the 18 agency decisions that did not change, six of them resulted from congressional or presidential action. Congress responded five times by rewriting statutes to support agency policy positions. For example, in *TVA v. Hill* (1978) the Court informed the Tennessee Valley Authority (TVA) that it could not take any action jeopardizing endangered species' habitat. The Justices upheld an injunction against the nearly completed Tellico Dam on the Little Tennessee River, which endangered the snail darter. The Court ruled that Congress had clearly spoken in the Endangered Species Act--giving endangered species priority over the "primary missions" of federal agencies (437 U.S. 153, 185). Congress, though, subsequently provided the Tellico Dam project an exemption from "any other law."[28] And the project was completed.

The president formally responded to the Court after one case, *Hampton v. Mow Sun Wong* (1976). The Court held that the Civil Service Commission's (CSC) regulation barring resident aliens from employment in the competitive civil service was an unconstitutional violation of due process (5 C.F.R. § 338.101(a)). The opinion, though, suggested that the regulation would be legitimate if it had express congressional or presidential authority. President Ford therefore issued Executive Order No. 11935, which upheld the Civil Service Commission's regulation. Thus, the CSC retained its policy.[29]

---

[26]The Rehnquist Court surprisingly caused liberal change in a fairly high percentage of its cases. These data, though, only cover five years and amount to 27 cases.

[27]I combined the Burger and Rehnquist Courts because theoretically (though we see perhaps not empirically) the two are both conservative, and methodologically the Rehnquist Court has a fairly small N.

[28]It did so in P.L. 97-304; and the Supreme Court refused certiorari for 620 F.2d 1159, which upheld the TVA's completion of the dam.

[29]The Court also denied certiorari for 626 F.2d 739, which upheld the agency's action.

DISCUSSION

I argue that judicial opinions are institutions, or ". . . sets of rules that structure social interactions in particular ways" (Knight 1992, 54). These rules guide future courses of action and influence the distributional consequences of executive branch policies. But I also hypothesize that the implementation of these rules is a political process. I expect the courts' effects to vary by the prevailing preferences and resources of courts and agencies. What, then, do these data say with regard to my theoretical framework?

The most basic conclusion is the following: the rule of law, as delineated by the Supreme Court, is followed by agencies in the instant decisions before the Court. The rules in these cases fundamentally constrained the agencies' behavior. They forced the agencies to rescind regulations, change orders, drop proceedings, and the like. The Supreme Court does have an impact, and it is fairly robust.

But why do agencies comply and change their policies when directed to do so? If we listen to what agencies proclaim, then the answer is quite simple. After the Court ruled that the Civil Aeronautics Board (CAB) had incorrectly calculated an air carrier's subsidy mail pay (paid to the carrier by the Postal Service), the agency said:

> Regardless of how desirable we might still believe the result the Board previously reached in this case is, our clear duty is to follow the best of our understanding the views of the courts on the matter (21 CAB 1, 2).

The CAB's response suggests that it had a normative duty to comply. But how is it that the Court compels agencies to adopt policies they otherwise would not choose? I think the answer lies in the nature of the strategic interdependencies between agencies, the Supreme Court, and other involved social actors.

Court opinions affect strategic decision makers through two principal mechanisms--by providing information and signalling sanctions (Knight 1992). First, rules provide actors with information necessary to formulate expectations about the actions of those with whom they interact. The Court's opinions do so by altering actors' expectations of how the judiciary and agencies will rule in the future. It changes the framework within which decisions are made by interpreting statutory language. All actors can then choose strategies that they think will maximize their individual interests given the understanding that the agency will comply (see Knight 1992, 48-55).

This information is important because of the interdependencies existing in strategic situations. Agencies, courts, and other actors all act intentionally toward goals. Their combined actions produce social outcomes. These outcomes are a function of their mutual choices, and the choice (and payoff) of one actor affects the choices (payoffs) of other actors (Elster 1986, 7; Knight 1992, 48-83). Indeed, the Court's rules are produced through an adversarial process, with actors seeking rules providing them with distributional advantages (see Galanter 1974).

These "repeat players" all want to place constraints on those with whom they interact. The Court's rules provide these constraints and impose structures within which public policy is crafted and implemented.

Second, the Court's rules are accompanied by sanctions to be imposed in the event of noncompliance. While the Supreme Court does not directly control implementation, it at least signals that it, and presumably lower courts, will not tolerate agency actions outside the parameters of its rules. The question is why such a threat is credible and substantial enough to motivate agency compliance? The answer, again, lies in the nature of the strategic interdependencies of these actors.

In a certain sense, Supreme Court opinions are externally enforced institutional rules (see Knight 1992, 59-64). They do have enforcement mechanisms. Agency decisions can be reversed, agency officials can be held in contempt of court, special masters can be appointed, and administrators can be held personally liable. Thus, pursuing overturned strategies imposes costs on agencies. If these costs are sufficiently large, and judicial enforcement is likely, then agencies comply. In such situations, the Court has effectively constrained an agency's set of alternative policy choices. It has exercised power over an agency (see Knight 1992, 41).

I think this logic explains why we observe overwhelming agency compliance with Supreme Court opinions. The Supreme Court writes a general rule regarding an agency's statutory obligations. In so doing, it reverses a particular rule, order, or other administrative action. The Court is telling an agency that its decision is no longer in the set of legally acceptable outcomes. If an agency chooses to pursue the strategy anyway, then it will likely be sanctioned.

As I indicated earlier, enforcement is likely given that the agencies' adversaries are repeat players. The threat of a rule being enforced is quite high, at least with regard to the instant decision. For example, my data show that of the eight narrowly compliant agency responses, the Court reviewed two of them and reversed both. Moreover, agencies can not reasonably expect that Congress or the president will protect their policies from the Court. They supported an agency in only 6 (of 197) cases. Thus, it is unlikely that agencies perceive them to be a significant resource in their interaction with the Court.

In strategic terms, an agency's payoff for pursuing a reversed decision has been lowered. The Court has imposed costs on an agency for remaining steadfast to a policy. In fact, noncompliance requires that agencies believe the payoff from a rejected policy is greater than all future payoffs from continued interaction with the Court. Interactions between agencies and the Supreme Court are repeated and, in a sense, infinite. Recall that from 1954 through 1990 agencies (and the U.S. on behalf of agencies) were litigants in 1031 cases. Neither foresees any end to their interaction and both have an expectation that they will meet again.

In this sense, agencies are concerned about their reputations. Reputations are based upon

past behavior and they reveal something about preferences and resources (Binmore 1990, 24-26). Agencies do not want to be perceived as intransigent law breakers. The fact that agencies desire a good reputation may explain why they choose to comply with the Court even though there is no obvious immediate advantage. It is in their long-term interest to do so in that noncompliance may reduce the future probability of winning in the Court.

It is necessary to briefly consider an alternative explanation for the Supreme Court's impact. The primary competing hypothesis is that agencies view compliance as their normative duty. The earlier CAB quote suggests that the Court is an authoritative body, and agencies *should* therefore comply. According to this theory, agencies have certain policy preferences, but they discard them as soon as the Court rules.

My principal criticism of this idea is that it lacks an enforcement mechanism. Agencies are strategic actors. It is not in their interest to simply abandon policies unless they think they *must*. They do so because their feasible sets have been effectively constrained. But there must be some mechanism which limits their choices and compels compliance. I argue that the Supreme Court's resources--the information in its decisions and sanctions for noncompliance--provide such a mechanism. It allows the Court to provide a structure within which agency policies are formulated and implemented.

CONCLUSION

My data indicate that the Supreme Court exerts impact on the federal administrative agency decisions it reviews. It causes agency compliance and policy change. Agencies fully complied in 91 percent of the Court's cases. And 89 percent of the cases generated policy change. In fact, the Court caused full policy reversal in 71 percent of the decisions it reviewed.

I argue that the explanation for this behavior lies in the strategic interdependencies between agencies and the Supreme Court. The Court delineates formal rules in its opinions that constrain agency behavior. They communicate important information and impose costs for noncompliance. Agencies rationally choose to comply because the payoff for noncompliance is lower than the payoff from compliance plus the payoffs for future interactions with the Court.

But what are the broader implications of my study. I think these findings have something to say with regard to a current debate among judicial scholars: Do courts matter? In *The Hollow Hope* (1991), Gerald Rosenberg argues that ". . . U.S. courts can *almost never* be effective producers of significant social reform. At best they can second the social reform acts of other branches of government" (Rosenberg 1991, 338).

My study demonstrates that the Supreme Court, both theoretically and empirically, influences social outcomes. Its rules create structures within which agencies make policy. And these

rules directly affect the distributional consequences of executive branch decision making. They have tangible effects on the distribution of policy benefits and costs. What is more, the Court causes such effects without simply following the actions of other branches of government.

I further think that judicial scholars should define impact on social outcomes more broadly than "significant social reform." Instead of asking whether courts can produce ". . . the wholesale reshaping of bureaucracies" (Rosenberg 1991, 19), we should investigate how the courts constrain agency policy choices. If a court limits an agency's feasible set--the available policy alternatives--then it has exerted power over the agency. And these rules have profound implications for the outcomes of agency decisions and social outcomes.

The introduction listed five Supreme court cases with potential economic, political, and social consequences. In each case, the Supreme Court delineated a rule which attempted to constrain agency policy. And each one changed social outcomes--the pattern of distributional consequences. *NLRB v. Catholic Bishops of Chicago* (1970) ended the NLRB's regulation of church-run elementary and secondary schools. *Diamond v. Chakrabarty* (1980) allowed micro-organisms to be patented. *Public Employees v. Betts* (1979) terminated the EEOC's authority over discrimination in employee benefit plans (at least until Congress responded). *Train v. New York* (1975) required the EPA to fully allocate congressional appropriations. And *American Ship Building Co. v. NLRB* (1965) ruled that it is not an unfair labor practice for an employer, after bargaining to an impasse, to close plants and lay off employees solely to put economic pressure on striking workers. The agencies, in all of these cases, complied with the Court and changed their policies. Consequently, they had a significant impact upon different societal interests by redistributing the costs and benefits of public policies.

But these findings do not provide a full picture of the judiciary's influence on agencies. While it is fairly clear that the Supreme Court influences the decisions it directly reviews, the impact beyond these decisions is less apparent. Thus, I think there are three directions for future research which will further illuminate the courts' impact on federal administrative agencies.

First, my data say little with regard to how agencies interpret and implement the Supreme Court's rules in future decision makings. It is conceivable that agencies comply in the instant cases before the Court but then manifest noncompliance in future proceedings. The question becomes the following: do agencies implement the Court's rules when they should, interpret them correctly, and then appropriately apply them to legal and factual circumstances? In other words, what are the Supreme Court's broader social effects. I examine this question by studying agency decisions that are factually and legally similar to past Supreme Court opinions.

Second, these data do not address the lower courts' impact on agencies. It is common knowledge that some agencies, among them the NLRB and the Social Security Administration (SSA), have refused to acquiesce to lower court rulings which are adverse to

their interests (Schuck and Elliot 1990; Estreicher and Revesz 1989). I located several examples in my sample in which an agency indicated that it would not follow the lower court unless and until the Supreme Court ruled on the issue. But no one has attempted to explain or empirically verify under what conditions agencies refuse to accept lower court rulings. I therefore intend to investigate the influence of the Federal Courts of Appeals on agency policies.

Third, the amount of time required for an agency to comply with a court arguably reflects strategic considerations. The basic hypothesis is that protracted agency responses will occur when policy distance is greater and agency resources are abundant (Johnson 1979a). I examine the number of months between a court decision and an agency response and explain it with my theoretical framework.

These data will provide me with several ways of statistically estimating the judiciary's influence. For example, I can use maximum likelihood (with a logit distribution) to explain the variance in the agencies' implementation of the courts' rules over time. Further, I can use Box-Jenkins models to estimate whether particular court decisions affect agency policies and social outcomes (see McCleary and Hay, 1980, on time series analysis). I can therefore more directly test my theory with both aggregate and individual level data.

In conclusion, this research will hopefully begin to both theoretically and empirically address why courts influence agency policies and social outcomes. I think the courts, especially the Supreme Court, possess resources capable of causing change. And an understanding of this political process requires one to investigate the strategic relationship between courts and agencies. In particular, we must study the preferences and resources of both organizations to explain the judiciary's impact on executive branch decision making and social outcomes.

APPENDIX: INDEPENDENT VARIABLE OPERATIONALIZATIONS

POLICY DISTANCE: 1 for a procedural ruling with no real substantive policy change required, 2 for small substantive change demanded, 3 for requirement of moderate policy change, and 4 for complete policy reversal.

OPINION CLARITY: 4, 3, 2, or 1, for very explicit, explicit, somewhat explicit, and not explicit at all.

COURT CONSENSUS: the number of concurrences and dissents, with concurrences weighted by 1 and dissents by 2.

ADMINISTRATIVE PROCEEDING: 0 for orders and 1 for rules.

QUESTION TYPE: 0 for fact, 1 for mixed, and 2 for law.

SANCTIONS: 1 if Court has power to enforce board's orders, 0 otherwise.

RULE REITERATION: 0 if the rule is new, and 1 if the court is reasserting a rule.

SCOPE OF REVIEW--TIME: 0 before 1978, and increasing annually by 1/8 through 1984, when it achieves 1.

OPPOSING GROUP'S RESOURCES: the difference between the agency and opponent based on an ordinal scale with 1 for individuals, 2 for unions, 3 for small businesses (owner-proprietor, realtors, restaurants), 4 for businesses (between 3 and 5), 5 for corporations (airlines, railroads, banks, oil companies, etc.), 6 for local governments, 7 for state governments, and 8 for the federal government.

OPPOSING COUNSEL EXPERTISE: the number of times the attorney (and group) appeared before the Court in the sample.

AGENCY COUNSEL EXPERTISE: the number of times the agency appeared before the Court in the sample; and the number of full time employees on the legal staff; and the number of times the attorney appeared before the Court.

POLICY TECHNICAL COMPLEXITY: 1 for not complex, 2 for somewhat complex, 3 for complex, and 4 for very complex.

ORGANIZATIONAL STRUCTURE: 1 for independent regulatory agencies, 2 for executive departments, and 3 for independent agencies;

CONGRESS: the annual budgetary and personnel growth rate allowed by Congress.

PRESIDENT: the growth rate of the executive budget for the agency.

MEDIA ATTENTION: the number of favorable articles toward the agency in the *New York Times* index minus the number of unfavorable ones.

INTEREST GROUPS: the number of amicus briefs supporting the agency's policy minus the number opposed to it.

Abstract

Analyses of international environmental policy largely focus on international or systemic variables rather than on the domestic factors which shape national preferences for international environmental regulation. This article tries to overcome this research gap by suggesting a theoretical model which builds on comparative political theory.

In particular, a mass political pressure component is developed by combining theories of postmaterialism, new social movements, and electoral support for green or ecological parties. In addition, an industry pressure component is derived from comparative political theories which stress the importance of technological and ecological factors of environmental regulation. In combination, the research design amounts to a specification of the "capacity hypothesis" suggested by Prittwitz.

The hypotheses of the theoretical model are tested with mass public attitude data and expert data of the regulation of acid rain in Europe. The empirical analyses generally support the theoretical model and lend credibility to the capacity hypothesis of international environmental regulation.

Acknowledgments

For helpful comments on earlier versions of this article, I would like to thank Harold K. Jacobson, and James D. Morrow, Gayl D. Ness, Gerald Schneider, and Ernest Wilson III. Funding for this research by the Institute for the Study of World Politics (Washington, D.C.), the Population-Environment Dynamics Project (School of Public Health, The University of Michigan), the Horace H. Rackham School of Graduate Studies (The University of Michigan), the MacArthur Program for International Peace & Security Research (Center for Political Studies, The Institute for Social Research, The University of Michigan), and the Germanistic Society of America (New York, NY) is greatly appreciated. In addition, the Department of Political Science, The University of Michigan, provided generous computational support. Minor parts of Section 1 have been taken from Sprinz (forthcoming).

The most portentous development in the fields of comparative politics and international relations in recent years is the dawning recognition among practitioners in each field of the need to take into account entanglements between the two.

Robert D. Putnam

1. Introduction

International environmental regulation can be conceptualized as the reactions of national governments to international pollution exchange and domestic political processes. While there has been a proliferation of theories and studies of the impact of pollution on a country's preferences for international environmental regulation (see below), very little is known about the domestic political *processes* which are associated with the regulation of the international environment. The purpose of this article is to fill this gap in social science knowledge on the protection of the international environment.

If a country's exposure to pollutants of foreign origin is conceptualized as the major *international* source of environmental regulation, theories of interdependence (Keohane/Nye 1989), the foreign environmental policy approach (Prittwitz 1990a), and extensions thereof (Sætevik 1988) can be seen as important components of national preferences for internationally coordinated environmental policies. However, the pollution-based explanations of a country's preferences for international environmental regulation will rarely provide sufficient explanatory power (Sprinz 1992b). It is therefore suggested that domestic factors are needed to complement a pollution-based explanation. In fact, the contribution by Sprinz and Vaahtoranta (in this volume) suggests that environmental vulnerability and the costs of regulation are two crucial factors which account for national preferences. The purpose of this article is to further specify their model and to provide empirical tests of the political processes which meditate between these two factors and governmental accession to international environmental regulation.

In general, the analysis of regional, reciprocal environmental problems with many emitting and recipient countries resembles the problems encountered in the regulation of *global* environmental problems (Mäler 1990). In order to gain insights for the potential regulation of global climate change, the case of transboundary acidification in Europe has been chosen (see Sprinz/Vaahtoranta in this volume). However, in this article, I focus on two international environmental agreements in the domain of transboundary air pollution which mandate actual pollution abatement. In particular, I focus on the Sulphur Protocol and the Nitrogen Declaration

which both require signatories to reduce their emissions of these pollutants by 30% over a given time span (ibid.). Since compliant signatory countries will have to commit substantial resources to the abatement of their sulphur and nitrogen emissions, these international agreements represent two cases of *substantive* international environmental regulation.

In the second Section, I will briefly review the theories which specify the relationship among the domestic factors involved in the analysis (Section 2). After outlining the data sources (Section 3), I will proceed with the empirical analyses of the impact of domestic factors on international environmental regulation. In particular, the analyses will be undertaken with mass public data and expert data (Section 4). In the concluding Section, I will integrate the findings from these analyses (Section 5).

2. Theories of the Domestic Sources of International Environmental Regulation

Roughly twenty years after the publication of "Domestic Sources of Foreign Policy" (Rosenau 1967), international relations theory has renewed its interests in the non-systemic (or domestic) factors involved in the formulation of foreign policy. As Gourevitch pointed out in reference to neorealist reasoning, "[d]omestic structure for the 'I.R.' person is an independent or intervening variable and sometimes an irrelevant one" (Gourevitch 1978, 881). In contrast to Waltz (1979) and despite a different perspective on the discipline of international relations, both Putnam and Gourevitch would certainly agree that

> [a]ny policy pursued by the state must be able to elicit the support of at least enough social elements to sustain the state leaders in power (Gourevitch 1978, 903).

For Putnam, international negotiations are a simultaneous two-level game: On the one hand, a governmental representative negotiates with a set of foreign countries (Level I), and, on the other hand, s/he is in a bargaining situation with relevant domestic constituencies (Level II) (Putnam 1988). This framework of analysis lends itself to deductive and formal analysis, and its focus on the comparative *dynamics* of a bargaining situation could be easily applied to the analysis of international environmental regulation. Given my interest in *substantive* international environmental agreements, i.e., actual pollution abatement, rather than in negotiation analysis, a static theory may provide better guidance than a theory of international bargaining which is, understandably, more interested in short-term outcomes.

Typological, conceptual, and empirical analyses characterize the new wave of studies on the domestic sources of international regulation. Karns and Mingst provide an example of the first tradition, namely the typological approach (Karns/Mingst 1991). Their enumeration of contextual and policy process variables spans a wide domain of potential areas of research. Regrettably, the authors do not provide us with an integration of these domestic aspects of international politics.

Within the second category of conceptual perspectives on the domestic sources of international politics, Katzenstein takes a more focused approach by concentrating on state-society relations as a determinant of international (economic) policies (Katzenstein 1989; Katzenstein 1984a). Like Gourevitch, he focuses on those interests groups which define public preferences (on foreign economic policy) (Katzenstein 1984c, 18). As a consequence, "foreign ... policy is seen primarily to reflect societal pressures" (ibid., 18). However, this (neo-) corporatist view, in its present stage of theorizing, does not lend itself to specific, a priori expectations, and, therefore, severely compromises external validity. For example, Katzenstein contends that

> [t]he definition of policy objectives is shaped by the ideological outlook and material interests of the ruling coalition. Such coalitions combine elements of the dominant social classes with political power-brokers finding their institutional expression in the party system and in a variety of institutions a step removed from electoral competition - government ministries, industrial associations, and large public or private corporations (Katzenstein 1984b, 306-308).

It is not clear on theoretical grounds which particular institutions are relevant, and how they will influence foreign (economic) policy. While political history might suggest interesting hypotheses by way of induction, I prefer an explicit research design which specifies relevant factors and their directional impact in advance. In order to avoid the indeterminacy of Katzenstein's inductive approach, I will sharply limit myself to a group of actors and specify their expected support for international agreements.

Third, the research strategy preferred by this author is more closely represented by three separate studies. In an empirical-quantitative analysis of US domestic regulation of air pollution in the 1970s, Crandall shows theoretically and empirically that members of the US Congress from the Frost Belt had promoted air pollution regulations which will slow down the migration of industry to the Sun Belt (Crandall 1983, 110-130). Closer to the realm of international politics, Morrow presents a set of hypotheses derived from a sequential bargaining model and tests these hypotheses regarding the impact of (i) macroeconomic factors as well (ii) congressional behavior on the concessions made by both sides in international arms control negotiations (Morrow 1991). Furthermore, Magee et al. (1989) have developed a domestic endogenous policy model of support

for international trade policies. In all three studies, domestic interests play an important role in explaining aggregate outcomes. Thus, given an appropriate theory of the domestic sources of international environmental regulation, *directional* hypotheses should be tested.

In conclusion, various strands of theorizing emphasize the importance of domestic factors for the explanation of foreign policy. Because I will not engage in negotiation analysis of the international environmental agreements under consideration, I build on more static theories of comparative theory. However, (neo)corporatist theories lack much specificity in outlining expected relationships between explanatory and outcome variables. As a consequence, I will (i) focus on a concise set of actors involved in the regulation of the international environment and (ii) specify their presumed direction of support for international environmental agreements. Furthermore, I will test these propositions in a cross-national analysis. These hypotheses will be largely taken from a wide range of comparative political theories so as to contribute to the exchange of ideas alluded to by Putnam at the start of this article.

Postmaterialism may serve as a helpful point of departure for the analysis of mass public attitudes on the environment. However, it is not only postmaterialism which leads to (i) a rising awareness of environmental damage among the mass public as well as (ii) the growth of environmental movements, but, as , Inglehart points out

> [t]he rise of the ecology movement ... has taken place because the public has become more sensitive to the quality of the environment than it was a generation ago" (Inglehart 1990b, 44-45).

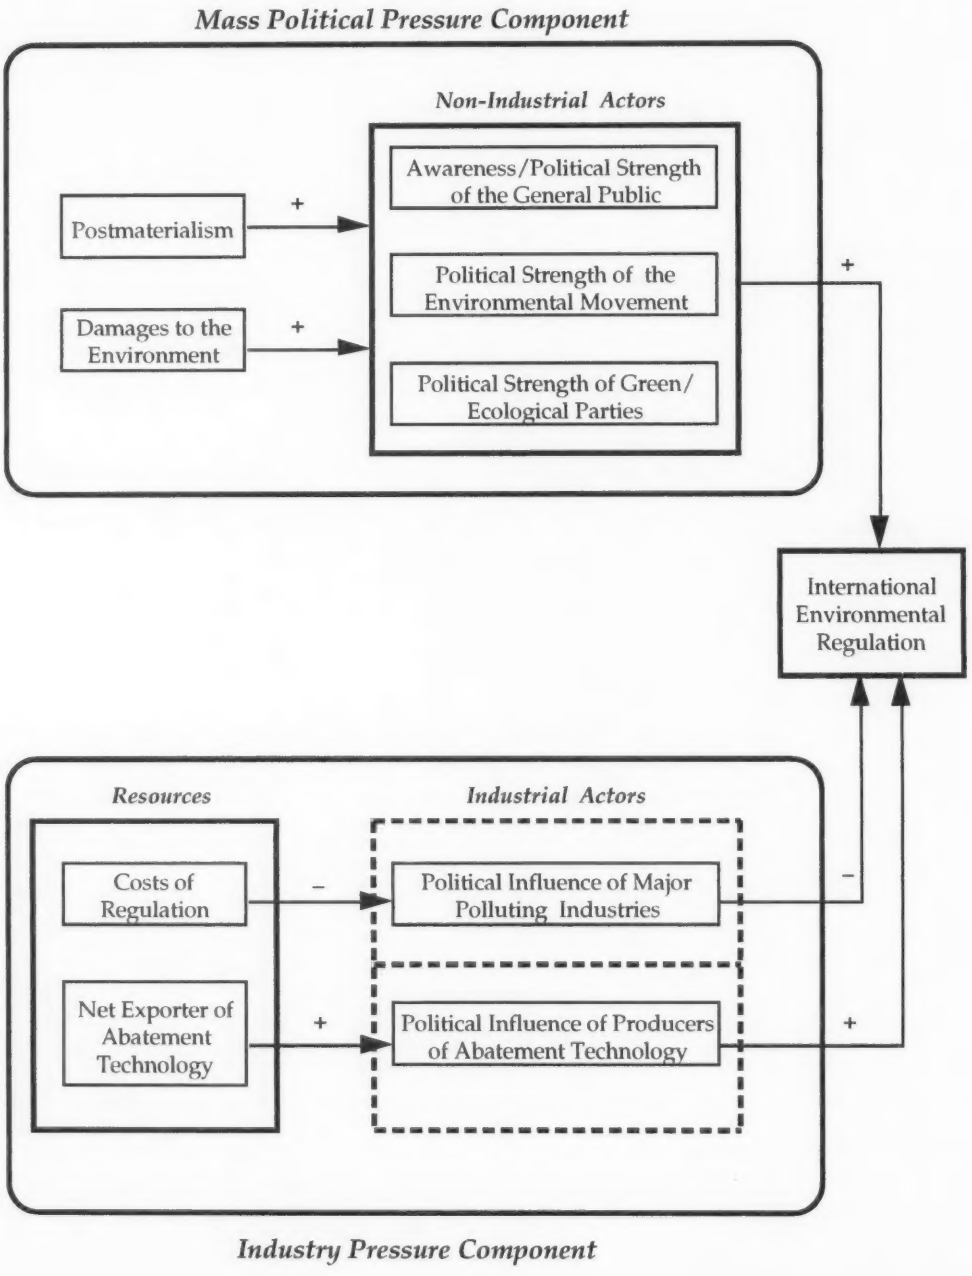
Therefore, a combination of perceived damage and postmaterialism should account for a mobilized public and the growth of the ecology movement. The 1980s also saw a rise of (European) green and ecology parties which is partially due to the rise of postmaterialism (Inglehart 1990a, 325), and they are "a political vehicle for those movement supporters whose grievances have been ignored by the larger established parties" (Müller-Rommel 1989, 17). Moreover,

> most of these parties follow an ideology that consists of strong concern for equal rights ..., *strong ecological* and anti-nuclear power thinking, solidarity with the Third World, demands for unilateral disarmament, and a general left-wing egalitarian disposition. Among others, most New Politics parties stand for ... *protection of the natural environment through the introduction of transnational pollution controls, and more generally an effective environmental policy* against an unquestioned commitment to economic growth (Müller-Rommel 1990, 217, emphasis added).

While it should be expected that the strength of green voting behavior will translate into a higher likelihood for the adoption of international environmental regulations, it will not be sufficient to explain green party support solely by way of environmental damage and support for the environmental movement. However, given the scope of this study, I will limit myself to this restrictive specification and, thereby, reduce the explanatory power for green party support.

In conclusion, the following line of argument is suggested: Damage to the environment as well as the degree of postmaterialism among the mass public should be positively correlated with (i) a public that holds pro-regulatory attitudes, (ii) the strength of support for the environmental movement, and (iii) support for green or ecology parties. These three factors also serve as (conceptual) aggregates on the country level. In turn, I also expect this mass political pressure component to be positively related to support for international environmental regulation (Figure 1).

Figure 1: The Domestic Sources of International Environmental Regulation - An Overview



Economics is fundamentally concerned with scarcity, and the same holds for politics. Indeed, major (but not all) policies depend on (i) new resources being acquired or (ii) reallocation of resources from previous uses in favor of a new policy domain - such as environmental policies. Given my interest in those international environmental agreements which are supposed to have substantive environmental impacts, I expect that a country's economic and technological resources play an important role. From an economist's point of view, resources should act like a budget constraint in view of the pro-environmental aspirations of a country. Conversely, if we assume that countries only accede to international agreements which they will honor, resource constraints can be represented by an industry pressure component of international environmental regulation.

In the domain of environmental regulation, two important types of resources may merit particular consideration. First, countries can be conceptualized as a pool of economic wealth, traditionally represented by the Gross Domestic Product (GDP). Wealthy countries (with a high GDP per capita) will face less of a budget constraint than poorer countries for the accomplishment of a uniform abatement program - other factors held constant (Jänicke/Mönch 1988). One important factor to be held constant is the absence of substantial resource transfers among countries. However, wealthy countries have been reluctant to commit themselves to substantive international resource transfers: The discussion about the New International Economic Order (NIEO) in the 1970s, the Rio de Janeiro meeting of the UN Conference on Environment and Development (UNCED) in 1992, and the international bargaining on transboundary air pollution (LRTAP) during the 1990s[1] all point into this direction. Therefore, it seems appropriate to assume that countries are largely dependent on their own resource pool.

Second, wealthy countries may also be more likely to develop the technologies needed to undertake abatement efforts, especially if they have ecological incentives as a result of substantive damages or an ecologically mobilized public (Jänicke 1990). In the field of environmental regulation, two particular forms of technology seem to be important.[2] First, so-called end-of-pipe (or add-on) technologies control the release of hazardous emissions while

---

1 Personal observation at the top level meeting of the Executive Board Air in November 1990 and November 1991. Interviews with government delegates point to a tendency among Scandinavian governments, foremost Sweden, to undertake limited international resource transfers. However, major European countries, like the FRG (before or after its enlargement of jurisdiction), are unwilling to transfer resources beyond demonstration projects or monitoring equipment. Although it would be actually more cost-efficient for a *pool* of Western European countries to "bribe" some Eastern European countries to undertake emission reductions for the benefit of *Western* (and Eastern) European countries, I could find no evidence of substantial international resource transfers.

2 I am indebted to Andrzej Jagussiewicz for a discussion on this issue.

keeping the industrial processes unaltered. Most common filter and scrubber technologies are examples of add-on technologies for reducing the emissions of acidifying pollutants. Second, industrial processes can be modified so as to reduce the production of emissions of hazardous substances in the first place. These technologies are called integrated or process technologies (UNECE 1985, 33-133). Countries which export these products and services undoubtedly have interests in further international environmental regulation apart from their pollution-based incentives.

The introduction of economic and technological factors permits a differentiated assessment of "industry". On the one hand, major polluting industries (smokestack industries such as utilities and smelters, and car manufacturers) are adversely affected by regulations, and, therefore, I expect them to favor less stringent regulations (or, alternatively, substantial subsidies). On the other hand, technology producers should have the opposite interest: Environmental regulation creates demand for their products, and, consequently, they should be supportive of environmental regulation (Praetorius 1989) (see Figure 1), and their political strength should be positively associated with their volume of net exports of abatement technology.

Overall, the specification of the political pressure component and the industry pressure dimension, as outlined above, provides an extension of Prittwitz' "capacity hypothesis" (Prittwitz 1990b, 107-108). Rather than referring simply to the importance of the "state of socioeconomic and political-institutional capacities" to deal with environmental hazards (ibid., 108), I suggest a particular set of factors which reflect victim, polluter, and third party (or technology) interests as well as their antecedents on the *domestic* level (see Figure 1). The empirical analyses to follow in Section 4 will test if the mass political pressure component and the industry pressure component are helpful in explaining support for international environmental agreements.

The model presented in Figure 1 can also be interpreted as a more detailed specification of the model suggested by Sprinz and Vaahtoranta (see their article earlier in this volume). Rather than relying on *objective* representations of (i) "ecological vulnerability" and (ii) "abatement costs", the analyses in this article rely on the regulatory effects of the *perceptions* of the mass publics *or* specialized elite (experts) regarding (i) damage to the environment and (ii) resources (costs of regulation and net exporter of abatement technology). In addition to substituting human responses for objective data, the model introduced in this article also specifies a *political process* which relates ecological and resource constraints to political decisions.[3] However, it shall

---

[3] The model introduced by Sprinz and Vaahtoranta (see their chapter earlier in this volume) and the model presented here have different strengths. From the perspective of research strategy, the classification offered by Sprinz and Vaahtoranta is most useful for the comparison of a *larger*

not be overlooked that the basic predictions made by both models are identical: Countries which are (i) ecologically vulnerable and (ii) control substantive resources are likely to seek international environmental agreements in order to enhance the quality of their environment.

In conclusion, the model depicted by Figure 1 suggests that countries with strong political pressure components and a developed technology sector favor international environmental regulations, whereas major polluting industries are likely to oppose stringent regulations. In particular, relatively poor countries, which are also likely to be technology importers will be less likely to support international regulations - provided they intend to honor their international obligations. However, what should be expected if a country has a strong mass political pressure component, but its resource base is weak? If technology and wealth are interpreted as a budget constraint, it is unlikely that political mobilization will be able to overcome the lack of resources. Conversely, What should be expected of a country with resource abundance despite low political pressure? In effect, it should not be surprising if this country will sign and implement this treaty since, at worst, the resource requirements are minimal, and, at best, governments will be able to improve their environmental image. However, some governments may simply ignore such opportunities, since they may not be politically rewarded for their support of internationally coordinated environmental policies.

The analyses to follow further below (Section 4) concentrate on various aspects of the full model. First, most aspects of the political pressure component will be tested with aggregated data stemming from surveys of the public. Regrettably, for reasons of data availability, these analyses will be restricted to the members countries of the European Community (EC). Second, I will evaluate the comprehensive model with the help of a written questionnaire which I had administered to experts in a group of nine countries. All geographical regions, political systems, levels of wealth, and various levels of support for international environmental regulation will be represented. Before turning to the various analyses of the model in Section 4, I will briefly introduce the data sources below.

---

set of cases of environmental regulation and for the purpose of case selection. These cases may then be analyzed in more detail with the model suggested in this chapter.

3. Data Sources and Manipulation

The data employed for these two analyses comprise

- Euro-Barometer data (of the Commission of the European Community) for the analysis of analysis of mass public attitudes and
- responses to a written questionnaire by experts in the field of transboundary air pollution (collected by myself).

3.1. Mass Public Attitudes

Twice each year since the mid-1970s, the Commission of the European Community (CEC) sponsors the Euro-Barometer survey of the mass public attitudes among its member states. These surveys normally include a core of civic culture items and a much larger section of questions sponsored by a particular Directorate General of the CEC, the administrative arm of the Commission.[4] Of particular interest to this study are two specialized Eurobarometer studies which concentrate on environmental attitudes of EC citizens: Euro-Barometer 25 (Rabier et al. 1988), and Euro-Barometer 29 (Reif/Melich 1990).[5,6] Since fieldwork for Euro-Barometer 25 was undertaken in April 1986 - shortly after the conclusion of the Sulphur Protocol in November 1985, and since fieldwork for Euro-Barometer 29 was conducted roughly *parallel* to the signing of the Nitrogen Declaration in November 1990, these data sources seem to be adequate for the purpose of this study. Although only data for the 12 member countries of the EC were available, this still represents an adequate distribution of the supporters and non-supporters of the various international environmental agreements. However, EC member countries either signed *both* environmental agreements *or none* of them (compare Table 1 with Table 2).[7]

---

4 I am indebted to Ronald Inglehart for this information.

5 The data utilized in this study were made available by the Inter-University Consortium for Political and Social Research. The data for Euro-Barometer 25 ("Holiday Travel and Environmental Problems, April 1986") were originally collected by Jean-René Rabier, Helene Riffault, and Ronald Inglehart. The data for Euro-Barometer 29 ("Environmental Problems and Cancer, March-April 1988") were originally collected by Karlheinz Reif and Anna Melich. Neither the collectors of the original data nor the Consortium bears any responsibility for the analyses or interpretations presented here.

6 The Department of Political Science of The University of Michigan, Ann Arbor, and Ricardo Rodriguiz were very helpful in accessing the data and in providing generous computational support.

7 Luxembourg was omitted from the analyses due to its minor importance.

Table 1: **Support for International Environmental Agreements: Distribution of All Countries (Reference Table and Aggregate Analysis)**

		Nitrogen Declaration		Number of cases (% of total)
		no	yes	
Sulphur Protocol (Ratification)	no	DDR, GR, IRL, PL, P, R, E, UK, YU (N=9)	-- (N=0)	N=9 (38%)
	yes	BG, CS, H, SU (N=4)	A, B, DK, SF, F, D, I, NL, N, S, CH (N=11)	N=15 (63%)
Number of cases (% of total)		N=13 (54%)	N=11 (46%)	N=24 (100%)

source: Ågren (1989); UNECE/Executive Body for the Convention on Long-Range Transboundary Air Pollution (1991, 16). Due to rounding, the margins do not necessarily sum up to 100%.

Table 2: **Support for International Environmental Agreements: Distribution of Euro-Barometer/EC Countries (Mass Public Attitudes)**

		Nitrogen Declaration		Number of cases (% of total)
		no	yes	
Sulphur Protocol (Ratification)	no	GR, IRL, P, E, UK (N=5)	-- (N=0)	N=5 (45%)
	yes	-- (N=0)	B, DK, F, D, I, NL (N=6)	N=6 (55%)
Number of cases (% of total)		N=5 (45%)	N=6 (55%)	N=11 (100%)

source: Ågren (1989); UNECE/Executive Body for the Convention on Long-Range Transboundary Air Pollution (1991, 16).

The Euro-Barometer surveys permit a first test of the political problem pressure component. Both surveys include specific variables representing postmaterialism and the salience of damage caused by acid rain.[8] In addition, variables on environmental movement membership (as a combination of membership in nature protection associations and the ecology movement) (in Euro-Barometer 25), as well as variables representing voting intentions for green or ecological parties (in Euro-Barometer 29) were included. Furthermore, a variable representing

8 The particular phrasing of the questions and the recoding procedures appear in Appendix 1.

environment-macroeconomic tradeoffs has been included so as to control for the resource component of environmental regulation. All individual-level, non-missing data have been aggregated to the country level for cross-national analysis. Following the research design outlined in the previous section, I expect the particular hypotheses to hold in a cross-national analysis of the mass public attitudes for the support of the Sulphur Protocol in 1985 (Eurobarometer 25) and for support of the Nitrogen Declaration in 1988 (Eurobarometer 29).

2.2. Expert Data

While the data on mass public attitudes only permit a limited test of the structural model introduced in Section 1, I undertook a series of 129 oral interviews with experts in nine countries between November 1990 and October 1991. In addition, 90 participants also volunteered to return a *written questionnaire* which in most cases reached them in advance of the interview. The statistical analysis of the expert data will be based on the completed, written questionnaires. However, references to oral interviews are based on (i) all oral interviews conducted in 9 countries, (ii) interviews undertaken with the professional staff at the UNECE, Geneva, and (iii) the staff of the Directorate General for Environment of the Commission of the European Community, Brussels.

Originally, only 6 countries from Northern, Western, and Southern Europe were included in the study. However, shortly before the anticipated start of the field phase, the political changes in the Eastern European countries made the inclusion of three East Central European countries feasible, and participation rates across the former political/economic East-West divide did not pose a problem. In effect, East Central European experts were as eager as their Western and Northern counterparts to participate in the study, potentially because environmental activities - including publication of monitoring results and epidemiological studies - had often been forbidden until the late 1980s. Thus, the subsample of 9 countries drawn from the set of 24 countries adequately replicates the distributional pattern of support for international environmental regulation (compare Table 1 with Table 3). In addition, the 9 countries included in the expert study also show considerably variation across (i) the victim and polluter dimensions, (ii) type of (former) political system, and (iii) economic wealth and access to abatement technologies. Therefore, patterns found for this subgroup of nine countries should approximate the relationships to be found in the set of all 24 European countries.

Table 3: **Support for International Environmental Agreements: Distribution of Countries Included in the Expert Study**

		Nitrogen Declaration		Number of cases (% of total)
		no	yes	
Sulfur Protocol (Ratification)	no	PL, E, UK (N=3)	-- (N=0)	N=3 (33%)
	yes	CS, H (N=2)	F, D, NL, S (N=4)	N=6 (67%)
Number of cases (% of total)		N=5 (56%)	N=4 (44%)	N=9 (100%)

source: Ågren (1989); UNECE/Executive Body for the Convention on Long-Range Transboundary Air Pollution (1991, 16).

In order to test the propositions of the model outlined in Section 2, experts were sought in the above mentioned set of countries which represent the

- national Ministry of Environment (or the equivalent regulatory body),
- Foreign Office,
- Committee of the Environment (federal legislature, or the respective committee),
- environmental interest groups,
- industry peak associations (or major industrial firms; regardless of type of ownership),
- natural scientists, and (varying by country)
- social scientists, representatives of political parties (if not already included in the above mentioned categories), labor or trade unions, and consulting firms.

The qualifying characteristic for all participants was their *active* involvement the regulation of sulphur and nitrogen emissions.[9] Functional representation varied across countries.[10]

Most respondents received the written questionnaire two weeks in advance of the oral interview.[11] Persons not returning the questionnaire until shortly after the oral interview received two reminder letters with a new questionnaire enclosed with the cover letter. Overall, the response rate, based on those participating in the oral interviews was 70% (see Table 4).[12] Only Spain posed a problem of a very low response rate. However, it also has to be noted that the issue of the regulation of air pollutants is a *relatively* minor environmental issue in Spain. The same holds for the U.K. and Hungary.

In the analyses undertaken, all non-missing cases were aggregated without weighting, and at least two non-missing cases had to be present per variable to compute the country average.[13,14]

---

9 Without the generous help of many persons and institutes, I would not have been able to execute the interviews in such a diverse set of countries or institutions. I am especially grateful to Christer Ågren, Joseph Alcamo, Leen Hordijk, the International Institute for Applied Systems Analysis (Laxenburg) and their Regional Air Pollution Project in particular, Endre Kovács, Marc Levy, Vladimir Novotny, the Swedish Institute (Stockholm), Peter Sand, Peter H. Stief-Tauch, Lopez de Uralde, and Pierre Woltner for their kind assistance.

10 The question wording pertaining to the relevant variables is reprinted in Appendix 2.

11 Peter Sand and Christer Ågren provided valuable assistance in improving question wording.

12 Roughly 20-30 persons per country were originally invited to participate in the study. However, due to the technical and highly specialized nature of the questionnaire (Sprinz 1992a), only the persons counted in Table 4 participated in the study. While the particular response bias is not known, I suspect, based on oral and written communication, that persons who are less dedicated to the particular issue of the regulation of sulfur and nitrogen emissions will have disproportionately declined to participate. In conclusion, I assume that most of the active participants in the expert interviews constitute a representative sample of the *core* specialists in their respective countries. Biases towards inclusion in the sample are unknown beyond (i) knowledge of English (or, in a few cases, German) and (ii) familiarity with the subject matter.

13 Any proper weighting procedure has to rely on *a priori* knowledge of the distribution of a particular characteristic in the population. However, the "true" distribution of all potential participants across functional groups (see above) is unknown. Furthermore, the "true" distribution of functional groups is likely to vary across countries with natural scientists being particularly prominent in East Central Europe and Parliamentarians being particularly well-informed in Northern Europe. For the purpose of the cross-national analysis presented in Section 4.2., I decided to use *un*weighted national aggregates for the computation of the average score of each variable.

14 The coding rule of 2 non-missing cases balances the requirement of (i) de-emphasizing extreme scores with (ii) reducing the maximum sample size of 9 countries for the cross-national analysis. A requirement of 3 or more non-missing data per country would have led to the exclusion of the Spanish case in many instances. However, since Spain replicates the pollution

Table 4: **Response Rates in the Expert Study**

Country	No. or Oral Interviews	No. of Returned Written Questionnaires	Response Rate to Written Questionnaire[1)]
CSFR	17	14	82%
France	8	6	75%
FRG	18	14	78%
Hungary	13	7	54%
The Netherlands	13	12	92%
Poland	15	11	73%
Spain	12	4	33%
Sweden	22	16	73%
U.K.	11	6	55%
All Countries	129	90	70%

Note: In a few cases (N=4), an oral interview was not possible, *although* the questionnaire was returned. In these cases, the respondent was counted as having participated in the oral interview and as having returned the questionnaire. No more than one interview per country was affected by this procedure.

1) The response rate is defined as:

$$\left(\frac{\text{Number of Written Questionnaires Returned}}{\text{Number of Oral Interviews}} \times 100 \right).$$

After submitting the data for analysis, the hypotheses put forward in Section 2 will be tested below.

4. Empirical Analysis of the Domestic Sources of International Environmental Regulation

In this section, I will first proceed with the analysis of mass public attitudes and then present a more detailed analysis with expert data.[15]

---

situation of the U.K. for sulphur emissions to a considerable degree (and no other "substitute" is available in the remaining sample), the case selection would have become less balanced on theoretical grounds.

15 The data for all analyses to follow are reported in Sprinz (1992b, Appendix 1).

4.1. The Analysis of Mass Public Attitudes

Due to limitations imposed by the data sources, I will largely limit the analysis of mass public attitudes to building blocs of the mass political pressure component (see Figure 1). In addition, this part of the study is restricted to the member countries of the European Community.

Given the theoretical perspective chosen, postmaterialism and damage to the environment will influence environmental movement membership which consists of self-declared membership in environmental protection associations and the environment movement. To represent perceived damages to the environment, a variable capturing the explicit mentioning of acidification as one of three top environmental concerns was chosen. Postmaterialism follows the standard 4-item postmaterialism index developed by Inglehart (1977). Two different specifications for the organized non-industrial interest groups were undertaken. First, in Euro-Barometer 25, actual membership in natural protection associations and the environmental movement were grouped together. Second, for the analysis of Eurobarometer 29, an environmental movement variable was *not* available; therefore, I chose a variable representing voting intention for green or ecological parties as a suitable surrogate.[16] In order to provide a partial analysis of the industry pressure dimension of international environmental regulation, I included a trichotomy index of environment-macroeconomic tradeoffs.[17]

Fortunately, Euro-Barometer 25 had been conducted shortly after the signing of the Sulphur Protocol. Therefore, support for the Protocol will be regressed on the independent variables as outlined in Figure 2. In addition, fieldwork for Euro-Barometer 29 took place in parallel to the signing of the Declaration. Thus, support for the Nitrogen Declaration was regressed on the independent variables as shown in Figure 3.

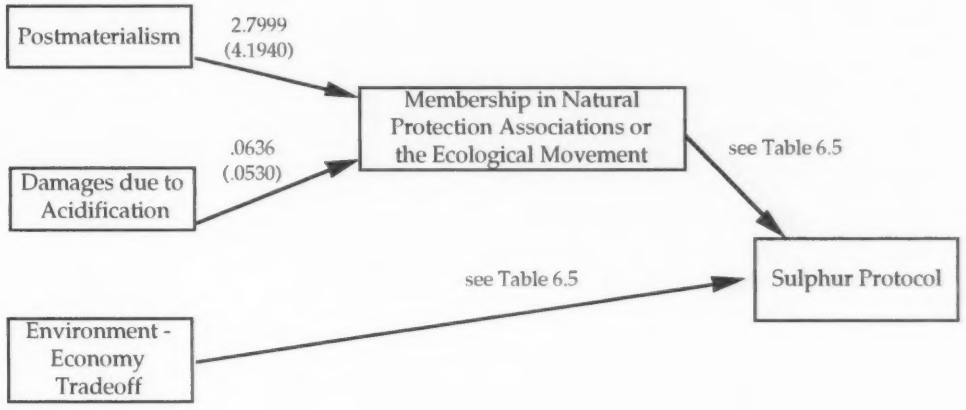
---

16 The latter procedure could also be used for the analysis of Eurobarometer 25. However, support for environmental organizations is much more specific than support for green or ecological parties, because these parties also accommodate other new social movements (see Section 2.). In addition, in both Euro-Barometer studies, green or ecological parties were explicitly mentioned in some countries but not in others. In the latter case, they were coded as having zero support. As a consequence, the variable "voting intention" is unlikely to perform conceptually and statistically as well as an environmental movement variable. Some evidence to this point is the negative, cross-national association between environmental movement support and green party voting. This clearly contradicts theoretical expectations, since the environmental movement and green parties are, in part, resulting from the rise of postmaterialism (Inglehart 1990a, ch. 11; Müller-Rommel 1989). However, green or ecological parties came into being in some countries only after 1988, particularly in the Netherlands (Müller-Rommel 1990, 216).

17 See Appendix 1.

As expected from prior research by Ronald Inglehart (see Section 2.), postmaterialism and the awareness of environmental threats go hand in hand. In fact, this association leads to strong multicollinearity among the postdictors in the analysis of (i) membership in natural protection associations or the ecological movement (Eurobarometer 25)[18] and (ii) the voting intention for green or ecological parties (Eurobarometer 29).[19] Since the *bivariate* regressions between (i) postmaterialism and (ii) environmental damages, on the one hand, and membership in environmental organisations, on the other hand, show strong explanatory power (results not shown here), I retained both variables in the analysis (see Figure 2).

Figure 2: Mass Public Attitudes and Support for the Sulphur Protocol (Euro-Barometer 25; Path Analysis)



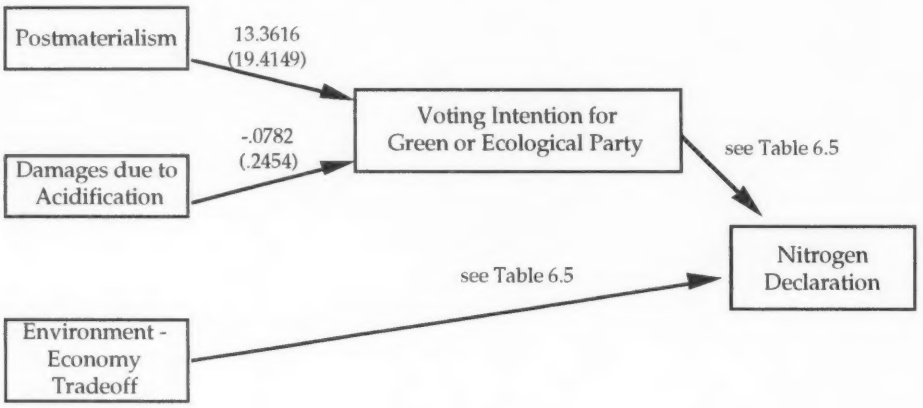
Note: N=11. The score for the membership variable has been rescaled for Denmark and the Netherlands. Entries are unstandardized OLS regression coefficients; standard errors of the coefficients appear in brackets.

18 Membership in the ecological movements and nature protection associations in Denmark and the Netherlands are 3-4 times higher than in the other EC countries. The reasons for this response pattern are unknown. To avoid undue impact of the scores for these two countries on the estimations in the cross-national analysis, I have rescaled these two scores by multiplying the raw scores by .40. This procedure clearly preserves the cross-national rank-order.

19 Multicollinearity will not influence the coefficient estimates, but it will inflate the variances of the estimates. As a consequence, the significance tests of the coefficients are substantially affected (Hanushek/Jackson 1977, 86-93).

In the parallel analysis for the Nitrogen Protocol (Euro-Barometer 29, see Figure 3), the voting variable had to be chosen instead of the (theoretically more appropriate) environmental movement variable. While the postdictors of voting intention, namely postmaterialism and damages resulting from acidification, are strongly correlated, the variable representing damages shows a very weak *negative* association with voting intention while postmaterialism is positively associated with green voting.[20] In conclusion, I find that postmaterialism is positively associated with support for environmental movements, whereas perceived damages to the environment do not translate into intended voting behavior for green parties in a cross-national analysis.

Figure 3: Mass Public Attitudes and Support for the Nitrogen Declaration (Euro-Barometer 29; Path Analysis)



Note: N=11. Entries are unstandardized OLS regression coefficients; standard errors of the coefficients appear in brackets.

The second part of the analysis tests the impact of (i) environmental movement support (Euro-Barometer 25) or (ii) voting for green or ecological parties (Euro-Barometer 29) on international environmental regulation. In both cases, I controlled for the resource dimension by way of an environment-economy tradeoff variable (see Table 5). Regardless of the analysis undertaken, the analyses show a theoretically predicted positive relationship between (i) non-

20 See footnote 16.

industrial group support and international environmental regulation, and (ii) a positive association between environmental (over economic) preferences and support for international environmental agreements.[21] In substantive terms, a 1% point increase in the membership of ecological and nature protection associations translates into an odds ratio of support for the Sulphur Protocol of 4.95, and a 1% point increase in green voting doubles the odds of signing the Nitrogen Declaration. Furthermore, the economy-ecology tradeoff variable also shows substantive coefficients in the theoretically predicted direction. As a consequence, the measures of the proportional reduction of error show encouraging results which attest to some postdictive power of both models.

Table 5: **Mass Public Attitudes and Support for International Environmental Regulation**

	Sulphur (Euro-Barometer 25)			Nitrogen (Euro-Barometer 29)		
Explanatory Variable	$(\hat{\beta}_i)$	$S.E.(\hat{\beta}_i)$	t	$(\hat{\beta}_i)$	$S.E.(\hat{\beta}_i)$	t
Membership in Nature Protection Assoc./ Ecological Movement	1.60*	1.01	1.57			
Voting for Green/Ecological Party				.70	.58	1.21
Environment/Economy Trade-off	12.07	12.35	.98	8.58	9.46	.91
Constant	-32.21	30.89	1.04	-22.80	23.89	.95
-2xLog Likelihood (-2LL)	7.11			7.85		
significance (-2LL)	.0286			.0197		
Proportional reduction of error (all cases)	.60			.80		

Note: N = 11 for the analysis of the Sulphur Protocol as well as for the analysis of the Nitrogen Declaration. All significance tests for the coefficients are one-tailed tests based on their predicted sign. The score of the membership variable (Euro-Barometer 25) has been rescaled for Denmark and the Netherlands.
* denotes statistical significance at the .10 level; ** at the .05 level; *** at the .01 level.

21 To simplify the analysis, I assumed uncorrelated errors among the dependent variables in all analyses of this chapter.

In conclusion, the analysis of aggregated mass public attitudes of EC member countries shows some support for the propositions laid out in Section 2. In particular, specific damages and postmaterialism lead to a mobilized mass public in the form of environmental movements, while their impact on green party support is less clear in this cross-national analysis. Although the impact of environmental movement membership and voting intention is not strongly associated with a country's support for the particular international environmental agreement, knowledge of the models tested above provides considerable guidance as shown by the indicator of the proportional reduction of error. Since only a partial test of the whole theoretical model was possible at this stage, I turn to the analysis of expert interviews which covers nearly all aspects of the theoretical model.

4.2. The Analysis of Expert Perceptions

Surveys of mass public attitudes are rarely geared to answering specific questions about a single type of pollutant. Therefore, experts in 9 polities, as described in Section 3, were invited to participate in a highly *specialized* survey on the regulation of transboundary air pollution in Europe. In particular, they were asked to respond to questions which capture the research design for this specific analysis (see Figure 1). While this degree of specificity is a particular advantage of expert interviewing, one has to expect to deal with a reasonably small group of persons per country. Furthermore, comparative expert studies rarely include more than a handful of countries. As a consequence, statistical "fit" in the cross-national analysis will *not* be comparable to so-called "large N" studies. However, the cross-national analysis of 9 countries will allow me to assess the hypotheses outlined in Section 2.

The analysis will proceed in three steps. First, I will analyze the effect of environmental damages on the level of perceived strength of non-industrial actors (mass political pressure component) (Section 4.2.1.). Second, I will test which impact various types of resources have on the strength of industrial interests (industry pressure component; Section 4.2.2.). Third, I will assess the impact of each of these aggregates on international environmental regulation (Section 4.2.3.).

4.2.1. The Mass Political Pressure Component

The mass political pressure component assumes that environmental damages activate various political actors. In particular, experts were asked about the importance of the acid rain

issue in their country as well as a host of *other* major environmental problems (World Resources Institute 1990). It is hypothesized that, from the perspective of these experts, environmental problems translate into (i) pro-environmental concerns held by the mass publics, as well as into (ii) the political strength of environmental movements, and (iii) green parties. In short, the pressure of environmental problems activates actors who, in turn, influence governmental elites in their decision-making regarding international environmental agreements. In particular, governments of countries with well-developed pro-environmental constituencies are much more likely to sign international environmental agreements than countries where environmental issues are not yet well institutionalized.

The general public, environmental groups, and green parties are involved in the domestic *and* international regulation of sulphur and nitrogen emissions. Both the domestic and international policy domains are linked because of the transboundary nature of air pollution and the effects of policies. For this reason, the composite, average score of the impact of these three actors on the (i) domestic and (ii) international regulations of air pollutants were computed and incorporated in the analyses.

In the empirical analysis, two different approaches were taken to assess the impact of environmental problems on the mobilization of the non-industrial interests: First, it was assumed that *ecological vulnerability* to transboundary air pollution would determine the issue-specific strength of the mass public, environmental movement, and green party. While the directional hypotheses were supported in all cases, the strength of association was generally weak. Alternatively, one could assume that a few environmental problems (including acidification) mobilize pro-environmental interests. In turn, any of these environmental problems are perceived to be capable of mobilizing non-industrial actors on the subject matter of acid rain. In fact, this is underlying the concept of "induced variables" (Alwin 1988): One variable out of a group of *conceptually related* variables triggers variation in the dependent variable. Applied to the regulation of transboundary air pollution, this concept assumes that mobilization for any major environmental issue can be transferred, at least in part, to the regulation of acid depositions. This alternative operationalization was considered by including the importance attributed to

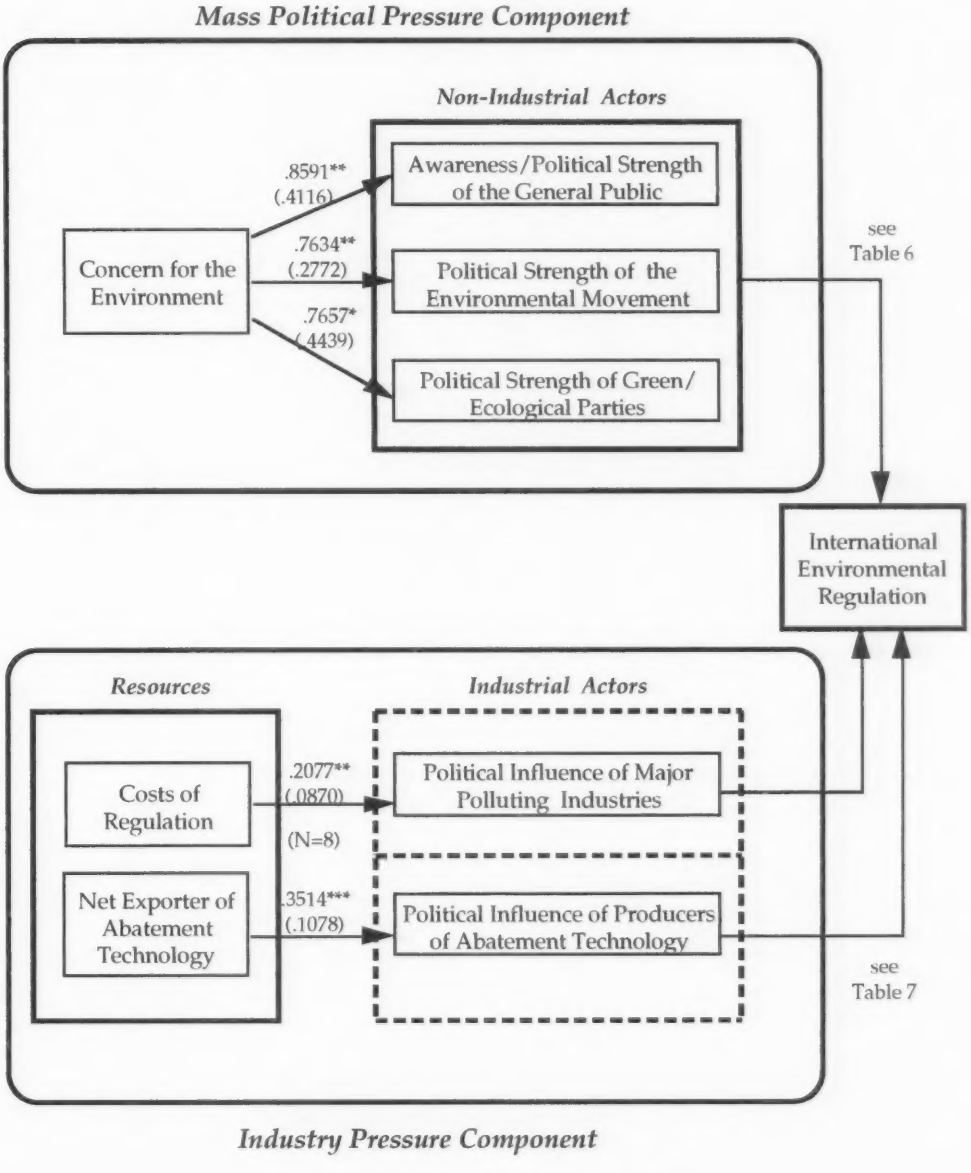
- transboundary acidification,
- population growth,
- decline of tropical rainforests,
- side-effects of modern agriculture,
- global climate change,
- biodiversity,

- oceans,
- freshwater, and
- toxic chemicals.

The *maximum score* across these 9 items was chosen for the analysis. Thus, the most important environmental component was assumed to trigger *acid rain-related* strength of mass publics, environmental groups, and ecological parties. This specification worked particularly well: Non-industrial actors may "acquire" political strength on a wide range of environmental issues and use this goodwill to lobby for the regulation of a *particular* environmental problem (see Figure 4).[22] In a broader sense, this implies for the case of global warming that countries which have been mobilized on at least one other major environmental problem are likely to respond to the extended greenhouse heating effect. In particular, the results of this study lead to the expectation that the EFTA countries, the Netherlands, and the FRG could be major proponents of stringent regulations on the release of greenhouse heating gases.

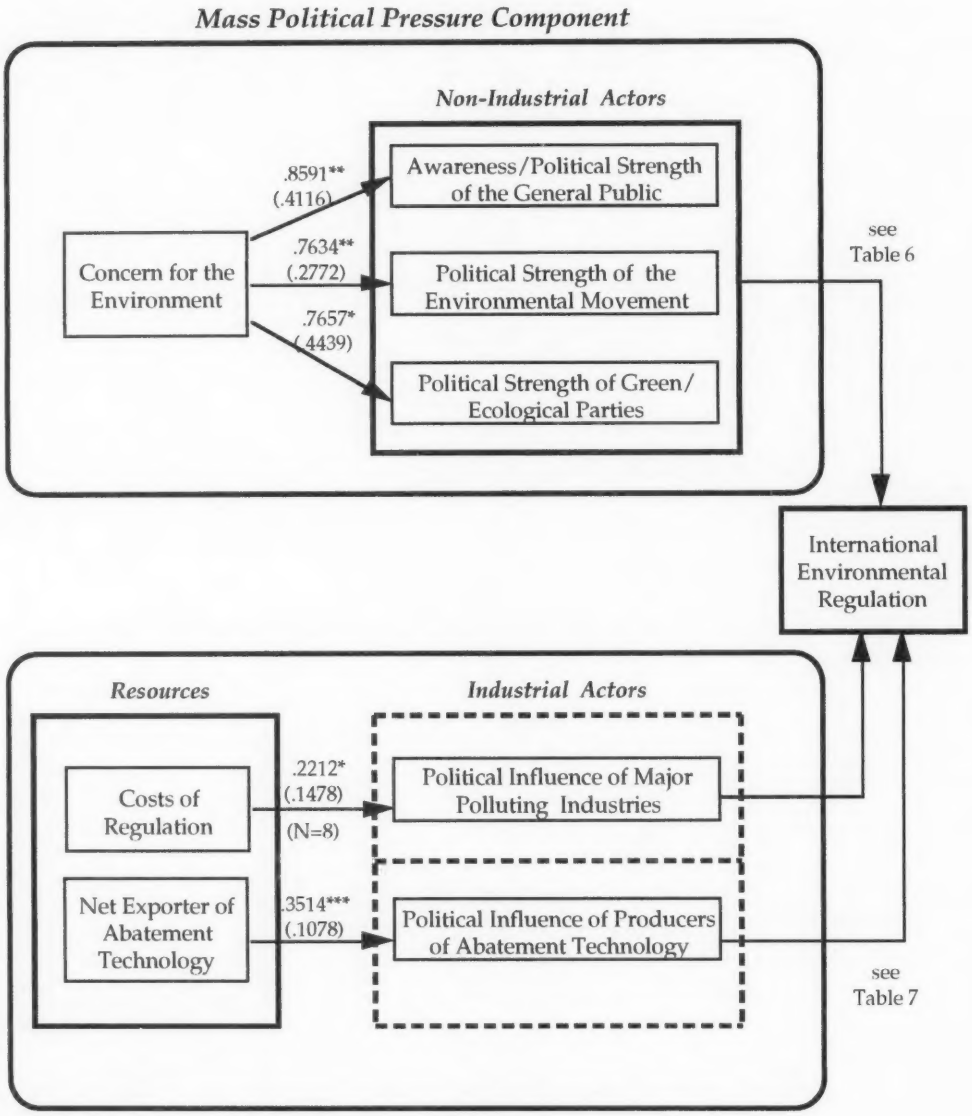
22 Nearly all questions used in the analyses reported here (excl. the costs of regulation) were made *without* specific reference to sulfur or nitrogen oxides. Therefore, most coefficient estimates reported in Figures 4 and 5 are identical. However, the logistic regression results presented in Tables 6 and 7 should be different due to differences in support for the Sulfur Protocol and the Nitrogen Declaration. This simplifying procedure had been chosen, since it is nearly impossible to find a substantially large group of experts with familiarity with the technical as well as political aspects of the regulation of air pollution. Many technically-oriented respondents eschewed answers to political questions in the oral interview, and more politically oriented respondents relied on outside consulting for technological aspects.

Figure 4: **The Analysis of Elite Perceptions - The Sulphur Protocol**



Note: N=9. Entries are unstandardized OLS regression coefficients; standard errors of the coefficients appear in brackets below the coefficient estimates. All significance tests are one-tailed tests based on their predicted sign. All entries but "Costs of Regulation" are identical to the estimates for the Nitrogen Declaration (see Figure 5).
* denotes statistical significance at the .10 level, ** at the .05 level; *** at the 0.01 level.

Figure 5: The Analysis of Elite Perceptions - The Nitrogen Declaration



Note: N=9. Entries are unstandardized OLS regression coefficients; standard errors of the coefficients appear in brackets below the coefficient estimates. All significance tests are one-tailed tests based on their predicted sign. All entries but "Costs of Regulation" are identical to the estimates for the Sulphur Protocol (see Figure 4).
* denotes statistical significance at the .10 level, ** at the .05 level; *** at the 0.01 level.

4.2.2. The Industry Pressure Component

While pro-environmental interests of *non*-industrial groups are likely to be positively associated with support for international environmental regulation, the industry pressure dimension may limit the options which a government has. In particular, I have suggested that perceived high costs of regulation will strengthen the position of major polluters, which, in turn, are normally opposed to national and international environmental regulation, since their profitability is affected.[23] However, the opposite is true for the producers of abatement technology, since environmental regulation creates the demand for their products. For this group, I suggest that a net exporter position will strengthen the regulatory clout of technology producers which, in turn, should support international environmental regulation. In the analysis, support for this differentiated perspective of industry interests was found for the case of the international regulation of sulphur emissions and for the case of nitrogen.[24] In particular, the political strength of abatement technology producers is positively related to their export position, while the costs of regulation spur resistance to regulation by major polluting industries. The theoretical expectations are supported for the industry pressure component (see Figures 4 and 5).

4.2.3. The Impact of the Mass Political Pressure Component and the Industry Pressure Component on International Environmental Regulation

In this final step, non-industrial and industrial political strength have been combined in the analysis of support for international environmental regulation. The particular problems

---

23 Major polluting industries include private sector industries (like the German and Italian car manufacturers) and public sector industries (such as utilities in many countries and parts of the French automotive industry). Unless they are compensated by subsidies, as the Dutch and German subsidies for "clean" cars, these firms should have an interest in avoiding the higher costs of environmental regulation. However, the motive varies across type of ownership: Privately-owned major polluters might see environmental regulation as a threat to their profits, while publicly-owned major polluters may wish to protect their "x-inefficiency".

24 In the questionnaire, respondents were asked to evaluate the costs implied by the Sulphur Protocol and the Nitrogen *Protocol*. However, the costs associated with compliance with the Nitrogen *Declaration* should be uniformly higher than those for the Nitrogen *Protocol*. Since all nine countries included in this analysis have signed the Nitrogen Protocol as well as the Nitrogen Declaration, I assume that cross-national differences in perceived costs of compliance should roughly translate into similar cross-national cost differences for the implementation of the Nitrogen Declaration. In conclusion, while the first best variable has not been included in the questionnaire, the surrogate measure of perceived costs of the Nitrogen Protocol should still measure the underlying cost differences for complying with the Nitrogen Declaration.

encountered in this part of the analysis are related to (i) the small sample size (N=9) in relation to the number of variables to be specified in the mass political pressure and industry pressure components (k=5) and (ii) "perfect fit" of the data (see below). To circumvent the first problem, I suggest using the idea of an "induced variable" for a second time, and I apply it to the three non-industrial interests which shape the mass political pressure component. Substantively, this implies that any of the three groups could have had the decisive impact on government decision-makers. As in the previous application of the induced variable concept, the maximum score across the three groups was chosen to represent the impact of these three groups. Unfortunately, the same idea cannot be applied to the influence which the various industry groups hold, because major polluters are assumed to have *opposite* interests when compared to technology producers. However, taking the difference between the strengths of both groups preserves the directional hypothesis: If the influence of the major polluters is subtracted from the influence exerted by technology producers, I expect this composite variable to be *positively* related to support for international environmental regulations.[25] An example might clarify the point: In Sweden, technology producers seem to exert more influence than major polluters do (see Sprinz 1992b, ch. 6). Thus, the difference is positive, and I expect Sweden to sign the various international agreements (other factors held equal). To the degree that polluter interests exceed the influence of technology producers, the composite score turns negatively, and countries shall be less likely to sign international environmental agreements.

These transformed predictor variables produce a *perfect* fit for the case of the Sulphur Protocol, while logistic regression can still proceed in the case of the Nitrogen Declaration.[26] For the case of the Protocol, the transformed variables are perfectly associated with a country's international regulatory behavior: Countries with mobilized pro-environmental interests sign it, as is the case for countries with relatively influential technology producers. Since logistic regression can fit more than one (logistic) curve to these patterns, there will be no unique solution to estimating the coefficients. Instead, the bivariate coefficients have been estimated with

---

25 Participants in my expert interviews confirmed that end-of-pipe technologies have been widely used in Germany and Sweden as a consequence of domestic air pollution regulations. As a result, these countries have gained substantial experience with these technologies, and, as other countries have been adopting more stringent environmental regulations, Sweden and the FRG have turned into major exporters of abatement technologies. In turn, government officials conceded that this had a beneficial effect on their country's willingness to sign international agreements despite opposition from the major polluting industries.

26 The estimation problems also affect major subcomponents, and they are *not* generated by the induced variable procedure.

ordinary least squares (OLS) and a Weighted Least Squares (WLS) transformation suggested by Hanushek and Jackson (1977, 181-182).

Although OLS is *not* the appropriate techniques for the estimation of categorically dependent variables (ibid., 180-186), it provides a first approximation of the strength of relationship in the absence of a converging maximum likelihood (ML) (see Tables 6 and 7).[27]

Table 6: Expert Perceptions and Support for International Environmental Agreements: The Influence of Non-Industrial Interests

	Sulphur (Euro-Barometer 25)			Nitrogen (Euro-Barometer 29)		
Explanatory Variable	$(\hat{\beta}_i)$	$S.E.(\hat{\beta}_i)$	t	$(\hat{\beta}_i)$	$S.E.(\hat{\beta}_i)$	t
Maximum Score Non-Industrial Groups	1.30***	.32	4.11	5.60	4.18	1.34
Constant	-3.93	1.14	-3.44	-19.54	14.87	1.31
-2xLog Likelihood (-2LL)	n.a.			3.99		
significance (-2LL)	n.a.			.0459		
Proportional reduction of error (N=8)	1.00			.75		
Proportional reduction of error (all cases)	1.00			.50		

Note: N = 8 for the analysis of the Sulphur Protocol and for the analysis of the Nitrogen Declaration. All significance tests for the coefficients are one-tailed tests based on their predicted sign. For the analysis of the Sulphur Protocol, Spain was omitted; Hungary was omitted from the analysis of the Nitrogen Declaration. The entries of for the Sulphur Protocol are unstandardized *OLS* regression coefficients and their standard errors, whereas the entries for the Nitrogen Declaration are (unstandardized) *logistic regression* coefficients. Computation of the proportional reduction of error for the Sulphur Protocol is based on a threshold of .5 of the predicted value of signing this agreement. The results for the Sulphur Protocol should be interpreted with caution!
* denotes statistical significance at the .10 level; ** at the .05 level; *** at the .01 level.

27 In Table 6, Spain was omitted from the analysis of the Sulphur Protocol due to extreme values of regression diagnostics (Cook's D), and Hungary was omitted from the analysis of the Nitrogen Declaration for the same reason.

Table 7: Expert Perceptions and Support for International Environmental Agreements: The Influence of Industrial Interests

	Sulphur (Euro-Barometer 25)			Nitrogen (Euro-Barometer 29)		
Explanatory Variable	$(\hat{\beta}_i)$	$S.E.(\hat{\beta}_i)$	t	$(\hat{\beta}_i)$	$S.E.(\hat{\beta}_i)$	t
Relative Strength of Producers of Abatement Technology over Major Polluters	.40**	.14	2.75	3.29*	2.04	1.61
Constant	1.18	.22	5.27	4.08	2.98	1.37

significance (-2LL)	n.a.				.0117	
Proportional reduction of error (all cases)	1.00				.50	

Note: N = 9 for the analysis of the Sulphur Protocol for the analysis of the Nitrogen Declaration. All significance tests for the coefficients are one-tailed tests based on their predicted sign. The entries of for the Sulphur Protocol are unstandardized *OLS* regression coefficients and their standard errors, whereas the entries for the Nitrogen Declaration are (unstandardized) *logistic regression* coefficients. Computation of the proportional reduction of error for the Sulphur Protocol is based on a threshold of .5 of the predicted value of signing this agreement. The results for the Sulphur Protocol should be interpreted with caution!
* denotes statistical significance at the .10 level; ** at the .05 level; *** at the .01 level.

While the OLS provides a first measure of the relationship among the variables, it cannot capture the functional form of a logistic curve, and OLS cannot appropriately deal with predicted values outside the [0,1] interval for a (2-level) categorically dependent variable (Hanushek/Jackson 1977, 185). To check for the plausibility of the substantive conclusions from the OLS results, the models in Tables 6 and 7 (Sulphur Protocol only) were reestimated with a Weighted Least Square (WLS) procedure while forcing predicted values into the [.05, .95] interval (Hanushek/Jackson 1977, 181-182). The estimation results (analysis not shown here) do not change the substantive conclusion that non-industrial and industrial interests are positively related to support for the Sulphur Protocol and, to a lesser degree, this also holds for the explanation of the Nitrogen Declaration. With respect to global warming, I expect that

environmentally ambitious countries, which are likely to have their own technology providers (such as Sweden and the FRG), will be pushing for the reduction of greenhouse heating gases. On the other extreme, Spain and Poland should be reluctant to join these countries due to the influence of major polluting industries (and lack of overall resources). Since the energy sector is of much importance for the regulation of acidifying pollutants as well as global warming, these conclusions may merit further attention.

The analysis of the expert perspective on international environmental agreements showed that a (i) mass political pressure component and (ii) industry pressure component help to explain national positions on international environmental regulation. Although the small sample of countries included in the analysis (i) does not lend itself to strong statistical conclusions, and (ii) interpretation shall always proceed with caution about the assumptions explicitly made, the major propositions should hold for all 24 countries.

5. Conclusions

In this article, I have developed a general model of the domestic sources of international environmental regulation. In particular, I hypothesized that ecological damage- in combination with the rise of postmaterialism - mobilize (i) mass publics, (ii) environmental organisations, and (iii) green or ecological parties to demand international environmental agreements. This mass political pressure component has been juxtaposed with an industry pressure component. Particular emphasis has been placed on the influence of wealth and technology. It was also hypothesized that a growing influence of technology providers will be positively associated with the support for international environmental regulation, whereas major polluters are likely to hold opposite preferences.

In the empirical analysis, data on mass public attitudes and expert perceptions were employed for the various components of this general model. In most cases, support was found for the major hypotheses. However, there was stronger support for the case of the Sulphur Protocol than for the Nitrogen Declaration. Furthermore, the small ("most different cases") sample design provided particular challenges for the estimation with maximum likelihood, whereas the measure of proportional reduction of error points to the classificatory strength of the estimation results. While theoretical propositions should always be tested for their external validity, it seems that the combination of mass political pressures and industrial interests provides adequate guidance for the study of international environmental regulation.

From a theoretical perspective, I have specified (in terms of *political* actors) how a combination of ecological pressures and economic factors (Jänicke/Mönch 1988) account for international environmental regulation, and I tested a more elaborate version of the "capacity hypothesis" (Prittwitz 1990b). Given the results of the various analyses presented above, I conclude that the ability of a country to further environmental quality in a world of transboundary pollution is well served by a mobilized citizenry in combination with economic and technological factors, and both are needed to turn the protection of the international environment into reality.

Appendix 1: Question Wording of Mass Public Attitude Data

Euro-Barometer 25

source: Rabier et al. (1988)

Note: All cases with missing data codes were omitted by variable (except if explicitly mentioned). All data were recoded so as to follow the directional hypotheses outlined in Section 2. Missing data codes are not included in this listing.

Postmaterialism: variable 310 (composite 4-item index, see Inglehart 1977).

Damages due to Acidification: variable 172

"When we talk about possible damage to the environment, what do you think of above all? Would you please choose from this list the three things that come immediately to mind? ... Acid rain which attacks woods and forests.

0. not mentioned;
1. mentioned."

Environment-Economy Tradeoff: variable 218

"I would like to give you some opinions which are often expressed about the problems of the environment. Which of these opinions are you most in agreement with?

1. Development of the economy should take priority over questions of the environment.
2. Sometimes it is necessary to make a judgment between economic development and protection of the environment.
3. Protecting the environment and preserving natural resources are necessary conditions to assure economic development."

Membership in Natural Protection Associations or the Ecology Movement: variables 276 and 277

"There are a number of groups and movements seeking support of the public. For each of the following movements, can you tell me ... whether you are a member, or might join, or would certainly not join?

var 276: ... The Nature Protection Associations
var 277: ... The Ecology Movement

1. is a member;
2. might join;
3. would not join."

Coding:
Both variables were crosstabulated (incl. missing data), and all persons who are at least a *member* of one of these two movements were included in the computation of membership for the combined movements.

Euro-Barometer 29

source: Reif/Melich (1990)

Note: All cases with missing data codes were omitted by variable (except if explicitly mentioned). All data were recoded so as to follow the directional hypotheses outlined in Section 2. Missing data codes are not included in this listing.

Postmaterialism: variable 443 (composite 4-item index, see Inglehart 1977).

Damages due to Acidification: variable 181

"When we talk about possible damage to the environment, what do you think of above all? Would you please choose from this list the three things that come immediately to mind? ... Acid rain which attacks woods and forests.

0. not mentioned;
1. mentioned."

Environment-Economy Tradeoff: variable 221

"I would like to give you some opinions which are often expressed about the problems of the environment. Which of these opinions are you most in agreement with?

1. Development of the economy should take priority over questions of the environment.
2. Sometimes it is necessary to make a judgment between economic development and protection of the environment.
3. Protecting the environment and preserving natural resources are necessary conditions to assure economic development."

Voting Intention for Green or Ecological Party: variable 422

"If there were a general election tomorrow (say if contact under 18: and you had a vote), which party would you support?"

- France: 50. Ecologistes
- Belgium: 55. Ecologiste
- The Netherlands: *no green or ecological party explicitly listed*
- Germany: 50. Die Grünen
- Italy: 50. Verdi
- Denmark: 50. De Groenne
- Ireland: 50. Ecology Party
- U.K.: 51. Ecology Party
- Greece: *no green or ecological party explicitly listed*
- Spain: *no green or ecological party explicitly listed*
- Portugal: *no green or ecological party explicitly listed.*"

coding:

Green or ecological party support was computed as a percentage of all non-missing data.

Appendix 2: Questions from the Expert Interviews

source: Sprinz (1992a)

Note: All cases with missing data codes were omitted by variable (except if explicitly mentioned). All data were recoded so as to follow the directional hypotheses outlined in Section 2. Missing data codes are not included in this listing.

Concern for the Environment: variables 14, variables 164 through 171

"Which environmental problems *other* than acid rain are of great concern to your country?

var 14 "In your view, how prominent has the acid rain problem been in the 1980s relative to other environmental problems in your country?

1. much more
2. more
3. roughly equal
4. less
5. not at all".

var 164 Population growth
var 165 Decline of tropical rainforests
var 166 Side-effects of modern agriculture
var 167 Global climate change
var 168 Biodiversity (incl. protection of flora and fauna)
var 169 Ocean and coastal pollution
var 170 Freshwater pollution
var 171 Toxic chemicals

1. very high
2. high
3. medium
4. low
5. very low."

coding:

All scores for non-missing cases (by variable) were aggregated separately and by country; the maximum score across all variables (by country) was used in the analysis.

Strength of General Public, Environmental Movement, and Green/Ecological Parties: variables 111 through 113, variables 127 through 129

"How do you assess the strength of various groups or organizations in the domestic political decision-making process on national and international acid rain regulation? Please use a scale ranging from "1" ("very strong") to "5" ("very low") for the domestic and the international process. If an item seems to be inappropriate in your country, please enter "9".

domestic regulation

var 111 green or ecology party
var 112 concern of the mass public
var 113 environmental groups

international regulation

var 127 green or ecology party
var 128 concern of the mass public
var 129 environmental groups

1. very strong
2. strong
3. medium
4. weak
5. very weak."

coding:

The scores of the domestic and international regulation were combined for each of the three groups.

Costs of Regulation: variable 37, variable 38

"Within the framework of the United Nations Economic Commission Europe (UNECE), several pieces of international regulation have been concluded. Some countries and the European Communities joined these agreements and have begun to implement them, while other countries have abstained from parts of UNECE-sponsored international regulation.

Please compare the standards called for by the international agreements listed below with the respective regulatory standards in your country before the conclusion of the UNECE-sponsored international treaties. Were the costs associated with international regulation higher than the costs associated with the domestic standards at that point in time? For the temporal domains, please find the year(s) mentioned in brackets with each legal instrument.

var 37 Sulphur Oxide Protocol (1985, provision: reduction of sulphur emissions or their fluxes by 30% until 1993 compared to 1980; so-called "30% Club")

var 38 Nitrogen Oxide Protocol (1988, provision: standstill agreement on nitrogen emissions or their fluxes by the end of 1994 compared to 1987)

1. much higher
2. higher
3. roughly equal
4. lower
5. much lower".

Net Exporter of Abatement Technology: variable 151

"Is your country a net exporter or a net importer of acid rain control technologies?

1. Major exporter
2. Minor exporter
3. Exports match imports
4. minor importer
5. major importer".

Influence of Major Polluting Industries and of Producers of Abatement Technology: variables 152 and 153

"How strong would you rate the influence which various industries (private or public) have on acid rain regulation in your country?

var 152 major polluting industries
var 153 producers of end-of-pipe technologies

1. very high
2. high
3. medium
4. low
5. very low".

The "New Austria," the "New Europe," and the "New Nationalism"

Manfred Steger

THE "NEW AUSTRIA," THE "NEW EUROPE," AND THE "NEW NATIONALISM"

Manfred Steger, Rutgers University

I. Introduction

Beginning in 1983, the complacent self-understanding of many Austrians who saw themselves living on an "Island of the Blessed"[1] has been swept away by a series of extraordinary events that have triggered a new Austrian identity. The stability and predictability of the post World War II Austrian political system has dissolved in insecurity over Austria's future role in the "New Europe" and has given rise to increasing levels of popular protest. It seems that the struggle for a new Austrian identity in the "New Europe" has put an end to the Austrian Gemuetlichkeit (coziness) of compromise and consociationalism.[2] As the underlying causes of this development, Peter Ulram has identified profound domestic and international socioeconomic changes accompanied by economic malperformance; the erosion of popular loyalty to the established parties and the fading of old ideologies; the transformation of political communication; and the collapse of popular support for traditional sociopolitical and cultural structures.[3]

This enduring dissatisfaction with "politics as usual" is reflected in the rise of "postmaterialist" values like ecological themes and political ethics within Austrian political culture,[4] thus providing an opening for libertarian parties of the "New Left," like the two Green parties (GAL, VGOE) and authoritarian nationalist-populist parties of the "New Right," like Joerg Haider's Freedom Party (FPOE).[5] Between the national elections of 1979 and 199Ø, the share of those parties in the national vote increased from 6.1 percent to 21.4 percent while the general voter turnout declined from 92.2 percent to 86.1 percent.[6] Both the New Left and the New Right have offered new identity contents that, though in most points diametrically opposed to each other, nonetheless meet in the slogan, "No to the European Community; Yes to Europe" of French and German radical rightists.[7] Their rejection of the EC's version of the "New Europe" adds fears about Austria's future to the climate of uncertainty and mistrust.[8]

For many Austrians, the term "New Europe" signifies not merely Austria's new relationship to the EC and West European integration but also the problems connected with the process of Eastern European disintegration. The "New Europe" has created a "New Austria" whose self-image may move toward either of two mutually incompatible cultural identities. The first takes off from the early twentieth-century dream of a federated Mitteleuropa with Vienna as its economic and cultural center. But unlike this nostalgic, pompous cliche, a "new and improved version" of the wish for federation would give Austria a cosmopolitan, multiethnic identity of a small country embedded in an expanding European Community and committed to its traditional role of linking Western and Eastern European cultural heritages.

Conversely, the realization of the second option would mean a victory of "Haiderism" in Austria: the solidification of an alternative Austrian identity based upon the rejection of the "multiculturalism" of the EC in favor of the imagined "purity" of a narrow "German cultural community." This essay will examine in some detail this nationalist-populist response of Joerg Haider's FPOE to the emerging Western and Eastern "New Europe." This paper will first analyze Haider's "New Nationalism" and will then investigate in some detail two of Haider's controversial political strategies--his intiation of an anti-foreigner "Austria First" petition for parliamentary action to be signed by concurring Austrian citizens, and his sudden reversal of the Freedom Party's traditional liberal pro-EC course. Both strategies reveal the synthesis of nationalism, populism and xenophobia that lies at the base of all current European right-wing parties. It is here that Austria faces its greatest challenge on its path toward a new European-Austrian identity.

Some authors deplore the pro-EC course of the governing Social Democratic-Conservative coalition as a nervous and hasty escape from the difficulties of the 198Øs into the arms of the "great brother EC." Rejecting the nationalist-populist option as well, they hope that a prolonged search for a clear and distinct national identity--a sense of "genuine Austrianness"--might in the end turn out to be successful after all.[9] Although such arguments are well constructed and undoubtedly have some merit,[10] I would still maintain that the idealism that fuels such hopes disregards the socioeconomic realities of late twentieth-century Europe. Admittedly, the European Community is facing enormous problems in moving along the process of European integration. It must remain a top priority for Austrian EC representatives and negotiators to argue in favor of more decentralization and democratization of Brussel's power structures; the implementation of a strong federalist principle; and effective support for localized agriculture and other victims of the new European economic order. Yet, the goal of a successful evolution of a "New Austria" can only lie in the country's successful integration into the European Community. New variations on the old exceptionalist theme of the "Island of the Blessed" or the "Sound of Music country,"[11] have passed their time.

II. Austrian Identity--Past & Present

As the prominent Austrian historian Friedrich Heer pointed out several years ago, there is no other historical formation in Europe whose existence is so closely connected with the identity problems of its members as Austria.[12] For long stretches of its modern history, Austria has shown ambivalent feelings toward developing a "national identity" separate from Germany. Although the multinational heritage of the Habsburg Empire prompted guardians of classical Weimar culture like Johann W. von Goethe and Friedrich Schlegel to refer to Austria as an "intellectually foreign country" having "the least to do with Germany,"[13] the Austrian Empire, at least during most of the nineteenth-century, continued to define itself vis-a-vis its northern neighbor

through the protracted struggle for military, political, and cultural hegemony. Yet, Austria could also proudly point to its distinct identity as the curator of a multi-ethnic "Central European Culture" with Vienna as its sophisticated center of gravity. However, by 19ØØ, Germany had cemented its position as the representative of "real" German culture and power, drawing the German-speaking part of Austria-Hungary closer into its orbit. The liberal Vienna with its Jewish cosmopolitanism and Roman Catholic noblesse oblige elitism was captured by the anti-intellectual political forces of its anti-Semitic Mayor Karl Lueger, foreshadowing the post-World War I polarization of Austrian society into three antagonistic Lager (camps): the Christian Conservatives, the Social Democrats, and the German Nationalists.

After the 1918 disintegration of the Monarchy, the remaining small rump-state of "German-Austria," prevented from following its natural impulse to unite with Germany, never succeeded in developing its own identity. As David Luft has pointed out, Austria was haunted by "the option of Anschluss [annexation] from its inception until its dissolution into the grossdeutsch [greater German] dreams of its son from Braunau on the River Inn."[14] The years from 1918 to 1938 saw a rise of nationalist and fascist parties throughout Europe; in the Austrian case this development was amplified by the short 1934 Civil War which overpowered the young democracy and contributed to a further eclipse of liberalism and the idea of a Central European community. The 1938 Anschluss "fetched Austria back into the [German] Reich," simply confirming the suspicion of many Austrians that the German-speaking remainder of the Habsburg Empire had been, as Freedom Party Leader Joerg Haider fifty years later would put it, "an ideological monstrosity."[15]

The 1945 re-establishment of a Second Republic of Austria and the 1955 signing of the State Treaty established an independent Austria committed to "perpetual neutrality" and its new role as a mediator between the West and East blocs. Yet, it took decades for Austrian culture to develop distinct social, political, and economic features that lent legitimacy to the "Austrian way."[16] Oppositional Lager mentality gave way to a system of compromise between the Socialist (SPOE) and the Conservative (OEVP) Lager, making Austria the prime example of consociational democracy. Stable voting behavior reflected the reliability of traditional voter loyalties and the survival of the Lager mentality. In addition, the Proporz system set up by the two dominating parties divided the spoils of power in the form of jobs, housing, and government contracts strictly according to proportional strength and party affiliation. Persistent awareness of its neutrality and geopolitical position kept Austria from seeking closer ties to the European Community (EC), thus facilitating the establishment of "Austrokeynesianism": A distinct set of principles of neo-corporatist economic policy, it relied on a regular but informal participation of all major interest groups in industrial and welfare policy-making.[17]

The 197Ø-1983 "Kreisky Era" of an absolute Social Democratic parliamentary majority represented both the apex and the last phase of a process of finding a new national identity predicated upon the fiction of a perpetual Austrian social and economic exceptionalism. The goverment under Chancellor Bruno Kreisky made great strides toward modernizing Austria and achieved impressive social and political reforms that, for almost a decade, sheltered Austria's economy from adverse international developments. However, it failed to initiate Vergangenheitsbewaeltigung ("coming to grips with the past"), a public debate on Austria's ambiguous identity that could have contributed to a further expansion of "civic culture" in Austria. Kreisky's tactical overtures to the the national-liberal Freedom Party and his glossing over the Nazi past of its chairman Friedrich Peter are clear examples of this failure. Presenting itself as the guardian of social security and political stability, the SPOE deliberately projected a self-satisfied image of Austria as an "Island of the Blessed." The ideological thaw and the soothing effect of spreading prosperity in concert with the lingering one-sided interpretation of Austria's immediate past (a "victim of Nazi aggression") artfully covered remaining cultural identification potentials to the far right of center. Only occasional sparks of anti-Semitism, widespread feelings of antipathy toward foreign "guest workers," the lingering German nationalism in the province of Carinthia, and the involvement of Austrian right-wing terrorists in the German-speaking Italian province of Southern Tirol provided hints of the persistence of xenophobic attitudes and values in some segments of the Austrian population.[18]

The first signs of an emerging "political culture of unease"[19] appeared in Austria in 1983 when Kreisky's Social Democratic Party (SPOE), in the midst of economic woes and mounting accusations against the government's disregard for "new issues" and its increasing detachment from the people, lost its absolute majority in the National Council (parliament). The ensuing coalition between the Social Democrats and the national-liberal Freedom Party (FPOE), plagued by seemingly unending scandals and a continuing economic downturn, was dissolved by the successful 1986 bid of the populist-nationalist Carinthian Freedom Party Leader Joerg Haider for the national chairmanship of the party and by the ensuing refusal of Social Democratic Chancellor Franz Vranitzky to maintain the coalition agreement with a Freedom Party under Haider's leadership. The same annus horribilis saw the unravelling of the "Waldheim Affair,"[20] and the spectacular electoral success of Haider's nationalist populism,[21] which, together with the Green-Alternative List's first entrance into parliament, managed to dealign petrified party structures.[22]

The second wave of changes from 1987-1988 amplified the swing to the right[23] in the protracted domestic and international debate over President Waldheim's Nazi past, a series of brilliant successes for Haider's Freedom Party in state elections, and the fiftieth anniversary of Hitler's 1938 annexation of Austria. Rival interpretations of the events leading up to 1938 among the political parties raised questions of collective guilt that had

been neglected for too long.[24] Although Chancellor Vranitzky publicly admitted to Austria's complicity in the Nazi crimes and even President Waldheim apologized for the "crimes of National Socialism committed by Austrians," questions about Austria's past remained. Moreover, popular sentiments of distrust and suspicion toward old-style politics were further fueled by a new string of corruption scandals that engulfed prominent Social Democratic politicians like the former Chancellor Fred Sinowatz and the former Minister for Foreign Affairs and President of the National Council Leopold Gratz.

However, between 1989 and 1993, a third wave of changes completely exploded familiar identity structures of Austria as an "Island of the Blessed." Austria's 1989 "Letter to Brussels"--the application to join the EC--reversed its cautious tradition of walking a "middle path" between the East and West blocs in favor of the West and European integration. Several months later, the breakdown of communism in Eastern Europe led to a disappearance of the iron curtain and a fundamental shift in Austria's geopolitical position. The 199Ø unification of Germany coincided with a flood of asylum seekers from Eastern Europe into Austria, sparking xenophobic cries for restrictive immigration laws that helped Haider's right-wing populism to increase its share in the national elections to over 16 percent. The 1991 outbreak of the Civil War in Yugoslavia added war refugees to the stream of Eastern European asylum seekers, prompting heavy-handed proponents of immigration and asylum restriction in the coalition government to follow the Freedom Party's popular demands for harsher measures. The passage of the new 1991 Alien and Asylum Laws and the 1992 Residence Laws further destabilized Austria's political culture, with the Left citing negative reactions to the new laws by Amnesty International and the U.N. High Commissioner for Refugees[25] and the Right pushing for even more extensive restrictions. Austria's "New Nationalism" had won an important battle.

III. The Face of "New Nationalism" in Austria: The Freedom Party as a Nationalist-Populist Protest Party

Although it would be a mistake to regard the Austrian Freedom Party simply as a revamped old-style fascist party, it would be equally erroneous to downplay both its connection to the nineteenth-century German-nationalist "Third Lager" and its National Socialist heritage.[26] Post-World War II denazification laws in Austria excluded all members of the NSDAP or its military affiliates from the first national elections in 1945 and forced over 27Ø,ØØØ ex-NSDAP party members from their jobs.[27] However, a series of amnesties between 1947 and 1949 allowed 487,ØØØ "minor incriminated" ex-NSDAP members (12 percent of the new electorate) to participate in the 1949 National Elections. Most of them cast their votes for the recently organized national-liberal "League of Independents" (VdU), which established itself as the surprisingly strong third political force in Austria by gaining 11.66 percent of the vote.

Howver, the VdU represented not only a gathering place for ex-NSDAP party members. In its election campaigns, the VdU courted old-style liberals and dissatisfied voters of the two main parties by employing anti-communist slogans, emphasizing the government's inefficiency and "bloated bureaucracy," demanding the establishment of a truly "free market" economy, and connecting bitter-sweet images of the Austrian Heimat (homeland) with German Volkstum. The party's success suddenly prompted both the Social Democrats and the Christian-Conservatives to refer to the old denazification laws as "laws of vengeance" that frequently had "stigmatized" people, who, "in their hearts," had "never been National Socialists."[28] Thus, the two main parties contributed to the perpetuation of a strange Austrian self-image that simultaneously pitied itself as the "victim of Nazi agression" and took pride in belonging to a "German cultural community" free of Slavs and Jews.

By the mid 195Øs, the VdU, plagued by internal tensions, merged with a political group that had formed around Anton Reinthaller, a former Nazi Minister of Agriculture in the 1938 Anschluss Cabinet. The new conglomerate, the Austrian Freedom Party (Freiheitliche Partei Oesterreichs), consisted of a liberal wing around Wilfried Gredler and Reinthaller's German nationalists. Regarding self-employed professionals, independent shopkeepers, tradesmen and certain sectors of public employees as their main constituency, the FPOE ran its 1956 election campaign emphasizing German-nationalist issues.[29] Rejected by voters, the Freedom Party plumetted to 6.52 percent, and for the next thirty years its share in the national vote remained relatively stable, fluctuating between five and seven percent.

Under the 1958-1978 chairmanship of ex-SS man Friedrich Peter, the Freedom Party moved closer to the center, endorsing both traditional liberal values and nationalist rhetoric that stressed Austria's alleged connection to the German Volk. In accordance with its economic liberalism, the FPOE pioneered a pro-EC course for Austria. It was also the first political force in the country to realize the rising importance of "quality of life" and ecological issues. By the early 197Øs, the liberal wing within the FPOE gradually began to dominate the party. The "Atterseer Circle," a liberal academic-intellectual support group for the Freedom Party, became the ideological and financial backing for the carriers of a young generation of party leaders. However, these liberal "Young Turks" never entirely disavowed the nationalist heritage of the FPOE. After all, it was Friedhelm Frischenschlager, one of the leaders of the "Atterseer Circle," who, as the Minister of Defense in the 1983-1986 coalition government with the Social Democrats, publicly welcomed Walter Reder, a pardoned Austrian war criminal. The incident triggered a domestic and international outcry that forced him to resign.

The new Right-liberal course of the party found its external expression when, in 198Ø, the liberal Norbert Steger was elected its new chairman, narrowly defeating the nationalist candidate Harald Ofner. Steger tried to reverse not only the Freedom Party's German-nationalist image but also abandoned much of its opportunistic populism by assuming governing responsibility in a

Social Democrat-led coalition government. However, constant scandals surrounding SPOE politicians and the government's ineffective economic policies rubbed off on the Freedom Party, which added to the negative public image of the coalition government with mistakes of its own.

However, Steger refused to quit the coalition, adhering to his unsuccessful liberal course aimed at the weakening of Social Democratic social welfare programs and their large subsidies to the ailing nationalized industries. Removing himself more and more from the party base, Steger inadvertently strengthened the nationalist-populist faction around the Carinthian Member of Parliament, Joerg Haider. When, in June 1986, polls indicated that the Freedom Party's popularity had dropped to unprecedented low levels, Haider's German-nationalists openly revolted against the liberal course of Steger's Viennese party headquarters, forcing a party convention in Innsbruck on 14 September 1986 to decide over the future direction of the FPOE.

Admidst cheering delegates waving Hitler medallions to provoke and mock the liberal "Steger Faction,"[30] Haider emerged as the new chairman, beating Steger by more than eighteen percentage points. As Max Riedlsperger has pointed out, although the domestic and international press pounded the "nazistic tendencies" that had been unleashed in Innsbruck, many Austrians responded positively to the change in FPOE leadership, thereby revealing not only the lingering shadows of the past but also their disgust with the shortcomings of the coalition government.[31]

Leading a successful campaign for the upcoming 1986 National Election, the 37-year-old Haider relied on his image as a "youthful rebel" and his considerable telegenic talents. Within two months, Haider succeeded in remodelling the public image of the FPOE as a wilting, old-style nationalist-liberal party to that of a dynamic, youthful and aggressively honest "citizens' initiative."[32] In tune with Austria's new "political culture of opposition,"[33] Haider emphasized issues like the spiralling national debt, corruption scandals, and the privileges of "old-style politicians." To everyone's surprise, the Freedom Party managed to almost double its 1983 total by receiving 9.7 percent of the vote. Still, the 1986 National Election was only the beginning of an unbroken series of impressive national, state, and municipal electoral successes that have continued to the day of this writing. In many cases, Haider tripled the FPOE's share in the vote, surpassing the Christian-Conservatives in two states (Vienna '91 and Carinthia '89) by drawing between 20 and 30 percent of the vote. After the 1989 Carinthia State elections, Joerg Haider was the first FPOE politician in the history of the Second Republic to become the governor of a state. Despite the loss of his Carinthian governorship two years later, resulting from Haider's public "defense" of the Third Reich's "proper employment policy,"[34] the Freedom Party achieved spectacular vote increases in three State Elections that were held later in 1991.

Political analysts in Austria and abroad have marvelled at the success of "Haiderism" in Austria. Together with parties like Jean M. Le Pen's French "National Front" or Franz Schoenhuber's

German "Republicans," Haider's Freedom Party represents Europe's rising "New Nationalism," the less extreme cousin of old-style fascism. As right-wing protest parties, the "New Nationalist" parties combine the populist understanding of a rule of "the will of the people" with the nationalist definition of a "people" as an autonomous and homogenous "us" clearly distinguishable from "them." Referred to as "nationalist-populist" by Pierre-Andre Taguieff,[35] such parties operate on a democratic party platform while their constant calls for the consideration of the opinion of the "common person" through referenda, plebiscites, and other forms of "direct democracy" can easily deteriorate into an intolerant and discriminatory tyranny of "common sense." The party structure is usually tailored in the image of a charismatic party leader like Le Pen, Haider, or Schoenhuber, who, as the "tribune of the people," appeals to his ties to the "people" in their mutual struggle against a corrupting "old" political system. At the same time, he is involved in a perpetual intra-party process of purging his rivals. For example, Haider's increasingly authoritarian style of leadership has not gone unnoticed.[36]

Robert Knight has correctly described Haider as a master of right-wing prose who loves flippant provocations and portrays himself as both the anti-establishment fighter of corruption and inefficiency and the restorer of public safety, thus securing values of "community."[37] Raised in an ex-Nazi German-national household, Haider's life was, from his high school years on, directed at a political career in the nationalist camp. Keeping close ties to nationalist organizations like the notoriously right-wing Turnerbund ("Gymnasts' Association"), the college student Haider quickly moved on to leadership in the FPOE's Students' and Youth Association. After a brief stint as assistant professor of law at the University of Vienna, Haider, at age 29, became an FPOE member of parliament in 1979. Since at least 1983, Haider secretly planned and coordinated his party take-over,[38] while artfully deceiving the "Steger Liberals" and a good part of his own intra-party nationalist competition. Finally in control of the Freedom Party, Haider innovated a new style of politics in Austria--a nationalist-populism that F. Plasser and P. Ulram have characterized as a "politics of masks, symbols, and emotions."[39]

Like all successful populists, Haider possesses the ability to read the resentments and prejudices of the masses, anticipate likely developments in the political climate, and effectively exploit controversial issues that reflect popular prejudice but are frequently considered "too hot" to deal with by the established political parties. Advertising himself as the "voice of the people," Haider draws both protest voters who simply "want to register their resentment" with old-style politics and the World War II generation which feels itself redeemed by an ideal son who publicly asserts that "our fathers and grandfathers have only done their duty...and don't deserve to be dragged through the mud."[40]

A master of language and the new "politics of symbols," Haider meticulously picks concepts that are partly based on facts and partly on fiction, often connecting events that are totally

unrelated but which trigger desired associations in the listener. Franz Januschek's and Ferdinand Karlhofer's studies of Haider's language use shows clearly that his political success relies on a double-pronged strategy.[41] First, Haider's choice of words mobilizes and amplifies widespread political anxieties, traumatic experiences, and unfulfilled wishes that lie beyond solutions offered by traditional parties. Secondly, Haider uses clearly recognizable national-socialist expressions like "the final solution," but when applied in a different context, like "the final solution of the agrarian question," escape blame. Such allusions to NS-vocabulary signal the Right that Haider is "one of them" and provoke criticism from the Center and the Left, which Haider then easily defeats in a rational defense that refers his critics to the "neutral" dictionary.

Haider is one of the first Austrian politicians who, due his youth and political acumen, identified the shifting structure of Austrian political culture. There is no doubt that Haider took advantage of a new political phenomenon that Theodore Lowi has described in his work on the U.S. as the "republic of service delivery"--the development of an unmediated relationship between independent, atomized individuals and an executive-centered government.[42] Grasping the main cause of popular dissatisfaction and resentment against government--the "Austrokeynesian" paradigm's increasing inability to fulfill its role of providing a growing number of services and entitlements to its citizens--Haider deliberately fueled the emerging "political culture of unease" by encouraging voters to evaluate government even more in terms of "service delivery." The impossibility of meeting the long list of popular demands consistently allowed Haider to find governmental "shortcomings" in relation to shifting constituencies like farmers or, most recently, blue collar workers who were allegedly "badly served" by the government." At the same time, Haider prudently avoided possible coalitions on the national level, thus avoiding governing responsibility and monopolizing the advantageous position of a "critical opposition" to the governing Grand Coalition. The last step toward a full-blown nationalist-populism resided in a "politics of emotions"--the fueling of mass sentiments of resentment by identifying issues that conjured up enemy images of an easily identifiable "them"--"central government," "corrupted politicians," "social parasites," "foreigners," and a "bureaucratic EC."[43]

An attentive student of opinion polls and attitudinal surveys, Haider noticed the decline of trust in politics and the emergence of new "postmaterialist" issues like the environment and political ethics in the early 198Øs,[44] and fit his strategy to the new political conditions.[45] At the same time, the tendency of nationalist-populist parties to tailor their program to the personality of the leader helped Haider to take advantage of the decline of parties and party loyalty and the rise of the media-centered politics of the 198Øs and 199Øs. Over and over again, Haider emphasized that the Freedom Party did not represent a "party in the conventional sense."[46] He brilliantly utilized the "politics of masks"--the unmediated relationship between politician/rhetorician and the individualized mass audience of

the 199Øs television-centered "couch potato democracy."[47] This T.V. mass audience allowed him to build a "Haider coalition" that, semi-independent of his own party structure, ran across party lines. Only by the 199Ø National Election had the Social Democrats begun to copy Haider's strategy. By dropping conspicuous party labels and encouraging voters to give a "preference vote" to their popular candidate Chancellor Franz Vranitzky without having to check off the party name on the ballot, they successfully turned the elections into a plebiscite for the popular Chancellor Vranitzky. The Christian-Democrats, unable to utilize the new person-centered political paradigm, suffered a crushing defeat.

Haider also realized that the continued success of his populist strategies depended on unchanging high levels of public resentment and dissatisfaction. These seemed to be threatened by an expanding and healthy 1989/9Ø Austrian economy. Encouraged by excellent election results and supported by current opinion polls, Haider decided to fuel popular anxieties over the influx of Eastern European "foreigners" and Austria's possible integration into the EC. Given the strong public resonance with the "foreigner issue" and Austria's EC application, the FPOE succeeded in pushing its own agenda onto the SPOE-OEVP coalition government. Having made populism presentable in Austrian politics, Haider's Freedom Party had won another important battle.

IV. Eastern European Disintegration: The Freedom Party and the "Foreigner Issue"

Initially, two-thirds of the Austrian citizens were enthusiastic about the 1989 breakdown of communism in Eastern Europe and the lifting of the Iron Curtain vis-a-vis its eastern neighbors, Hungary and Czechoslovakia.[48] However, beginning in the Spring of 199Ø, the mood began to turn when many Austrians realized that open borders to the East did not only boost Austria's economy, but brought thousands of legal and illegal migrants--mostly from Romania. Totally unprepared and not considering itself "a country of immigration," the Austrian Center-Left coalition government aggravated the situation by making a clumsy and thoughtless selection of temporary refugee shelters and camps.[49] Small incidents involving aliens working illegally in Austrian companies and criminal acts committed by asylum seekers were taken up and completely blown out of proportion by the country's largest tabloid, Neue Kronen-Zeitung. Warning against a "foreigner threat," the paper carried long articles in favor of severe asylum restrictions, showing caricatures of giant "alien rats" attacking "Mr. Austria."[5Ø]

As early as March 199Ø, the Freedom Party had latched onto the "foreigner problem" with top functionaries openly claiming that, though peoples were of equal value, they were "certainly very different from each other."[51] Concentrating on the problem of mass migration from Eastern Europe to the "Golden West" and supported by the daily headlines of the Kronen-Zeitung, the Freedom Party succeeded in dominating domestic politics by

emphasizing the inadequacy of old asylum policies that were internationally recognized as liberal and humane. Opinion polls confirmed the increasingly radical anti-foreigner course of the FPOE: large majorities were in favor of asylum restriction, demanding "harsh measures against migration 'abuses'."[52] Once again, Haider skillfully exploited widespread sentiments of prejudice and fear by continuing to thunder against "multiculturalism" and the government's "misconceived humanity" that simply "imported criminality" from the East.[53] Later that same year, a poll showed that 21 percent of Austrians could be classified as "strongly xenophobic," whereas only 5-7 percent bore "strong friendly" sentiments toward foreigners.[54] During the election campaign of 199Ø, Haider made the "foreigner issue" and the corruption scandals of the " political establishment" his two main themes. In Vienna, the biggest prize of the election, the "foreigner issue" advanced to the position of second most important problem, with 31 percent of the respondents making it a "high criterion" for their voting choice.[55] Particularly Arabs, Jews, Russians, and Serbs were rejected[56] --a peculiar snapshot of the Austrian mind, given that none of these ethnic groups could be counted among the top in the list of immigrating nationalities.

After Haider's impressive capture of more than 16 percent of the national vote, the government slowly began to cave in. Franz Loeschnak, the Social Democratic Interior Minister, and his deputy, Manfred Matzka, jumped on the populist train, endorsing severe asylum restrictions and even threatening the immediate deportation of thousands of Romanian immigrants.[57] Other top-level Conservative and Social Democratic politicians joined the chorus of voices, claiming that "the boat" was "full" and demanding, among other things, increased border controls and visa duty for Eastern Europeans. Yet even at the height of the migration influx, the number of legal asylum-seekers never surpassed 3Ø,ØØØ, and only a small number of citizens reported to have actually had "negative experiences" with foreigners.[58] In his recent study on international migration, Alexander Melamid called the recent immigration figures calculated in multiple scenarios for Austria "reasonable."[59] Moreover, the growing anti-foreigner sentiments stood in stark contrast to the benefits Austria's economy reaped from the disappearance of the Iron Curtain: in 199Ø, exports to Hungary increased by 43 percent (imports only by 29 percent), and exports to Czechoslovakia jumped an amazing 82 percent.[6Ø]

With the outbreak of the 1991 Civil War in Yugoslavia, Croat, Slovene, and Bosnian refugees and displaced persons began to enter Austria, pouring oil on Haider's restrictionist fire. Under the leadership of the FPOE, and with the votes of the governing Grand Coalition--but against the votes of the Greens--new Alien, Asylum, and Residence Laws were passed establishing quotas on immigrants, strengthening the arms of the Austrian foreign-police in making identity checks, and allowing the dismissal of "unfounded applications for asylum" without detailed investigation.[61] Austria's foremost political scientist Anton Pelinka described this latest FPOE show of force as "the

transition of Austria's elitist democracy to a populist democracy."[62]

But Haider felt that the new laws had not gone far enough. Lauding the Kronen-Zeitung's most xenophobic columnist as "talking truthfully,"[63] the Freedom Party leader and his chief propagandist, Andreas Moelzer, raised the "foreigner issue" to a new level by insulting the "lazy Poles" and their "fat President Walesa," and warning against the danger of a possible Umvolkung (ethnic transformation) of the "entire white race."[64] In spite of Haider's above-mentioned loss of the 1991 Carinthian governorship due to his defense of "Third Reich employment policy," state elections in the same year showed spectacular gains for the Freedom Party.

Using the simplistic formula "stop foreigners," Haider entered the campaign for the Vienna State elections in November 1991. In a way, these elections were the last "test case" of how far Haider's Freedom Party could go with the "foreigner problem" at the center of its political agitation. Calling Vienna a "German City" that should remain the "home-town of Viennese," the Freedom Party pointed to alleged "housing problems of the Viennese population" due to the "foreigner avalanche," and to the "high proportion" of foreign children in Viennese schools.[65] When it became clear that Haider's strategy resonated with a sizeable portion of Viennese citizens, the SPOE and OEVP jumped on the bandwagon, using the battle cry, "Vienna for the Viennese!"[66] Once again, the two main parties legitimated Haider's nationalist-populist strategy only to experience another electoral disaster. The Social Democrats lost their absolute majority for the first time since 1945 by polling only 47.7 percent, and the Conservatives lost more than ten percent of the 1987 total, reaching a mere 18.1 percent. Haider's FPOE improved by 12.9 percent, gaining 22.6 percent of the total vote, thus becoming the second strongest political force in Vienna. The Greens also had a strong showing, reaching 9.7 percent. The Viennese result surprised leading Austrian political scientists who later established that the "foreigner issue," mixed with high levels of general public dissatisfaction with the coalition government, had been especially effective with Viennese blue-collar workers, thus opening a new constituency for the traditionally professional middle-class and farmer-oriented FPOE.[67]

By 1992 the influx of Bosnian refugees reached record levels, prompting Haider to engage in a new show of force by using the tool of "direct democracy" and initiating an anti-foreigner "Austria First" petition for parliamentary action to be signed by concurring Austrian citizens. Yet, the Yugoslavian catastrophe had begun to divide Austrians, with an increasing number of private citizens and public and private institutions criticizing Haider's and Loeschnak's positions on immigrants. Austrian Radio and Television, the Red Cross and the Catholic relief organization "Caritas" had jointly begun to organize the project "Neighbor in Despair," and by mid-1992 had collected $36 million in aid for refugees in the former Yugoslav republics. By the end of the year, Austria had admitted more than 57,ØØØ

refugees from war-torn former Yugoslavia, and Haider campaigned for his 12-point programme to tighten the curb on foreigners in Austria. Among those points, the "Austria First" petition included the following demands:

> ...2) An absolute halt to immigration until a satisfactory solution was found to prevent illegal immigration, the elimination of housing shortages and the decrease of the unemployment rate below 5 percent...
> 3) Obligation for foreign workers to carry an identification card at their workplace...
> 4) Adding of new foreign police jobs to detect illegal immigrants and fight crime, especially organized crime...
> 6) Relaxation of the situation in schools by limiting the share of students with a foreign mother-tongue to a maximum of 30 percent...
> 9) No premature grant of Austrian citizenship...
> 12) Establishment of a "Foundation for Eastern Europe" for the prevention of migration...[68]

Haider hoped for a million signatures that would surpass his share in the 1990 National Elections by 250,000. Such an outcome would pressure the government to translate this programme into law. However Haider underestimated two factors: the popularity of "SOS Fellow Human Being--Decency First," the sister project of "Neighbor in Despair," and fear of many Austrians to publicly endorse obviously xenophobic demands. In other words, Haider lost many protest voters who, in the anomymity of the voting booth, had checked off the FPOE box, but were not ready to put their names to an anti-foreigner petition.[69] By the end of the one-week signing period, "only" 417,278, or 7.37 percent of Austria's 5.65 million registered voters, had signed. On 23 January 1993, more than 200,000 people turned the Viennese "Heroes' Square" into a sea of light from torches and candles in celebration of the petition's failure.[70] Unfazed, Haider blamed "the coordinated witchhunt against us [the FPOE]" and the "psychological terror of the old parties that kept people from signing."[71] But five days later, Heide Schmidt, a Haider protege and Third President of the National Council, resigned from the Freedom Party, citing as her main reasons the growing nationalist course of the party and Haider's increasing criticism of Austria's integration into the EC. Taking four other FPOE MPs with her, she formed a new party, the "Liberal Forum." In addition, the Liberal International, after having warned and fined the FPOE repeatedly for its right-wing sympathies, initiated an expulsion process against the Freedom Party, hinting that it would instead consider the application of the new "Liberal Forum" as the true "Austrian representative of liberalism."

The FPOE experienced a temporary intra-party crisis, but Haider soon redeemed his leadership qualities, proving that he was capable of leading the party to electoral success. At the May 1993 Lower Austria State Election, the Freedom Party improved its 1988 total by 3 percent and gained more than 12 percent of the vote, in spite of a strong 5 percent showing of the Liberal

Forum. Temporarily pulling back on the "foreigner issue," Haider's populist instincts had found in the European Community the image of a new enemy through which he hoped to create a "solidarity effect" in Austrians that would benefit the FPOE's nationalist populism. As Maximillian Gottschlich pointed out, Haider strove to portray the EC as representing a perfect "Them" that was needed in order to create an "Us" of national unity:

> ...Haider, probably again with the help of tabloids, will push the image of himself as the main opponent of Austria's joining the EC: a political Batman who selflessly jumps in front of the EC train, declaring Europe a hostile foreign territory. Europe as enemy. This is the confrontation that bestows upon him the mantle of historical significance.[72]

V. West European Integration: The Freedom Party and the European Community

It would exceed the scope of this essay to provide a detailed history of Austria's relationship to the EC, hence a few general remarks must suffice.[73] After 1955, Austria's cautious approach to the EC reflected the country's constitutional and geopolitical situation as a neutral state and as a mediator between East and West. However, in the late 198Øs, renewed efforts of both the OEVP and the FPOE for closer relations with the EC and the changed political realities in Europe eventually convinced the Social Democrats to endorse an application for membership in the European Community. Two years after the delivery of Austria's "Letter to Brussels" on 17 July 1989, the EC Commission presented its positive assessment ("avis") of Austria's application based on an intensive study of Austria's economic, political and social system. The next step was taken when the Austrian National Council adopted the EEA (European Economic Area) Treaty that aimed at the 1993 linking of the economies of the twelve EC member-states with the remaining EFTA (European Free Trade Association) countries.

On 1 February 1993, direct negotiations between the EC and Austria formally commenced over remaining sticking points like the continuation of Austria's neutrality and federalist structure, environmental policy, agricultural subsidies, and transit agreements.[74] Given the positive signals coming from both sides, Austria might join the EC as early as 1995 or 1996. However, Austrian attitudes toward an EC accession have polarized since 199Ø, and it is uncertain whether a majority of Austrians will vote for EC-membership at the necessary plebiscite in 1994 or 1995.[75] With Haider indicating his willingness to derail the traditional pro-EC course of the Freedom Party for his own nationalist-populist purposes, it has become clear that Austria will have to overcome internal rather than external hindrances on its path to West European integration.

Given its sympathies toward a German cultural identity, the Freedom Party always exhibited a bias in favor of closer relations to West Europe: "In the spirit of freedom we declare

our preference for the Occident. Therefore, we want the creation of a European Confederation of free and equal nations and states."[76] In the late 195Øs and early 196Øs, the FPOE unsuccessfully petitioned the federal government to take the necessary steps for the entry of Austria into the EEC. In its 1968 "Bad Ischler Program," the Freedom Party again voiced the same demands in the form of a creation of "all-European economic, currency, and social policies" as well as a "common security system within the framework of an independent European foreign policy."[77] The still officially valid 1985 "Salzburger Program" continues to endorse a future Austrian EC-membership. At the same time, it rejects the "tendency of the EC to speak for all of Europe" thus allegedly fostering the unfortunate situation where small "countries like Austria" are impacted by EC politics but cannot codetermine those policies.[78]

After his 1986 Innsbruck "coup," Haider intensified the FPOE's pro-EC course in the face of the Grand Coalition's awkward hesitance and ambivalence regarding Austria's future relationship to the EC. While the Conservatives favored a process of gradual integration that, in the "near future," would not result in Austria's "direct membership in the EC," the Social Democrats rejected any formal association with the EC in favor of greater cooperation with other EFTA countries. Especially between 1987 and 1989, Haider's pro-EC stance fit nicely into his overall populist strategy of portraying the Freedom Party as the "defender of the common person's interests" that were neglected by an indecisive government. The FPOE's relentless criticism of the Grand Coalition's passive EC policy went as far as chiding the government for missing the "cosmic window for Austria that opens only once in a century."[79] At the end of a long parliamentary harangue against the the coalition's inactivity, Norbert Gugerbauer, the FPOE's Secretary General, exhorted the Conservative minister for foreign affairs to finally join the Freedom Party in "seizing the European bull by its horns."[80]

Yet the sudden 1989 change of heart on the part of the Grand Coalition, pioneered by OEVP politicians around Vice-Chancellor and Foreign Minister Alois Mock, made clear-cut protest tactics more difficult for the Freedom Party. Although he asked his party to vote in favor of the 1989 application, Haider's enthusiasm for the EC cooled markedly. However, he did not yet attack the EC directly, but rather scorned the EEA as a permanent "European Waiting Room" for powerless EFTA countries. Knowing only too well that Austria's entry into the EEA was a non-negotiable precondition for joining the EC, Haider's quarrel with the EC's alleged "sidetrack tactics"[81] for EFTA countries seemed to be designed to signal to Austrian citizens that they were once again--like in the case of Anschluss debates or the 1986 Waldheim elections--victims of powerful foreign interests. Rejecting the EEA as an organization that, rather than creating genuine rights for Austria vis-a-vis the European Community, would only burden the country with numerous obligations, Haider again registered his dissatisfaction with government policies while keeping his options open regarding a final strategy toward the "EC issue."

As the next step, Haider, in late 1991, announced to Chancellor Vranitzky the Freedom Party's "conditions" for its support of Austria's entry into the EC. In a highly effective PR-campaign to focus the public's attention on Haider's new initiative, the Freedom Party demanded from the coalition government that it first "put its own house in order" before joining the EC. Haider's "homework" for the government included, among other issues, the strengthening of the federalist principle in Austria, the expansion of "direct democracy" and "plebiscitary rights," the privatization of Austria's nationalized industry, tax reforms favoring private business, massive subsidies for agriculture, and higher environmental standards.[82] Like the anti-foreigner petition, the FPOE's EC-campaign operated under the slogan "Austria First"--a populist move that allowed Haider to appeal to an independent "Austrian identity" while, in its party program, the Freedom Party continued to define this identity along German-national lines.[83] By the fall of 1992, Haider had managed to link xenophobia with Europhobia. In a provocative speech in the German town of Bad Canstatt, Haider discussed the liberal German asylum laws and the Maastricht Treaty in one breath. Warning against both mass immigration from the East and a "gigantic EC-apparatus" that would create a "standardized European person,"[84] Haider once again revealed that the success of nationalist populism depends upon its ability to raise the public's fears and prejudice. Endorsing Le Pen's "No" to Maastricht, Haider put pressure on the last remaining pro-EC FPOE functionaries to either reverse their old position or leave the party.

After the disappointing result of the anti-foreigner petition, Haider managed to quickly refocus public attention on the "new enemy." Calling a "Special Party Conference on the Freedom Party's Position Toward the European Community," Haider introduced a new 13-point program entitled "Libertarian Visions of a New Europe" that was endorsed by 95 percent of the party delegates.[85] A masterpiece of ambiguity, the paper combines the moderate "Yes, but..." attitude of the 1991 "homework" demands with a more radical "Probably no...." rejection of the EC's "centralized bureaucracy" and its "lack of genuine democracy."86 Riddled with contradictions and incompatibilities, the 13-point proposals attack Brussel's centralism while simultaneously demanding more power for the European parliament. Chiding the EC for its alleged support of a "multicultural standardized society" in which "the many different European cultures" merge, the resolutions call for a "Europe of Variety." Asking for a greater contribution of the EC to the Austrian economy, the paper warns against the "sell-out of our homeland" and a "strain on our economy."[87] But the Freedom Party's nationalist-populist politics of emotions and symbols is best summarized in a short passage of Haider's main address to the Freedom Party delegates: "The point is not whether Austria will become fit for Europe, but whether Europe will become fit for Austria."[88]

VI. Concluding Remarks

Less than three weeks after the Freedom Party's Vienna Special Conference, Haider remarked on Austrian national television that he would only reconsider his party's "No" to the EC, if Brussels would agree to special privileges that would treat Austria as a "special case like Denmark," thereby helping to "preserve Austrian national identity."[89] Thus, we return full-circle to the issue of "Austrian identity" raised at the beginning of this essay.

Just at a time when the EC has taken decisive steps to advance economic and political integration, "New Nationalisms" have appeared on the scene that threaten Europe with old nineteenth-century problems dressed up in new clothes. As Miroslav Hroch has observed, two opposite tendencies dispute the constitutional future of the EC: "one seeking to make of Europe a continent of citizens irrespective of their ethnicity, the other holding fast to traditional ethnic identites and trying to construct Europe as a unity of separate nation-states."[90] A Europe threatened by the disintegrating effects of growing nationalisms can only be held together and strengthened by the centripetal force of intensive cooperation within the framework of supranational institutions.

Haider's challenge to Austria's emerging new "European identity" will be answered by Austrian citizens within the next 24 months in a plebiscite on the EC. For Austria, neither a German-national identity nor the Cold War identity of a sheltered "Island of the Blessed" as neighbor to an impenetrable "Iron Curtain" any longer reflect the reality of an increasingly interdependent Europe. Embedded in this "New Europe," Austria's main future task will still be its role as a mediator between West and East by pioneering the formation of an open EC integration structure toward the former East Bloc countries. In spite of its shortcomings, the European Community remains the closest approximation of Immanuel Kant's Enlightenment vision of a Confederated Europe--a society based on the principles of mutuality and perpetual peace.

NOTES

[1] This term was coined by Pope Paul VI during a 1972 Vatican audience with an Austrian delegation.

[2] For a thorough discussion of the question whether Austria can still be regarded a case of consociationalism, see the special issue on "Politics in Austria" of West European Politics 15.1 (January 1992), pp.1-227.

[4] Ibid., p.169.

[5] My terminology follows that of Scott Flanagan, "Value Change in Industrial Societies" American Political Science Review 81.4 (1987), pp.13Ø3-1318. However, it has become extremely difficult to use old labels like "Left" and "Right" to characterize such parties. Firstly, the labels themselves have undergone significant changes in meaning, and second, European Greens and nationalist-populist parties are ideologically more eclectic than the "old" established parties.

[6] Andreas Khol, Guenther Ofner and Alfred Stirnemann, Oesterreichisches Jahrbuch fuer Politik 199Ø (Vienna: Verlag fuer Geschichte und Politik, 1991), pp.1Ø5-1Ø9.

[7] For the history and features of current Eurocentric racism, see Geoffrey Harris, The Dark Side of Europe: The Extreme Right Today (Savage, MD: Barnes & Noble, 199Ø), especially pp.25-3Ø; and Glyn Ford, Fascist Europe: The Rise of Racism and Xenophobia (London: Pluto Press, 1992).

[8] Examples of recent publications that argue a new Left line are: Margit Scherb and Inge Morawitz (eds). Der Unheimliche Anschluss (Vienna, 1988); Johannes Voggenhuber and Franz Floss (eds). Oesterreichs Europa-Integration als Walze-Walzer (Linz, 1992). Studies along the lines of the new Right include: Ruediger Foresta and Maria Gruen, Warnung vor EG-Europa (Vienna, 1992); and Joerg Haider, Unser Weg nach Europa (Vienna, 1992). How difficult it is to apply labels like "Left" and "Right" to the emerging postmaterialist political culture is shown in Wolfgang Hingst's Zehn Thesen gegen Grosseuropa (Vienna, 1992) and Karl Steinhaeuser's EG. Die Super-UDSSR von Morgen (Vienna, 1992). These books represent a mixture of socialist, nationalist and ecological ideologies. For a brief review of above-mentioned works, see Albrecht Rothacher, "Alpenfestung-Neuauflage: Zum Elend der EG-Kritik der Alten Linken und Neuen Rechten" Oesterreichische Monatshefte 1-2 (1993), pp.17-22.

[9] See, for example, Anton Pelinka, Zur Oesterreichischen Identitaet: Zwischen deutscher Vereinigung und Mitteleuropa (Vienna: Ueberreuter), pp.127-151; Karin Liebhart, Anton Pelinka, and Andreas Pribersky, "Oesterreichische Identitaet--Zur Erhebung ihrer Konstruktion" Oesterreichische Zeitschrift fuer Politikwissenschaft 91/4 (1991), pp.375-382; Peter Hanak, "Central Europe: An Alternative to Disintegration" The New Hungarian Quarterly 33.127 (Autumn 1992), pp.3-10.

[10] In particular, I appreciate Anton Pelinka's (1990) argument that Austria's integration policy should only proceed from the foundations of a secure national identity rather than be driven by the wish to escape into the arms of the EC (pp.143-145). Still, I think that only Austria's membership in the EC will eventually render a "secure national identity" in the context of a common Europe.

Disequilibrium and Equilibrium Theory: Explaining War in a Theory of Peace, Explaining Alliances in a Theory of Autonomy

Arthur A. Stein [1]

Department of Political Science
University of California, Los Angeles

Paper presented at the Annual Meeting of the American Political Science Association, Washington, D.C., September 5, 1993

This paper argues that two critical facets of international politics, war and alliances, are problematic elements of, and are inexplicable by, current theories of international relations. It argues that the balance of power and realism, especially in its neo- variant, is an equilibrium theory of peace and autonomy, and that war and alliances are persistent disequilibria that pose a fundamental explanatory problem for equilibrium theories of international relations.[2] Dealing with this challenge and explaining these phenomena lead to important extensions and modifications of extant theory.

THE PROBLEM OF WAR IN REALIST THOUGHT

It seems ironic to describe realism as a theory of peace since it is billed as a hard-headed, coldly and brutally realistic theory of conflict and the primacy of power in international relations. The modern history of realism and the emphasis on the primacy of power politics lies in the World War II era and the desire to explain aggression, expansion, and war. Realists gave themselves their label and successfully dubbed their intellectual opponents as idealists, generating an image of woolly-headed utopians who believed in the possibility of world peace through international

---

[1] This paper was written with the financial assistance of the University of California's Institute on Global Conflict and Cooperation, UCLA's Center for International Relations, and UCLA's Academic Senate. My thanks to Alan Kessler, and Kristin Williams for research assistance, to Amy Davis and Alan Kessler for comments, and to Deborah Larson and Richard Rosecrance for opportunities to present these ideas.

[2] Actually I have set the paper up this way because of the aesthetic attraction of symmetry. To be more precise, autonomy is an assumption of the model rather than something explained by it; alliances pose a problem to the underlying assumptions of the model even as they are argued to be outgrowths of it.

agreements, organizations, and law. In contrast, realists emphasized the existence of conflicts of interest and the primacy of state concerns with power.

Interest in the balance of power, however, has a much older pedigree, and twentieth-century theorists credit Thucydides as the first realist, quoting his explanation of the origins of the Peloponnesian War in the growth of Athenian power.[3] International relations theorists also point to a number of important philosophers and political theorists who wrote directly on the balance of power, including Bentham, Hume, Hobbes, Montesquieu, Rousseau.[4]

Modern international relations theory is equilibrium theory.[5] In neorealism, for example, the balance of power is an equilibrium stable state.[6] States are presumed to be minimally interested in self-preservation, and, as a result, respond to adverse shifts in the global balance of power.[7] Thus, any perturbation in the balance of power generates reactions that return the system

---

[3] The conception of an equilibrium balance of power in both internal and external political affairs is an idea with roots not only in Graeco-Roman thought, but also in ancient Hindu thought. A collection of essays on the balance of power (Seabury, 1965) includes excerpts from Kautilya, Aristotle, and Demosthenes.

The adequacy and character of Thucydides's account are widely debated. For some, his account is hardly a realist's one (Garst, 1989). For others, his account, although realist, is analytically wrong (Kagan, 1969). Doyle (1990) distinguishes between three strands of realism and defends Thucydides as a minimalist realist.

The balance of power is not only a long-lived conception, but it has been used both as a normative prescription and a positive explanation (in Wight's [1968, p. 153] words, "almost insensibly, the phrase passes from a descriptive to a normative use"), and thus scholars have long noted that there are many meanings. Moreover, the phrase was at times used to describe domestic politics and was used by pamphleteers as well as scholars (Anderson, 1970). Pollard (1923) consulted the Oxford English Dictionary and found 20 meanings of "balance," 63 of "of," and 18 of "power" but deferred to mathematicians to compute the number of combinations. Discussions of the historical use of the term can be found in Gulick (1955) and Maurseth (1964), among others. Excellent elucidations of the number of ways the concept has been used are by Claude (1962), Haas (1953), and Wight (1968). Despite the disagreement it is possible to ascertain a common analytic core (Zinnes, 1967, Chatterjee, 1972).

[4] Still others, such as Machiavelli, did not extensively discuss interstate relations but are characterized as realists, and attempts have been made to extract a balance-of-power component from their work (Sullivan, 1973). Classical historians, such as Polybius and Guicciardini, described the workings of balance-of-power systems without extensive theorizing, as did diplomats such as Sir Eyre Crowe in his well known memorandum of 1907.

[5] Even its earliest formulations include such a conception. Pillinini, writing in the 15th century, described the balance of power as "un equilibrio di egoismi," and Guicciardini used terms such as counterpoise (Wright, 1975, pp. x-xi). Writers often used Newtonian mechanics as an analogy, using its concepts and laws.

[6] "Almost inseparably entwined with the idea of a 'balance' is the concept of an 'equilibrium.'" (Chatterjee, 1975, p. 70).

[7] It is in this conceptualization of actor motivation that neorealism differs from earlier formulations. Classical realists either make no assumptions about actor interests (Doyle's [1990] characterization of minimalist realists) or assume that all nations act to maximize their power (Morgenthau, 1948) or that states pursue policies intended to equalize power (Wright, 1942; Kissinger, 1957; and Gulick, 1955). These

to balance. What disturbs any balance is considered outside the theory, and the central implication of the theory is that "balances recur."[8]

This formulation is precisely the same as that of equilibrium arguments in other fields.[9] The theory characterizes the forces that maintain any system or structure in some equilibrium state. Those forces that disturb the equilibrium are considered exogenous shocks that cannot be explained within the theory. Natural scientists cannot explain when or why a girl will throw a pebble in a pond, but they can explain the forces, generated by this disturbance, that will return the pond to an equilibrium smooth surface. Similarly, the oil shock, for example, was not an event that economists could explain, but its consequences are grist for their theoretical mill.

Waltz's balance of power argument mirrors this equilibrium precisely and self-consciously. Waltz grants that disturbances to any balance of power are outside the scope of his structural argument; indeed, that such disturbances originate at the level of the individual and the nation-state. Technological breakthroughs, such as industrialization, and even individual madmen may generate disturbances in the balance of power, and these cannot be explained by any international systems theory. The theory does, however, explain the consequences that attend them. Perturbations in the balance generate responses by individual nation-states that result in a return to an equilibrium balance of power. In the two-word phrase that is the core Waltzian proposition, "balances recur" (Waltz, 1979).

Scholars have quite self-consciously rooted modern international relations theory, including recent strains of balance-of-power thinking, in economics.[10] The competitive market provides an analogue for the competitive international system, and the balance-of-power equilibrium that emerges from a competitive international system is akin to the workings of the invisible hand in the price system. For economists, the interaction of individual greed in a competitive market place

---

formulations were either tautologous or internally contradictory (Rosecrance, 1961; Riker, 1962), and were rooted in a view of human nature (what Doyle [1990] calls fundamentalist realism).

[8] Just as variants of realism differ with respect to their assumptions of actor interests and motivation, so do they differ in their conceptions of the equilibrium state. To some, a balance of power assures peace, to others it merely assures no great power war. To some it assures the survival of the great power actors, to others it assures the maintenance of the system but not of any particular distribution of power or any particular set of great power actors (Claude, 1962; Dehio, 1962; Doyle, 1990). Finally, there is also some disagreement about whether the actors in the international system must internalize a set of rules and act in accordance with them in order for a balance to emerge. Waltz (1979) argues that an equilibrium emerges from their self-interested behavior in an anarchic world. Kaplan (1957, 1979) argues that rules of behavior constitute "equilibrium conditions" for the emergence of a balance of power.

[9] Butterfield (1968, p. 141) points out that equilibrium ideas captured the European imagination in the eighteenth century and scientific and mechanistic analogies developed for a number of social and economic phenomena: the balance of trade, equipoise in the British constitution, etc. In the words of Martin Wight (1973, p. 98), the balance of power "was the political counterpart of Newtonian physics." For an intellectual history of the diffusion of equilibrium ideas out of natural and into social science, see Cynthia Russett (1966).

[10] The obeisance to economics is clear in Kaplan (1957) and Waltz (1959, 1979, 1990). Still another route to equilibrium logic in international relations came via general systems theory.

results through the invisible hand in the counter-intuitive result of the lowest prices for all goods. Individual greed results in maximum collective welfare. Similarly, in international relations, the rapaciousness of some states and the fears of others lead to an intense concentration on power and force, which ironically results (through the field's own invisible hand) in the stable peace of a balance of power.[11] The constant preparation for war assures the maintenance of the peace.

Put this way, realism is not a theory of war at all. It is a theory of peace.[12] It can explain the constant readiness to use and threaten force, but not the actual resort to force.[13] If the balance of power worked as advertised, there should not be any war. Perturbations in the balance should be small and short-lived and generate the pressures that return the system to a stable peaceful equilibrium balance of power.

This description of realism as a theory of peace can be illustrated by an analysis of its most important current exponent, Kenneth Waltz.[14] In an essay entitled "The Origins of War in

---

[11] Characterizing the period 1848-1918, A. J. P. Taylor (1954, p. xx) writes that the balance of power "seemed to be the political equivalent of the laws of economics, both self-operating. if every man followed his own interest, all would be prosperous; and if every state followed its own interest, all would be peaceful and secure."

[12] Daniel Defoe, writing at the beginning of the 18th century wrote, "a just Balance of Power is the Life of Peace" (Maurseth, 1964, p. 126, n. 29). Guicciardini's history of Italy describes the actions of Italian city-states: "Since they were moved by mutual jealousy . . . they were unremitting in the watch that they kept on one another's movements, deranging one another's plans whenever they thought that a partner was going to increase his dominion or prestige. And all this did not make the peace any less stable, but rather made the powers more alert and more ready to bring about the immediate extinction of all those sparks that might start a fire" (Butterfield, 1968, p. 137). Burke, who criticizes the balance of power as a cause of war, describes such a policy as "intended to preserve the general peace as well as freedom of Europe" (Butterfield, 1968, p. 144). The link between balance and peace has recently been fuzzed over, but is necessarily there (Claude, 1989, p. 78; Waltz, 1989).

[13] This is the way in which to interpret the characterization of the international state of nature as a state of war. It is a world in which states constantly prepare for war, in which "force remains the final arbiter" (Waltz, 1979, p. 180), and in which there is "an omnipresent threat of war" (Doyle, 1990, p. 224). Unfortunately, many conclude therefore that in explaining such a state of war, realism also explains the occurrence of war. But in this equilibrium state of war, actual war should not break out. The use of phrases such as state of war has obscured the fact that realism is a theory of peace based on the constant preparation for war and not a theory of war at all. Similarly, the prisoners' dilemma in international relations is an armament dilemma that explains a suboptimal outcome of mutual armamentation rather than the superior but non-equilibrium outcome of mutual disarmament. What can be explained is the existence of a world of all armed against all but not of all actually waging war against each other.

[14] Waltz's importance as an international relations theorist is evident in his selection as one of the few scholars in the field to be elected president of the American Political Science Association (the first purely international relations scholar so to be honored since Quincy Wright; this excludes the selections of Samuel Huntington and Karl Deutsch in the intervening years). His position as the father of modern neorealism is underscored by the contents of Robert Keohane's (1986) edited volume *Neorealism and its Critics*, in which the neorealism portion consists of four of seven chapters reproduced from Waltz's *Theory of International Politics*.

Neorealist Theory," Waltz (1988) describes neorealism as a systemic theory in which each state's search for security in an anarchic environment generates conflict and competition. He argues that "although neorealist theory does no explain why particular wars are fought, it does explain war's dismal recurrence through the millenia," a recurrence which "is explained by the structure of the system." On the same page, he writes, "in an anarchic realm, peace is fragile," because "the prolongation of peace requires that potentially destabilizing developments elicit the interest and the calculated response of some or all of the system's principal actors" (Waltz, 1988, p. 620).

Waltz's own words make it clear that the balance of power in an anarchic world should generate a fragile peace. Since the balance can be disturbed, maintaining that peace requires that states respond to perturbations and that the equilibrium be quickly and readily restored. It is the failure of the system to reequilibrate that is the cause of war. If the system were functioning correctly, and states immediately responded to changes in the distribution of power, then peace would be maintained.

The argument that realism is a theory of peace can also be made analytically. First, the condition brought about by nations' responses to changes in the balance of power must perforce be presumptively stabilizing for it otherwise could not be explained as the product of self-interested actors concerned with their survival and security. States who feel threatened by a particular international situation and who are self-interested and minimally interested in assuring their own survival would not (and in an evolutionary sense, could not) react in ways that put their own survival in jeopardy by making war more likely. To have a model in which self-interest and a concern with security result in war would require perverse aggregation processes (the resultant outcome of individual state choices) as well as myopic states.

A second analytic way to demonstrate that realism is a theory of peace involves thinking about the equilibrium state that is the balance of power. Such an equilibrium may not be about war and peace at all, in which case the balance of power would be neither a theory of peace nor a theory of war--it simply would not address either. If the equilibrium is about peace and war, then the actual equilibrium must be one or the other. If the equilibrium balance of power resulted in war, we would expect wars to occur all the time and find peace the aberrant departure from equilibrium. This would be empirically problematic, since there are quite extended periods of peace between the great powers. Moreover, if the balance of power resulted in war, we would have to explain why states interested in their survival engaged in balancing behavior which generates wars that threatened their survival. The alternative is to recognize that self-interested security-seeking states engage in balancing behavior, which results in a return to an equilibrium balance of power that provides peace and stability. The peace may be tenuous, but as long as states respond to the imperatives of the system an equilibrium balance of power assures peace and stability.

War poses the same challenge to such an equilibrium theory of the balance of power as does involuntary unemployment to economists' vision of a competitive labor market. If the market generates pressures to equilibrate supply and demand through a flexible price system, then labor markets should clear just as any other markets. When there is a willing supply of labor that is unemployed, the equilibrium price (the wage rate) should fall so as to bring supply and demand into balance. Prolonged departures, evidenced by the obvious existence of involuntary unemployment, should simply not occur. The existence of involuntary unemployment is not explained by the market, but by the failure of the market to function as presumed. Similarly, any imbalance of power should generate forces to return the system to balance. Prolonged departures from a balance, as evidenced

by major power wars, should not occur. That wars do occur is not explained by the workings of the system, but by the failure of the system to work as presumed.

Although equilibrium theories need not explain shocks that disturb the equilibrium, they are asked to explain the existence of prolonged disequilibrium. They need not explain why states expand and assert themselves, but they do need to account for the failure of equilibrium to emerge. It must either be that states fail to respond to adverse changes in the balance of power as the model would predict, or that the balance of power is an equilibrium state that does not tell us anything about war and peace.

Assuming that the balance of power is an equilibrium argument that does address peace and war leads to the immediate implication that systematic and sustained underbalancing occurs in the international system. The failure readily to maintain the balance of power results in wars that might have been avoided and in balancing accomplished only during wartime.[15] Indeed, the coalitions were formed to prevent recent attempts at global and regional hegemony were often formed during war rather than prior to war.

There are a number of responses to the observation of systematic and sustained disequilibrium events. One is that prolonged departures simply do not exist. Some economists do, in fact, hold that observed unemployment is really voluntary rather than involuntary. Such intellectual redefinition is not available to the international relations theorist, for the occurrence of war has been an obvious and recurrent feature of the international system. A second intellectual response is to argue that prolonged disequilibria are caused by stickiness, or lags in the equilibrating mechanism. The forces that return the system to equilibrium do indeed function as advertised, but do not do so smoothly. Such solutions provide no answer, they simply refocus the problem as one of explaining lags and stickiness.

The Information Solution to the Problem

An explanation that has received recent attention in economics, and that has a long pedigree in international relations, is that of incomplete, imperfect, and asymmetric information. Classical economic arguments depend on the assumption of full and complete information. Imperfections in information can readily lead to departures from the otherwise expected equilibria in market exchanges.[16] Recent developments in game theory have made such models mathematically tractable, which has created a growth industry in modeling many phenomena including that of involuntary unemployment. The arguments being developed hold simply that informational imperfections generate the sustained departures from the equilibria that would be expected in a world of full information. Thus, for example, strikes would not occur if both workers and

---

[15] For a discussion of wartime balancing, see Papayoanou (1992).

[16] For the development of information economics, see Hirshleifer and Riley (1992). The emphasis on the centrality of information has gone so far that some scholars are prepared to treat it on a par with energy and matter as a basic ingredient of reality. Ed Fredkin pushes the role of information even further still, arguing that it is more fundamental than energy and matter and that the most basic atomic and subatomic particles consist of binary bits of information, a view characterized as digital physics (Wright, 1988).

management knew one another's reservation levels and the strength of one another's preferences. All would be better off simply going to the finally agreed-upon outcome and avoiding the intervening costs of strikes and lockouts. But the strikes and lockouts play a role in giving each side the information that the other holds privately at the outset (Stein, 1990, p. 62, n. 22).

The equivalent argument in international relations theory is the one that explains war as a function of uncertainty.[17] When the international system generates certain knowledge of power and threats, the balance of power readily reemerges and reequilibrates. It is uncertainty that generates non-equilibrium outcomes such as war.

This emphasis on uncertainty already presses the balance-of-power argument in the direction of disaggregating states by type. The standard story in the field argues that states are like-units, that perform comparable functions and that vary only in their relative power. Thus, for example, the field distinguishes between great powers and lesser powers.[18] But the emphasis on uncertainty suggests that states assess one another as to type, as revisionist challenger or status quo state, as reliable ally or undependable one. The initial formulation of the balance-of-power argument already contains the seeds of a distinction between states that take steps to disturb the balance of power and those that respond defensively to assure their security and survival. Yet international relations theorists have also emphasized that defensive concerns can generate preemptive aggression and that offensive considerations need not.[19] The emphasis on uncertainty places the distinction between actor types front and center. Uncertainty means that states cannot ascertain whether others constitute revisionist challengers or the full scope and range of their challenge. Nor can they identify status quo states and the extent and scope of their commitments to maintain the status quo.

The emphasis on uncertainty and its attendant distinction between actor types is mirrored in recent work in microeconomics.[20] Situations in which complete information generates unique

---

[17] This is discussed more fully below.

[18] It also characterizes historical epochs by such relative assessments, as in descriptions of eras as witnessing "the rise of German power" or "the decline of American power." Further, historical periods are distinguished by particular constellations of great powers: unipolar, bipolar, and multipolar.

[19] Jervis is interesting in this regard. In an important article he distinguished between eras in which defensive technology was seen to be superior from those in which offensive technology was deemed superior (Jervis, 1978). Worlds characterized by offensive superiority could result in war even if states were defensive in their intentions and pursuits. Alternatively, where the defense was deemed superior, deterrence would hold even where states held offensive intentions. This suggests that the nature of technology was determinative rather than actor type. Further, Jervis has recognized the historical importance of defensive arguments for offensive action such as the arguments made for the expansion of the British empire. On the other hand, he has also distinguished between actor types and emphasized the importance of recognizing whether other states are status quo ones or revisionist challengers (Jervis, 1976).

[20] Recent work on signalling games and games with incomplete information is built on the notion that there is something to ascertain about other actors, because there are different types of actors with different preferences. This work distinguishes among types of strategies and types of actors and characterize the problem of strategic interaction as that of ascertaining the nature of the other actor. A classic microeconomics article, for example, distinguishes between an actor who prefers beer and one who prefers quiche; each is

equilibria dissolve into a multiplicity of equilibria (indeed, of equilibrium concepts) when the assumption of complete information is relaxed. And the heart of such games of incomplete information is conceptualized as uncertainty about what types of actors others are.

A stylized example can illustrate the point. Assume that some states contemplate aggression while others contemplate balancing behavior against potential threats. If all states knew that no state contemplated challenging the status quo, then none would enter balancing alliances and no challenges would take place. Alternatively, if states knew which among them constituted a threat, then they would enter countervailing coalitions and deter. In both cases, the result is no challenge, no aggression, no war. The system works smoothly and efficiently and responds to the slightest changes.

Uncertainty transforms this situation, forcing both status quo states and challengers to ascertain one another's preferences and intentions. Status quo states look at others to ascertain whether they are challengers and what threats they pose under what circumstances; based on such assessments they then decide whether to make commitments or not. Challengers must look at status quo states to determine whether they will fulfill their commitments by responding to attack and challenge (which they may or may not do independently of having made or not made commitments); based on such assessments they must then decide whether to challenge and attack or not. When this is modeled as a game of incomplete information, multiple equilibria emerge. One of these is war--an outcome that could not emerge in the full information case (Papayoanou, 1992).

Implications of the Uncertainty Resolution

One implication of the foregoing analysis akin to, but critically different from, a key distinction made by Waltz (1964, 1979, 1988) between bipolarity and multipolarity. In both worlds, the balance of power can function, but he argues that the balance of power is more readily sustained in a bipolar world,[21] in which each great power recognizes from where threats emanate, monitors the relevant other, and responds immediately to actions taken by the other. In contrast, a multipolar world with more than two great powers is one of greater uncertainty. States are uncertain about which one of them is threatened by the incremental growth of one.[22] Moreover, each can hope that a third will respond (the passing-the-buck phenomenon). This greater uncertainty explains the

---

presumed to have different preferences as regards conflict, and the problem for each actor is determining the other player's type (Cho and Kreps, 1987). In biological applications, the common distinction is between hawks and doves (Smith, 1976).

Students of international politics are reconstructing international relations theory similarly: states have imperfect information, and their actions constitute a signal that others evaluate in order to reassess their own behavior (Alt, Calvert, and Humes, 1988; Banks, 1990; Morrow, 1989; and Powell, 1987).

[21] The literature on bipolarity is typically ambiguous on the issue of whether bipolarity refers to great power blocs or to two major powers. Below this turns to be an important difference.

[22] Bolingbroke put it this way, "they continue to dread a power no longer able to hurt them, or they continue to have no apprehensions of a power that grows daily more formidable" (Maurseth, 1964, p. 125, n. 26).

greater war-proneness of multipolar worlds than of bipolar ones.[23] The workings of the balance of power, the ready reemergence of equilibrium in reaction to perturbations, is affected by the uncertainty that exists in a multipolar world.[24]

The model developed here suggests that the war-proneness of either multipolarity or bipolarity is a function of informational uncertainty. In either world, wars do not occur when there is full information. In both, wars can occur when there is uncertainty about actor types--uncertainty about the intentions of challengers and uncertainty about the commitments of status quo states. The question then is whether such uncertainties are systematically different in different international systems. The model suggests that war in multipolar worlds, which can include war between great powers, occurs because challengers are uncertain about the commitments of status quo powers to each other. The same uncertainty can exist in bipolar worlds.

The likelihood of war in bipolar worlds depends on the kind of bipolar world that exists. One possibility is the bipolarity that consists of two blocs, each of which can contain more than one great power. Such a world should have as much prospect of great-power war as a multipolar world, because there should still be uncertainty about great-power commitments towards one another. In contrast, there exists the bipolar world in which each pole consists of one great power allied with other much smaller powers--a world more accurately described as a great-power duopoly. In such a world, each of the great powers can be uncertain about the other's commitment to its allies and this can be the basis for war. But such wars will be between one of the great powers and the other's client. One would not expect a war directly between the two great powers, for they have no doubts about the other's commitment to its own defense, and neither one requires allies to achieve its own defense.[25]

The implications of uncertainty in explaining war in the international system mean that the sole analytically deducible systematic difference is that war is least likely directly between global duopolists because there is no uncertainty about the nature of challenge and no uncertainty about the nature of commitment--each is presumptively committed to its own defense (one of the initial assumptions of the neo-realist argument). Otherwise, the uncertainty problem about challenge and

---

[23] There is an important link between the emphasis on uncertainty and the literature on misperception in international relations. An international relations that emphasizes, as does economics, uncertainty as the basis for sustained departures from equilibrium (one providing peace and stability in international relations), is inherently a liberal theory that expects a welfare-improving equilibrium absent misperception and uncertainty (Stein, 1990).

[24] There is some irony in Waltz's making this pitch about uncertainty. As he argues in the text, such a focus on uncertainty to explain sustained disequilibria is a fixture of equilibrium arguments in the social sciences. But it is peculiarly ironic in international relations, since balance-of-power theorists are open to the charge that balances of power generate more actor uncertainty than imbalances of power. Power preponderance theorists have argued that the very certainty provided by inequality is what creates peace and stability. Ironically, Waltz argues, in effect, that it is the systemic uncertainty inherent in a balance of power that makes for stability, but that the certainty in the emergence of a balance of power creates stability.

[25] This last point is a critical assumption. There may still be a great power war in a world characterized by duopoly, if for some reason, the balance of power shifts decisively in favor of one and the other is not in a position to match.

commitment remains. It remains as regards the commitments of global duopolists to their clients, and it remains as regards the commitments of bipolar bloc leaders to other great powers in their blocs (in a bipolar world that is not duopolistic).[26]

Uncertainty, misperception, and miscalculation are thus important elements of a more complete realist model of international politics. On its own, an emphasis on the system and on actor concerns with security can explain conflict and a peace born of a vigilant concern for survival and security. But explaining the occurrence of war depends upon explaining sustained departures from balancing behavior by self-interested powers, and thus entails a central place for informational asymmetry in a realist model capable of explaining peace and war.

Domestic Constraints and Balancing Behavior

Uncertainty and informational asymmetry is only one analytic way of resolving the problem of explaining war in a theory of peace. The other is to focus on the domestic assumptions entailed in the realist model and relaxing those.

The power politics model is often dubbed the billiard-ball model of international politics because it focuses on the interaction of states and not on their internal composition. States are like-units, undifferentiated except for their relative power.[27] Their internal ideologies or the nature of their political systems do not matter. To focus on such internal attributes is to shift to a different level of analysis and engage in reductionism, something Waltz finds reprehensible.

The balance-of-power model assumes that states are capable of responding to the exigencies of the international environment. Since states are primarily concerned with survival and the provision of security against external attack, it is presumed that states have no problem extracting from the society the resources necessary to accomplish these core tasks.

Relaxing the assumption of a domestically unconstrained state is still another way of explaining the failure of balances readily to emerge. Only in a subset of cases is it enough that elites perceive a shift in the international balance of power for appropriate reactions to be undertaken. In many cases, elites in status quo states are constrained both politically and economically from

---

[26] Although these conclusions mirror Waltz's argument, they seem quite different. Waltz makes the point that bipolarity is more stable as regards war between great powers and accepts the possibility of wars involving one great power and the other's clients. When he writes of bipolarity, he clearly has in mind the post World War II world and the overwhelming importance of the two bloc leaders relative to all the others. He points out that the movement of China in and out of the two camps, for example, mattered little to the overall strategic balance between them. The same point can be made more broadly, and can be linked to the issue of war. Neither global duopolist would directly attack the other in response to an aggressive attack. Attacks on clients deriving from uncertainty about the nature of commitments would not generate a response of a direct attack upon the other great power. Wars between duopolists would be by proxy and in peripheral areas.

[27] Here, too, international relations theory, is akin to microeconomics, with nations being treated like firms. The internal composition and arrangement of firms is simply not relevant to the theory of the firm developed in microeconomics. Interestingly enough, arguments that focus on differences between firms and that focus on so heretical a conception as "corporate culture" have emerged, but from business schools.

responding readily to adverse shifts in the balance of power. It need not be uncertainty that prevents a return to an equilibrium balance of power, but the constraints of society upon the elites running the state.

Policies to restore the balance of power entail either increased domestic mobilization or changes in international alignment.[28] Internal mobilization requires either increased extraction or the redirection of societal resources, and in some countries the state is more readily capable of accomplishing this than in others. Even changes in a state's international alignments, and most specifically the extension or retraction of international commitments, may also be subject to societal and political constraints and cannot be unproblematically undertaken by the executive branch.

Further, a state's grand strategy is public policy and reflects its mechanisms for arriving at social choices. Dictatorships may respond more readily to international challenges than states which require a political consensus before acting.[29]

Domestic institutional, political, and economic constraints can all play a role in diverting a state's grand strategy from presumptive systemic imperatives.[30] This, of course, explains why realism is characterized as a unitary-actor model. The existence of a single unconstrained actor is central to a model that stresses environmental imperatives. The alternative retains the conceptualization of states that act as singular entities on the world stage and of an international system in which states are the primary actors. It is merely that the existence of different constituent components makes it possible to develop arguments about internal constraints that function on a par with environmental forces in shaping behavior.

Treating the existence of domestic constraints as a variable, it becomes possible to demonstrate that the classical realist balance-of-power argument arises only in those circumstances where potential challengers and status quo states are both unconstrained, all states respond to the pressures of the international environment. This is the realist world in which states readily respond to international challenges and take the appropriate steps either internally (by arming) or externally (by allying). But that leaves three other possibilities (see Table One).

Table One

---

[28] Classical theory emphasized alliances, but given Organski's critique, internal mobilization came to be equally emphasized. See Organski (1958), and compare Waltz (1959) to Waltz (1979).

[29] A standard critique of democracies is that they are slow to respond. It should be noted that democracies may vary in the extent to which national security policies are insulated from the normal workings of representative government.

[30] Following international relations scholars who studied the impact of incomplete information on crisis, but interested also in including a domestic component, Bueno de Mesquita and Lalman (1990) focus on domestic opposition and crisis choices.

In contrast to the realist world of unconstrained powers lies the world in which war is explained by asymmetric domestic constraints. This is the case in which challengers are domestically unconstrained while status quo states are constrained. This is the prototypical situation in which deterrence failures and a breakdown of the balance-of-power system results in war. Indeed, common knowledge of the domestic constraints of status quo states may be decisive in encouraging aggression by unconstrained challengers.

Domestic politics can be the basis for sustained departures from an equilibrium balance of power. Challengers unconstrained (or even pressed) by domestic forces can disturb the balance of power while status quo states fail to respond, not because of uncertainty but because of an inability of elites to extract the requisite resources and/or commitments necessary to undertake the balancing behavior which would result in a return to an equilibrium balance of power. A classic case is the British response to the growth in German power in the 1930s. Arguments that the British elite was either sympathetic to Hitler or misjudged him are wrong. In fact, the British had a reasonably good sense of German capability, and the leadership understood the threatening quality of German actions. But the pace of British rearmament was driven by the perceived economic constraints operating on the British Treasury. In the final analysis, economic and political constraints drove British responses.[31]

The set of situations delineated in Table One reveal two other cases, besides the realist one, that can generate peace and stability. First is the case in which potential challengers do not challenge because of domestic constraints. Second, and most interesting, is the peace that obtains in a world in which both challengers and status quo states are constrained. In both cases, revisionist aggressors cannot mobilize the requisite capability to mount military challenges to the status quo.

Peace and stability in the international system are sometimes secured because of domestic political constraints on the ambitions of state elites. Peace in international politics can also occur because the dog does not bark. In any epoch, there are many cases in which aggrieved states do not challenge not just because they are deterred by the extant distribution of power and alignment, but also because they are domestically precluded from mobilizing their societies to undertake such steps.

But domestic constraints on the foreign and military policies pursued by elites is a mixed blessing: it can be the basis for war as well as peace. A balance of power is most fragile when status quo states are constrained and challengers are not. In such circumstances, challengers are particularly emboldened, for they rely for their success upon the reduced and belated ability of others to respond.

The case of the 1930s can be used as a stylized example. Hitler's interest in revising Versailles could not have been realized had he been constrained by forces within Germany. Even if domestically unconstrained, he might have been deterred had the other great powers mobilized their forces to match the growth of German power and extended commitments to one another and to small states that they did not want to see absorbed into a greater German empire. The failure of the other great powers to do so may have reflected some uncertainty about the true magnitude of Hitler's appetite, though that became dispelled with time. But they were unable to respond to

---

[31] For an excellent review essay, see Richardson (1988). For an argument that British politics also dictated the militarily untenable response of the guarantee to Poland, see Rosecrance and Steiner (1993).

Hitler's challenge quickly because of domestic constraints. Concerns about Britain's economic position constrained the pace of British rearmament. Political constraints prevented President Roosevelt from extending U.S. commitments which he saw it necessary to deter Germany. War resulted from the asymmetric constraints operating on the great powers and the attendant uncertainty created by this.

Both uncertainty and domestic constraints generate the prospect of underbalancing. For either or both reasons, states will fail to respond appropriately and adequately to adverse changes in the balance of power. The resultant sustained departures from equilibrium are the bases for war in the international system. And they explain why the return to equilibrium and the reestablishment of a balance of power occurs as a result of war. For it is the occurrence of war that dispels the prewar uncertainties about the intentions of challengers and the commitments of defenders. Moreover, I have argued, war also affects the domestic constraints on mobilization and the occurrence of war often makes possible the very mobilization that was unachievable but would have prevented war in the first place (Stein, 1989, 1990, 1993).[32]

THE PROBLEM OF ALLIANCES IN REALIST THOUGHT

Alliances are a central concept of international relations theory.[33] States unable to deal unilaterally with an adverse distribution of power enter into alliances in order to reestablish a balance of power.[34] Alliances are thus the central mechanism for the functioning of an international balance of power.

Yet alliances pose a problem for international relations theory. For realists, the international system is anarchic, and the states that interact within it are autonomous and independent. In this world, any explanation of cooperation must be rooted in the self-interest of states. Why, then, should alliances exist as formal, institutionalized arrangements? If a certain behavior is in a nation's self-interest, it should act accordingly and be expected by others to do so. Moreover, if interests change, then so will behavior. We cannot explain why states form alliances nor what difference these arrangements make.

Further, alliances should be inconsequential. If states act to further their self-interest, then alliances will not change their actions. In this view, alliances do not engender behavior; rather,

---

[32] This, I think, is the basis of the ironic and seemingly contradictory argument that the balance of power prevents war but that war also establishes the balance.

[33] This section draws upon material in chapter 6 of Stein (1990). For reviews of the literature on alliances see Holsti, Hopmann, and Sullivan (1973), especially Chapter 1 and Appendix C; Burgess and Moore (1972); Bueno de Mesquita and Singer (1973); and Job (1981). For an empirical description, see Singer and Small (1966) and Small and Singer (1969).

[34] This characterization corresponds to what historian Paul Schroeder (1976) has dubbed the capability aggregation view of the role of alliances. Schroeder notes, however, that not all alliances are formed by states in order to meet a common threat by pooling their resources. Rather, states sometimes ally with those who are hostile and troublesome but who can be managed within an alliance. Further, it may be that alliances between great powers differ from those between a great power and a minor power (see Morrow, 1991).

behavior and alliances are both products of the underlying pattern of preferences. In the realists' view, states must ultimately rely on themselves for their own survival. If international politics is the product of autonomous independent national behavior in an anarchic setting, then there should be no reason for multi-nation groupings to exist.[35]

Most international relations theorists, especially realists and balance-of-power theorists, take the view that alliances represent temporary marriages of convenience. Indeed, if alliances are to play a role in maintaining balances of power, they must be fluid and flexible, continually changing as the relative power of states changes. As Morton Kaplan describes them, alliances "lacked permanence, they were transient instrumental adjustments to a changing international environment" (Kaplan, 1957, p. 116; also see preface, p. 29). Indeed, one scholar argues that the very security dilemma that exists between potential and actual enemies exists within alliances as well (Snyder, 1984).

The role of alliances in balance-of-power theory is inherently paradoxical. States concerned with their own survival will act in concert to prevent the emergence of a power that threatens them. This coincidence of interests forms the basis for alliances which, in turn, undergird a balance of power. Hence, these alliances hardly seem necessary. If, on the other hand, alliances entail commitments that states have no interest in fulfilling, then nations will not keep to their terms, and the accords will have no consequence. Alliances, then, must be either unnecessary or inherently unbelievable bluffs.[36]

Further, realists argue, alliances are a last resort. States greatly prefer to deal with adverse distributions of power through internal mobilization. Only when this is impossible do they enter alliances in order to reassert the balance of power. Implicit in this argument, and central to realist theory, is that states place primary weight on autonomy and self-reliance. It is not merely that the system is one of self-help, but that states prefer to go it alone whenever possible and enter alliances

---

[35] Alliances should be equally problematic for liberals. Autonomous self-interested actors engage in mutually advantageous exchange. The international system, like a market, should involve only discrete interactions and not entail alliances. This is analogous to the problem economists confront in explaining the emergence of hierarchical firms that internalize certain exchanges in lieu of market transactions. The development of vertical and horizontal integration, as well as the emergence of the multinational corporation, are all problematic for the classic view of market economics. The economists' solution is to explain that self-interested actors create hierarchical structures precisely in order to internalize particular exchanges and so do away with the transaction costs that sometimes make market exchanges less than optimally efficient. The key figure associated with this argument is Oliver Williamson (1985). For an application of this to international relations, see Weber (1992).

[36] Alliances might be inconsequential as regards the behavior of allies but still fulfill a useful role as devices to signal intentions about contingent future behavior that might not otherwise be presumptive to third parties. States signal commitments to their allies in order to deter others from attacking these allies. For the determinants of successful extended deterrence, see Russett (1963), Fink (1965), and Huth and Russett (1984). Such signaling is important because these interests and behaviors might not otherwise be assumed by potential aggressors. One implication of this reason for alliance formation is that without alliances, other states might draw different inferences about the interests and behaviors of the parties. In other words, alliances signal the existence of interests different from those that might otherwise be observed.

only if absolutely necessary.[37] The inherent assumption is that alliances do entail some sacrifice of the autonomy that states preeminently prefer. As Michael Altfeld puts it, "the cost of an alliance to a government is computed in terms of . . . autonomy" (Altfeld, 1984, p. 526).[38] But in this view, alliances are presumed to constrict state autonomy in ways that the autonomous pursuit of self-interest would not, and we are left with the question of explaining the existence of alliances within an equilibrium theory of autonomy.

Alliances and Free Riding

One resolution to the quandary poses still more problems. Some have argued that states enter alliances because they prefer to shift to others the burden of mobilizing resources to respond to adverse distributions of power. But this passing-the-buck view of international relations poses many problems. For one, states that are minimally concerned with their own survival should presumably not take the kind of chances with their survival implied in reliance on others. Moreover, this model suggests that there is a tradeoff between expending resources on security and other uses to which they might be put, and that states might actually prefer to make other use of such resources. It also suggests a tradeoff between autonomy and other uses of resources in which states prefer the other uses and are willing to exchange some of their autonomy. Such a view thus challenges the primacy of security interests generally as well as the preeminence placed on autonomy. More damaging still are the implications of the respective views for international stability and peace. The standard view which holds that states respond to changes in the distribution of power, including the formation of alliances, which results in a reestablished balance. But if states prefer to depend on allies and be free-riders on others' efforts, then security constitutes a collective good that must be suboptimally supplied. If so, alliances formed to generate countervailing power would not reestablish a balance of power since they would do less than what would be necessary.

Information, Domestic Politics, and Alliances

Informational asymmetry provides, as it does for the problem of war, one resolution to the alliance problem. States form alliances because they do not have full knowledge of one another's preferences. Alliances serve as signalling devices to allies and foes alike. Allies signal to one another, in the process of negotiating, that their interests are indeed coincident. They also signal to the intended targets that their interests are coincident in opposition. Alliances are signals of commitment in a world of imperfect and incomplete information.[39]

---

[37] Autonomy then is something that is assumed rather than explained by the realist model of international politics. Realism and the balance of power are not then theories of autonomy but assume it.

[38] Altfeld (1984) argues that alliances tie nations to their ally's positions, and he cites scholars who have made that or similar assumptions. Also see propositions V3 and V17 in Holsti, Hopmann, and Sullivan (1973, pp. 276-77).

[39] Whether they represent credible commitments or constitute cheap talk is a second-order question. Some alliances are indeed intended to establish more credible commitments than merely words on paper.

Domestic political conditions also provide, as they do for explaining the failure to balance, an explanation for why alliances are formed even in a world of full information. Alliances transform the domestic bases of international commitments, from vague formulations of interest to codified arrangements. An extant alliance typically becomes the basis for a host of arrangements between the citizens of allied states that creates an interest in the maintenance of good relations. The development of domestic constituencies with an interest in good relations with another particular state further sustains the commitment and makes it more credible.

The absence of full information and the need to signal credible commitments are thus as essential underpinnings to alliances as are common interests. An explanation rooted in power and interests, as the standard realist formulation has it, is insufficient to explain alliances (as it is to explain war). Alliances are equally rooted in the stickiness of power politics and the inability smoothly and effortlessly to respond dynamically to changes in the international distribution of power.

Alliances and Secrecy

The implications of both bases for alliances suggest the centrality of openness in alliance arrangements and imply a restricted domain of secrecy in such agreements. Alliances intended to signal commitment and generate domestic interests in favor of their maintenance cannot be secret arrangements. What can be expected is that specific commitments may indeed be made secretly. States that limit their commitments to one another quite narrowly may keep these constraints secret precisely in order to expand the scope of the deterrence provided. Ambiguity can keep others guessing and, in the context of the alliance, can be salutary. Ambiguity that can be destabilizing when it takes the form of an unwillingness to form an alliance at all can be stabilizing when it constitutes an unwillingness to make public the exact range of interstate commitment.[40]

The second basis for some secrecy in alliance commitments has to do with domestic politics. Although states want the positive reinforcement to commitments provided by domestic support and the development of constituencies, they also want to avoid detailing the costs to autonomy that the alliance entails. An emphasis on the benefits while hiding the costs is a classic rule of domestic politics, one that applies to international relations as well.[41]

Finally, secrecy may be a hallmark of expansionist alliances that challenge the status quo. The above discussion has focused on those alliances formed to deal with perturbations in the balance of power--alliances formed by status quo states responding to assertive challengers or potential challengers. But alliances may also be formed by revisionist aggressive powers, and these are as outside the scope of realist theory as any other exogenous disturbance to the balance of power. Such

---

[40] A case can be made on behalf of ambiguity in other settings as well.

[41] This provides the classic explanation for the overreliance by democracies on indirect and unobserved taxes while engaging in extensive public displays of the benefits of government activity.

offensive alliances might very well be secretive, since deception is typically in the interest of challengers.[42]

The model of alliances developed here complements the realist argument. The realist emphasis on the aggregation of capability is an insufficient explanation for the emergence of alliances. Rather, alliances are necessary because of informational asymmetries and domestic constraints, two factors that can retard the emergence of tacitly coordinated action in pursuit of a common security objective. An understanding of alliances depends not only on an analysis of the international distribution of power and their role in affecting that configuration, but also on an analysis of the signalling requirements of the situation and their role in establishing credible commitments.

It is the very stickiness of the system, caused by informational asymmetries and domestic constraints, that explains both war and the need for alliances. A system of fully informed states unconstrained domestically would be one without either alliances or war.

Directions for Research

In addition to the substantive arguments made about war and alliances, the analysis in this paper also contains implications for future scholarship. Most immediate is the continued study of uncertainty and information and the use of the mathematical models developed in microeconomics and game theory. Critical results from such scholarship are already well apparent--the emergence of multiple equilibria in those areas in which a unique and singular equilibrium had been expected. A second important line of inquiry is also evident--a focus on the domestic bases of grand strategy.[43] Unfortunately, modern neorealists deride of work done at the national level of analysis given what they presume is an inability to integrate structural and national level arguments. But work needs to be undertaken and <u>can</u> be done while maintaining a focus on strategic interaction and systemic effects (see my discussion in Stein, 1990, pp. 175-184).

The failure of the balance of power model to work as advertised and the occurrence of underbalancing as a result of uncertainty, informational imperfections, and domestic constraints leads scholarship in specific directions and generates important avenues of intellectual inquiry. After all, states in an anarchic system confronted by such problems would presumably take steps to mitigate the consequences of uncertainty and resort to various means to signal international commitments and to make them credible. The importance both of signals and of attempts to make credible commitments emerge immediately from such an analysis of international politics. The causes and consequences of different signals and different commitment strategies must become central components of the analysis of systemic stability.

One line of inquiry entails studying the ancillary underpinnings of foreign policy and strategic alignment. States that are uncertain about balancing responses to the emergence of strategic threats

---

[42] On deception, see Brams (1977) and Stein (1990).

[43] Not surprisingly, the exact title of a just-published volume I have co-edited (Rosecrance and Stein, 1993).

undertake various means of binding themselves to one another. Economic policies including foreign aid, investment, and discriminatory trade treatment can all be undertaken as a means of assuring strategic alignment. Work by Lars Skålnes (1992) shows that trade policy often entails country-specific forms of discrimination (positive as well as negative) even though such policies are not predicted by any of the standard economic explanations for trade policy. Further, Skålnes beautifully demonstrates that such policies can be explained by political and strategic factors.[44]

A second line of inquiry focuses on the reverse causal process, the balancing implications of extant economic ties among great powers. Work by Paul Papayoanou (1992) shows that depending on the economic links between the great powers, the uncertainty as to whether states will balance can be either enhanced or undercut. Economic interdependence between status quo powers when no such economic ties exist between them and challengers leads to strong balancing despite the presumptive and prevailing uncertainty in the international system. Papayoanou demonstrates that preexisting economic links (some developed purposively as suggested in Skålnes's strategic theory of foreign economic policy) are decisive in explaining strong versus weak balancing behavior on the part of great powers.

Conclusion

A realist balance of power theory built on the assumptions of full information and no domestic constraints on grand strategy is an equilibrium theory of peace that cannot explain either war or alliances. Domestically unconstrained states are in a position to respond continuously and readily to changes in the global balance of power. States fully aware of the interests and intentions of others respond appropriately to systemic changes.

Incorporating imperfect information and domestic constraints generates a realist balance of power theory with multiple equilibria in which peace and war are both equilibrium outcomes, and in which alliances and autonomy are also both equilibrium outcomes. In such a theory, the international system generates less-binding constraints and imperatives. States no longer engage in the balancing behavior implied by changes in the global distribution of power. Domestic politics is no longer something that can be systematically excluded from international political theorizing. Such a theory is necessarily less precise in its implications. And such a theory generates new and important avenues for future scholarship.

---

[44] Hirschman (1945) demonstrates that Skålnes-type discriminatory economic policies can be pursued by revisionists with aggressive intentions as well as status quo states interested in the maintenance of peace and stability. A more restricted formulation of the strategic bases of trade policy focuses only on the security externalities of the material consequences of trade (Gowa, 1989; Gowa and Mansfield, 1993).

"Please, Daddy, Not in Uniform"

INTRODUCTION

During most of the Cold War era, and despite the vocal opposition of a minority peace movement, most Germans respected and supported their Armed Forces, the Bundeswehr. Today, as a consequence of the end of the Cold War, increasing numbers of Germans have turned from support to indifference and, in many cases, active hostility to the Armed Forces. Internal surveys of the Armed Forces conducted by the Bundeswehr's Institute of Social Sciences have indicated an increasing problem of low morale among the officers and men and an increasing questioning of whether or not there is any public support for the Bundeswehr. As the German historian Arnulf Baring commented: "Let us not deceive ourselves: for most of our countrymen the Bundeswehr is just as anachronistic as Frederick the Great – a relic of that realm of legend in which there were still wars."[1] For the officers and men of the Bundeswehr, this lack of public support is manifested by increasingly "cool" relations with the larger society.

Traditionally, for example, as most officers lived "off base," they wore their uniforms to work. Today, the custom is increasingly "unicivil:" a civilian raincoat worn over the uniform to avoid being insulted on the bus. A German troop magazine commented that soldiers need "to camouflage themselves when they go to work." Or, as the daughter of a senior Navy officer, who at his own wedding had worn his dress blues, said before her wedding: "Please, Daddy, not in uniform."[2]

If it were only uniforms in public, there would be no serious problem. Rather, the uniform issue is seen by the members of the Bundeswehr as evidence of increasing hostility to them as individuals. German newspapers report cases of children of officers at a local caserne being denied admission to Kindergarten play groups because as a soldier's child they would come into contact with war toys; or officers' wives being rejected at their jobs because they are "married to killers." Enlisted men fare no better. "Teachers are viewed by society as lazy, policemen as stupid – but the ones who come off looking worst are the soldiers."

With the end of the Cold War, no western military has been undergoing such a series of external and internal changes as the German Bundeswehr. Externally, the Bundeswehr has been subject to a massive reduction in size, a rapid drop in the budget (in part to pay the costs of reunification), and massive restructuring and geographical redeployment. There have been three "final" restructuring plans during the past three years.[3] Likewise, the Bundeswehr finds itself caught in the midst of an increasingly rancorous public debate about, on the one hand, new roles and missions including "out-of-area" deployments and, on the other hand, about whether or not there is really any need for the German armed forces at all. Increasingly, German soldiers see themselves more and more isolated from in the larger society by public opinion made hostile through political party manipulation for short-term electoral ends.[4] While the government cuts the budget, force structure, and simultaneously proposes new out-of-area deployments, the opposition Socialists continue their attack on "militarism" and find defense issues an easy means to attack the government. The main consequence is a serious collapse of internal morale and combat readiness while,

simultaneously, being assigned new roles and missions - missions which appear to lack both genuine governmental and social/popular support.[5]

BACKGROUND

The Bundeswehr was established in 1955 consequent of joining the North Atlantic Alliance (NATO) and the Western European Union (WEU) and, for obvious reasons, was unlike any previous German armed forces or, indeed, any other armed forces in the world. The establishment of the Bundeswehr was part of the larger issue of the incorporation of West Germany into Europe and, simultaneously, part of the larger issue of the North Atlantic Alliance. Initially, and largely in response to quite legitimate French and British reservations, the Bundeswehr was constrained by a series of militarily significant restrictions.[6] The most important restriction was simply that the West German Bundeswehr was not a German national force. With the exception of some National Guard-like "Territorial Defense" forces for logistic support to NATO Alliance forces, all Bundeswehr military units, army, navy and air force, were integrated fully into NATO command-and-control structures. NATO Alliance requirements, not national requirements, determined the size, structure, and mission of the Bundeswehr.

A second series of restrictions limited the types of weapons available to the new Bundeswehr. The German Army would be restricted to twelve divisions. Initially, and again in response to British and French concerns, West Germany was restricted in the types of tanks, military aircraft, rockets and missiles, and, of course, nuclear, chemical and biological weapons were banned. By 1984, the Western European Union had lifted all restrictions

while, simultaneously, Germany undertook to continue its rejection of nuclear, chemical and biological weapons.

A third series of restrictions, in many ways self-imposed to assure the support of the anti-militarist Social Democratic Party, was the rejection of any effective national command-and-control mechanism. There was to be no German "General Staff" as all units were subordinated into larger Alliance formations. The Inspector General, the highest ranking Bundeswehr officer, was not in the chain-of-command. In American terms, there was to be no "Chairman of the Joint Chiefs-of-Staff." Indeed, there was no Joint Staff. Obviously then, there was no institutional structure by which the Germans could do military planning outside the watchful eyes of their NATO partners. Legally, control over the Bundeswehr in peacetime rested with the civilian Minister of Defense and each individual service chief reported directly to him. During wartime, the forces were subordinate to the Federal Chancellor but, in fact, NATO would have controlled their operations.

A fourth restriction, discussed at length below, was, again, a self-imposed restriction of the mission of the Bundeswehr solely to the defense of Germany and, in case of attack, the defense of the physical territory of an Alliance state. On the one hand, the goal of rejecting "out-of-area" actions was to reassure Germany's new allies. On the other hand, from the narrowly German perspective in 1955, the goal was to avoid being involved in British, French, or Belgian colonial wars or, equally important, the US-led United Nations operation in Korea, especially as Germany had not yet been granted admission to the UNO. The Bundeswehr was a military force to serve only under the control of the Alliance and only in defense of the physical territory of the Alliance.

Finally, the Germans themselves undertook to transform the very essence their new armed forces. In addition to the external restrictions mentioned above, especially the lack of a national command-and-control structure, the new Bundeswehr sought to insure the "primacy of democratic political control" over the forces and destroy any trace of "militarism" in the new German armed forces. To avoid the development of the military as a "state-within-the-state," general conscription was established but was accompanied by generous provision for conscientious objection. The goal was to develop the armed forces' self-image as "citizens in uniform" (*Staatsbürger in Uniform*). Unquestioning obedience to orders was to be replaced by "self-direction" (*Innere Führung*) by which officers would earn the respectful obedience of the troops on the basis of having explained the "orders" in a way that a free citizen in uniform could see that the order was consistent with the physical defense of Germany in the Alliance.[7] Military service was "meaningful" and "moral" because it was consistent with the Basic Law (Constitution) and the soldier's oath to "serve the Federal Republic of Germany faithfully and bravely defend the rights and freedom of the German people."

With the exception of the continuing self-denial of NBC weapons, all the weapons restrictions have been lifted and, in many ways, the post-unification Bundeswehr is a new creation. The new Bundeswehr, however, faces serious problems. The Bundeswehr's main problems are those of restructuring and reducing the size of the armed forces, the total reorientation of the roles and mission of the forces, and the confused state of the public debate on defense and security issues in the larger society.

The restructuring of the Bundeswehr is a consequence of the end of the Cold War, arms control reductions negotiated by the CFE treaty, the unification of Germany, and the self-imposed troop ceiling of 370,000 men stipulated in the "Two-plus-Four" negotiations with the Soviet Union. With German unification, the West German Bundeswehr stood at 495,000 men, all of which were integrated fully into larger NATO formations. The East German National People's Army (NVA) had 170,000 men. The reduction, then, is from 645,000 to 370,000 by 1995. The first part was easy. The Bundeswehr did not "merge" with the former National People's Army; rather, the NVA just ceased to exist. With the exception of some small amounts of equipment, for example, one squadron of MiG 29s, most NVA equipment will simply be destroyed as it does not meet NATO/German standards. For example, some 3,000 tanks, 2,000 artillery pieces, and over one-hundred-fifty combat aircraft will be destroyed. West Germany, by contrast, will destroy some six hundred older M-48 tanks to bring the new Bundeswehr totals within CFE limits. Considerable expense is involved in the environmental cleanup of former NVA bases as the NVA was as environmentally conscious as the rest of Soviet-dominated Eastern Europe. Much of these environmental costs are deducted from the Bundeswehr budget. All high-ranking NVA officers were presumed to have been promoted in large part for their loyalty to the German Democratic Republic and were thus, retired. In essence, only 3,500 officers and 6,000 NCOs of the NVA will be permitted to "transfer" to the Bundeswehr after two-year's probationary service.[8]

As part of the "Two plus Four" Treaty, Germany agreed that no "NATO" forces would be stationed or deployed in eastern Germany until after full Soviet withdrawal and even then, only German "NATO" troops are to be stationed in the new Länder. Thus, as

Germany became responsible for the new territory and began the force drawdown, the Bundeswehr consolidated its old "Corps" assigned to NATO with the national guard "Territorial Command" to create three new Corps: two in the West and a new Bundeswehr Eastern Command. This new command represented the first "national" German forces not formally incorporated into NATO. Likewise, with the regaining of full sovereignty, the German Air Force took over responsibility for air policing in both "West" and "East" Germany from NATO. One major consequence of these new responsibilities, combined with a general reduction in numbers, is a major change in the career pattern of officers, NCOs, and long-term professional members of the Bundeswehr. These changes have had a very serious impact on morale.

The "normal" tradition in the Bundeswehr was for conscripts to be drafted into the units near their homes. Although some officers would be transferred to different assignments in different parts of (Western) Germany, most enlisted personnel and NCOs would remain in their original caserne for either the duration of their one-year service in the case of conscripts or, for the professional and long-term soldiers and NCOs, for the duration of their careers. In 1992, however, 42,000 officers and NCOs were transferred to new locations; more transfers and re-postings than in the entire history of the Bundeswehr. Before the final reorganizations of 1995 are finished, it is expected that some 25,000 officers and 87,000 NCOs will have been relocated.[9] This, in the experience of the German military, is very disruptive as, given the influx of illegal asylum seekers, high civilian unemployment and low military pay, finding family housing has been almost impossible. Divorces have increased significantly. German newspapers carry stories of officers' wives going house-to-house trying to find an apartment in the new assignment area. For a significant number of

men in the Bundeswehr, the new situation is even worse. As the East German NVA was essentially abolished, the need to establish a German military presence in the new Länder requires that significant numbers of officers and NCOs be transferred "East." To date, some 29,000 NCOs and long-term personnel have been transferred to Bundeswehr Eastern Command.[10] Here, the disruption to families, the impossibility of spouse employment, the degraded housing stock and, to some degree, continued social isolation by a local population trained to fear their own previous military have made the announcement of a transfer to Eastern duty assignment the time for deciding whether or not to stay in the Bundeswehr. Likewise, "Western" officers and NCOs commanding "Eastern" conscripts is an unfortunate situation for morale on both sides and until a new generation of young officers can be raised from the eastern Länder, this "colonial" relationship will remain a serious drag on morale and readiness.

The new Bundeswehr will be drastically reorganized internally as well, with new roles and missions both within the Alliance and, potentially, for out-of-area deployment.[11] This too has been very disruptive as officers and men are not only moved around the country, but familiar units are deactivated, recombined to form new units, and, most importantly, the Bundeswehr evolves into a "two-tier" structure. There will be three "categories" of military units. Category One are those few forces which are normal in any sovereign state: military academies, air defense and air police, ceremonial units, search & rescue, and military intelligence. Little commentary is needed on these forces except to note that the required manpower reductions will result in more "headquarters" officers being transferred to "field" duties. Category Two units of the Bundeswehr are those which correspond to the new

NATO "Main Defense Forces" to be available to repel any revanchist Russian threat. That is, the great majority of the Army forces will be mobilization or "reserve" forces which, after 1995, will require a full eight months warning time for reconstitution as fully-trained units. Most conscripts will serve in these "partially active" Main Defense Forces. That is, most conscripts will serve, to use an American analogy, in National Guard and Reserve units. Officers, NCOs and long-term professionals assigned to these Category Two "reserve" forces cannot be expected to have as "bright" career prospects as those personnel serving in the "real" Bundeswehr. The "real" Bundeswehr will be the Category Three units, that is, the fully active standing forces. Most of the Air Force and Navy will remain fully manned and available for rapid deployment although force levels, especially in the Navy, will be considerable reduced. The Navy, for example, which stood at 44,900 men in 1990, will drop to 32,200 by 1994, and after 1995 will be reduced further to about 26,000 men. The Air Force, likewise, will reduce from about 120,700 currently to 82,400 by 1994 and, consequent of a shift away from combat aircraft to transport aircraft and anti-aircraft defense for rapid deployment, will rise slightly to about 84,000 after 1995. The Army will reduce from the current Bundeswehr force level of forty-eight combat brigades and eighteen motor-rifle and tank regiments of the former NVA to only twenty-eight brigades by 1995. That is, to about 255,400 men.[12] The numbers, however, in the case of the Army are misleading. Only seven brigades will remain fully active; the other twenty-one brigades will be assigned to the Category Two Main Defense Force mobilization-dependent army as either "*teilaktiv*" or mobilization dependent and manned at about half-strength and two brigades will be "*gekadert*" or equipment-only holding units. That is, only the 50,000 men in the seven active brigades can be considered as forces available for immediate deployment for home defense

or out-of-area service. Most brigades, whether fully active or Category Two, remain assigned within traditional NATO force structures such as the American-led "Multinational Corps," the German-led "Multinational Corps," or the combined German-Danish "Jutland" Corps.

It is the seven active brigades (about 50,000 men) which will form the basis of the proposed Rapid Reaction forces of the new Bundeswehr and are, thus, the most controversial. Most of these active brigades are assigned within the larger Alliance force structure, but in a novel way which represents a shift in German planning, training, and equipment acquisition away from the traditional heavy armored divisions to mobile, light units.[13] The Germans do not expect a major land war in Europe. The 26th airborne brigade, for example, will be assigned to the current NATO "Allied Mobile Force-Land" (AMF-L) for rapid deployment to the northern (Norway) or southern (Turkey) flanks of NATO. Two brigades (9th mechanized & 21st armored) of the 7th Panzer Division will be assigned to the newly developed NATO Allied Rapid Reaction Corps (ARRC) and the 31st airborne brigade will be assigned to a new NATO "Multinational Division North." On the other hand, Germany has assigned the 12th armored and 30th mechanized brigades of the 10th Panzer Division plus the Franco-German brigade to the newly established "Euro-Corps."[14] The Euro-Corps will be composed of French, German, Belgian, and Spanish units and, in the first instance, report to the European Community through the Western European Union. And, Germany has designated two battalions of the 25th airborne brigade and 23rd mountain brigade to be available to the UNO as "Light Airborne Crisis Reaction Forces." As this restructuring has not yet been fully implemented, the German troops deployed currently to Somalia have been drawn primarily from the NATO AMF-L assigned 26th airborne brigade. That is, Germany is simultaneously developing a small "national"

military capability, contributing to the development of WEU European Community "European" forces, and remaining integrated in the NATO Alliance. National forces imply national command.

As a consequence of the Two-plus-Four Treaty and the need for Germany to begin to exercise full sovereignty, there was an obvious need to reform the "command and control" structures of the Bundeswehr. As long as every relevant military unit was subordinate in a larger NATO command, German "national" control of its forces was unimportant. Now, especially in the context of the debate concerning German participation in UNO or even NATO/WEU/CSCE out-of-area missions, national planning and control have had to be addressed. The structures in place until recently are inadequate and resemble those of the United States before the 1986 Defense Reorganization Act. Reform of Bundeswehr command and control structures has proved very contentious with, as expected, Socialist politicians warning about secret attempts to revive the Prussian General Staff, etc.[15], [16]

In early 1992, the Federal Ministry of Defense (*BMVg*) proposed the creation of a new "Armed Forces Command" (*Streitkräfteführungskommando*) which would increase the power of the Chief of Staff (*Generalinspekteur*) by making him more like the American Chairman of the Joint Chiefs of Staff. It would appear that the current Inspector-General, Lt.Gen. Klaus Naumann, had developed these proposals based on his experience as the former chief of *FüS VI* (Planning) and *FüS III* (Political/Military Affairs) in Central Staff of the Ministry of Defense.[17] The Defense Minister, Volker Rühe, rejected the reform in April 1992 apparently in response to hostile press coverage which implied that "the generals are trying to upset civilian control."

The need for national command and control reform still exists. Currently, it appears that Chancellor Kohl has come to agree more with General Naumann on the question. It would appear that a new "Common Armed Forces Leadership Staff" will be established in the Ministry of Defense. The staffs of the Inspectors-General of the individual services will be reduced; many combat service support functions like logistics, medical issues, communications, and intelligence which are now done on an individual service basis will be consolidated (or become "joint"); and, most importantly, the 1970 "Blankeneser Decree" which established the current system will be changed to increase the power of the Inspector-General by placing him above the Service Chiefs on the "Joint Staff" and, for the first time, directly in the chain of command between the Minister of Defense and the individual services.[18] In essence, the Bundeswehr command and control structures are moving slowly to resemble those of the United States (or any other "normal") military. Additionally, two divisional headquarters have been "held back" from the general reorganization of the army into three Corps. Army Command North (HKN) and Army Command South (HKS) have been "retained" for contingency planning and could serve as HQ to command German units "detached" from NATO structures for "crisis management" or out-of-area deployment. Finally, as General Naumann himself has been quite visible and outspoken on issues affecting the Bundeswehr, there has been a continuing commentary in the German press about "generals forgetting their civilian masters."[19] The slow development of a "national" Bundeswehr will remain contentious but talk about this being a threat to the "primacy of democratic politics" and civilian control is not realistic.

Perhaps the greatest negative impact on Bundeswehr morale has been the apparent collapse of the national security consensus. While some Germans have always viewed post-war Germany as a "civilian" power which should evolve into a neutral "big Switzerland," most Germans have accepted the North Atlantic Alliance and its consequent requirements for an effective armed forces.[20] For most Germans, even the Social Democratic Party when they were not in opposition, the core principals of German national security policy have remained constant since the establishment of the Federal Republic. Germany would be secure only as a member of the emerging European Community and only as a member of the larger Atlantic Alliance. To emerge from being an object of policy as at Yalta and Potsdam, Germans would need to convince both themselves and other Europeans that they were "acceptable" in the democratic, liberal family of nations. From the establishment of the European Coal and Steel Community in which Germany ceded control of its war-making potential to a "European" institution, to the Maastricht Treaty of 1992, Germany has been among the most "Europeanist" nations. Likewise, since the establishment of the Bundeswehr in 1955, German military forces were fully and totally committed to and subordinate to the larger NATO force structure. "Alliance acceptability," meaning both European unity and North Atlantic solidarity, has been the key to German political success.

With the revolutions of 1989 culminating in German unification in October 1990, the old order of Yalta is over. Germany is now the largest nation in Europe outside Russia. For all its new power, independence and centrality however, the core principals of German national security remain. Germany must retain "alliance acceptability" via the European Union and North Atlantic solidarity.[21] If, as seems to be happening through calls for Germany to participate in out-of-area military missions, the NATO Alliance begins to make

demands for actions which Germany cannot support, alliance acceptability is threatened.[22] If, as seems to be happening with the demand stated at Maastricht for a strengthening of a separate "European" security identity and even a European military identity, then alliance acceptability is threatened from another direction. And if, as seems to be the case, there is increasingly significant domestic political debate on the future role of the Bundeswehr in both the European Union and the North Atlantic Alliance, alliance acceptability is threatened.[23] In essence, the public debate on the future roles and mission of the Bundeswehr, both domestically and internationally, is emerging as the most significant issue for the European Union movement in Germany, the continued relevance of the North Atlantic Alliance, and Germany's international role.

As late as August 1990, the former Foreign Minister Genscher, a leader of the FDP partners in the governing CDU/CSU/FDP coalition government, maintained that deployment of the Bundeswehr outside Germany was not possible until a Constitutional amendment had been developed.

> All federal governments including the present one have held the opinion that the employment of the Bundeswehr outside of NATO territory is not permitted. This reflects the clear wording of our Basic Law. Even those who adhere to a different constitutional interpretation must accept that their opinion is at least doubtful. No government can take the responsibility for such a momentous decision as sending German troops to other regions on a doubtful constitutional basis.[24]

Currently the major political parties remain divided totally on the appropriate post-Cold War role of the Bundeswehr with the result that the officers and men of the Bundeswehr are acutely aware that they are being moved into politically dangerous waters whether they wish it or not.[25] The German Social Democratic Party (SPD) is continuing its traditional "antimilitarism" and insists that any deployment of German troops apart from a

direct attack on NATO is illegal as it would violate Article 87a, paragraph 2 of the Basic Law: "With the exception of defense, the armed forces may only be employed insofar this Basic law explicitly permits." The SPD position is that there is no "explicit" provision for any out-of-area deployment. The SPD view, as presented in the latest party platform, the "Petersberg Declaration," is willing to support a constitutional amendment which would explicitly permit Bundeswehr deployment only for United Nations Blue Helmet "peacekeeping" in response to a request from the UN Security Council, but not "peacemaking" missions. And this, only if the United Nations rather than NATO, the WEU, or the CSCE has the total monopoly of political authority over the operation. The SPD antimilitarism extends to a promise to both remove all nuclear weapons from Germany and to withdraw Bundeswehr forces assigned to the recently established EuroCorps as the Socialists reject any "defense" identity for the European Community via the Western European Union.[26]

The leading party of the governing coalition, the Christian Democratic Union (CDU) and its Bavarian sister-party the Christian Social Union (CSU), support the deployment of the Bundeswehr for United Nations Blue Helmet "peacekeeping," UNO "peacemaking," and, more importantly, deployment by NATO, the WEU, or the Conference on Security and Cooperation in Europe (CSCE) as long as these deployment would be in conformity with the UN Charter.[27] The CDU/CSU position is supported by NATO, especially the United States. The CDU/CSU position is that the decision for United Nations deployment would be legal if it were made by an absolute majority vote of Parliament.[28]

The smaller party of the governing coalition, the Free Democratic Party (FDP), has taken a middle position on the out-of-area question. In recent years, the FDP has argued

that out-of-area "peacekeeping" is an appropriate mission. Currently, the FDP position is that an absolute majority in parliament for both peacekeeping and peacemaking UNO deployment would be legally acceptable. However, for any deployment not explicitly in response to a UN Security Council resolution, that is, any deployment consequent of NATO, WEU or CSCE requests, the FDP position is that this would require a two-thirds vote of parliament. As it is currently impossible that the Socialists will agree to such a deployment, the position of the FDP guarantees that the CDU/CSU/FDP Government will not deploy Bundeswehr troops out-of-area apart from a UN Security Council mandate. That is, the FDP has given the opposition Socialists a veto on any German participation in any out-of-area military action by NATO, the WEU or the CSCE. In the context of the actual reorganization of the Bundeswehr to support "rapid reaction" and "crisis management" deployments, it is obvious that most members of the armed forces are confused.[29]

Although the Bundeswehr is, in fact, preparing for out-of-area deployments, German officers and men are fully aware of the "Vietnam" syndrome and do not want to undertake missions out-of-area without full public support.[30] During the Gulf War, for example, the "peace movement" took to the streets to protest "Western Imperialism," several leading opposition politicians argued that deploying German Air Force units to Turkey was illegal because Iraq had not attacked Turkey, and sixty members of an Air Force anti-aircraft unit petitioned to have themselves reclassified as conscientious objectors because deploying to Turkey was illegal. This little "mutiny" by serving members of the Air Force has made the Bundeswehr very hesitant about undertaking deployments without full governmental and popular support. Is there, in fact, a consensus to support out-of-area deployments?[31]

In a survey of one-third of German Air Force pilots, for example, almost half said they would consider refusing to obey orders for an out-of-area mission "without the necessary clear legal preconditions." Eighty percent argued for a "new labor contract" with "clearly formulated rights and duties." Indeed, fully 49% would want to "swear a new oath" if the currently accepted view of the role of the Bundeswehr were extended beyond defense of the homeland.[32]

Despite the lack of a final government consensus, Bundeswehr troops have been deployed out-of-area and are being currently deployed. Small "humanitarian" missions serve in Cambodia and a significantly larger force, about 2,000 men, is deployed to Somalia. The legal "fiction" being used by the government is that these forces are deployed under Chapter VI of the United Nations Charter concerning the "Pacific Settlement of Disputes" rather than under Chap.VII concerning "Actions with Respect to Threats to the Peace, Breaches of the Peace or Acts of Aggression."[33] That is, the Somalia mission is "peacekeeping," not "peacemaking."

More controversial deployments such as joining the United Nations missions in northern Iraq, participating in the WEU/NATO naval monitoring the UNO embargo against the former Yugoslavia and, most controversial, serving on the NATO AWACS aircraft monitoring the "no-fly" zone over Bosnia have all resulted in the Social Democrats lodging a formal request for an injunction against the government with the German Supreme Court. To date, the Constitutional Court has not issued any "final" ruling which satisfies either the government or the Socialist opposition. The Constitutional Court has issued preliminary opinions which, essentially, have returned the debate to the Parliament.[34] A "legalistic"

resolution by the Court would not be adequate for either German public opinion or for Bundeswehr morale.[35]

The immediate impact of these "out-of-area" deployments on the Bundeswehr is difficult to evaluate. One the one hand, the entire training system, armaments, deployment patterns, etc. had been oriented against the great Soviet invasion. Currently, the Bundeswehr lacks both the proper equipment and any sustained training for out-of-area deployment.[36] Thus, while the Socialists may complain about a new German "Afrika Korps" engaged in imperialistic operations against poor Third World natives, the troops themselves lack appropriate tropical kit, sand filters for their helicopters, etc. More importantly, these early out-of-area deployments have introduced a major strain within the Bundeswehr itself over its own self-image and place in society.

As recently as April 1993, former Socialist Chancellor Helmut Schmidt made the case for no out-of-area deployment. "The principal mission of our armed forces is to protect, together with the forces of our allies, the security of our own country and the territory of our allies. For this and for this alone did we create the Bundeswehr."[37]

The central issue, then, derives from a contradiction between the previous self-image of the Bundeswehr, especially among the conscripts, that defense of the homeland was the only legitimate reason for military service and the demands of a new, unfamiliar, and dangerous mission.[38] For many Germans the "contract" implied by conscription cannot be changed without a full "renegotiation" by the larger society. To date, only professional or long-service officers and men have been assigned to out-of-area missions. Government

policy is that conscripts do not serve out-of-area.[39] Conscripts may, however, volunteer and, indeed, many have. This conscript "opt-out" has, in the current Bundeswehr structure, a "ripple" effect that essentially "strips" the long-term and professional soldiers out of units throughout the forces to replace the conscripts from any unit deployed out-of-area. In essence, the disruption of unit cohesion and the need to scour the army for appropriate long-term soldiers for the Somalia deployment has stretched the Bundeswehr to its limits. As many of the "combat support" and "combat service support" roles in the Bundeswehr are done by conscripts, Germany could not sustain two "Somalias" within the current personnel deployment policies.

The issue of conscription and out-of-area deployment illustrate the lack of a wider social consensus on the role of the Bundeswehr both within the military proper and within the larger society. The need to reduce the 1990-level 495,000 man Bundeswehr and the 170,000 men of the former East German National People's Army (NVA) to, at most, 370,000 by 1995 has raised anew the domestic debate on conscription. From a philosophical point of view, successive German governments, whether CDU/CSU/FDP or SPD, remain committed to conscription as the best means to assure the ideal of the "citizen in uniform" (*Staatsbürger in Uniform*), assure the armed forces reflect the larger society, and do not develop, as in the pre-World War Two era, into a "state within the state." Likewise, conscription was seen as the most fair way to distribute the "costs" of citizenship. On the other hand, the unhappy experience with a militarized society and the traditional anti-militarism of the Socialists and the "individual rights" views of the (European-style) "liberal" Free Democratic Party assured that there would be generous provision for conscientious objection to military service. Neither conscription nor conscientious objection provoked

serious problems as long as the Bundeswehr was facing the Red hordes in defense of the homeland and, simultaneously, there were a sufficient number of young Germans to be drafted. All this has changed and there is good reason to believe that the prospect of out-of-area deployment must be included as a major factor in the renewed debate about conscription or whether to change to a "professional" armed forces.[40]

There is an honest "pragmatic" issue of whether or not conscription makes sense if the Bundeswehr is not only reducing in size but, as discussed above, is also reorganizing itself into two distinct armed forces: the cadre-mobilization dependent Main Defense Forces to prepare against a new conventional threat from the East and the much smaller (seven brigades) active force assigned to the various Rapid Reaction forces. It is already clear that once the Constitutional question is settled, some German units may deploy out-of-area. These units will receive the modernized equipment, new rifles, body-armor, and realistic training. These units will, obviously, become the "prestige" units and, as only volunteers from among conscripts would be deployed, these units will attempt to avoid having conscripts as members. The Rapid Reaction forces will become the "real" Bundeswehr while the conscripts in the Main Defense Forces will train for the great invasion that will never come.[41] This evolution into two armies will have numerous consequences, none of which are good for Germany or the Bundeswehr. There will be elite units and "as one says in the French army" *culs de plomb* - lead asses. "The one group will engage in combat operations, the other will carry toads across the road."[42]

First, there is the question of whether conscription is even working under current conditions. There is a fairly widespread consensus that the young German conscript is not sufficiently trained for either modern European warfare or UNO-like deployment.[43]

Conscription is for twelve months; the Bundeswehr "labors" under a 38.5 hour work week; the first three months are standard basic training; different "intakes" are at various stages of their training at any one time; thus, it has been argued that only fifty percent of the conscripts are "fully" trained on a yearly average. As it is likely, for budgetary as well as tactical reasons, that realistic training of conscripts for a hypothetical war will decline while the long-term and professional soldiers train for the "real" missions of Rapid Reaction deployment, the only conclusion possible for the young conscript, and the larger German society, is that the previously legitimating myth of the Bundeswehr - defense of the homeland - has fallen to last place.[44] Unfortunately for the Bundeswehr, while there appears to be support to "do something" in Somalia, fully 80% of Germans surveyed now believe that national defense is the "least significant" role of the State. The impact on morale has been obvious and both government leaders and senior Bundeswehr commanders have been attempting to convince the troops that the Bundeswehr remains vital national service.[45] Already some young conscripts have ceased referring to themselves as *Staatsbürger in Uniform*, but rather "*Gästarbiters in Uniform*," (Guest-workers {Turks} in uniform).[46] Why continue conscription?

Why continue conscription, indeed? While there has always been a fairly high number of young men who refuse military service in Germany, since the end of the Cold War the numbers have increased dramatically. In 1990, the number refusing conscription was 75,000 in West Germany. With the coming of the Gulf War, the number rose to 150,000. The number has fallen somewhat now, but remains very high: 130,000 in 1991.[47] The Bundeswehr, then, must plan for about thirty percent of the eligible pool to claim "alternative service" and another twenty percent to be rejected as physically or mentally unfit

for service.[48] That is, fully half of the draft-age male population is unavailable to the Bundeswehr. Currently about 120,000 young men are performing their twenty-month "alternative service" as hospital orderlies, social workers, etc. Indeed, there is some pressure from German social service agencies to keep conscription as the "alternative service" option provides a significant percentage of their "low cost" labor force.

The 1991 Defense budget projected a reduction by 1995 of long-term professionals (who served four to fifteen years) from 145,000 to 115,000; two-year volunteers from 17,000 to 5,000; and twelve-month conscripts from 208,000 to 145,000. These projections were based on an initial Bundeswehr calculation that saving money by reducing professional, long-term and volunteer soldiers would be preferred to reducing conscription. Likewise, the Bundeswehr is quite sensitive to the issue of the "citizen in uniform" and did not want to present a convenient "antimilitarist" target by advertising that "only professionals need apply." The Parliament, however, realizing that conscription is increasingly unpopular and, more realistically, recognizing that conscripts may be inappropriate or unavailable for future "crisis reaction" and out-of-area missions, reduced the number of conscripts in the Bundeswehr personnel plan. The Parliament, for good reasons or bad, is nudging the Bundeswehr in the direction of a professional armed force. Under current planning assumptions, the Bundeswehr needs as annual conscription intake of about 186,000 men to sustain a projected 370,000 force. The pool of eligible young men is estimated to be about 370,000. With standard projections of 185,000 men being unavailable for conscription, the Bundeswehr may have difficulty finding sufficiently qualified draftees, especially since those opting for alternative service tend to be the better educated. If the Bundeswehr reduces to about 300,000 men after 1995, it is planned to maintain a professional, long-term core of

about 220,000 men and conscript only 70,000.[49] While this may represent a short term "pragmatic" response, the "duty" to serve becomes more difficult to argue. The normal conscript, for example, is liable to "call up" for reserve duty in the first year after service: some estimates indicate that as many as sixty percent of those liable do not bother to report for their reserve "duty."[50] Likewise, the "equity" of conscription will continue to be a contentious issue both in the larger society and especially in the Bundeswehr.[51] Desertion is an increasing problem, especially in the new Eastern Länder. In "old" Germany, during 1991, about 4,000 of the 320,000 soldiers deserted. In the "new" Länder, about 1,400 out of 60,000 have deserted in the first nine months of 1992; twice the rate for West Germany.[52] One reason for the high desertion rate in the East must be the killing boredom of conscript duty. The NVA had such a vast quantity of weapons dispersed through the former GDR that the normal "Eastern" conscript spends 40% of his time on "guard duty" over this vast warehouse complex. In the West, the conscript spends only 5% of his time on guard duty. Conscientious objection is also increasing in the new Länder; 15,500 in 1991, 18,000 in the first nine months of 1992. Many of these men flee to the Netherlands and, to avoid being deported back to Germany, claim political asylum.

Within the larger society, the issues of conscription and out-of-area deployments remain contentious, but public opinion is not as divided as the major political parties and has been evolving in the direction of the policies of the government. The Social Democrats may be out of phase with the electorate. In 1992, 69% of Germans surveyed supported Bundeswehr deployment in UNO Blue Helmet "peacekeeping" operations although fully 65% opposed, for obvious historical reasons, any German peacekeeping role in

Yugoslavia.[53] In August 1992, only 18% favored a Bundeswehr UNO "peacemaking" role; by February 1993, 26% favored the Bundeswehr being deployed in a UNO peacemaking role. Currently, fully 68% support the German mission in Somalia; 72% in "west" Germany but only 57% in the East. Likewise, the number of Germans who hold the "traditional" view that the Bundeswehr can be used "only" for the defense of German territory has decreased. Only 26% of those surveyed still hold the "traditional" view: 16% of voters who identify themselves as CDU/CSU and only 27% of Socialist voters. The Social Democratic leadership, then, holds a far more restrictive view of the role of the Bundeswehr than the Socialist electorate.[54] Most important, however, 65% of those surveyed insist that any UNO out-of-area deployment be conducted only by the "professional" soldiers. Only 8% were prepared to send conscripts out-of-area![55] Again, the role of the conscript and the justification for continuing conscription is obvious: defense of the homeland and nothing else.

As the defense of the homeland becomes an increasingly irrelevant military mission and the Bundeswehr prepares for Rapid Reaction deployment with "professional" soldiers, Germany will face a divisive internal debate on conscription, alternative service, and the proper role of the military in German society.

CONCLUSIONS

From the perspective of formal institutional arrangements, it could appear that the Bundeswehr has greatly increased its influence in the emerging post-Cold War European environment.[56] Bundeswehr units are assigned to multinational corps of the new NATO Main Defense Forces, the NATO immediate-reaction AMF-L, the new NATO Rapid

Reaction Force (ARRC), the WEU-related EuroCorps, "national" forces in the new Länder, and have assumed "national" responsibility for air defense and air policing from NATO.[57] Significant numbers of Allied forces are withdrawing from Europe. Logically, as there is a putative relationship between political influence and deployable military assets, a simple listing of increased German military "presence" could be seen as increased political influence. The reality, however, is in the details and in an investigation of the actual state of readiness or deployability. One major reality is that, despite the high "paper" numbers, only seven brigades (50,000 men) are to remain fully active in the sense of being immediately deployable military assets. The Bundeswehr is, in reality, turning itself into a "two-speed" force: a small active force and a mobilization-dependent "militia." Simultaneously, the continuing divisive debate in the governing elite, whether CDU/CSU/FDP or the SPD, and the very confused state of public opinion on key questions such as conscription, out-of-area deployment, and even the relevance of military forces in the post-Cold War Europe, are causing a serious crisis of confidence in the Bundeswehr.[58] Confusing and contradictory direction from the government continues to plague the forces: that is, reorganize for crisis reaction deployment but don't deploy because that is not the purpose of the Bundeswehr. Confusing and contradictory messages from the public such as "no professional army to threaten the image of the citizen-in-uniform" contrasting with "do something, but don't use the citizens-in-uniform to do it" leave the Bundeswehr unsure of its role in society and its relationship to society. Morale, readiness, commitment, and even the inner conviction that military service is morally appropriate for other than the direct defense of the homeland have all suffered as the Bundeswehr has had to essentially re-invent itself.[59]

The German Bundeswehr was formed in 1955 and has been in existence longer that the Reichswehr of the Weimar Republic and the Wehrmacht of the Third Reich combined. Its central function has been to be the military contribution to the foundation of German national security - alliance acceptability. If the political, economic and social changes currently being demanded of the Bundeswehr result in a force so "downsized" into a militia and so politically constrained that its seven brigades cannot comply with alliance requests, whether the NATO Alliance, the new European security identity via the WEU, or even to support contentious United Nations missions, then the role of the Bundeswehr in supporting German foreign and security policy is an open question.[60] The German Bundeswehr is, once again, being forced to "reforge the Iron Cross."

Legal Hermeneutics
and the Constitution of "Indian" Identity

The Indian became important for the English mind not for what he was in and of himself, but rather for what he showed civilized men they were not and must not become.
Roy Harvey Pearce[1]

"Native Americans were and are real, but the *Indian* was a White invention and still remains largely a White image, if not stereotype," wrote Robert Berkhofer in his noted study of the images of Indians held by Europeans and their American descendants, *The White Man's Indian*. The more than two thousand cultures of the Western hemisphere did not think of themselves as being of any common identity, nor could they have done so, the groups located across the length and breadth of two continents being mostly unaware of each other. However, for better and for worse, "the idea of the Indian has created a reality in its own image as a result of the power of the Whites and the response of Native Americans."[2] Thus, federal Indian law and policy is a function not of Indian reality, but of the symbolic value of the Indian image. Understanding the non-Indians' policy toward Indians therefore requires understanding their images of Indians, and an understanding of those images reveals both important contradictions and persisting themes.

Using Roy Harvey Pearce's 1953 study, *Savagism and Civilization*[3] and Bernard McGrane's history of anthropology, *Beyond Anthropology*, the following combined chronology of images of the Indian Other can be developed:

1. The Renaissance and 16th Century
2. The Enlightenment (1700 to 1871)
3. Early Social Science (1871-1928)
4. The Era of Cultural Relativism: Indian Reorganization, Termination, and Pseudo-Self-Determination (1928-1977)
5. The Era of Indigenous Peoples (1977-Present)

After a brief review of the first two periods, this paper will give more sustained attention to the last three.

Christian and Renaissance Images

The Other in the Renaissance and 16th century cosmography was a pagan, defined by the lack of Christianity.[4] To describe the new Other they found in the Americas, the English used the term "savage" or "salvage," derived from the Latin "silvaticus," meaning "a forest dweller."[5]

Wildness "implied everything that eluded Christian norms," and referred to "what was uncanny, unruly, raw, unpredictable, foreign, uncultured, and uncultivated." Medieval society defined itself against this background, and saw wildness as "the background of God's lucid order of creation."[6] Thus, the Europeans had a ready-made conceptual framework which would tell them all they needed to know about the inhabitants of this previously unknown world.

During the early period, and especially in times of violent conflict, Europeans portrayed American savages as godless, even soulless. Samuel Purchas considered Indians to have "little of humanitie but shape," thought them "ignorant of Civilitie, of Arts, of Religion," and "more brutish than the beasts they hunt." He believed they were "captivated also to Satans tyranny in foolish pieties, mad impieties, wicked idleness, busie and bloudy wickednesse."[7] Nature itself was something very close to evil for believers in a God who had handed dominion in this fallen world to the Devil, and the natural man was

close to evil as well.[8] Indians were assumed to be the result of a process of decay and degeneration that followed the Fall of humanity. With little or no contact with the revelation of God and his chosen people, the inhabitants of the Americas were the most corrupted and vile form of human society.[9]

Interestingly, Pearce noted an increase in demonological rhetoric, and the passion of this rhetoric, toward the end of the 17th century. He believed this development reflected, first of all, growing pessimism among the missionaries, who were finding conversion much harder than they anticipated. They explained their failures by claiming that Satanism "was at the core of savage life," and thus difficult to weed out. Secondly, Pearce traced an increase in the conviction that Indians were unalterably diabolical to an increase in contact and tension between the growing and spreading European settler population and the ever more hedged in and impoverished Indians.[10]

The Christian cosmology that cast Indians as evil eventually was superseded by the intellectual movements we know as the Enlightenment. For many non-Indian Americans, however, Christianity continued to retain its intellectual and moral force, and Christian images of Indians were not so much overturned as modified. Consciously and unconsciously, less religious and more "scientific" and "secular" non-Indians also built their new worldview on Christian foundations. "Degeneration therefore remained a powerful analytical tool in White discussions of the Indian well into the nineteenth century for the orthodox, scholar and non-scholar alike."[11]

Images of the Indian Other in the Enlightenment

In the Enlightenment period the savage Other is not evil, but in error.[12] At the end of the 17th century and the beginning of the 18th, Europeans began to express a radically new understanding of themselves in relation to others. No longer was Christian Europe contrasted with idolatrous pagans, but rather civilized Europe was contrasted with superstitious and ignorant savages.[13] Of course, as Pearce indicated, Christianizing Indians was always seen as part of a project of civilizing them: "Success in empire-building and trade was to be measured by success in civilizing and Christianizing; success in civilizing and Christianizing would assure success in empire-building and trade." The Enlightenment change of focus was not all that great a departure from the earlier policy; all agreed that "the Indian, in his savage nature, stood everywhere as a challenge to order and reason and civilization."[14] Drinnon noted, "from the Indian point of view, the end result was pretty much the same: death, flight, or cultural castration."[15] Ultimately, however, this development allowed Europeans to think of others as something they did not have to either expel or destroy, but something they could confine and control. McGrane pointed to the change in U.S. Indian policy from removal (exclusion and assimilation) to reservation (confinement and administration) as a late example of the logic of this development in practice.[16]

Indians and other savages, in the view of many Enlightenment thinker, were ignorant because their environment was not conducive to the development, maintenance, and transmission of knowledge. "If their religion is savage, it is because they are unenlightened aborigines, living in a cruel, hard world."[17] As part of the general Enlightenment project of substituting rational and naturalistic explanations for supernatural, pagans and savages no longer were condemned as carnal, worldly, and in league with the devil; they were instead linked to error and ignorance.[18] So, for example, Robert Beverly's 1705 history of Virginia presented Indian religion as "neither brutal devil-worshipping nor deistical free-thinking," but merely as "the religion of savage ignorance."[19]

The Enlightened contrasted themselves with a large and disparate Other, stretching rather improbably across space and time, which had ignorance, the state of being unenlightened, as its hallmark. And if this Other is ignorant, it needs to be educated. Non-Indian America therefore took its mission to be that of teacher and parent; the government of "the Great Father" began to imagine and then create a paternal and pedagogical trusteeship over its Indian children.[20]

In its enlightened way, this policy was as hostile to the Indian as an Indian as any Puritan. If the Indian refused paternalistic assistance in eradicating Indianness,

then he confessed himself a madman or a fool who refused to enter the encompassing

world of reason and order. The red child then had to be expelled from the landscape of pastoral tranquility - or buried under it.[21]

The removal policy, often credited to President Andrew Jackson, enough of a rogue and redneck to take suspicion off of more sophisticated policy-makers,[22] was very much a part of the enlightened President Jefferson's paternalism.[23] When the student refused to learn from its teacher, when the child refused to mind its father, the teacher-parent could turn dark and vengeful. Jefferson cautioned the Indians, "if ever we are constrained to lift the hatchet against any tribe, we will never lay it down till that tribe is exterminated, or driven beyond the Mississippi." The tribes needed to learn one very important lesson: "In war, they will kill some of us; we shall destroy all of them."[24] There is no law in this policy, no sense that the government is operating under any limits of civil and political convention. The paternal wardship envisioned here brings the Indian only partially into the American family, and misbehavior would fracture the illusion of connection and re-establish a state of war.

President James Monroe's 1825 Indian affairs message to Congress made removal the express policy of the United States, since "experience had shown," he said, that Indians and non-Indians could not live together. After being moved across the Mississippi, the Indians would be civilized through the auspices of a U.S.-established government. Monroe claimed that no one in the government was contemplating forcible removal, since it was "revolting to humanity and utterly unjustifiable;" whether or not Monroe had convinced himself of that, the idea that anything short of force would remove the Indians is, and was even then, absurd. This assessment is not simply a matter of 20/20 hindsight or anachronistic moralizing. Jefferson, Madison, and Monroe were politicians capable of feats that still manage to impress; that they were unable to see the absurdity of their plans, unable to see that there was really no plan there at all, must be admitted. But Removal was the order of the day, and whether it realistically accommodated Indian desires was never the issue. The Removal policy changed the debate about the place of Indians in American society be announcing they had no place. "What was left after Removal in the 1830's was border warfare," noted Pearce, not really domestic politics at all.[25]

A politics of border warfare, not being a matter of domestic relations, did not have to presume that Indians were members of the political community. As late as 1857, in the *Dred Scott* case, the Supreme Court could write that Indians were like "foreigners not living under our Government." Though "within the limits of the United States" and "under the subjection of the white race," Indians were foreign enough that naturalization was the appropriate mechanism by which they could receive citizenship, wrote Chief Justice Taney.[26] However, Taney's opinion came at a time when the collective imagination of non-Indians was about to undergo significant changes in its understanding of the Indian. As Pearce noted of the period:

> What... nineteenth century Americans were aware of was degradation and destruction of the Indian, Removal, desperate drives to civilize and to Christianize before it would be too late, abhorrence of the perverse cruelties of white man on the frontier, frightening glimpses of the Indian as the vanishing American. If they were to be borne, if men were to be able to live with them, all these attitudes and impulses had to be shown to be products of a civilizing process whose good finally negated the evil in them, even if it did not make that evil immediately less painful. When this came to pass, when the destiny of the savage was fully comprehended in its relationship to the destiny of the civilized man, the Indian had been mastered not only as individual but as symbol.[27]

That mastery was only achieved when the Enlightenment image of the Indian was given new focus through the development of recognizably modern social science.

Early Social Scientific Images of the Indian Other

By the 19th century, "it was *time*, geological time, evolutionary time, that came between the European and non-European Other," and anthropology was "the positive and positivist form of a

comparison between past and present."[28] The savage was dead, replaced by an image of the primitive. Travel into the world of the primitive was like time travel, McGrane observed. The journey into the "heart of darkness," Conrad himself wrote, was like a trip "back to the earliest beginnings of the world," to "a prehistoric earth."[29]

Different societies were understood in terms of historical development because of the belief in progress. We can only understand some Other as primitive if we hold a conception of progress. Indeed, the term "primitive" itself is "essentially a temporal concept," McGrane noted, a category of thought and not an object of study.[30] "Primitive peoples" are "the invention and institutionalization of progress in the mode of anthropological discourse."[31]

The rise of the primitive Other may be seen as marking the end of the savage Other. The "scientific theory of the primitive" quickly supplanted the "historical-moral emphasis of the theory of the savage," Pearce noted.[32] A revolution in the image of the Indian was occurring, and that revolution began to reveal itself in Morgan's *The League of the Iroquois*, called in its day "the first scientific account of an Indian ever given to the world."[33] Morgan's book represented the nascent science of anthropology, with a commitment to objectivity and analysis, and a methodology of fieldwork. Morgan began from the conviction that social evolution as a process was understood enough to use it as a framework for interpreting specific societies. Monarchical societies were followed by oligarchical and then democratic, each form of political association bound up in its own social and productive context. To Morgan, "[t]he hunter state is the zero of human society;" all "elevation" could be measured from that point.[34] Morgan thought it unproblematic that different societies existed in different stages of historical development at the same moment in history:

> It does not affect the main result that different tribes and nations on the same continent, and even of the same linguistic family, are in different conditions at the same time, the condition of each being the material fact, the time being immaterial.[35]

However, Pearce still found traces of a savagist theory in Morgan's early work, and credited the later full blooming of Morgan's social evolutionism to his discovery of Spencer and Darwin. In his evolutionism, Morgan came to reject explanations of Indian identity based in theories of historical degradation and decline, which "removed an essential prop from under the earlier tradition which identified historical analysis with moral-theological evaluation."[36]

The full emergence of the new image of the Indian might be dated to 1817, a year of double significance. The year the U.S. Congress decided it would no longer recognize Indian tribes as foreign entities capable of making treaties was the same year in which the social scientific idea of primitivism, and perhaps anthropology itself, was born in a text that centered on the idea of social evolution.

The anthropological implications of Darwin's 1859 *Origin of the Species* were made manifest in Oxford professor E.B. Tyler's 1871 book, *Primitive Cultures*,[37] and then later in Morgan's *Ancient Society* (1877). Darwin himself reported that Lyell's *Principles of Geology* of 1830 made Darwin's own 1859 work possible. Without the conception of a geological time-scale, evolution through natural selection is impossible. "In the space opened up by 'geological time' Darwin found the room he needed to construct 'evolution.'"[38] Similarly, Tyler wrote that "geology establishes a principle which lies at the very foundation of anthropology," since human cultural development also require the presumption of a past so remote that "the ancients, as we call them, are but moderns."[39] McGrane cited Tylor's successor at Oxford, Robert R. Marrett, writing in 1914: "Anthropology is the child of Darwin. Darwinism makes it possible.... for anthropology stands or falls with the working hypothesis derived from Darwin, of a fundamental kinship and continuity amid change between all the forms of human life."[40]

As Darwin's biology made animals and humans comparable, 19th century anthropology discerned "a fundamental kinship" between Western man and the non-European Other.[41] Indians and primitive Others therefore were less different than previous thought "in that they re-present stages that the Europeans have long since progressed beyond in the ever expanding space of "history.""[42] Pearce wrote:

> ...the Indian was the remnant of a savage past away from which civilized men had

> struggled to grow. To study him was to study the past. To civilize him was to triumph over the past. To kill him was to kill the past. History would thus be the key to the moral worth of cultures; the history of American civilization would thus be conceived of as three-dimensional, progressing from past to present, from east to west, from lower to higher.[43]

Differences in culture were presented as differences of development. This presumption made difference somewhat unreal, and "not a primeval, indelible, and persisting dimension." The differences between peoples were an illusion, superficially obscuring the underlying sameness of all human society.[44] The different cultures of the world are merely the stages of human cultural development that reaches its further development with the Euro-American West. Of course, having the benefit of hindsight, the West alone knows this fact. Study of the different cultures helps the West understand itself; explaining non-Western cultures explains the West to itself. " '[S]avage tribes' are merely the occasion for anthropology: the real subject of anthropology is our own culture and its real object is to understand ourselves."[45] Thus, there is still a clearly established "us" and "them" in anthropology; "we" are the readers and producers of this new social science, and "they" are its objects.[46]

The significance of this development must noted. As Pearce put it, in Morgan's work "savages and savagism are so completely absorbed into a universal theory of progress as to lose their separate identity and their separate meaning."[47] This loss of separate identity and meaning is precisely what the Congress sought to enforce from its 1871 repudiation of treaty-making with Native Americans to the 1924 citizenship act, and it is clearly reflected in the Supreme Court cases of the period after 1871. The late 19th century saw the last of the Indian wars and the "closing" of the frontier; whatever Indians leaders tried to do the conclusion was foregone: "defeat and death or confinement." In this context, the Supreme Court in cases like *Jones v. Meehan* (1899), was unable to see any sense in the notion of Indian autonomy or sovereignty. Though one might be pained by events, the conscience of the U.S. "could only be a philanthropic, humanitarian conscience;" the Native American nations had been reduced "to a state so pitiful as to be comprehended only by philanthropy and humanitarianism."[48]

Only in the end of the 19th century did the Indians become wards in the fullest sense. Reservations were the basis of the so-called "Peace Policy," and rapid assimilation was to be achieved through concentration and domination of Indians; "total control and utter dependence" was the government's goal.[49] Unlike the earlier period after Removal, the federal government began to seek to exercise direct control over internal affairs of Indian communities. Instead of rhetoric about seeking to build up or aid Indian governments, the United States unashamedly sought to destroy any indigenous institutions and substitute its own.[50] Berkhofer stressed that with the 1871 end of treaty-making, "Native Americans moved officially and legally from being domestic dependent nations represented through their own governments to being wards of the state, to be acted upon by agents of a bureaucracy in their midst."[51] In Berkhofer's caustic summary: "Thus did the wardship postulated by John Marshall in his 1831 decision become actuality as Indians were denied self-government and particularly religious freedom in the very hope of giving them democracy and liberty according to the American model."[52]

The General Allotment Act and the Major Crimes Act were part of this trend. Reservations provided the resources necessary for some continuance of Indian life and values, so reservations would have to be eliminated. Furthermore, reservations preserved the "communistic" lifestyle of Indians, keeping them alien to the individualism of post-republican life in the U.S.[53] As individual land owners, Indians would learn the habits of self-interest so basic to liberal, capitalist society. The Allotment Act would be "a mighty pulverizing engine to break up the tribal mass," said President Theodore Roosevelt.[54] In addition, Berkhofer noted, "[t]otal detribalization demanded nothing less in their minds than bringing crimes among Indians under the penal statutes of the United States instead of the customs of a tribal government."[55] When there were no more reservations or Indian programs to be administered, the BIA would whither away. Wardship would end when Indian identity was itself ended.

"Yet," Pearce concluded after surveying the effects of the assimilation and allotment period, "even

philanthropy and humanitarianism would not work," since it was aimed not at real Native Americans, but at "an image which the civilized conscience had created just for the protecting, which the civilized intellect and the civilized imagination had earlier created just for the destroying."[56]

Cultural Pluralism: Indian Reorganization, Termination, and Pseudo-Self-Determination

The period after 1924 has produced a sequence of policies most observers of Indian law find a bit hard to explain. The 20th century has seen a time of enhancement of tribal governments, a vigorous attempt at termination, and a time of "self-determination" and "New Federalism for Native Americans." The conventional way of accounting for this sequence has been to dismiss it as simply erratic and inconsistent. Different policy-makers and interest groups had different goals, and they competed with one another to enact those policies. As one side won, policy would move in its direction; as the other side won, policy would reverse.

Examining the history of Indian law and policy from the perspective of non-Indian images of the Indian provides an alternative understanding. Images of the Indian Other have changed only in certain nuances since the 1920s, and nearly all policy postures, despite some significant differences in practice, have shared the broad outlines of a cultural pluralist standpoint. The Merriam Report of 1928 and the appointment of John Collier to the Bureau of Indian Affairs under Roosevelt certainly marked a change in thought and policy from the era of assimilation and allotment that ended the 19th century and started the 20th. This change reflected the fact that both the writers of the Report and Collier himself were part of an intellectual movement that changed anthropology and social science in the United States. Since the 1920s, however, there has been much more continuity than difference in the images of the Indian that have served as the basis of federal Indian law and policy.

Difference was first understood as a difference in cultures in the late 19th and early 20th centuries. Tylor, Morgan, and others had seen differences as a matter of different stages in the development of what amounted to one human culture. The idea that there might be different cultures, each with its own history and patterns of integration, was part of the 20th century's understandings. As the 19th century concept of progress transformed difference into the primitive, the current anthropological concept of culture has transformed difference into relativity. There is no culture, only cultures.[57]

The development of a plural conception of 'cultures' made possible a "radical democratization of difference," McGrane suggested. The new conception of culture has dismissed the evolutionary perspective which located the Other in the past; difference is no longer a temporal characteristic.[58] However, he added,"To see the Other as culturally different is no cause for applause and self-congratulation." Embarrassed by claims to cultural superiority, bourgeois Western society began to deny that different cultures were inferior or superior. McGrane cautioned that this was "not a moral or an intellectual victory," only "a great trivialization of the encounter with the Other." It "merely reaffirm[s] the Eurocentric idea of the progress of knowledge."[59]

How does respect for difference reaffirm the Eurocentric ideal of progress? Having been exposed to so much difference through travel and advances in communication, the West has a different understanding of difference. Through such exposure Westerners have become different. In fact, McGrane has noted, they seem to take this new understanding of difference as the thing that makes them different from others. Early Western society, and less advanced societies today, lack an appreciation of the true nature of difference. "They" are different from "us" in that they do not have a grasp of cultural relativism, and are still "primitive" in that they believe in the absolute truth of their own culture.[60] It bears some similarity to the Enlightenment vision; those who do not travel and communicate with other cultures are ignorant.[61]

Thus, the identification of difference with cultural relativity paradoxically resurrects the denial of difference. The democratic relativity of all human cultures is a universal constant of human existence. But Western social science, anthropology, which allows us to see the diversity and relativity of culture, is a universal truth exempt from what it observes of all other human existence. The Western way of seeing

cultures "is somehow not cultural, not relative, but of the nature of things and of the order of truth."[62] As Todorov noted of Cortez, so McGrane noted of the modern anthropologist: "he has never abandoned his feeling of superiority; it is even his very capacity to understand the other that confirms him in that feeling."[63]

The paradigm of cultural pluralism and its "democratization of difference" shaped a politics of Indian affairs that reflected a liberal democratic, civil rights model. Indians were to be integrated rather than assimilated; ending federal control of Indian lives was to be a triumph over racist denials of civil rights and liberties; moving people off reservations, or even dismantling reservations, was an end to segregation; tribal government was home rule. In the Indian Reorganization Act period tribal governments were to be *like* municipal governments. The Termination policy merely turned this new Indian law simile into a declaration; terminated reservations were to be municipal governments. The Self-Determination policy resurrected parts of the municipal government simile and created another; tribal governments were like welfare agencies. All of these developments demonstrated yet other similes; Indians were like a minority in need of individual civil rights, and the federal role in Indian affairs was like that in civil rights generally, serving as a referee over local and state institutions of majoritarian representative democracy. Therefore, as Castile noted, "[t]he modern drama over Indian affairs finds political significance and utility as a continuing affirmation of eventual federal good faith in the prolonged civil rights struggle."[64]

The Indian Reorganization Act: This combination of cultural relativism with a conviction that Western social science had progressed to an appreciation of the absolute truth was expressed in a rudimentary form in the Merriam Report of 1928 and the Indian Reorganization Act of 1934. A product of the Progressivist impulse, the Report called for giving power and responsibility in Indian affairs to professional bureaucrats and experts in education and vocational training, health care, conservation, community organizing, record keeping and statistics, and so forth. The Report used the rhetoric of cultural pluralism, and did establish as its goal promoting programs that would help Indians "be absorbed into the prevailing civilization or be fitted to live in the presence of that civilization at least in accordance with a minimum standard of health and decency."[65]

The Merriam Report's recommendations, "advanced tentatively" by the Hoover administration, "became official policy and practice under [John] Collier" and the Roosevelt BIA. The principle vehicle for this policy was the Indian Reorganization Act of 1934. Despite some efforts to the contrary, the IRA was taken by many to be an expression of the idea that tribes are instruments of the federal government certainly survived. For example, Theodore H. Haas, writing a ten-year review of IRA as chief counsel for BIA, "described tribal powers as 'delegated' rather than recognized, a reward for good behavior rather than a right."[66] Haas saw tribal governments as mediators between the BIA and the individual Indians. His report gave great attention to this role in smoothing the exercise of Bureau responsibilities, but did not envision that tribal governments would play much of a role in actual decision-making.[67]

Collier, an anthropologist and self-proclaimed "friend of the Indian," usually described the IRA as providing "recognition of tribal powers" that Congress had not abrogated, and not "a grant of new powers."[68] However, he also said the Act was similar to federal delegation of power to a municipal government, and that the tribal governments under it would be federal instrumentalities.[69] Even the language of the early drafts of the Act portrayed it as grant of power and authority from secretary of Interior to the tribes.[70]

Collier's first version the Act has been described as "encourg[ing] the political independence of tribes through permission to form tribal governments with the powers common to municipalities in the United States."[71] However, the equation of "political independence" with "permission" to form municipal governments is an odd one. For tribal governments to depend on the permission of the federal government would fit very few people's definition of political independence. The comparison to chartered municipalities, which lack even the sovereignty held by states in the federal system, further indicates a minimal appreciation for the political and legal status of tribes.

There were big problems with the IRA, especially regarding the tribal governments. Established

on non-Indian models and subject to BIA intrusions, they only moderately satisfied the "progressive" factions, and they thoroughly alienated the "traditionalists."[72] The imported model, at best an imperfect and often corrupted version of Western liberal representative government, "institutionalize an infrastructure for divisiveness within communities."[73] Collier continued to flirt with the federal instrumentality formula, and understanding this fact helps clarify Collier's claim that the Act would prepare Indians for "real assimilation."[74] He claimed the Act, even though imperfectly implemented, had "immeasurably hastened the day when complete integration of the Indian into the general population will have been achieved."[75] In response to the Senate criticisms of the BIA in 1943, Collier argued:

> ...tribal Indians are citizens, who ought to enjoy all the rights of citizenship but toward whom the Federal Government has assumed certain additional obligations generally connected with the rendering of public services. The basic job of the Indian Service is that of meeting these special obligations without infringing upon the Indian's right of citizenship.[76]

Collier went on to suggest that the country had nothing to fear from allowing tribes "the status of limited municipal sovereignty."[77]

Termination: The image of Indian tribes as federal instruments analogous (even homologous) with municipalities survived, and even flourished, because it was consistent with the dominant paradigm of cultural pluralism. Respect for the plurality of cultures within the United States never needed to be synonymous with respect for a legal and political plurality of sovereigns. It easily comports with a liberal civil rights outlook that has dominated 20th century understandings of difference in the U.S. It also allows a reconsideration of the typical distinction drawn between the IRA period of federal Indian law and the termination period. If Collier's program had as its bottom line granting tribes "the status of limited municipal sovereignty," and the termination program actually went about turning reservations into municipalities, the distinction may not have been as great as some would have liked. Both visions are expressions of a cultural pluralism combined with political liberalism, which sought to grant home-rule on the basis of individual civil rights to cultural minorities in geographic enclaves.

Termination proponent and Indian Affairs Subcommittee Chair Senator Arthur V. Watkins of Utah and his allies always defended termination as intended to free Indians from domination by the federal government, and the BIA in particular. It is more interesting to set aside assumptions of bad faith and take the terminationists at their word; the logic of their position cannot be simply dismissed. Senator Chavez complained that he was "upset at times because we treat them [Indians] like a bunch of peons and slaves." Watkins insisted that the motto of the termination policy was that of the Emancipation Proclamation: "These people shall be free!" He wanted to "end the status of Indians as wards of the Government and grant them all the rights and prerogatives pertaining to American citizenship."

> With the aim of "equality before the law" in mind our course should rightly be no other. Firm and constant consideration for those of Indian ancestry should lead us all to work diligently and carefully for the full realization of their national citizenship with all other Americans.[78]

Deloria and Lytle presented termination as an element in the post-war trend toward civil rights for minorities in the United States. Democrats and other liberals, "ashamed" of U.S. laws too reminiscent of Axis racial laws, included a civil rights plank in their 1948 presidential platform, and "if the Democratic liberals could not immediately assist the blacks in their struggle, they could at least assist the Indians, over whom they had a more direct control." Truman's BIA Commissioner Dillon Myer wrote to his staff that "the government was preparing to withdraw from all Indian programs." Though Indian support for the withdrawal was to be sought, Myer acknowledged that "it will not be possible always to obtain Indian cooperation," but insisted "[w]e must proceed even though Indian cooperation may be lacking in certain cases."[79]

Deloria has argued that the termination policy did not so much fail as it "evaporated" when the federal government began to describe Indian policy in the slogans of the Great Society - "help the poor help themselves by giving them power over the local institutions that touched their lives."

> The shift in perception of Indians is all-important in this instance. Indians were fading from public view as "domestic dependent" nations, but they were emerging as one of a number of deprived racial minorities who had at least a moral claim on American society. Reservations in the 1960s received massive infusions of money from the poverty programs of the Johnson administration, not because they were Indians but because they were poor.[80]

The "Self-Determination" Policy: Some Great Society programs were open to tribal governments, which Getches and Wilkinson described as implicitly "recognizing the permanency of Indian tribes." Presidents Johnson and Nixon both gave special presidential messages on Indian affairs. The Nixon message gave a name to the new era, calling for "self-determination without termination."[81] Getches and Wilkinson acknowledged, "[t]he ideas in Nixon's text were not new," though they thought it "served as a catalyst" for action because of "its remarkable force and specificity."[82] However, this policy, as with most Indian affairs policies, was imposed from the top, an odd way for "self-determination" to be realized.[83]

Churchill and Morris criticized even the use of the term in the 1975 Indian Self-Determination and Educational Assistance Act, the supposed centerpiece of the new era of federal Indian law:

> This oddly titled statute... does nothing at all to afford American Indians the internationally recognized right to determine for themselves their social, political, and economic relationships to the U.S. and other foreign powers. Rather, it requires that they be included more fully in staffing the various programs aimed at them by federal policymakers, who - the Act makes clear - continue to hold preeminent authority over Indian affairs. The statute would thus have been more accurately titled the "Indian Self-*Administration* Act."[84]

The Act itself called only for "effective and meaningful participation by Indian people" in Indian affairs, and was not a wholesale transfer of federal power and authority.[85] Title I of the Act granted veto power over relevant contracts and programs to the Secretaries of Interior, Education, and Health and Human Services.[86] In a 1992 review of the Indian Self-Determination and Education Assistance Act, ethnographer George S. Esber, Jr. concluded that "the objectives of the self-determination policy are not designed to guarantee Indian self-determination, and further, that one of its effects has been the creation or intensification of divisiveness and the favoring of factions in tribal organizations that pattern their actions after an assimilationist model."[87] "[G]ranting Indian participation in Anglo activities... is not equivalent to the governance of Indian affairs as Indian undertakings," Esber observed.[88]

During the period of so-called self-determination, tribal governments became what Deloria and Lytle called "surrogates for the federal government," a status "clothed ironically not as termination but in the new language of self-determination." Despite rhetoric about a "government-to-government" relationship between tribal governments and the federal government, "tribes were almost totally dependent upon the federal agencies for their funds and program ideas." Innovation came from Washington and the BIA with little input from the reservation. "In almost every instance," lamented Deloria and Lytle, "a new program could trace its ideological roots to someone in the federal government and its funds to a consortium of federal agencies that had sponsored the activity at the urging of interested bureaucrats."[89]

Thus, the policies of the self-determination period has not been that much different from the IRA period, and the failures have been much the same as well. "Recent evaluations of the IRA suggest that even limited self-government was a mirage," Deloria and Lytle conceded, though they were generally sympathetic to Collier and his efforts. "Every decision that an Indian tribal government made was subject to the approval of the secretary of the interior," and in the end "[e]conomic development rather than political and social progress was Collier's real achievement."[90] Churchill's review of the Navajo tribal

government, which served as the model for the IRA, led him to the same conclusion:

> Fantasies to the contrary, the Navajo council and its chair have exactly zero control over any aspect of Navajo affairs. Every shred of their policy is an always has been utterly contingent upon the approval of the U.S. Interior Secretary, the federal courts, corporate executives, and the governments of the three states (Arizona, New Mexico, and Utah) within which the Navajo Reservation technically lies.
>
> Today, the same colonial puppet "self-governance" prevails on almost all reservations in the United States.[91]

The self-determination policy was thoroughly derivative, growing out of general poverty programs like the Office of Economic Opportunity, which was committed to "maximum feasible participation of the poor." Castile noted, "The program was designed for non-Indian poverty constituencies and was applied on the reservations only as an afterthought." The Nixon Administration continued the rhetoric of Indian self-determination because it was consistent with "New Federalism," and not out of any drive to do right in Indian Country.[92]

Deloria lamented that, "had anyone analyzed it precisely," the self-determination policy "was more potentially destructive of the traditional relationship than termination." The termination policy at least "required all federal debts to be paid before releasing Indians from the tentacles of the national government."[93] Pseudo-self-determination reflected a "misconception" that "obligatory debts in perpetuity are temporary payments in relief," Esber charged. Rather than recognize "the idea of a perpetual debt to peoples of prior rights," the U.S. government has felt more comfortable thinking of Indian affairs as a matter of welfare policy, and "has demanded a certain degree of assimilation from Indian communities" as the price of assistance.[94] Deloria in 1985 was resigned to "the practical fact... that Indians have forsaken their traditional special status for that of a needy minority." Since the days of termination, he concluded, "both Indian successes and failures have been connected to the Indian status as an identifiable racial minority within American society, not to the status of Indian tribes as domestic dependent nations."[95]

What must be noticed is how this image of Indians and the evolution of federal Indian law have been manifested in the Court's use and presentation of the Indian law canons of construction. When cases involving Native Americans came before courts that operated with images of Indians as, at worst, inferior, or, at best, disadvantaged, the canons came to have "little bite," since they seemed to judges "so blatantly normative - 'you should help these poor Indians.'" This conception of the canons, "normative in a fuzzy, liberal direction," has had a particularly tough go of it recently in a judiciary of Reagan and Bush appointees.[96] Though often used by more Indian-friendly judges and commentators, this conceptualization is of dubious value:

> ...by missing the essential differences between the legal and political cultural situation of Native Americans and that of America's racial minorities, this conceptualization is antagonistic to the most basic claims put forward by American Indians: a claim to be free from assimilative forces and to make their own laws and be governed by them. It is not a conceptualization, then, that Native American leaders would likely embrace even if it could produce a few judicial victories along the way.[97]

The era of cultural pluralism continues to this day in many areas of federal Indian law and politics in the U.S. Building on the paradigm of African-American experience, many new friends of the Indian have portrayed the "plight" of Indians as a civil rights problem. Litigation in the federal courts of non-Indian America then becomes the vehicle for resolving the problems of Indians. The focus is often on promoting and protecting the rights of individuals who are Native American, rather than on anything special about Native American legal and political identity. Federal relations with Indian tribes and reservations have often been based on a general model of development, which takes the forms of both "heavy-handed paternalism and client-centered therapy, for Indians as a special group and as part of the growing underclass."[98]

As the permission for self-administration by tribal governments is not the same as respect for the self-determination for Native American nations, civil rights and poverty programs are not the same as a recognition of U.S. obligations to Native Americans. Deloria and Lytle have speculated:

> When the dust finally clears away and people evaluate the most recent period of Indian history, they will realize that the progress of the past two decades [1964-84] was purchased at an enormous price. In order to attach themselves to national social welfare legislation, Indians had to pose as another American domestic minority. Few of the funds and programs that Indians received during the sixties and seventies were given to them because the government felt responsible to fulfill treaty obligations long withheld and due them. National policy sought to abolish poverty, and all low-income groups and areas were eligible to receive funds to accomplish this purpose. Indians happened to be a group that fell within the identifiable guidelines of the poverty program, and they therefore qualified as recipients.[99]

Churchill worried that under such circumstances many Indian peoples, especially smaller tribes, faced "auto-termination" as they became absorbed into the American melting pot over the next 50 years.[100]

The civil rights movement itself reflected economic and political (even demographic) dynamics sweeping through American society. This movement created a degree of what Castile called "sympathy clout" for Native Americans "as proxies or surrogates for the more important minorities." "Red power" reflected the political significance not of Native Americans themselves, but instead of "the sympathetic political magic which makes an offence against Indian rights a symbolic offense against all ethnic groups."[101] "The downside of this symbolic power," Castile advised, is that "there has been little practical benefit." If the image of the Indian functions as a political symbol, there is little reason to expect improvement in the real lives of actual Native Americans. "In the realm of the imaginary Indian," Castile continued, "rhetoric and formal gestures meet the symbolic needs, and so images are manipulated, but not the underlying realities."[102]

Furthermore, the case for federal intervention in Indian affairs is strengthened in the public mind when Indians are imagined to be basically a disadvantaged minority, since federal payments to Indian peoples then are thought of as "remedial and temporary," and made under "conditional terms."[103] When non-Indians have an image of Indians as "just another needy minority on whom federal dollars must be spent," they seem to envision tribes as "welfare recipients whose use of government dollars must necessarily be monitored by the government."[104] When the image of the Indian is that of a peculiarly disadvantaged minority in a cultural pluralist paradigm, pseudo-self-determination and continued federal domination are the logical policy results.

Administrative Enclaves and "New Federalism"

The Indian Reorganization Act is still in force, and still defines the status of Indian nations and regulates much of their relations with non-Indian America. Itself a manifestation of cultural pluralism, the IRA deals with tribes as institutions of government, and hence goes beyond the individualist focus of the civil rights approach. However, tribal governments under the IRA have been little more than administrative enclaves, home rule devices by which federal regulation is made more acceptable and, it was hoped, more efficient. Churchill complained that "Indian nations have been unilaterally diminished to subordinate, 'quasi-sovereign' status similar to that of the 50 states of the union." Even that status was the best case Indians could expect, he warned, since "[i]ncreasingly, their status is being reduced even further, to that of counties or municipalities, subject to state jurisdiction and control."[105] Sovereign for some purposes but not subjects of international scrutiny according to the U.S. government, Indian nations occupy a legal and political space many find confusing and even contradictory.[106] As Churchill observed, these tribal governments know the limits of their power, and they "will not, indeed structurally *can*not, pursue actual self-determination, self-governance and sovereignty." These governments suffer in a relationship of "unbalanced symbiosis and mutual perpetuation," unwilling to risk the benefits of federal dependency

through any assertions of autonomy.[107] To Churchill, IRA tribal council governments generally represented "institutionalized capitulation on virtually every significant issue of Indian rights," and "problems to be overcome as part of any genuine decolonization struggle."[108]

Tribal governments were created by Congressional statute and executive branch oversight, and the non-Indian governments of the U.S. often have treated tribal governments as federal instrumentalities, with little inherent autonomy. The Supreme Court has created doctrines of federal Indian law that reflect this diminished status. The "infringement test" first suggested in *Williams v. Lee* limits state interference in tribal affairs when such interference would infringe upon important matters of tribal government, but it has been applied in a way which allows many state interferences. Even when states are barred, the Court often does so on the grounds that the federal government has acted so as to prohibit state action in some area.

The infringement test thus shades into the "federal pre-emption test," which prohibits state action in any area (whether or not in Indian affairs) where the federal government has regulated matters so thoroughly as to pre-empt the field. Federal interference with Indian affairs has usually verged on total domination; no field could be more thoroughly pre-empted. Courts have therefore considered state interference with Indian tribal government an infringement upon the prerogatives and powers of the federal government, with Indian interests altogether elided.

The debate over religious freedom and tribal government jurisdiction illustrate the derivative nature of tribal government sovereignty. The Supreme Court in *Lyng* and *Smith* found no constitutional grounds for the protection of Indian sacred sites or religious practices such as the sacramental use of peyote. In *Oliphant* and *Duro* the Court found no inherent rights of tribal governments to have jurisdiction over the behavior of non-members on reservations. The solution to these problems appears to be in Congressional statutes directing the Court to interpret laws in ways that promote and sustain Indian religious life, and which delegate jurisdiction to tribal governments. In both sets of cases the response of federal statutory action may appear to resolve the problem, but such action in no way confirms the distinct and autonomous legal and political identity of Indian nations. Statutes offering religious protection or delegating federal jurisdiction only ask the Court to respect the will of Congress or the supremacy of the federal government over the states.

The Indian and Otherness in Contemporary Thought

The Western imagination has begun to construct a new world, a world in which identity and difference have become central to the Western understanding of politics. This imagination also reflects its historical situation. Shane Phelan has called the late 20th century a time in which the West has come to know that "[t]he legitimate drive for community degenerates into unmediated unity, a unity that carries as its twin an excessive fear of difference." And, she cautioned,

> What is only now becoming clear is the cost of simple unity, unmediated by individual differences. Such unity can only be achieved through the imposition of certain categories and the denial or outright rejection of any other possibilities.... [A] discourse that does not admit the possibility of alternative discourses or new categories that challenge the old is a discourse solely of domination, not of politics. The first necessity for politics must be the recognition that others exist independently of oneself, and that these others are no less real or valid for that.[109]

It is this aspect of the current situation of the West that compels us to reject earlier images of the Indian and the current law and policy in Indian affairs that continues to reflect the lack of appreciation of genuine difference.

In *Justice and the Politics of Difference*, Iris Marion Young has similarly discussed assimilation versus diversity as paradigms of liberation. For conventional liberals in America, liberation is made to equal "the elimination of group differences," an "ideal of universal humanity" which has indeed been important in struggling against adverse discrimination, Young conceded. As long as difference is equated with inferiority, the assimilationist paradigm has attractions, she noted, yet, she continued, many times in

American history "movements of the oppressed" have rejected assimilation in favor of "the assertion of a positive group cultural identity." The Black Power movement, and assertions of African-American culture are an obvious example of this phenomenon, but Young suggested that "Red Power" and the American Indian Movement rejected "perhaps even more vehemently than Blacks the goal of assimilation."[110]

Instead of assimilation and coerced unity, some of Western political thought is seeking a way to respect real and profound difference. Young noted:

> Implicit in emancipatory movements asserting a positive sense of group difference is a different ideal of liberation, which might be called democratic cultural pluralism.... In this vision the good society does not eliminate or transcend group difference. Rather, there is equality among socially and culturally differentiated groups, who mutually respect one another and affirm one another in their differences.[111]

Similarly, Phelan cautioned that one cannot expect to replace difference with unity through any political stratagem, since all such projects are destined to be wrecked upon the rocks of Otherness, "a constant, harassing presence that will not vanish under any political or discursive regime in modernity."[112] One should therefore "strive to create more institutional space to allow otherness to be."[113]

"Treaty federalism" and the demand for respect for indigenous rights are the kinds of institutional accommodations that allows for otherness. However, these accommodations are not just consistent with the demands of certain developments in Western thought; they also seem to be what Native Americans and other indigenous people want. This point is significant. Too many times the demands of intellectual theories have been given priority over the real lives and interests of Native Americans. If non-Indians prefer these institutional accommodations of treaty federalism and indigenous rights for their own reasons, or because they believe it is best for Indians, there is no improvement over the long pattern of supposed friends of Indians forcing their policy preferences on Indians. Only when Native Americans themselves express a preference for certain policies, only when non-Indians actually listen to Native Americans and seek to meet their needs and demands, should an institutional accommodation be promoted.

Young argued that the politics of difference must focus on groups and group solidarity. Such politics are necessarily not liberal -- institutions of liberal governance must be altered to offer "group representation in policymaking."[114] Many liberals seem to fear that the affirmation of difference can lead to conflict between groups. However, as Young argued, such conflict results not from "group difference per se," but from "the relations of domination and oppression between groups that produce resentment, hostility, and resistance among the oppressed." In such a situation, seeking homogeneity "only exacerbates division and conflict, because it gives members of the dominant groups reason to adopt a stance of self-righteous intractability."[115] Indeed, as Young cautioned,

> if the only alternative to the oppressive exclusion of some groups defined as Other by dominant ideologies is the assertion that they are the same as everybody else, then they will continue to be excluded because they are not the same.[116]

Young wrote that the situation of Native Americans especially exemplified the importance of a political and legal respect for difference, "because it is perhaps clearest here that justice toward groups requires special rights, and that an assimilationist ideal amounts to genocide." As she noted:

> The justice of recognizing both specific needs of a group and rights of full participation and inclusion in the polity has a clear precedence in U.S.-Indian law. Indians are the only group to have what almost amounts to a dual citizenship: as members of a tribe they have specific political, legal, and collective rights, and as U.S. citizens they have all the civil and political rights of other citizens....[117]

Young noted that Native Americans are "the most legally differentiated people in the United States, the

only group granted formally special status and rights by the federal government." She thought they embody a kind of "*arche*-difference" that "subverts the claim to origin, to a New World, that founds the myth of America and the home of English-speaking farmers, traders, and inventors."[118]

However much the government and people of the settler states of the Americas have "attempt[ed] to purge this difference within," the legal and political history of the U.S. also "testif[ies] to a begrudging acknowledgement of the Indian peoples as independent political entities with which the government must negotiate."[119] Young admitted that

> the special legal status of Indians was conceptualized almost entirely as a relation of wardship and dependence between an inferior savage people and a superior civilized sovereign, and the shadow of this conceptualization darkens even recent legal decisions.[120]

Young also noted that most non-Indians have assumed that "an end to this position of tutelage and wardship implied assimilation to the dominant culture."[121]

"Throughout this history, however," Young pointed out, "assimilation was not a live option for the Indians." Individuals may have been integrated into non-Indian society, but "Indians as groups persistently preserved their differences from white society against the fiercest opposition." Though many Native Americans complain about the existing system of tribal governments, few question the principle of tribal self-government.[122] Indeed, the biggest complaints about tribal governments is that they do not represent real self-government.

"New Federalism" for Native Americans

The latest attempt at comprehensive policy-making in federal Indian affairs was the 1989 Senate Select Committee on Indian Affairs investigation and report.[123] After documenting the failures and inadequacies of the Bureau of Indian Affairs, the Senate Select Committee plan called for the termination of the BIA, with grants going directly to tribal governments. The "New Federalism for American Indians" called for by the report would extend the "self-determination" policy of the past decades into something a bit more substantive. But, only such governments that met with the approval of the U.S. government would receive funding, and a separation of political power into various branches was an absolute requirement. Tribes with traditions of authority not consistent with Western models of representative liberal democracy would be severely disadvantaged. Esber charged that "the more a community or part of a community is held together by tradition, the more difficult it will be for its members to be involved in the politics leading to tribal self-determination."[124]

The report proposed the creation of a new executive branch office to replace the various bureaus and agencies of Indian affairs. Still, the new office "would operate through a block grant system similar to the relationship between the Federal Government and state and local governments."[125] The New Federalism program would continue dealing with the IRA tribal governments as municipalities and service-delivery providers in much the same way critics have charged is the case with the "self-determination" policies and programs of the past few decades.

Self-determination can only become real if it is genuinely a product of the people by whom it is to be exercised. "Self-determination as a policy of a dominant group toward a minority is a contradiction in terms and can never be a reality," Esber stressed. It will never result from "a policy decision of a dominant government," but requires instead the "disempowerment of the dominant government and recognition of the genuine sovereignty of the other."[126]

However, even Esber admitted "[t]here is no question that Native Americans are closer now to the ideal of self-determination than at any other time since Anglo domination began."[127] Castile argued that IRA governments were "puppet governments initially, but potential mechanisms for self-administration nonetheless."[128] Eddie F. Brown, Assistant Secretary for Indian Affairs in the Department of the Interior at the time of the 1989 report, acknowledged that the Select Committee's proposals "reflect[ed] a trend

which is growing stronger within tribal communities - the assumption of greater self-determination by tribal governments."[129]

From "New Federalism" to "Treaty Federalism"

The New Federalism suggested by the Select Committee may have greater potential than cynical critics might suspect. The report called for a new era of agreements between Indian peoples and the United States, hoping to use such agreements as the mechanism by which mutually acceptable changes could be negotiated. Reopening the treaty-making process, even in the qualified form of new post-1871 "agreements," would represent a significant concession on the part of the U.S. After so many years of unilateral policy-making by the federal government, it would signify a greatly enhanced respect for Indians peoples and their political representatives.

That enhanced respect is not likely to take the form of anything like a recognition of independence or complete autonomy; many would even think that undesirable and unnecessary. However, it may mean that Chief Justice Marshall's notion of Indian tribes as "domestic dependent nations" is taken more seriously. Domestic and dependent, Indian tribal governments would be recognized as the political agency of Indian peoples. In a multi-ethnic, multi-cultural society with a federal system of government, United States Indians are in a distinct and special situation, but not one that is unimaginable and unmanageable.

Indian peoples are "annex[ed] to the federal system in a status parallel to, but not identical with, that of states,"[130] wrote Russell L. Barsh and James Youngblood Henderson in their 1980 study of federal Indian law, *The Road*. They called this arrangement "treaty federalism." This arrangement acknowledges that treaties are still central to the relationship between governments in the era of tribal political resurgence, and the federal Indian law canons would still be in effect. In fact, the canons might be more important than ever if the law of nations justification for them outlined in previous chapters above was taken into account. The theoretical work of Barsh and Henderson, which seeks to take seriously the political and cultural practice of contemporary Native Americans, may thus benefit from a reconsideration of the federal Indian law canons.

Barsh and Henderson suggested that the relationship between the United States and the Indian nations included within it be characterized as "treaty federalism." Though treaties form the basis of the relationship, they are now almost universally considered different in function and nature from treaties under international law. They are, argued Barsh and Henderson, "something more than 'treaties' as they are understood in international law. They are political compacts irrevocably annexing tribes to the federal system in a status parallel to, but not identical with, that of states."[131] "Regardless of their original intent," they continued, these treaties "have resulted in a complete political and economic integration of tribes into the federal system. Separation is practically impossible."[132]

Barsh and Henderson noted that the United States denies the power of tribes to terminate treaties or alter their provisions, and it considers armed resistance by Indians to the federal government to be criminal behavior, possibly treason, rather than an act of war. The U.S. will no longer entertain any claim that a treaty is illegitimate, no matter what fraud, coercion, or deceit accompanied its negotiation and ratification.[133] In the ultimate evidence of the special character of Indian treaties, Barsh and Henderson noted:

> If tribes can no longer remove themselves from the Union, it is all the more essential that their political rights be secured on a fixed and certain basis. In an alliance of sovereigns, the ultimate relief from oppression is exit. In a national compact, the only safety is in the architecture of its constitution and laws.[134]

"Treaty federalism" expresses the idea that tribes are now part of the United States, that treaties between formerly distinct and sovereign peoples have evolved into a still ill-defined "compact," and are no longer *contracts*.

> Parties to a treaty have a right to revoke, and an action inconsistent with its articles revokes a treaty de facto. An injured nation has no recourse but to war.

> Compacts differ in origin, nature and effect. Their object is to restructure the parties and create or enlarge some common, national sovereignty. Treaties are agreement between existing sovereigns; compacts create new sovereigns.... Once ratified by the people, a compact cannot be modified, dissolved or superseded except by the same process. It is not alliance, but the constitution of an amalgamated body politic.[135]

Barsh and Henderson believe that treaty federalism is not so novel as it may seem. Rather, "[i]t simply reinterprets the sources of federal Indian law to be more consistent with our general political and ideological heritage, and in a way reconcilable with the realities of tribal survival today." It is, they say, the best way to make sense today of Marshall's description of tribes as "domestic dependent nations" in *Cherokee Nation*.[136] Treaty federalism is the best way to make sense of a sequence like the 1921 Snyder Act (authorizing general expenditures for Indian affairs rather than appropriations for each specific treaty obligation), the 1924 act making all Indians citizens (whether they wanted to be or not), and the 1934 Indian Reorganization Act (setting up new systems of tribal government based on tribal referenda and recognized by the U.S. government). These acts speak of "political integration" with an ongoing respect for the existence of tribes as political entities. The Indian Reorganization Act, in particular, "embodies the principal criteria of compact. It restructures the governing of the parties, establishes a permanent political relationship, and flows from the consent of the people."[137]

Deloria also has argued that the consent of Indian peoples "can only be found in the Indian treaty relationship with the United States." There is then "a strong analogy" between the constitutional status of states and Indian tribes. For the constituent states of the Union, the 10th Amendment guarantee that all powers not expressly delegated to the federal government were retained by the states or the people. The Indian law canon known as the reserved rights doctrine parallels this constitutional provision. Deloria observed,

> It is standard treaty law that everything not specifically ceded to the United States by an Indian nation in a treaty remains vested in the Indian nation.... The proper relationship of Indian nations and the Constitution is, therefore, also one of delegated rights and powers with the Indian nations, like the states, reserving and preserving everything not specifically ceded by treaty.[138]

Frickey similarly has concluded that the best application of the Marshall precedents and the canons of federal Indian law in the modern context would be something very close to Barsh and Henderson's treaty federalism. Marshall's opinions were a kind of "quasi-constitutionalism by interpretation,"[139] which viewed treaties as constitutive of a political relationship, and as the device by which Native Americans became subject to the U.S. Constitution and law.[140] In parallels between Marshall's opinions in *Worcester* and *McCulloch v. Maryland*,[141] a fundamental case of constitutional law, Frickey revealed Marshall's concern in both to give attention to the spirit of the document and to the broader public purposes to be served rather than to plausible narrow interpretations of the text.[142]

Using the canons derived from the Marshall Court as if they were formulaic maxims would do a disservice to the sensitivity of that Court. It also was concerned to address questions of federal Indian law in light of the real context of the day, the actual state of things. "The most important result of reviving Marshall's legacy," Frickey mused, "would be looking at Indian law afresh in today's context." The principles crafted by the Marshall Court and handed down as canons direct interpreters to issues of structure, to seeing Indian law as dealing with "conflicts among sovereigns, and not a contest between a sovereign and a disadvantaged group with hat in hand, seeking judicial solicitude."[143]

What would interpretive sensitivity to the actual state of things require in the late 20th century, 500 years after Columbus? Though even observers as sympathetic as Frickey have been cautioned against it,[144] federal Indian law is on a collision course with international human rights law, and Native Americans and other indigenous peoples are forcing the issue.

Native Americans as Indigenous Peoples

Scholars have remarked on the "rapid" and "sudden emergence of indigenous peoples' human rights as a subject of major concern and action in contemporary international law."[145] Very significantly, Native Americans and other indigenous peoples are playing a leading role in forcing and shaping those changes.[146] Frustrated with the lack of response by the U.S. government to their assertions of a right to self-determination, and further frustrated by the IRA governments on many reservations, many Native American activists had followed the logic of their own positions and took their claims into the international arena. Despite the fact that tribal governments usually refused to act in support of their efforts, Indian activists in the 1970s began a strategic approach to the United Nations and other international bodies in an effort to bring international pressure to bear on the government of the United States, and in 1977 the international arm of AIM, the International Indian Treaty Council, secured UN Type II (Consultative) Non-Governmental Organization status. In 1982 the UN Human Rights Commission, through its Sub-Commission on Prevention of Discrimination and Protection of Minorities, formed a Working Group on the Rights of Indigenous Populations, and in 1987 the International Labour Organization began to revised its old-of-date Convention on the rights of indigenous and tribal peoples.[147] Reflecting the input of indigenous peoples, a new conception of the place of indigenous peoples in international law has taken shape.[148]

The United States in its Indian affairs policies, as well as all other states with indigenous peoples, will have to take account of those changes in norms and in international law. Some significant developments that must be considered would include:

(1) changes in the understanding of the nature of nation-state sovereignty,
(2) the distinctive "people-hood" of indigenous peoples and their concomitant right to self-determination as subjects of international law,
(3) the status of treaties with indigenous peoples as appropriate mechanisms for interaction and as instruments in international law,
(4) the rights of indigenous peoples to lands and resources necessary for the maintenance *and development* of indigenous communities,
(5) the right of indigenous peoples to define their own membership, including some of the obligations of indigenous peoples as subjects of international law, and
(6) the religious rights of indigenous peoples, including to sacred geography and religious sacraments.

Following Reisman and Torres,[149] the authorized and expert interactions of indigenous affairs specialists and representatives of governments, responsible agencies, and interest groups can be taken as evidence of the emergence of new norms. In particular, the deliberations of the UN Working Group on Indigenous Populations is a primary source for such material, and an especially valuable one, given the great amount of participation of indigenous peoples' representatives and advocates.[150]

(1) *The Less-than-Absolute Sovereignty of the Nation-State:* The sovereignty of the so-called nation-state[151] no longer looks so absolute, since all of human rights law and much of international law can be seen to constitute an infringement on sovereignty.[152] International law obviously limits the things a state can do, or at least do legitimately, and it includes such external limits as the prohibition on aggressive force and a commitment to the freedom of the seas, and such internal limits as guarantees regarding water resources flowing from one state to another, diplomatic immunity, and respecting the provisions of treaties, as well as humanitarian rules of war and demands for protection of fundamental human rights.[153]

A newly emerging limitation on the freedom of action of the state is its obligation to take account of the well-being and wishes of distinct communities of minority and/or non-dominant status within their borders. Hurst Hannum has insisted that logic, history, and "[a] glance at the headlines" show that "the assumption that majoritarian democracy and individual rights would be sufficient conditions for the

peaceful resolution of disputes was incorrect." Nationalism was a "reaction against the all-powerful sovereign state which was unresponsive to the needs of the many communities of which it was composed," and a force sufficient to redraw the old Austro-Hungarian and Ottoman empires.[154] Nationalism was in no way a progressive force with regard to indigenous peoples, however. As noted by an indigenous observer at the UN Working Group on Indigenous Populations, prior to the nineteenth century indigenous peoples had been recognized as being subjects of international law, and had been considered to have at least some natural rights to the territory they occupied. As the nation-state became the focus of international law, "national sovereignty precluded the natural rights of indigenous peoples."[155]

The overseas colonial empires of Western Europe fell under the logic of self-determination and the force of people struggling for that goal. By 1960 the "principle" of self-determination enshrined in the UN Charter and the Universal Declaration of Human Rights became a "right" of "all peoples" in the Declaration on Granting Independence to Colonial Countries and Peoples.[156] The "blue water" thesis tried to limit self-determination to situations of overseas colonial expansion, and to define "peoples" as the population living within former colonial boundaries. Older states of Europe and Asia, new African states, the Soviet Union, and settler states such as the U.S., Canada, and Australia all had an interest in that formulation, and principles of territorial integrity and national unity have been cited to defeat claims to secession and/or self-determination on the part of Basques, Tamils, Kurds, Eritreans, and indigenous and aboriginal groups.[157] After the unilateral secession of Bangladesh was recognized by the world community, the blue water thesis no longer looked so sound.[158] After the break-up of Soviet Union and Yugoslavia, and the declaration of independence of Eritrea, it is positively out-of-date.[159]

Self-determination is now commonly claimed by minorities and indigenous peoples throughout the world, generally recognized as an emerging international norm by scholars and statesmen, and even occasionally conceded by governments. Formal arrangements for self-determination or autonomy are an increasingly favored solution to the difficulties of many societies. Consociationalism and other schemes of constitutional power-sharing have shown both promise and peril in Switzerland, Belgium, and Lebanon, but, as the Canadian constitutional process shows, there is little alternative when the demands of distinct societies are raised.

Assimilation on the basis of nondiscrimination, the putative ideal in the age of the nation-state, has been discredited by a history of policies of coercion and terror, as well as forced assimilation through policies of top-down centralization leading to degradations in the quality of life of such groups as the Sami of Scandinavia and the Menominee of the U.S. Too often the failure of assimilation has led to policies of population transfer, outstandingly exhibited in the Nazi era in Europe and the "ethnic cleansing" in the former Yugoslavia.[160] These and other cases have led the international law scholar Lung-Chu Chen to note that "[t]he absolute adherence to territorial integrity is no virtue when the people who demand freedom are subjected to systematic deprivations on a vast scale." Concerned by the vigor and violence shown by governments rejecting separationist demand, he asked, "Is genocide an acceptable alternative to independence or autonomy?" Unfortunately for many indigenous peoples, including Native Americans, many governments have answered that apparently rhetorical question in the affirmative. However, Chen went on, it is now conceded that the principle of territorial integrity should serve to promote social good, and, if asserted absolutely in such a way that it exacerbates social tensions, is self-defeating.[161]

(2) *The Right of Self-Determination of Indigenous Peoples:* As noted by the UN's Hector Gros Espiel, the UN "condemn[s] any attempt aimed at the partial or total disruption of the national unity and territorial integrity of a country," but it also insists that "the guise of ostensible national unity" should not mask "colonial and alien domination [if it] does in fact exist." The Declaration on Principles of International Law concerning Friendly Relations and Co-operation among States (G.A. Res. 2625) notes that protection of territorial integrity of states applies only when a state is "possessed of a government representing the whole people belonging to the territory without distinction as to race, creed or colour."[162]

> [I]f the national unity claimed and the territorial integrity invoked are mere legal fictions which cloak real colonial and alien domination, resulting from actual disregard of the

> principle of self-determination, the subject people or peoples are entitled to exercise, with all the consequences thereof, their right to self-determination.[163]

Self-determination is a right of all peoples, and "is not contingent on any kind of condition or requirement," particularly not any "pretext that a people has not reached a sufficiently high level of development to lead an independent existence." This point was made explicit in the Declaration on the Granting of Independence to Colonial Countries and Peoples (G.A. Res. 1541).[164] Of course, the various qualifications that have been placed on the right to self-determination limit its scope both in theory and in practice, though the doctrine maintains a potency in international law and in indigenous politics.

If the principle or right to self-determination is to be maintained,[165] but indigenous peoples are to be denied self-determination, one must deny the "peoplehood" of indigenous peoples, and call them something else, such as indigenous "populations."[166] Alternatively, one might allow them to be called "indigenous peoples," but make a specific proviso that the term "peoples" does not have the same meaning as when it is used in the UN Charter and other international instruments guaranteeing self-determination to all peoples.[167] Indigenous representatives and advocates strongly condemn these distinctions as racist,[168] and have insisted that the rights to self-determination of indigenous peoples should be the same right as that enshrined in the UN Charter.[169] The Indian Law Resource Center has argued that the right to self-determination can have "only one meaning under international law, for indigenous people and non-indigenous peoples alike," and international instruments should not "re-define or dilute" that right for indigenous peoples, nor should they "establish[] a category of second-class rights for indigenous peoples."[170] The Center has suggested that the draft Declaration being considered by the UN's Working Group on Indigenous Populations should guarantee to indigenous peoples

> the right to self-determination, including at minimum the collective right to autonomy in matters relating to their own affairs, including education, information, culture, religion, health, housing, social welfare, civil and criminal jurisdiction, traditional and other economic activities, land and resource administration and the environment, as well as internal taxation for financing these autonomous functions.[171]

Native American and indigenous representatives and advocates have repeatedly stressed that self-determination need not imply independence. They often put forward a "nonstatist conception of self-determination" which claims only "substantive rights to economic, political and social means for indigenous modes of life, and procedural rights to shape the decisions affecting these modes of life," recognizing that the details of these "will vary with the contemporary circumstances of particular indigenous peoples around the world." Self-determination, so defined, would, "like many other international human rights standards, condition but in no way deny the principle of territorial integrity."[172] In comments by indigenous observers to the 1987 session of the UN Working Group on Indigenous Populations, self-determination was defined to "encompass the possibility of choosing full independence, but various other forms of the right, such as autonomy, self-government, self-management and participation in the political processes of States, were frequently mentioned."[173] Self-determination need not be an absolute, all-or-nothing affair, but may be thought of as "a spectrum from autonomy in particular subject matters such as cultural concerns, to full political autonomy, in which indigenous populations establish their own governments, design their own political systems, and enforce their own laws."[174]

Native American activists repeatedly stress that most Indian peoples are not seeking independence or secession from the United States, though they often go on to insist that their rights to self-determination should not be denied even if they were to do so. Only when Indians can "freely determine their political, social, and economic destiny," insisted Rebecca Robbins, can the continuing relationship between Indians and non-Indians begin to be conducted on an equal footing.[175] However, "[r]ecognition of the right to self-determination does not compel a move to national independence," Morris has noted. The UN and international law allow three options to non-self-governing peoples expressing self-determination: independence, association with or autonomy within an existing state, or full integration with an existing

state. "Given the difficult practical political and economic difficulties facing smaller states in the world today, most indigenous peoples may very well *not* opt for complete independent state status," Morris concluded. "Many would probably choose some type of autonomy or federation with existing states, preserving rights to internal self-governance and control as members of a larger state," and some would even choose full integration.[176] Robbins agreed, suggesting that only the Navajo and, possibly, a revived "Great Sioux Nation" of unified Lakota peoples would attempt to exercise complete independence. Other Indian peoples would seek something like commonwealth status similar to that created in the unwinding of the British Empire, or home-rule similar to that of Greenland in relation to Denmark. "Trans-border tribes" might seek some special multi-national arrangements.[177]

What should self-determination mean in the case of Native Americans and other indigenous peoples? The draft Universal Declaration on the Rights of Indigenous Peoples has a commitment to self-determination as its first operative paragraph.

> Indigenous peoples have the right to self-determination, in accordance with international law. By virtue of this right, they freely determine their relationship with the States in which they live, in a spirit of co-existence with other citizens, and freely pursue their economic, social, cultural and spiritual development in conditions of freedom and dignity.[178]

Subsequent paragraphs make this general commitment meaningful by guaranteeing to them:

- full and equal rights, and freedom from adverse discrimination (paras. 2, 3),
- the right "to exist in peace and security as distinct peoples" with the right of self-identification, free from genocide and such "cultural genocide" as forced assimilation, removal, and official propaganda against their continued existence (para. 4, 5, 6),
- the right to practice and develop their culture and to restitution of illegitimately removed cultural artifacts and human remains (para. 7, 8),
- "the right to manifest, practice and teach their own spiritual and religious traditions, customs and ceremonies," and "to maintain, protect and have access to religious and cultural sites" and ceremonial objects (para. 8),
- the rights to use their own language, to education in their own language and that of the dominant society, to have access to the media, and to have governments act to make official information and proceedings understandable to them (paras. 9, 10, 11, 12),
- "the right to adequate financial and technical assistance, from States and through international co-operation, to pursue freely their own economic, social and cultural development." (para.13),
- the right to own and "to maintain their distinctive and profound relationship with their lands, territories, and resources," defined to include "the total environment of the land, waters, air and sea" they have "traditionally occupied or otherwise used," and to protection of their environment (para. 14, 15, 17),
- the right to restitution of wrongfully taken or damaged lands and territories, or to compensation, "preferably [in] the form of lands and territories," where restitution is impossible (para. 16)
- the right to protection of their rights and interests in intellectual property, including arts and medical and scientific knowledge (para. 18)

The draft Declaration also admonishes governments to "take effective measures to eliminate prejudices and to foster tolerance, understanding and good relations." (para. 11)

What would such a series of commitments mean if taken account of in federal Indian law in the United States? Some provisions of the Declaration, of course, will not be of immediate application to Native Americans and their relations with non-Indian society, and others will be of only limited use. As an international document, the Declaration needs to speak to the situations of peoples as diverse as the Chittagong Hill Tribes of Bangladesh, the Sami of Scandinavia, and the Yanomami of Brazil. For some of these peoples genocide is an immediate and ongoing problem, while others have achieved a high degree of autonomy and respect.

Self-determination must mean some form of self-government.[179] Indigenous observers to the

1987 session of the Working Group on Indigenous Populations insisted that "self-determination should mean the freedom of indigenous peoples to determine the form of institutions, their composition and their functions, also in self-governance relationships with States.... the free and informed consent of indigenous peoples constituted an essential element of any and all self-determination exercises."[180]

Of course, there is a long history of legislation and federal action designed to encroach on Native American self-government and self-determination. Statutes such as the Major Crimes Act of 1885 and Public Law 280 of 1954 sought to remove jurisdiction over important areas of civil life from Native American authorities, and hand it over to federal or state officials in no way responsible to the Native communities.[181] The Supreme Court cooperated in diminishing the power of Indians to determine the conditions of their own existence, for example, holding in *Kagama*[182] that the silences regarding Indians in the Constitution should be interpreted to grant Congress "plenary power" over Indians, and holding in *Lonewolf*[183] that the federal government could unilaterally abrogate provisions of treaties with Indians, without having to give back any of what the tribes had ceded in the treaty.

There have also been statutes and Court decisions favoring some forms of Indian self-determination. The Indian Reorganization Act of 1934, the principal statute to this day, appeared at least in part as an effort to promote some degree of self-governance, however, it has long been derided by Native American activists as having been "imposed by the United States to supplant traditional forms of indigenous governance in favor of a tribal council structure modeled after corporate boards," and foisted on native nations after rigged and misleading referenda.[184] The Four Directions Council has complained that such tribal councils do not amount to true self-governance, though the Council does acknowledge the U.S. and Canada to be places where indigenous communities "enjoy a limited degree of autonomy under national legislation."[185]

The IRA has been modified by courts and Congress over the years. The Council noted, "The practical significance of tribal self-government was somewhat limited until the 1960s, when the United States began to provide the tribes with direct financial aid for administration and development." Especially after the 1975 Indian Self-determination and Education Assistance Act, which promoted tribal sub-contracting of federal services to Indians, "tribes administer a wide range of community services for themselves". However, indigenous governments in the U.S. and Canada are actually "administrative enclaves," the Council has cautioned.

> Even where they enjoy fairly wide-ranging responsibilities, their powers are circumscribed by national laws, their activities are supervised by national ministers, and they remain largely dependent on year-to-year financial aid arrangements for all economic and social programmes. To this extent they function more as subordinate elements of the national system of Indian administration, than as autonomous constituents of a federal state.[186]

The courts and Congress indeed have treated these tribal council governments as instruments of the federal government in the exercise of its trusteeship and plenary power over Indians rather than true governments.[187] Most Indian and indigenous activists insist that self-determination is more than an Indian presence in federal administration. The so-called Indian Self-Determination and Education Assistance Act passed by Congress in 1975[188] was not using the term "self-determination" according to any recognized international standard, but instead sought only to increase the number of Native Americans on the staff of the various federal programs overseeing Indian affairs.[189] In *McClanahan*,[190] a decision authored by the Justice who has recently been most sympathetic to Indian claims, Thurgood Marshall, the Supreme Court held opined that Native American sovereignty was merely a legal fiction useful as a "backdrop" against which to interpret treaties and other texts. Though the Indian litigants won the case, *McClanahan* has become a favorite of anti-Indian lawyers.[191] The Court's contribution to the erosion of tribal council governments' capacity to regulate and promote order on reservations continued with *Oliphant*, a decision that tribes could not exercise police jurisdiction against unruly and lawless non-Indians,[192] and *Duro*, which held that they could not exercise jurisdiction over Indians not members of the tribe.[193] The Court also recently has held that tribal council governments cannot enforce zoning laws

against non-Indian lands within reservations.[194] Given the patchwork nature of land-holding the federal government has encouraged on reservations, and the concomitant multi-ethnic population on most reservations, these decisions have been devastating to the capacity of tribal governments to conduct the ordinary affairs of political life.[195]

To end these devastating erosions, and to make indigenous governance in America "more stable and effective" with a better "partnership with the national, State or provincial governments", the Four Directions Council suggested five steps toward meaningful autonomy should be taken:

(1) reduce or eliminate administrative supervision over indigenous government, "so that they are truly autonomous and publicly accountable within their own spheres of responsibility,"

(2) establish a "clearer division of territorial and subject-matter responsibility" between indigenous and non-indigenous governments,

(3) guarantee "an equitable share of national financial resources" to indigenous governments so they can put their programmes into practice,

(4) acknowledge "to the extent that indigenous governments remain subject to some degree of national control or supervision, they must enjoy some appropriate form of direct representation in the national Government,"

(5) reaffirm that intergovernmental agreements, i.e. treaties, should form the basis of the political and administrative relations between indigenous and non-indigenous governments.[196]

APPENDIX
A Survey of Federal Indian Law

The evolution of the tribal community from semi-sovereign enclave to quasi-penal reformatory began in 1871, and continued through a century long decade sequence whose logic was so inescapable as to seem intentional, despite the fact that no particular persons in positions of responsibility could have been politically active over the course of the period. A look at the important pieces of federal legislation and a number of Supreme Court decisions provide the outline from the United States' diminishment of Indian sovereignty.

1871 - Indian Appropriations Act: By a provision of this act the federal government declared "no Indian nation or tribe within the territory of the United States" would be "recognized as an independent nation, tribe, or power with whom the United States may contract by treaty." A further provision did note that this act should not be understood "to invalidate or impair the obligation of any treaty heretofore lawfully made with any such Indian nation or tribe."[197]

The House of Representatives, which has no constitutional role in treaty-making, resented being excluded from policy-making in Indian affairs, and would not appropriate funds for Indian affairs without being given a say in policy. Proponents claimed the provision to be merely legislative definition of what were foreign nations, and thus of no great constitutional significance (the principal concern was vis-a-vis the executive power in foreign relations and the Senate's power to give advice and consent on treaties.) However, treaties (theoretically) functioned to express Indian consent in Indian relations with non-Indians; lacking this mechanism, Indians as unfranchised non-citizens would be subject to unilateral acts of the federal government. "Thus what appeared to be a transfer of responsibility between branches of the federal government, was in actuality an assertion or arrogation of the power to govern tribes without their consent."[198]

1883 - *Ex parte Crow Dog*:[199] A victory for the Indians which turned out to be short-lived, the *Crow Dog* opinion denied the federal government's claim to be able (even obliged) under Article 8 of its Treaty with the Brule to punish the murder of one member of an Indian tribe by another member of the tribe. The Court applied the canons of construction to argue that such an interpretation should not be accepted without an express statement to that effect.

The victory was short-lived for two reasons. Most obviously, two years after this decision the Congress passed the Major Crimes Act, sweepingly and unilaterally abrogating any treaty provisions limiting federal jurisdiction over major crimes by any person in Indian country. More subtly, though admitting that the Brule Sioux Treaty of 1868 envisioned eventual complete self-government by the Indians, the *Crow Dog* opinion stated that the Brule Sioux were to be

> subject to the laws of the United States, not in the sense of citizens, but, as they had always been, as wards, subject to a guardian; not as individuals, constituted members of the political community of the United States, with a voice in the selection of representatives and the framing of the laws, but as a dependent community who were in a state of pupilage, advancing from the condition of a savage tribe to that of a people who, through the discipline of labor, and by education, it was hoped might become a self-supporting and self-governed society.[200]

The Court had thus significantly redefined 'dependency' from its use in Marshall's *Cherokee Nation* opinion.[201]

1884 - *Elk v. Wilkins*:[202] The Court upheld the power of Congress to deny citizenship to an Indian, John Elk, "a fully Anglicized farmer living on his own land," who "was evidently serious enough about his allegiance to demand his right to vote all the way to the Supreme Court." Though Indians were subject to extraordinary control by the federal government, the Court held that they were not covered by the 14th Amendment's guarantee of citizenship to "all persons born or naturalized in the United States, and subject to the jurisdiction thereof."[203] Only Congress could decide when an Indian was assimilated or integrated enough to receive the protections of citizenship, a position that would exceed the ordinary understanding of the separation of powers. The *Elk* opinion was "an ideological anachronism," said Barsh and Henderson, "reviving a theory of subjectship, as opposed to voluntary allegiance, belonging more properly to monarchical English than American law."[204]

1885 - Major Crimes Act: Responding to *Crow Dog*, the Congress unilaterally asserted federal jurisdiction in Indian territories over seven major crimes (no extended to fourteen crimes and covering most serious forms of felony) regardless of the identity of the suspect. This act represented a significant departure from the previous policy of recognizing Indian autonomy over internal affairs in Indian territory.[205] Represented as a step toward civilizing Indians, it was supported by the same groups of Indian "friends" who supported allotment.[206]

1886 - *U.S. v. Kagama*:[207] In a case upholding the Major Crimes Act, the Court allowed federal prosecution and punishment of a murder of an Indian committed by an Indian on the Hoopa Valley Reservation. One of the central cases in the Court's late 19th century reconstruction of federal Indian law, *Kagama* "laid the groundwork for a more logically consistent vindication of congressional supremacy." By analogy to the precedents involving federal control over the process of territorial expansion and the governance of territories, *Kagama* developed what Barsh and Henderson have called "a theory of domestic colonialism." The analogy was not self-evident; after all, the law of territories dealt with the regulation of affairs in settlements by non-Indian American citizens in areas their sovereign government was claiming, with no obvious connection to Indian nations' internal matters.[208]

Very significantly, the Hoopa, the tribe at issue in *Kagama*, had no treaty with the U.S., and no functioning institutions of tribal government.[209] As Barsh and Henderson noted, the result in *Kagama* might have been seen as arising from that fact, however, the case was read very broadly, and applied to tribes with treaties as well.[210] Barsh and Henderson noted: "Loosely interpreted, as it later was, *Kagama* reclassifies all tribal areas as parts of the territory of the United States, and thereby authorizes Congress to abolish tribal governments and create new ones. It provided a sweeping legal theory for a new epoch of federal Indian legislation."[211] *Crow Dog* had concluded that tribes had exclusive jurisdiction over internal affairs; *Kagama* might have concluded that the Major Crimes Act had established a system of concurrent jurisdiction, since nothing in the provision specified the termination of tribal jurisdiction. However, *Kagama* has been taken to stand for exclusive federal jurisdiction over felonies committed by Indians in Indian country.[212]

Famously, or infamously, Justice Miller's *Kagama* decision distorted Marshall's simile about Indians being like wards into a bald declarative:

> These Indian tribes are the wards of the nation. They are communities dependent on the United States,-- dependent largely for their daily food; dependent for their political rights. They owe no allegiance to the states, and receive from them no protection. Because of the local ill feeling, the people of the states where they are found are often their deadliest enemies. From their very weakness and helplessness, so largely due to the course of dealing of the federal government with them, and the treaties in which it has been promised, there arises the duty of protection, and with it the power.[213]

Note that the opinion concluded that "the duty of protection" arose not only from "the treaties in which it has been promised," but also "from their [i.e. the tribes'] very weakness and helplessness," a condition the opinion admitted was "due to the course of dealing of the federal government with them." Since the Hoopa had no treaty, the federal responsibility for them, and power of regulation over them, can only be derived from the weak and helpless condition to which the federal government had reduced the tribe. The Marshall precedents had founded the simile of wardship in the treaties between the U.S. and the Cherokee, in the federal government's constitutional powers under the treaty and commerce clauses, and in the discovery doctrine's fiction of federal ownership of the land. As Deloria and Lytle observed:

> *Kagama* probably assumes the same doctrinal background but the doctrines are not made a central part of the argument. Indeed, it appears in *Kagama* that social-economic-political weakness of the Indians alone provides a justification for congressional intervention and this line of reasoning is a decided departure from the mainstream of constitutionally enumerated powers of Congress.[214]

1886 - *Choctaw Nation v. U.S.*:[215] Following up on its *Kagama* decision, even quoting extensively from it, the Court applied to tribes with treaties the same principles applied to the treaty-less Hoopa tribe. The Court decided that the Choctaw Nation were entitled to a liberal reading of their treaty and legislation referring to it, a reading in keeping with the spirit of the treaty regardless of the specific terms. Interestingly, the Court was still willing to acknowledge that this principle derived at least in part from the law of nations.

> The rules to be applied in the present case are those which govern public treaties, which, even in case of controversies between nations equally independent, are not to be read as rigidly as documents between private persons governed by a system of technical law, but in the light of that larger reason which constitutes the spirit of the law of nations. And it is the treaties made between the United States and the Choctaw Nation, holding such a relation, the assumptions of fact and of right which they presuppose, the acts and conduct of the parties under them, which constitute the material for settling the controversies which have arisen under them.[216]

The Court presented this rule of interpretation as "arising out of the nature and relation of the parties," but was also influenced by the fact that the rule was "sanctioned and adopted by the express terms of the treaties themselves." In Article 11 of the treaty, the United States declared it was "desirous rights and claims of the Choctaw people against the United States 'shall receive a just, fair, and liberal consideration.'"[217]

However, *Choctaw Nation* also laid much emphasis on the argument from *Kagama*, insisting that the "recognized relation between the parties" was "that between a superior and inferior." The "inferior" party, the Indians, were "placed under the care and control" of the "superior," the United States. The relationship was an odd one, since it "authorizes the adoption on the part of the United States of such policy as their own public interests may dictate,"[218] licensing a self-interest which Barsh and Henderson pointed out was inconsistent with the general rule for guardianship of a ward.[219] The only limit on the interest of the U.S. the Court mentioned was the observation that the Court should recognize

> such an interpretation of their [i.e. the United States government's] acts and promises as justice and reason demand in all cases where power is exerted by the strong over those to whom they owe care and protection. The parties are not on an equal footing, and that inequality is to be made good by the superior justice which looks only to the substance of the right, without regard to technical rules framed under a system of municipal jurisprudence formulating the rights and obligations of private persons, equally subject to

the same laws.[220]

1887 - The General Allotment Act ("Dawes Act"): By this act, the federal government "intervened unilaterally in the internal affairs of native nations to break up their traditional systems of collective land tenure." The Act marked the first time the federal government used a "blood quantum" system to define Indians and assign different status and rights to "full blood" and "mixed blood" Indians. After reservations were allotted, "surplus" lands were parcelled out to non-Indians, including corporations and government ownership. In the decades following this act, two-thirds of the Indian land base was taken.[221]

1890 - *Cherokee Nation v. So. Kansas Ry. Co.*:[222] Taking rather extravagant liberties with history, the Court stated that wardship had always been the law and practice of the U.S., and that powers of tribes were only what U.S. allowed them to have. The dependence on the federal government Indian nations might have consented to in treaties was transformed into a wardship relationship that seems to have been presumed to pre-exist any treaty relationship.[223]

1899 - *Stephens v. Cherokee Nation*:[224] The Court articulated the "plenary power" doctrine in Indian affairs. Felix Cohen interpreted this doctrine to mean "that all issues of Indian law are to be resolved by reference to the supreme will of the national legislature."[225] Plenary power became the doctrine the courts used to "limit state power over tribes to matters expressly delegated by Congress," and some courts began to require some act by Congress to prohibit state power.[226] In Worcester, the federal power over tribes had been grounded in the federal government's exclusive treaty power, but by the Reconstruction period the courts were finding "federal purpose" to be the deciding factor in cases, so reservations were immune from state government because they were federal instrumentalities. Cases up until 1867 are decided on the basis of tribal sovereignty, but cases after 1886, i.e. *Kagama*, are decided on the basis of federal purpose.[227]

Courts followed the logic of this federal purpose idea, and required strict adherence to any and all express statements of the will of Congress. The phrase, "plenary power," was construed by 19th century federal courts "to mean extraordinary congressional discretion to make policy, and lack of judicial authority to review it," argued Barsh and Henderson. Worcester was read very narrowly to say that between states and the federal government, only the federal government had constitutional power in Indian affairs. "Marshall's broad principle of tribal consent was ignored. This left congressional preemption without residual tribal sovereignty."[228]

1899 - *Jones v. Meehan*: The canons of construction are used in a very conventional way without any reference to the law of nations, and with only an oblique reference to treaty law in general. Following the pattern of *Kagama*, *Choctaw Nation*, and *So. Kansas Ry.*, the canons are conceived of simply as artifacts of the wardship relationship.

1903 - *Lone Wolf v. Hitchcock*:[229] The "classic judicial statement articulating the doctrine of the plenary powers of Congress over Indian affairs,"[230] the Court's *Lone Wolf* opinion concluded that Congress can "alter any of [the Indians'] political and property rights irrespective of applicable treaty stipulations, and even in violation of the Constitution."[231] The only protection remaining to the Indians, according to the Court, rested in the fact that "[i]t is to be presumed that in this matter the United States would be governed by such considerations of justice as would control a Christian people in their treatment of an ignorant and dependent race."[232] The Court acknowledged "a moral obligation rested upon Congress to act in good faith in performing the stipulations entered into on its behalf" in treaties,[233] but the actions of Congress were not subject to judicial review on constitutional grounds. Indian tribal status itself justified the presumption that tribal members, and tribes as a whole, were incompetent wards, but there was no mechanism by which this novel class of wards could demand emancipation, and no legally

recognized limits on the freedom of action of the guardian.[234] Interestingly, the Court in *Lone Wolf* found it convenient to revive the parallel between Indian treaties and treaties with foreign powers, noting that Congress can pass statutes that conflict with or abrogate foreign treaties.[235] Of course, by 1903 the situation of Indians was not exactly analogous to that of foreign nations in the most important respect; the Kiowa, Comanche, and Apache represented by the chief Lone Wolf lacked any meaningful power to reciprocate against abrogation of their treaty by the United States.[236]

1913 - *U.S. v. Sandoval*:[237] The Court permitted the federal government to enforce Indian law regulations in Pueblo territory. This permission was granted despite the fact that the Treaty of Guadalupe Hidalgo ceded Mexican territory to U.S. with stipulation that Mexican citizens in the area were to become U.S. citizens. Since Mexico had made all Indians citizens, Pueblo Indians in the area were citizens of the United States under the terms of the Treaty. The Court allowed unilateral federal regulation of the Pueblo after citing BIA "evidence" that they were "essentially a simple, uninformed, and inferior people," concluding that the U.S., "a superior and civilized nation," had "the power and duty of exercising a fostering care and protection."[238] Taken together with *Elk*, the *Sandoval* decision represented a development by which "[t]he principle of volitional allegiance, so central to revolutionary ideology [in American history], was therefore entirely overthrown by a racial classification spuriously reconciled with the Fourteenth Amendment, one by which the tribes are abandoned to federal despotism."[239]

1924 - The Indian Citizenship Act - This act finished the job of one of the provisions of the General Allotment Act, forcing citizenship upon all non-citizen Indians born in the United States. The 1924 Act that made Indians into citizens was a unilateral "clean-up measure" passed despite much Indian resistance, designed to make various laws granting citizenship to various tribes and persons more consistent.[240] The Chair of House Committee on Indian Affairs said in 1931, "It would be a great inconsistency for the Government to act as guardian for an alien ward, so in order for our guardianship to be consistent, they had to be made citizens of the United States."[241] Barsh and Henderson concluded that Native Americans were made "citizens so that the great experiment in coercive civilization could continue without possible legal impediment. Citizenship was conferred to benefit the government, not the tribes."[242]

1934 - The Indian Reorganization Act ("Wheeler-Howard Act") - The Act was mostly economic in intent, designed to undo the effects of allotment. It also was presented as if it would end the BIA's career as an "autocrat", a "benevolent despot" with "boundless powers."[243] Collier said the IRA would "terminate such bureaucratic authority by transferring the administration of the Indian Service to the Indian communities themselves."[244] However, Native Americans such as Churchill and Morris have long complained that the IRA "was imposed by the United States to supplant traditional forms of indigenous governance in favor of a tribal council structure modeled after corporate boards."[245] The IRA stipulated that tribes were free to decide by referendum whether to adopt an IRA government. This attempt "to put a 'democratic face' on the maneuver," charged Churchill and Morris, was distorted when various tribal referenda were "systematically rigged" by Collier's BIA.[246]

1953 - The Termination Act: The Termination "Act" itself was really House Concurrent Resolution 108, expressing "the sense of the Congress that, at the earliest possible time, [designated Indian tribes and the individual members thereof]... should be freed from Federal supervision and control and from all disabilities and limitations specially applicable to Indians."[247] Even some Indian witnesses before the Subcommittee supported the policy on those terms.[248] However, it came to be clear that termination was "the furthest extension of assimilationist policy," ending the trust responsibility of the federal government, and making the land and people of terminated tribes subject to state jurisdiction, inculding taxation.[249] Thirteen termination acts affecting 109 tribes and bands were passed between 1954 and 1962, with acts being put into administrative effect as late as 1966 and 1970. Only 3 percent of federal recognized Indians

were brought under the act, since the largest Native American tribes were able to resist termination.[250]

Public Law 280, another part of the termination policy, "reduc[ed] the level of native sovereignty to that held by counties or municipalities," according to Churchill.[251]

1975 - Indian Self-Determination and Educational Assistance Act: This Act was the centerpiece of the new era of federal Indian law, and it "requires that they be included more fully in staffing the various programs aimed at them by federal policymakers, who - the Act makes clear - continue to hold preeminent authority over Indian affairs."[252] The Act itself called only for "effective and meaningful participation by Indian people" in Indian affairs, and was not a wholesale transfer of federal power and authority.[253] Title I of the Act granted veto power over relevant contracts and programs to the Secretaries of Interior, Education, and Health and Human Services.[254]

80. Deloria, "The Evolution of Federal Indian Policy Making," 251.

81. Message from the President of the United States transmitting Recommendations for Indian Policy, H.R.Doc. No. 363, 91st Cong., 2d Sess. (1970), excerpted in Getches and Wilkinson, *Federal Indian Law*, 151-2. Nixon's message asked Congress to explicitly reject the termination policy, and encouraged Indian autonomy and community. Federal funding and assistance was not to be reduced as autonomy increased, and tribal governments would be eligible for federal programs within their jurisdiction. The message was followed up by the Indian Self-Determination and Educational Assistance Act of 1975 (which directed federal agencies "to contract with, and make grants to, Indian tribes and other Indian organizations for the delivery of federal services"), the Indian Child Welfare Act of 1978 (which sought to keep dependent Indian children under the jurisdiction of their tribe), the American Indian Religious Freedom Act of 1978 (which sought to protect Indian spiritual sites and practices), and various acts treating Indian tribes in a manner similar to states for purposes of taxation, environmental regulation, revenue sharing, and so forth. Getches and Wilkinson, *Federal Indian Law*, 153-4.

105. Churchill, *Struggle for the Land*, 378.

106. The confusion is resolved, Churchill wrote, when Indian nations are admitted for what they are: colonies.

> Of primary importance to understanding the imperial context is recognizing that the notion of "self-governance" among the colonized is an illusion. Like so many other colonial situations, this cruel hoax is deliberately fostered as a tactical expedient by the colonizer. Repeatedly, in advanced colonial settings, the colonized are convinced to administer and impose upon themselves the policies and regulations set forth by the colonizers. This self-administration in turn is so often cynically touted by the colonizers and their puppets among the colonized as "self-governance" and "democracy."

145. Williams, "Encounters on the Frontiers of International Human Rights Law," 662, 663, n.4.

146. Why has there has been such a sudden emergence of indigenous peoples' rights as an issue in international law? asked Williams. He suggested the answer rested in the fact that indigenous peoples, like other oppressed peoples, had come to see that international law could play a "more authoritative and even constraining role" on state actors, and that even small successes and limited responses can matter. Williams, "Encounters on the Frontiers of International Human Rights Law," 668-9. Torres has pointed to the ability of national and international indigenous organizations to get media attention as a matter of practical importance in raising the issue of indigenous rights. Torres, "The Rights of Indigenous Populations," 151-2.

147. Robbins, "Self-Determination and Subordination," 106-7. By 1987 ten organizations of indigenous peoples had consultative status, and the Grand Council of the Cree (Quebec) had become the first indigenous nation to receive non-governmental consultative status. ICIHI, *Indigenous Peoples*, 32-3.

148. "[I]ndigenous peoples' own stories" before the Working Group on Indigenous Populations have played "a central role" in the "development of an internationally recognized legal instrument declaring the human rights of indigenous peoples." Williams, "Encounters on the Frontiers of International Human Rights Law," 666.

149. W. Michael Reisman of Yale has offered a way of understanding international norms, including customary international law, and the changes in such norms. According to his student Raidza Torres, who applied Reisman to the rights of indigenous peoples, an international norm can be thought of as "a pattern of authorized communications and acts on the part of international organizations and states." She went on, "A norm includes, and is largely determined by, the enunciation and recognition of a given set of standards by authorized international bodies and agencies such as the United Nations." When the interactions of international groups, agencies, representatives, etc. "follow a particular pattern," a norm either exists or is emerging. Once developed, norms will indicate the broad outlines of the directions policy in an area will take. Some norms may be "soft," and do not depend on absolute compliance or mechanisms of enforcement. The violation of norms usually carries with it some costs, even if only in image and prestige, and Torres concurred with Henkin's observation that most states obey most norms most of the time. Torres, "The Rights of Indigenous Populations," 145-6, citing Louis Henkin, *How Nations Behave* 44-5, 46, 47 (1979).

150. Williams, "Encounters on the Frontiers of International Human Rights Law," 666.

Using material from the indigenous participation in international meetings makes particular sense given, as Douglas Sanders has noted, "[t]he present pattern of indigenous NGOs is heavily weighted in favor of North America." For example, the UN Seminar on the Effects of Racism and Racial Discrimination on the Social and Economic Relations between Indigenous Peoples and States, held in Geneva in January 1989, had no indigenous representatives from Asia or Central America, and the Sami of northern Europe were not represented. Sanders, "Another Step," 39, 41. Of course, this is a problem for some purposes, but it makes the results of such international meetings more useful for gauging the interests and demands of Native Americans.

The Independent Commission on International Humanitarian Issues noted that international indigenous movements were started by American Indians, and peoples from Africa and Asia are still under-represented, though the direction is definitely toward more participation from those areas. ICIHI, *Indigenous Peoples*, 32-3.

151. "Recognition that the classic nation-state does not exist in reality is essential to analyzing the appropriate limits on its actions, which necessarily have an impact on both majority and minority populations," wrote the human rights scholar, Hurst Hannum. The nation-state, he suggested, is "an increasingly archaic political concept" that retains an undeniable impact on "the legal and political order of the world." Hannum, "The Limits of Sovereignty and Majority Rule," 6-7. While wanting to acknowledge that "the state remains a critical element in the political equation" despite increasing globalization, Camilleri considered the state an element "more in the form of a variable than a constant." Camilleri, "Rethinking Sovereignty," 29.

152. "The global movement for human rights is redefining the world as we know it. Our contemporary ideas about law - once so stable, so sure that law was made and remade according to the positivities of state sovereignty in the world - have failed us." Williams, "Encounters on the Frontiers of International Human Rights Law," 660. It is "a sign of our times," says Meron, that sovereignty is understood to be limited - "human beings" are taken to be subjects of international law with rights independent of their governments. Meron, "Teaching Human Rights," 17-18. For Camilleri,

> ...the rapidly developing [international] legal order both reflects the inadequacy of the state as a self-contained unit of decisionmaking and restricts its freedom of action. International law - and the varying degrees of international organization that accompany it - feeds on itself and becomes so clearly interwoven with domestic law as to make the dividing line increasingly blurred. In these circumstances it has become progressively more difficult to demonstrate the primacy of domestic law, which is arguably one of the cardinal premises of state sovereignty.

Camilleri, "Rethinking Sovereignty," 22.

153. Hannum, "The Limits of Sovereignty," 4-6.

154. Hannum, "The Limits of Sovereignty," 6-8.

163. Gros Espiel, "The Right to Self-Determination," 14.

164. Gros Espiel, "The Right to Self-Determination," 10.

165. See Gros Espiel, *The Right to Self-Determination*, 5, 8-21.

166. The Canadian government, for example, has been vocal in international settings in its demand that "populations" be used rather than "peoples,' lest the impression be created that indigenous peoples have "rights of self-determination similar to those of sovereign nation-states." Canada, "Standard-Setting," 2. This semantic position has met with furious response from indigenous peoples. "When are a people a people?" the Grand Council of the Crees (Quebec) demanded of the UN Sub-Commission on Prevention of Discrimination and Protection of Minorities. "Is the threat of self-determination so great that we are no longer peoples because we invoke this basic human right which is so fundamental to the United Nations concept?... Does the word mean one thing in one place, and something else when indigenous peoples are concerned? Is this not discrimination - the very evil that this Sub-Commission is mandated to prevent?" Grand Council of the Crees (Quebec, "Written Communication," 1-2.

The UN Commission on Human Rights and its Sub-Commission on Prevention of Discrimination and Protection of Minorities had initially accepted the semantic dodge when establishing its Working Group on Indigenous *Populations*. The Working Group has wrestled with terms, sometimes using "indigenous rights" as a construction which avoids either "peoples" or "populations." The Sub-Commission began in the late 1980s to use the "indigenous peoples," noted David Weissbrodt, "thus laying the basis for a potentially significant change in terminology." Weissbrodt, "The Fifth Session of the Working Group on Indigenous Populations," 22.

167. This debate was conducted along these lines in the revision of ILO Convention No. 107 into Convention No. 169, and the strategy was to resort to a specifically qualified use of the term, "peoples." See Barsh, "Revision," 760; Swepston, "A New Step," 692-3.

168. Barsh, "Advocate's Guide," 231.

169. "Report of the Working Group, 8th Session," 7, 8, 26; "Report of the Working Group, 9th Session," 10.

170. Indian Law Resource Center, in a submission to the Working Group on Indigenous Populations regarding the draft Universal Declaration on Indigenous Rights. Indian Law Resource Center, "Standard-Setting Activities," 4.

171. Indian Law Resource Center, "Standard-Setting Activities," 3.

172. An unnamed indigenous representative speaking before the UN Working Group on Indigenous Populations. "Report of the Working Group, 8th Session," 25-6. See also the discussion of this point by Ward Churchill, who has expressed to "an emotional preference" for "complete sovereign independence," but who admitted that few indigenous nations in North America would be likely to adopt his "go it alone" approach. Churchill, *Struggle for the Land*, 431-2.

173. "Report of the Working Group on Indigenous Populations, 5th Session," 14. Speaking before the Sub-Commission, Erica-Irene Daes, Chairperson of the Working Group on Indigenous Populations, noted the difficulty the Working Group was having regarding the concept of self-determination. She pointed out, however, that when indigenous peoples used the term they were "principally concerned with internal self-determination," and asked that governments to "take into consideration the fact that the indigenous organizations had never suggested separatism or anything similar." Sub-Commission, "43rd Session," 18.

174. R. Bartlett, *Subjugation, Self-Management, and Self-Government of Aboriginal Lands and Resources in Canada*, 1-4 (1986), cited in Torres, "The Rights of Indigenous Populations," 142.

175. Robbins, "Self-Determination and Subordination," 110. Similarly, Torres noted: "Self-determination guarantees a people's right to choose its political destiny, but it need not manifest itself through independence or decolonization." Torres, "The Rights of Indigenous Peoples," 162. Similarly, UN Special Rapporteur Gros Espiel noted:

> ...the effective exercise of a people's right to self-determination is an essential condition or prerequisite, although not necessarily excluding other conditions, for the genuine existence of the other human rights and freedoms. Only when self-determination has been achieved can a people take the measures necessary to ensure human dignity, the full enjoyment of all rights, and the political, economic, social and cultural progress of all human beings, without any form of discrimination. Consequently, human rights and fundamental freedoms can only exist truly and fully when self-determination also exists."

Gros Espiel, *The Right to Self-Determination*, 10.

176. Morris, "International Law," 78-9. See also Torres,"The Rights of Indigenous Populations," 162. Torres has argued the strategic merit of non-statist conceptions of self-determination, since governments are more likely to concede to the demands of Native Americans and other indigenous peoples if something less than outright independence is at issue. Torres, 142.

177. Robbins, "Self-Determination and Subordination," 111.

178. The draft Declaration is available as a UN Document, and as an appendix in Falkowski, *Indian Law/Race Law*.

179. According to the authoritative study on the status of indigenous peoples done for the UN by Jose Martinez Cobo:

> Respect and support for the internal organization of indigenous peoples and their cultural expressions constitute an essential consideration for any arrangement aimed at securing appropriate participation by indigenous communities in all the affairs which affect them. Consequently, Governments must abandon their policies of intervening in the organization and development of indigenous peoples, and must grant them autonomy, together with the capacity for controlling the relevant economic processes in whatever way they themselves consider to be in keeping with the interests and needs.
>
> Self-determination, in its many forms, is thus a basic pre-condition if indigenous peoples are to

be able to enjoy their fundamental rights and determine their future, while at the same time preserving, developing and passing on their specific ethnic identity to future generations.

Martinez Cobo insisted that the right to self-determination "includes economic, social and cultural, as well as political factors," which will be different in each case.

> In its widest sense of its "external" connotations this means the right to constitute a State and includes the right to choose various forms of association with other political communities.
>
> With regard to its "internal" connotations within the national society, however, this right to self-determination means that a people or a group possessing a definite territory may be autonomous in the sense of possessing a separate and distinct administrative structure and judicial system, determined by and intrinsic to that people or group.(20)

Jose R. Martinez Cobo, *Study of the Problem of Discrimination Against Indigenous Populations*, 20.

180. "Report of the Working Group on Indigenous Populations, 5th Session," 14.

In the Declaration of Principles adopted by the Indigenous Peoples Preparatory Meeting of July 1987, prior to meeting of the fifth session of the Working Group on Indigenous Populations, the indigenous representatives declared:

> All indigenous nations and peoples have the right to self-determination, by virtue of which they have the right to whatever degree of autonomy or self-government they choose. This includes the right to freely determine their political status, freely pursue their own economic, social, religious and cultural development, and determine their own membership and/or citizenship, without external influence.
>
> No State shall assert any jurisdiction over an indigenous nation and people, or its territory, except in accordance with the freely expressed wishes of the nation and people concerned.

The Declaration is reproduced as Annex V of "The Report of the Working Group on Indigenous Populations on Its Fifth Session." Above is at p.30.

181. Churchill and Morris, "Key Laws and Cases," 14, 15-6.

201. Barsh and Henderson, *The Road*, 88.

202. *Elk v. Wilkins*, 112 U.S. 94 (1884).

203. Barsh and Henderson noted that the Court "was... careful... to paraphrase the Fourteenth Amendment" rather than quote it, which Barsh and Henderson take to indicate that the Court knew it was on weak ground. The Court noted that the Indians owed no allegiance to the United States, which Barsh and Henderson infer means that Indians did not consent and offered resistance to U.S. authority. Barsh and Henderson, *The Road*, 70.

204. Barsh and Henderson, *The Road*, 70-1.

205. Churchill and Morris, "Key Laws and Cases," 14, discussing the Major Crimes Act, 18 U.S.C. 1153. It is interesting to note that the "Major Crimes Act" was really an obscure rider to a general appropriations bill, passed without any hearings, and with little if any serious consideration by the Congress. The rider was apparently motivated by pressure from certain missionary "friends" of the Indian who were offended at the uncivilized practice exhibited by the Brule Sioux in allowing Crow Dog to pay compensation rather than suffer execution for the killing of Spotted Tail. Deloria and Lytle, *American Indians, American Justice*, 168-70.

206. Deloria and Lytle, *American Indians, American Justice*, 169-70.

212. Deloria and Lytle, *American Indians, American Justice*, 171-2.

213. *Kagama*, 383-4. The opinion went on to conclude:

> The power of the general government over these remnants of a race once powerful, now weak and diminished in numbers, is necessary to their protection, as well as to the safety of those among whom they dwell. It must exist in that government, because it never has existed anywhere else; because the theater of its exercise is within the geographical limits of the United States; because it has never been denied; and because it alone can enforce its laws on all the tribes.

Kagama, 384-5.

214. Deloria and Lytle, *American Indians, American Justice*, 42.

215. *Choctaw Nation v. U.S.*, 119 U.S. 1 (1886).

216. *Choctaw Nation*, 28.

217. *Choctaw Nation*, 28.

218. *Choctaw Nation*, 28.

219. Barsh and Henderson, *The Road*, 90.

220. *Choctaw Nation*, 28.

221. Churchill and Morris, "Key Indian Laws and Cases," 14, discussing the General Allotment Act, 25 U.S.C. 331 and following. "Full bloods" were given allotments, but their land was held in trust by the federal government. "Mixed bloods" were given outright ownership of their allotments, and were required to accept U.S. citizenship when accepting an allotment.

222. *Cherokee Nation v. So. Kansas Ry. Co.*, 135 U.S. 641 (1890).

223. Barsh and Henderson, *The Road*, 90-1.

224. *Stephens v. Cherokee Nation*, 174 U.S. 445, 478 (1899).

225. Barsh and Henderson, *The Road*, 137.

226. Barsh and Henderson, *The Road*, 140.

227. Barsh and Henderson, *The Road*, 140, citing *The Kansas Indians*, 5 Wall. 737, 755-6 (1867); *The New York Indians*, 5 Wall. 761 (1867); *Mackey v. Coxe*, 18 How. 100, 103-4 (1855); then citing *U.S. v. Kagama*, 118 U.S. 375, 383 (1886); *U.S. v. Clapox*, 35 F.575 (1888); *U.S. v. Rickert*, 188 U.S. 432 (1903).

228. Barsh and Henderson, *The Road*, 141.

Barsh and Henderson saw *Tee-Hit-Ton Indians v. U.S.*, 348 U.S. 272 (1954) as the zenith of this line of thinking. The Court said Alaskan native lands held "since time immemorial" but never expressly recognized by Congress could be taken without compensation. (*Tee-Hit-Ton*, 277) The federal government seemed to be exempt from Fifth Amendment restrictions in Indians affairs. Finding "nothing to indicate any intention by Congress to grant to the Indians any permanent rights in the lands of Alaska occupied by them by permission of Congress", (*Tee-Hit-Ton*, 278) the Court dismissed the property claims of the Indians.

Tee-Hit-Ton stood for the proposition that lands held as a result of privileges granted by the federal government are entitled to more protection than that held under original title.

> *Tee-Hit-Ton* implies that tribes with treaties enjoy mere privileges, an unsubstantiated historical hypothesis, and tribes without treaties have nothing. No tribe, therefore, could be safe from termination.... *Tee-Hit-Ton* attributed this remarkable power to 'discovery and conquest,' citing only *Johnson v. M'Intosh* in support."

Barsh and Henderson, 143, citing *Tee-Hit-Ton*, 280. However, the Court paid no attention to *Worcester*, which rejects these "pretensions", saying that discovery of a territory does not "annull[] the pre-existing rights of its ancient possessors". Barsh

and Henderson, 143, citing Worcester, 542-3.

Carino, a Philippines land case which was the only real precedent in Tee-Hit-Ton, said that in federal Indian policy the "dominant purpose of the whites was to occupy the land." (This supposedly made it different from U.S. policy in the Philippines, which the Court said was aimed at the benefit of the Filipinos. *Carino* offered no citations for its statement of Indian policy. Barsh and Henderson, 143-4, citing *Carino v. Insular Government of the Philippine Islands*, 212 U.S. 449, 458 (1908).

Lessons for the European Community from the United States:

The Case of Air Pollution

Sarah C. Stiles
Northeastern University

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association

ABSTRACT

As the European Community (EC) strives to unify policies across twelve different states, environmental policy is no less complicated than other "high politics" policies. This paper examines the structural elements the EC has in common with the US, such a federalism, in order to better understand the role of institutional frameworks in promoting effective environmental policy. Upon establishing this point of departure, the paper focuses on the problem of air pollution in the EC and the US and addresses how the US, an acknowledged leader in air pollution abatement, has dealt with the problem since 1970. The role of the EPA is examined in terms of failures and successes with the Clean Air Act of 1970 and how lawmakers and environmentalists have attempted to correct shortcomings in the Clean Air Act of 1990. The problem of compliance in the EC is addressed along with the various problems that are holding back progress, such as the inability to create an effective environment agency for the Community. Lessons for the EC from US include effective use of the judicial system, a realistic legislative process that is not too ambitious, and a well-organized bureaucratic structure to collect and manage accurate data.

Lessons for the European Community from the United States:

The Case of Air Pollution

As the problems affecting the environment become ever more obvious and well publicized, the public the world over is aware that pollution does not respect national frontiers. This is especially the case with air pollution that, with a breeze, easily becomes someone else's problem.

The international consequences of transboundary pollution have been the subject of dispute for some time. The U.S. has only two neighbors to consider in this regard. Canada has long complained about the effects of pollution emanating from the U.S. "rust belt" that manifests itself in Canada in the form of acid rain. In fact, it is estimated that approximately half of Canada's acid rain is a consequence of pollution emanating from the U.S. (Helm and Neme 1991, 19). Mexico's lax environmental standards have been a major concern in the U.S. border states and have been a source of extended negotiation in the North American Free Trade Agreement. The European Community Member States, on the other hand, suffer the effects of poor environmental protection coming from many directions and from many countries. Due to wind patterns in Europe, pollutants emitted particularly from the U.K. and France as well as other states tend to blow north. For years the northern European countries have had to contend with serious pollution problems that did not originate within their borders. Regardless of how the pollution got there, it must be cleaned up to avoid unacceptable damage to the natural environment and the economy of the area.

Pollution problems do not remain regional issues, either. Urgent global problems (*i.e.*, global warming, ozone depletion) as well as local problems require effective air pollution policy in the European Community and the United States. States should have a vested interest in the environmental protection programs of all other states.

In 1970 the U.S. passed what is now commonly referred to as the Clean Air Act. It was actually an update and revision of amendments of the 1967 Air Quality Act. However, because it resulted in a general overhaul of the previous legislation, the 1970 Act is treated as a new work. This paper focuses on some of the successes and shortcomings of the 1970 Clean Air Act and analyzes the underlying reasons for these outcomes. As the European Community moves to a federal system, EC policy makers may find useful lessons from the U.S. experience with clean air legislation.

However, first it is necessary to recognize the fundamental differences in the U.S. and EC systems before making policy prescriptions about what is transferable. Basic to the structure of both systems is the concept of federalism. The decision making process is profoundly influenced by the federalist separation of powers between the national and state levels. However, there are profound dissimilarities between the U.S. and the EC that limit some comparisons. This paper begins with a discussion of federalism in the context of environmental policy in the two systems. Following is an examination of clean air legislation and the differences in appropriateness for the U.S. and the EC.

Federalism

According to Americanist scholar Richard Hofstadter (1973, 9-10), the primary goal of the U.S. founding fathers was "balanced government." Certainly a hot topic of debate in the EC has been how to establish balance of power between the EC institutions and the Member State governments. But just how comparable is the European system to the federal U.S. system? Hofstadter lists three advantages of checks and balances in a federated government that have been cornerstones of the U.S. system. Following is an examination of Hofstadter's list and how these elements relate to the current structure of the EC.

1. The first advantage is that a federal government can maintain order against popular uprisings or majority rule in heterogenous societies. That is, a single state would run the risk of

being overrun by one particular faction, whereas the central government of a federation of states could prevent such an occurrence (Hofstadter 1973, 9). EC Member States in differing degrees have been rocked by extremist political parties. The far right has made substantial headway in German regional elections but it does not appear likely that it will actually gain control of the government. Likewise in France, the *Front National* has preached a xenophobic message and garnered 12.5 percent in the first round of regional elections in March 1993 but in the second round one week later managed only 5.6 percent (*Le Figaro* March 30, 1993 p.1). Despite its popularity in some areas, it appears cooler heads will prevail.

On a larger scale, there has been much discussion as to which EC Member State will "lead" the Community. The focus has been on Germany and the financial power of the German mark. EC scholars have analyzed the possibility of a two-tier Europe, with Germany leading the more industrialized north, and the southern tier countries lagging behind. Germany has also been the Community leader in the realm of environmental protection and cleanup. In this respect it has played the role of environmental trailblazer similar to that of California in the U.S. There has been considerable controversy about using the stricter environmental regulations of Germany and other northern European countries as standards for the rest of the Member States. The Community has used its central authority to prevent the occurrence of discriminatory trading practices based on environmental regulations. "Partial harmonization" of environmental regulations across the EC has been advocated in order to give the southern tier countries a chance to catch up with higher environmental standards and avoid suffering acute economic disadvantages in the process. So in the EC, as in the U.S., we see some Member States clearly stronger than others but not about to overwhelm the system as a whole.

2. Hofstadter's second advantage is a stable mechanism of representation for the general public by a chosen body of representatives. The legislative body of a federation has the potential to

effect great change in the environmental realm. The most far-reaching environmental legislation in the U.S. has emanated from the U.S. Congress. Generally speaking, ideas for improving environmental policy will go nowhere without the approval of the U.S. Congress. The most comprehensive and revolutionary reforms in air pollution abatement have been subject to constant congressional scrutiny. With the primary stated goal of protecting its constituencies' health, Congress passed the Clean Air Act and has updated this legislation. By the same token, however, in the name of representation Congress has watered down legislation that would have meant stricter environmental laws in order to protect industry and not damage the economy. In fact, Congressional scrutiny has been a major hindrance to an effective Environmental Protection Agency (Lazarus 1991, 336).

The European Parliament does not yet enjoy the prestige or legislative power of the U.S. Congress, but it has made great strides in acquiring this power since the Parliament first became an elected body in 1979 (Noël 1988, 31). According to the most recent Eurobarometer polls published in June 1992, 63 percent of EC citizens considered the European Parliament "important" regarding environmental protection policy, 17 percent considered it "unimportant" (Commission 1992, 57). The most consensus was in eastern Germany where 78 percent of those polled considered the Parliament "important" in this area. This represents a general upward trend over the last few years in this regard. It is difficult to compare the two elected bodies because of fundamental structural differences. For instance, laws do not originate in the European Parliament. The elected body can debate and discuss but has little control over what legislative initiatives are on its agenda (Wallace et al 1982, 56).

3. The final advantage on Hofstadter's list is that of a split legislature. This was to ensure that the aristocracy and the democracy neutralized each other; over both houses there was to be a powerful executive with veto power and oversight responsibilities (Hofstadter 1973, 9-10). This is the system in the U.S. although there is little talk of aristocracy these days. The two houses must

agree on the legislation, usually after considerable debate and compromise. There is always the possibility of presidential veto. At various stages, environmental policy has been held hostage either by disagreement between the two houses or executive oversight. Checks and balances are a cornerstone of the U.S. system but have also been used to stymie change.

In the EC, the Commission has formal control over legislative initiatives. The European Council exercises tremendous legislative and quasi-legislative powers (Commission 1992, 9). However, current polls show that when asked which EC institution wields the most power "in terms of having the final say on European Community legislation," 29 percent of those polled believe it is the European Parliament (Commission 1992, 8), the Council of Ministers came in second (24 percent), and the Commission placed third (17 percent) (Commission 1992, 8). The representatives in the European Parliament look forward to the ratification of the Maastricht Treaty that would fulfill the public's expectations (Commission 1992, 9).

Are the brands of United States and European Community federalism comparable?

The way the federal system works in each case will make an enormous difference in environmental policy formulation and implementation. There are some very basic differences between the two systems. When considering these differences it is important to ascertain in what ways, as a "supranational" institution, the European Community is inherently different from the U.S., such that some comparisons are moot and certain U.S. models are irrelevant.

McGrory (1990, 310) has pointed out several of the most basic differences that must be accepted before making generalizations about how the European Community should formulate successful policy. First, and perhaps most obvious, U.S. federalism is centuries old and was born of revolution. The EC is a post World War II phenomenon, and in its infancy. Second, the U.S. Constitution is the cornerstone of federalism in the U.S., however, as a document it is vague and

flexible. On the contrary, the three treaties establishing the EC (the ECSC, EEC and Euratom treaties) are examples of very detailed international law, they were not designed to be vague and flexible. Third, the purposes of the founding documents of the two systems are very different, the U.S. Constitution was written with the lofty purpose of establishing a nation, whereas the EC Treaties were meant to establish common markets. Finally, it is worthwhile to note the basic legislative tools with which a society is ordered. The U.S. has a detailed, unified system of common law, the European Community has the daunting challenge of integrating twelve separate, parallel systems of law. Despite their many similarities, the policy makers in the two systems will need to adapt distinct strategies.

Federalist issues relating to the environment

Environmentalists have long argued that a decentralized system is optimal for achieving goals of optimum environmental quality. Decentralization allows for more flexible policies that reflect the unique characteristics of each situation, be it weather patterns, population characteristics, or economic impetus. On the other hand, history has proven that in most cases strong central enforcement is needed to ensure compliance. At first glance, this may appear to be contrary to the traditional principles of federalism (Wald 1992, 521).

The situation in the U.S. in the 1960s is a good illustration of the perceived need for centralization. The 1967 Air Quality Act made provisions for states to set standards for individual sources of emissions (Muskie 1990, 14). The idea was that the states knew best what their problems were. Unfortunately, the scheme did not work as planned. Despite state policy regulations that made sense on paper, the states often ignored their own regulations. The system was decentralized with good intentions, but ultimately ineffective and fell victim to parochialism.

The European Community has experienced questionable success with its brand of nascent federalism also. Member States have a history of ignoring EC directives, and until recently, there has been little incentive to do otherwise; the Community institutions have been capable of little more than a slap on the wrist. For example, in the mid-1980s Italy was condemned by the European Court of Justice 46 times for noncompliance with directives (Del Duca 1988, 560). To put that in perspective, France and Belgium were the next biggest violators at the time, with a mere 7 condemnations each (Del Duca 1988, 560). In 1989 Spain held the unfortunate distinction of the EC's worst polluter with 57 cases of noncompliance with EC environmental standards (Silvers 1991, 285). This lamentable record is due in large part to the fast-paced economic development Spain has undergone since the death of Generalissimo Franco in 1975. Spain sacrificed environmental quality for economic growth and did not have the infrastructure to manage the environmental degradation.

Just as the central government stepped in to supervise state compliance in the U.S., the European Community has assumed responsibility for improved air quality in the Member States. The European Commission has implemented pollution monitoring programs in Madrid. The goal is to ensure that the 21 monitoring stations in the capital city are recording air emissions accurately and that these emissions are indeed within the standards established by the EC (Silvers 1991, 310). In an effort to impress upon the Spanish the authority the EC has over the state, the Spanish government has been brought to task to the European Court of Justice on several occasions (Silvers 1991, 310).

Policy Implementation

Air pollution legislation is only as good as its implementation devices. The U.S. experience is instructive. For years air pollution was generally seen as a local problem and, in most cases, enforcement was left up to local authorities. A good example is the state of Wisconsin.

U.S. case study: Wisconsin

The people of Wisconsin faced a chronic problem of particulate emissions from smokestacks beginning in the 1940s (Del Duca 1999, 506). The pollution was initially viewed mainly as a nuisance sullying the beauty of the new capitol, but after a few years, its true importance was understood. In the immediate post World War II years, litigation was done on a case by case basis, but it became clear that this approach was not going to be adequate to curb air pollution. Proof was difficult to come by and judges did not have sufficient technical expertise to make sound judgments (Del Duca 1988, 507).

The county of Milwaukee was put in charge of its own air pollution control from 1947 until 1973 (Del Duca 1988, 507). Although it made some effort, it did not expand air pollution control much beyond regulating particulate emissions. There simply was not the bureaucratic support and/or expertise to do much more, and consequently, the federal bureaucracy stepped in. The 1967 Air Quality Act allowed for federal intervention if states could not act on their own. In response to this legislation, Wisconsin enacted its own Clean Air Act (Del Duca 1988, 507). The Environmental Protection Agency (EPA) was created in 1970, the same year the famous federal Clean Air Act Amendments were passed. The clean air legislation required EPA approval for state air pollution controls. In compliance with the law, Wisconsin drew up new plans that were subsequently approved by the EPA (Del Duca 1988, 507).

Wisconsin, though making tepid attempts to improve its air quality, was hindered by circumstances common to other states. For instance, at this point in time there was a basic lack of

understanding about air pollution, the scientific research simply had not been done yet. In Wisconsin the focus centered mainly on particulates and the smoke problem and ignored other toxic emissions. The benefits from strict air pollution legislation were not seen to outweigh the political costs of raising taxes. On a related point, Wisconsin had reason to worry about damaging its competitive edge with other states that did not have costly air pollution controls. This is a common concern among Member States of the European Community as well, and has led to difficult negotiations concerning the relative "fairness" of environmental regulations and their impact on economic competitiveness.

The lesson from the Wisconsin case is that the state could not make effective air pollution policy until it was compelled by the EPA to do so. This was not a unique case. Members of the U.S. Congress were well aware that the states were not making significant progress in air pollution abatement. The 1970 Clean Air Act Amendments "converted Congressional distrust of State implementation into a mandate for more federal control" (McGrory 300). Nevertheless, the 1970 Clean Air Act was no panacea. Flaws in the original conception slowed implementation of the program, as did the repeated clashes between state and central government which are intrinsic to the U.S. federalist system (McGrory 300).

The EC case: Spain and Italy

Implementation in the EC is not without its complications either. The differences in governmental structure make effective implementation a task that can vary in complexity depending on the Member State. Spain, for example, is a regional state made up of 16 autonomous communities. The Spanish Constitution of 1978 provided for a transfer of power from the highly centralized government in Madrid, the product of nearly 40 years of dictatorship, to the autonomous communities. With this major move toward decentralization of the state, it not surprising that

effective environmental policy would get complicated when combined with centralization of the supranational institution of the EC.

Italy, like Spain, is a regional state, it also is working to decentralize and give more responsibility to the regions (Del Duca 1988, 535). Italy's Constitutional Court is concerned not so much with reinforcing central power (like the Supreme Court in the U.S.) but with balancing the development of regionalism. A presidential decree was established to adopt EEC directives into domestic law (Del Duca 1988, 554). Their application would be on a regional basis. The major problem is that the Italian Parliament has been very slow to make the directives law and to identify what the regional responsibilities will be.

There is another Italian law (no. 616 of 1977, article 6) that allows the central government to take care of business if the regional authorities are not complying with EC policy (Del Duca 1988, 555). The important point here is that the Constitutional Court acknowledges the importance of compliance with EC policy; the Court contends the responsibilities of the Italian State take precedence over regional autonomy. It is worth noting that if it were not for Community law, Italy might not have as much constitutional power in the face of regional inaction (Del Duca 1988, 555). EC legislation may be just what the Italian system needs to improve the system of central and local relations (Del Duca 1988, 556) and achieve the necessary compliance with environmental policy. Clearly for Italy to achieve any of the benefits of EC legislation, it must improve its record of compliance.

Parallels: U.S. and EC environmental policy

The U.S. environmental protection establishment uses a top down arrangement, wherein the EPA is responsible for overseeing implementation. For states to be eligible for grants-in-aid, avoid sanctions, and achieve enforcement primacy, a federal law required states to develop State

Implementation Plans (SIPs) for EPA approval (Eckert 1991, 38). Under this legislation, states were compelled to enact legislation at least as stringent as the federal equivalent. In addition, the states were required to provide enforcement. California has been granted a waiver which allows it more stringent legislation. The rationale for the grant waiver was that the car market is so large in California it would not be hurt by competition from neighboring states that did not have the tougher environmental laws.

In the European Community, Member States are required to adapt EC regulations and directives as national law. For example, Italy's presidential decree law no. 616 of 1977 (del Duca 1988, 554) makes EC law the law of the land. In France, theoretically, there was never much problem complying with EC directives because of the considerable power the French constitution vests in public administration (Del Duca 1988, 524). As a traditionally unitary state, France has tended to automatically incorporate Community norms by administrative order (Del Duca 1988, 524).

The Spanish Constitution paid homage to environmental concerns (Article 45 of the Constitution addresses the environment), but enforcement was lacking at the national level (Silvers 1991, 291). The transfer of authority from the central government to the Autonomous Communities (Articles 148 and 149) caused several problems. There was overlapping authority and lack of adequate coordination between the central government, the Autonomous Communities, and the local entities. Spain enacted EC legislation, current at the time of its accession to the EC (1986) and has adopted into Spanish domestic law the principles set forth by EC directives (Rodriguez Molnar 30).

Where did the Clean Air Act Go Wrong?

The short answer has been that there was too much emphasis on the command and control approach to environmental policy. The rigidity of this approach did not allow for the great variety of

situations that arise in society. As a result, deadlines were not met and meting out effective punishment was difficult, if not impossible.

Economists specializing in environmental policy have long advocated the use of incentive-based policy as the preferred alternative to the imperfect command and control approach. Economists have argued that incentive-based policy is decentralized and adaptable, in contrast to the centralized, more inflexible command and control approach. The truth may not be so simple. Studies have been done that address the advantages of the command and control approach over incentive-based policy (Oates, et al 1991; Atkinson and Tietenberg 1990) in particular cases. The single best approach is not obvious. As EC policy makers model air pollution legislation on the pattern of the U.S. 1970 Clean Air Act, the immediate concern is the positive and negative impacts of command and control policies as a result of the Act. The case of motor vehicles serves as an interesting example of how difficult it is to strike a balance with tough regulations and optimum compliance.

Flaws in the 1970 Clean Air Act: motor vehicles

Motor vehicles are among the first offenders that one envisions when considering air pollution. The gains that were made by establishing standards for individual vehicle auto emissions were undercut by the increased number of cars on the roads (Walsh 1991, 12). Not surprisingly, the vehicle population is growing faster than the human population (Wilson 1991, 15). Vehicles are responsible for up to 90 percent of carbon monoxide emissions, about half of nitrogen oxides and hydrocarbons that produce smog, and more than half of the toxic air pollutants (Wilson 1991, 15). More cars naturally increase actual emissions but also exacerbate the problem of traffic congestion, which in turn worsens emissions (Walsh 1991, 14).

The 1970 Clean Air Act regulated emissions for the full lifetimes of light and heavy trucks, but not for passenger cars beyond five years or 50,000 miles (Walsh 1991, 14). This is roughly half

the life of a car. Unfortunately, EPA research shows that the second half of a car's lifetime is when it pollutes most due to increasing deterioration in advanced technology.

Another obstacle to successful emissions reductions is that many vehicles in the U.S. are poorly maintained. Vehicles on the road regularly exceed their emission standards because drivers have deliberately tampered with or even removed the catalytic converters, used leaded gasoline where unleaded was required, or simply let the vehicles fall into disrepair (Walsh 1991, 12). Even though light and heavy trucks were regulated for a longer time than cars in the Clean Air Act, much less progress was made in reducing emissions from these sources than from passenger cars. In fact, the emission standards for trucks are considerably more lenient than those for cars (Walsh 1991, 13).

Particularly important are city buses that may not constitute the largest number of heavy vehicles, but have a tremendous impact on urban air quality. City bus emissions are considerably higher than other mobile sources and affect many people because the buses stand to be in operation for several years before being replaced and, logically, they operate in highly populated areas thereby polluting the air of the maximum number of people (Walsh 1991, 13).

The command and control "solution"

How could there be so many flaws in one of the most fundamental air pollution areas? To be sure, unforeseen problems inevitably arise. One illustration is the case of the "Inspection and Maintenance" programs. One way to avoid emissions due to vehicles in disrepair would be to require that they be maintained. The EPA established "Inspection and Maintenance" programs for this very purpose. The details of administration were left to state or local officials using EPA guidelines.

Unfortunately, the results were not uniformly positive. In many cases the drivers were at the mercy of unregulated inspection sites where quality was spotty and ethics were lacking. The more successful states attempted to eliminate unnecessary costs to the consumer by separating inspection

from repair. These centralized facilities concentrate on "high-quality, efficient inspections" (Walsh 1991, 13). In theory, the consumer does not have to worry about profit-hungry mechanics who diagnose non-existent problems only to charge for "fixing" them.

The EPA has set emission limits for criteria pollutants but the inspection is not always the most accurate means of determining whether a vehicle is exceeding the guidelines. A simple idling test that does not adequately replicate average driving conditions will not reveal important emissions violations. For example, it cannot measure emissions of nitrogen oxides that are emitted only when a car is moving at a higher speed (Walsh 1991, 13). However, the EPA has established certain test conditions for manufacturers that are meant to simulate a typical commute in Los Angeles under temperatures that are conducive to ozone. The problem with this test is that the same commute in a colder clime would produce unacceptable amounts of carbon monoxide because of cold engine choking needed to start the vehicle (Walsh 1991, 14).

New solutions for the 1990s: U.S.

The 1990 Clean Air Act has attempted to address and remedy these defects in pollution abatement. First, more stringent tailpipe emission standards are required of all new cars and trucks (Wilson 1991, 15). The catalytic converter which has been installed on nearly every car in the U.S. since 1975 has been responsible for reducing tailpipe emissions by about 95 percent (Wilson 1991, 16). The 1990 Clean Air Act required even better performance, however. It called for a reduction of 30 percent fewer hydrocarbons and 60 percent fewer nitrogen oxides by 1994 (Wilson 1991, 16). These standards will be in effect for 100,000 miles -- double the current requirements. New tests will be run that accurately simulate more weather conditions, and within a few years, diagnostic systems will be installed in all new vehicles that will alert drivers and mechanics to malfunctioning emissions-control equipment (Wilson 1991, 16).

Of course, it would not be necessary to concentrate so much on emissions if fuel burned cleaner. The most important advance the U.S. has made in this regard is the near elimination of leaded gasoline. Steps are being taken now to reduce the volatility of gasoline so fewer fumes escape into the air thereby reducing smog levels (Wilson 1991, 17). In 1995, the nine U.S. cities with the worst smog problems will be required to sell a new reformulated gasoline that reduces smog-forming and toxic pollutants (Wilson 1991, 17). Other cities may opt to sell this "clean" fuel also.

The 1990 Clean Air Act also established a California Pilot Program slated to begin in 1996 that will set an example of what gains can be made by using cleaner burning fuel (Wilson 1991, 17). Vehicle manufacturers must sell 150,000 cars in California with half the emissions levels allowed by law for new cars. The number of cars will increase to 300,000 in 1999 and by 2001 the emissions levels will be reduced by another 50 percent (Wilson 1991, 17).

Despite these measures to reduce toxic emissions, there still remains the problem of the shear number of vehicles on the roads. The EPA has arranged incentive plans for large corporations to invest in vans for their commuters (Wilson 1991, 17). Employers also must think of ways to persuade employees to use mass transit or car pools.

New Solutions for the 1990s: EC

The EC has considerable catching up to do when it comes to the required installation of catalytic converters and the elimination of leaded gasoline, for example. This is not to say, however, that important work has not been done; it just has not been evenly distributed. The inadequacies in EC environmental policy have a great deal to do with the concept of federalism in its simultaneously supranational and intergovernmental system.

The EC has had considerable difficulty achieving agreement by the Member States concerning requiring manufacturers to introduce catalytic converters on new vehicles. The United Kingdom has

been especially obstinate on this count, resisting their mandatory introduction (O'Riordan 1989, 297). Germany and Denmark are exerting significant pressure for the widespread use of the converters as well as the use of a lean burn engine (O'Riordan 1989, 297). The British would prefer to simply wait for the lean burn engine and skip the catalytic converter; they are skeptical of the scientific evidence justifying such a drastic move.

In an effort to use U.S. (and Japanese) standards as a goal, four European countries (none of which are presently EC Member States, Sweden, Norway, Austria, and Switzerland) have banded together to encourage "state of the art" fuel emissions standards in all of Europe. The EC has watered down their proposal by breaking down emission standards according to the size of the vehicle engine and then gradually phasing in the regulations. It is important to note that small cars make up the greatest proportion of the automobile market in the Community, and it is precisely that market that will be phased in slowest (O'Riordan 1989, 297). From a market standpoint, the manufacturers are loath to make extensive modifications of a product that has such a relatively small profit margin.

EC politics have played a part in slowing the rate in which Member States will phase in use of unleaded gasoline. A proposal to establish a date by which all new cars should be capable of running on unleaded gasoline failed. In keeping with its reputation for tough environmental legislation, Denmark was strongly in favor of such a proposal and Greece, although it is a country plagued by serious air pollution especially in Athens, lobbied hard for further funds for reduction (O'Riordan 1989, 299).

Although progress is being made in establishing environmental standards in the Community, it is slow going. The general economic malaise that has descended upon the Community has worsened the prospects for strong action. Germany was first to industrialize and pollute, and in the 1980s, thanks to a strong economy, was able to invest heavily in cleanup and clean technologies. Other Member States were not as fortunate. The United Kingdom did not begin to consider the very large

amount of investment it was going to take to clean and protect its environment until the late 1980s; now Britain's economy is having a hard time putting money in the environment when there are so many other pressing social problems. The same applies to the southern tier countries such as Spain, Portugal, and Italy.

Lessons

The 1967 Air Quality Act marked the beginning of federal air pollution control in the U.S. However, it was largely unsuccessful due to inadequate enforcement. This failure is attributable in large part to the fact that the 1967 "Act was intended to be implemented through the states to satisfy state and industry opposition to central control and to take advantage of decentralized flexibility" (McGrory 1990, 300). On one hand, states lacked access to financial funds and general environmental expertise, on the other hand, states were criticized for simply lacking the will to control air pollution (McGrory 1990, 300)

U.S. Senator Edmund Muskie, one of the chief architects of U.S. environmental policy during the 1960s and the primary author of the 1970 Clean Air Act, points out that one must remember the 1970 Act was an "experimental law" (Muskie 1990, 13). "It defined a new role for government in areas previously believed to involve a private right to a free resource" (Muskie 1990, 17). Experiments rarely are complete, unequivocal successes, often they need time for refinement and adjustment. Such was the case with the early clean air legislation in the United States.

The 1970 Clean Air Act Amendments have certainly received considerable criticism in the years since their enactment. Policy makers and scholars agree that the Act was too ambitious in its command to achieve drastically improved air quality standards. The approach--mandated regulations--proved to be ineffective when not used in conjunction with incentives, marketing, and education. Inadequate time to achieve its goals and lack of scientific knowledge to be able to accurately measure

emissions were major problems. Because deadlines were impossible to meet, extensions were granted over and over again. This resulted in a loss of credibility on the part of the EPA and disillusionment on the part of the public (McGrory 1990, 301).

The EPA

The EPA can serve as the rough model for a similar agency in the EC. The Community currently is preparing to establish the European Environment Agency (EEA) to oversee environmental protection in the Community. This agency has two stated goals, 1) to provide Member States with "objective, reliable and comparable information at the European level enabling them to take the requisite measures to protect the environment, to assess the results of such measures, and to ensure that the public is properly informed about the state of the environment; and 2) to that end, the necessary technical and scientific support" (Wright 1991, 719). The glaring omission in the stated goals of the Agency is that it lacks any capacity for enforcement. It would be beneficial to learn from the mistakes of the U.S. EPA and examine the stumbling blocks it has run across.

The creation of the EPA was symbolic of the schizophrenic attitudes of both the American public and its law makers. On one hand, there was great agreement that protecting our natural resources and preventing the negative externalities associated with industrialization were necessary. On the other hand, there was no consensus as to how best to regulate pollution, and a great deal of disagreement over who was going pay. Laudable aspirations collided with an inadequate grasp of the implications, both economic and otherwise, as well as the blatant unwillingness to act on realization of these aspirations (Lazarus 1991, 314). In sum, in this field there was much more talk than action.

From its inception, the EPA has been viewed with suspicion by those directly involved in its operation, especially the executive and legislative branches as well as the countless interest groups that stood to be affected by EPA regulation. Each competing interest sought to prevent "agency

capture" by an opposing interest (Lazarus 1991, 314). Briefly, there are three versions of agency capture theory, first that the agency over time begins to unite with the industries it is supposedly regulating; second, that the agency personnel succumb to political demands and economic interests and bargain away environmental values; and third, that the agency will be captured by its own liberal, pro-regulatory bureaucracy (Lazarus 1991, 315). EPA failures and shortcomings can be explained by each of these capture theories.

The executive branch in the Nixon administration worried that the new agency's regulation would have too much of an adverse impact on the economy, it therefore sought to curb the jurisdiction of the EPA (Lazarus 1991, 318). And it did; President Nixon suggested that the new agency be non-cabinet level and ultimately it comprised only "nine of the approximately fifty programs then pertaining to the environment" (Lazarus 1991, 316).

The legislative branch, eager to please its constituents with "tough" environmental laws, placed impossible burdens on the EPA, thereby dooming the agency to failure. Wildly unrealistic deadlines were passed into law. In the case of the Clean Air Act, fewer than 15 percent of the deadlines were met and none of them had to do with compliance with environmental quality standards (Lazarus 1991, 325). More than twenty years have passed and the auto companies are still receiving extensions on the original goals of a 90 percent reduction of the major pollutants produced by vehicles (Lazarus 1991, 325). Even if the EPA could succeed in reducing those pollutants it has determined to be dangerous, they represent only "seven of the 274 known hazardous substances emitted into the air" (Lazarus 1991, 325). Members of Congress are equally eager to please the special interest lobbies that are so important in funding their expensive campaigns. Industry has exerted its influence on both the Congress and the EPA to soften the rules.

Although Congress managed to pass strict environmental legislation it could not find the appropriations necessary to adequately fund such ambitious aspirations. From its inception the EPA

has received considerably less funding than would be necessary for even a modicum of success (Lazarus 1991, 329). This situation worsened dramatically under the Reagan administration which drastically cut EPA funding. The Office of Management and Budget (OMB) used its power of "oversight" to prevent what its director in the early Reagan administration, David Stockman, believed would be a total shut down of the economy if EPA rules were put into effect (Lazarus 1991, 332).

The EC Looks West

As the EC searches for the best aspects of the Clean Air Act and its 1990 amendments, the most basic lessons are perhaps the most important. Lessons lie in the realm of the legislative process, compliance with the legislation once it has been established, and a respected organization with authority to act.

First, it is important to avoid being either too ambitious or too rigid. The U.S. legislation set laudable, yet overly idealistic goals but there was no way the private sector would support such radical change and little recognition of how reluctant Americans would be to actually pay for a cleaner environment. Its rigidity lay in its unyielding emphasis on the preservation of health, yet in many cases it lacked the scientific proof of harm. Members of Congress knew they were setting unattainable goals but in many cases they were eager to appear to be the champions of the environment. Likewise, there was an impregnable coalition in Congress that was adamantly opposed to allocating realistic funding for the EPA. Members of Congress tend to focus on short-term goals because they are up for reelection fairly frequently (especially in the House of Representatives) and are hesitant to commit large sums of money for long-term projects that may not be firmly grounded in science.

There is no reason to believe elected representatives in the European Community will act differently. Consequently, it is of the utmost importance that the public understand the complex

issues behind environmental protection. This must be done through a massive educational effort starting with the very young as well as the seasoned taxpayer. The benefits of strict environmental policies in many cases will not be realized for generations, long after the present group of lawmakers is gone. With education and resocialization, the public will be willing to change its lifestyle and demand the necessary changes in managing the environment.

Another important issue in environmental protection is that of noncompliance, an enormous problem both in the U.S. and the European Community. Optimal enforcement encompasses several elements, "the sanction, the resources of the enforcing agency, the severity and certainty of a punishment being imposed or an incentive being awarded, the manner in which the regulated business perceives the enforcement policy, and the enforcement agency's relationship with other branches of government" (DiMento 1989, 112). The U.S. Environmental Protection Agency at one time or another was weak on each of these points.

Fundamental to effective policy is the credibility of the agency. Under the Reagan administration, the EPA suffered immense damage to its credibility with Anne Gorsuch Burford as administrator. "She confirmed the worst fears of those in Congress who were concerned about the agency's potential for deliberately undermining the federal environmental protection laws" (Lazarus 1991, 347). Her appointment to head the EPA represented an attempt on the part of the executive branch to take back the agency's bureaucracy that the Reagan administration felt had been "captured" by environmentalists (Lazarus 1991, 344). The supposed goal was to make the EPA more cost conscious. The effect was the appearance of an agency intimate with the regulated industries and numerous moves that resulted in the crippling of the agency. Personnel was demoralized, in fact, in 1982, 54 percent of EPA employees questioned said "they would make a genuine effort to look for new employment outside the federal government within the following year" (Lazarus 1991, 353).

Once damaged, it is difficult to regain respect and credibility. Compliance with environmental regulations was worst and morale was lowest after the agency suffered extensive budgetary and personnel cuts in the name of "regulatory relief" during the early years of the Reagan administration (Wood 1988,217). Due to budget cuts and frustrations among employees who felt they could not enforce the regulations, a mass exodus of EPA personnel ensued.

The United States has also attempted to deal with the issue of compliance through tough criminal enforcement of pollution laws. The Pollution Prosecution Act was passed by Congress in 1990 (Devaney 1992, 32). The purpose of the Act was to change the perception that penalties are just a cost of doing business. Since the Act was passed, there has been unprecedented growth in the criminal enforcement division of the EPA and consequently many indictments resulting in guilty pleas or convictions (Devaney 1992, 32).

Conclusion

The American public saw the EPA in an increasingly poor light throughout the 1970s and 1980s and this had a seriously damaging impact on the agency. Success of the European Environment Agency will hinge on having the respect of policy makers, bureaucrats, and the European public in general. Policy makers in the EC know what needs to be done and should move quickly to agree on a city in which to base the EEA. If the EPA has been criticized for not being able to ensure compliance, one can only wonder how successful the EEA will be without any power of enforcement. The issue here is clearly one of sovereignty and the degree to which Member States are willing to relinquish some power for the greater good.

Considering the seriousness of the environmental problems that face the EC as well as those that are shared by the entire world, a policy of playing politics displays humanity at its most petty and short-sighted. Lawmakers, bureaucrats, and the public on both sides of the Atlantic must accept the

consequences of their consumer-oriented actions of past centuries when they have been free to pollute relatively free of charge. Citizens must be made keenly aware that nations today are undeniably interdependent and must cooperate if they are to thrive.

The U.S. has made progress in environmental protection but all along the way there have been forces working against it. There is no reason why people cannot have both a clean environment and development. The key is in sustainability. Anything that is not sustainable gives a false sense of wealth, the price for which will be exacted later.

Politicians wield an enormous amount of power in this regard. The EC policymakers must see the importance of establishing the European Environment Agency soon, and begin negotiating a plan acceptable to the Member States in which the agency will have some "teeth" to enforce compliance with some of the most important regulations for the health and well-being of the EC citizenry.

PEREMPTORY CHALLENGE:

AFRICAN-AMERICANS, THE JURY, AND THE CONSTITUTIONALISM OF COMMON LAW

James R. Stoner, Jr.

Louisiana State University

Prepared for delivery at the annual meeting of the

American Political Science Association

Washington, D.C.

September 3, 1993

PEREMPTORY CHALLENGE:

AFRICAN-AMERICANS, THE JURY, AND THE CONSTITUTIONALISM OF COMMON LAW

I. THE BATSON CASES AND THE MARSHALL-THOMAS DISPUTE

In the 1986 case of Batson v. Kentucky,[1] when the United States Supreme Court condemned a prosecutor's use of peremptory challenges to remove black jurors in the trial of a black defendant, Justice Thurgood Marshall wrote a concurring opinion in which he called for, or perhaps predicted, complete abolition of the peremptory device. The Opinion of the Court by Justice Powell tried its best at once to enforce the Fourteenth Amendment's ban on state-sponsored discrimination and to preserve the historical right of the parties in a legal case not only to disqualify all potential jurors from the venire who can be shown to harbor prejudice but also to strike at will a certain number of venireman even without assigning cause. Both objectives had been endorsed in Swain v. Alabama,[2] the Court's previous encounter with the issue some twenty-one years before, and Powell's carefully crafted Opinion purported to modify Swain only by adjusting the evidentiary burden in accord with intervening Equal Protection precedents. Nevertheless, the Court clearly recognized that the implication of the shift was the reversal of the presumption, so that while Swain had left a prosecutor free to remove black jurors unless the defendant could establish his motive was to discriminate on the grounds of race, Batson effectively required that a prosecutor who employed a peremptory challenge to reject a black juror prove to the trial judge that the juror's race was not the reason for his removal. Justice Marshall joined and complimented the Court's Opinion, but he made clear that he thought it did not go far enough "toward

[2] 380 U.S. 202 (1965).

eliminating the shameful practice of racial discrimination in the selection of juries": "That goal can be accomplished only by eliminating peremptory challenges entirely," and this means, since the criminal justice system requires balance, eliminating challenges on the part not only of the government but also of the accused.[3] Though Marshall's concurrence stresses the likely ineffectiveness of the Court's compromise in suppressing discrimination, it was reinforced by the logical difficulty not overlooked in Chief Justice Burger's dissent, namely, how a challenge can still be called peremptory if, upon objection, the party must assign to it a legitimate cause.[4]

The subsequent history of the Batson doctrine forms what could be a textbook study of how, through changes in Court personnel and through the circumstances of particular cases, a doctrine can evolve in a direction that was resisted in its first appearance. In 1990 the Court declined the invitation of a white defendant to forbid prosecutorial use of peremptory challenges to remove blacks from his jury on the theory that the Sixth Amendment's guarantee of an impartial jury entitled him to a panel that was a representative cross-section of the community; writing for a 5-4 Court, Justice Scalia interpreted the Sixth as permitting the historic peremptory as a means to secure impartiality, without regard to cross-sectional characteristics, and he distinguished Batson as establishing an exception on Equal Protection grounds for defendants claiming racial discrimination against themselves.[5] The following year, however, a white defendant whose prosecutor had used his peremptories to strike black veniremen succeeded in getting his conviction

reversed, having relied in his argument on the Equal Protection Clause; the same term, in Edmonson v. Leesville Concrete, the Court extended the Batson rule to civil cases, which, since neither party was a governmental body, meant interpreting state action quite broadly and, incidentally, applying the ban on alleged race-based peremptory challenges to both sides.[6] These precedents in place, it comes as no surprise to learn that in 1992, in Georgia v. McCollum, the Court turned the Batson rule for the first time against criminal defendants, three whites who had used their peremptory challenges to remove blacks from a jury called to judge them on assault and battery charges that they beat a black couple.[7] And the Court has agreed to hear this coming term an Equal Protection complaint to the state's use of peremptory challenges to exclude members of the defendant's sex -- here in paternity proceedings[8] -- offering the prospect that the developed Batson scheme will be applied beyond the racial context and thereby, if not entirely fulfilling Marshall's goal of the outright abolition of peremptory challenges, at least validating Burger's prediction in his Batson dissent of their eventual extinction.

Justice Clarence Thomas, Marshall's successor on the Court, concurred in Georgia v. McCollum -- he thought the result mandated logically by the Court's decision in Edmonson -- but he wrote separately "to express my dissatisfaction with our continuing attempts to use the Constitution to regulate peremptory challenges." Like nearly every modern justice who has written on race and the jury, he invoked the precedent of Strauder v. West Virginia, the 1880 case in

which the Court for the first time reversed a conviction because of the exclusion of blacks, by state law, from jury service, but in a striking departure from earlier dicta, Thomas claimed that Batson and the line of cases following from it betrayed Strauder, rather than, as their authors had asserted, fulfilling it. "[T]hat conscious and unconscious prejudice persists in our society and that it may influence some juries" is for Thomas a reason to preserve the peremptory challenge intact, not an occasion for its abandonment and replacement by judicial monitoring that would at most insure in jurors and in parties appearing in court outwardly correct behavior in matters pertaining to race. "I am certain," he writes, "that black criminal defendants will rue the day that this court ventured down this road that inexorably will lead to the elimination of peremptory strikes."[9]

The opposition of perspective between the only two African-Americans to sit on the Supreme Court will surprise no one who has observed the Court or American politics in recent years, but it would be superficial, not to mention condescending, to dismiss their disagreement as a reflex of ideological posture. For one thing, in their assessment of the persistence of racial prejudice in America and of the fact that it marks our system of criminal justice they substantially agree, and both express this view with the authority that comes from experience. Moreover, neither is satisfied with the compromise worked out by the Court majority of carving out exceptions to the peremptory challenge, but each seeks rather a crisp and authoritative rule. In the discussion that follows, I do not intend to explore the differences between Justices Marshall and Thomas in particular detail, nor will I develop systematically an analysis of the changes of personnel and position that characterize

---

the peremptory challenge cases, but I will suggest that the disagreement on the Court concerning this matter reflects a larger pattern in American constitutionalism, the tension between the common law heritage of that constitutionalism on the one hand and its modern interpretation in the light of liberal political theory on the other. Since the liberal influence is better known and, in the contemporary era, undeniable, I will concentrate where I am at any rate obliged to begin, with attention to the jury at common law.

II. THE COMMON LAW JURY, THE CONSTITUTION, AND THE PEREMPTORY CHALLENGE

The jury may not be the most ancient institution of the common law, but it is surely among its most distinctive. William Blackstone repeated the traditional account of its origins in the fog of pre-Norman England, but modern historians date the trial or petit jury to the thirteenth century, the catalyst for its establishment having been the decree of the Lateran Council in 1215 forbidding clerical participation in trial by ordeal. (The inquest or grand jury is apparently somewhat older still, having grown with the rise of royal courts in the centuries following the Conquest.) By 1600, many of its now-familiar characteristics were well settled: the jurors sat alongside a judge, who was responsible for administering the trial and giving them their charge; juries sat in civil as well as criminal cases; though there were at law means for punishing false or tainted verdicts, juries had in practice substantial leeway to render a "verdict according to conscience" and thus could effectively nullify the effect of unpopular laws by returning a verdict of "not guilty"; and in the selection of jurors criminal defendants could challenge and remove jurors both for cause and a certain number peremptorily, while the Crown in criminal prosecutions and the parties in civil disputes were given various means, dependent on the number of veniremen the sheriff was able to produce, to

remove jurors before whom they did not wish to try their case. To submit one's case to the jury was, in the formula of common law, to put oneself upon "the country," and the jurors were said to be "twelve free and lawful men" or "twelve good men and true."[10]

The American colonists brought the jury with them from England along with the common law. In fact, historians have argued, the American jury in colonial times surpassed its English counterpart in authority, partly because eighteenth-century English judges were developing ways to limit juries, partly because the paucity of printed legal sources and the inaccessibilty of the courts in Westminster encouraged the colonial jury often to determine not only the facts of the case but also the governing law.[11] The best known instance of the power of colonial juries to settle the law is probably the seditious libel trial of Peter Zenger, whose acquittal signaled the legitimacy of truth as a defense in libel cases. Among the complaints lodged against the Parliament and the King in the struggle that led to the Revolution were their inroads against the right to trial by jury: this is protested in the Declaration of the Stamp Act Congress, the Virginia Resolves of 1769, the Declaration and Resolves of the First Continental Congress, and the Second Congress' Declaration of the Causes and Necessities of Taking Up Arms, as well as in the Declaration of

Independence.[12] Naturally the first state constitutions carried guarantees of the right to a jury trial.[13]

The place of the right to trial by jury in the Constitution of 1787 is of course a matter of interest to judges interpreting that document today, and it turns out not to be a simple tale. Article III, section 2, clause 3, of the Constitution guarantees the right, as follows:

> The Trial of all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed; but when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed.

To the Anti-Federalists this clause was not specific enough concerning the criminal jury and, by its silence concerning the civil jury, seemed to portend its abandonment in federal law; hence, the Sixth and Seventh Amendments:

> In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed; which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defence.
>
> In Suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any Court of the United States, than according to the rules of common law.

It must be admitted that the omission of the civil jury in the Philadelphia document was probably no accident; Hamilton defends its absence in Federalist No. 83, doubting the importance of the civil jury for liberty, and, as the Anti-Federalists probably sensed, the necessarily local character of the jury

[13]Ibid., pp. 333, 343.

cut against the grain of every other institution the Constitution established. Several of the procedures enumerated in the Sixth Amendment were unknown to the ancient common law, having been established by Parliamentary statute in the seventeenth or eighteenth century, but the jury itself, and the vicinage requirement, were long-settled. In the Seventh Amendment the common law is made the explicit point of reference, even to the point of open incorporation of some of its unwritten rules.

The federal constitutional law of the jury could probably fill a volume, even exclusive of the cases pertaining in one way or another to race. Modern students are perhaps most familiar with the decisions from the late Warren and the Burger eras, incorporating the jury right into the Fourteenth Amendment and thus applying it to the states, allowing, however, juries smaller than twelve or non-unanimous verdicts in state courts.[14] Numerous earlier cases raised matters of federal law concerning the jury, not least the question of peremptory challenges. From the start, Blackstone's account was taken as the authoritative rendering of English common law at the time of the Founding: The criminal defendant was to be allowed thirty-five peremptory challenges when tried for treason and twenty when on trial for other felonies, while the crown, as the result of a statute passed in the early 1300s, was allowed no challenges not for cause, but the prosecutor was by custom allowed to ask veniremen to stand aside without assigning cause, and they would be excused from serving unless they were needed to achieve a jury of twelve. Blackstone's account of the reasons behind the right has likewise been a common point of reference, and is worth quoting at length:

---

[14] Duncan v. Louisiana, 391 U.S. 145 (1968), Williams v. Florida, 399 U.S. 78 (1970), Apodaca v. Oregon, 406 U.S. 404 (1972), Ballew v. Georgia, 435 U.S. 223 (1978), Burch v. Louisiana, 441 U.S. 130 (1979).

> ...in criminal cases, or at least in capital ones, there is, in favorem vitae, allowed to the prisoner an arbitrary and capricious species of challenge to a certain number of jurors, without shewing any cause at all; which is called a peremptory challenge: a provision full of that tenderness and humanity to prisoners, for which our English laws are justly famous. This is grounded on two reasons: 1. As every one must be sensible, what sudden impressions and unaccountable prejudices we are apt to conceive upon the bare looks and gestures of another; and how necessary it is, that a prisoner (when put to defend his life) should have a good opinion of his jury, the want of which might totally disconcert him; the law wills not that he should be tried by any one man against whom he has conceived a prejudice, even without being able to assign a reason for such his dislike. 2. Because, upon challenges for cause shewn, if the reason assigned be proved insufficient to set aside the juror, perhaps the bare questioning his indifference may sometimes provoke a resentment; to prevent all ill consequences from which, the prisoner is still at liberty, if he pleases, peremptorily to set him aside.[15]

In 1790 Congress by statute adopted the English numbers for challenges by defendants, with subsequent statutes generally settling on twenty peremptories in capital cases and ten in others. Justice Story's opinion in United States v. Marchant discussed peremptory challenges in the context of a case where the precise issue was whether or not criminal suspects could be tried jointly against their own wishes, the ground of the complaint being that one defendant in a joint trial might wish to retain a juror the other challenged. Story ruled against the claim, since "The right of peremptory challenge is not, of itself, a right to select, but a right to reject jurors"; besides, Story reinforced the conclusion that the defendant had no right to select by finding that the right of the crown to ask jurors to stand aside was a "qualified and conditional exercise of the same right" of peremptory challenge.[16] The implication of this last point is that for Story the common law right of the

---

[16]United States v. Marchant, 12 Wheaton 480; the quotation is at 482. See also the account of the history of the peremptory in Swain v. Alabama, 380 U.S. at 201 ff.

government to set aside jurors in criminal cases is incorporated in federal law, if not through the Sixth Amendment at least through congressional statute, though he notes in passing a diversity at the state level on the question of government peremptories. An 1840 statute directing federal courts to constitute juries according to the law of the state in which they sit obviously complicated the matter, and in 1856, the Court held that, while the 1790 specification of defendant peremptories survived the 1840 act, the implication of a corresponding qualified right in the prosecutor did not, its existence now to be determined by the applicable law of the state.[17]

In 1865 Congress gave the government five peremptories where the defendant had twenty and two where he had ten. Perhaps in response, strong dicta in favor of the defendant's peremptory right appeared some years later in Lewis v. United States -- "The right of challenge comes from the common law with the trial by jury itself, and has always been held essential to the fairness of trial by jury" -- a case involving whether challenges could be made by separate lists given to the government and the accused where the record did not show that the defendant was present as the challenges were made, the Court deciding with the defendant that he had a right to inspect his potential jurors face to face.[18] But in Stilson v. United States, a criminal prosecution for conspiracy to violate the World War I Espionage Act, faced with a constitutional challenge to the provision of the 1865 statute that treated multiple defendants as a single party in apportioning peremptories, the Supreme Court upheld the statute, ruling:

There is nothing in the Constitution of the United States which

[17]United States v. Shackleford, 18 Howard 588 (1856).

[18]Lewis v. United States, 146 U.S. 370 (1892); the quotation is at 376.

> requires the Congress to grant peremptory challenges to defendants in criminal cases; trial by an impartial jury is all that is secured. The number of challenges is left to be regulated by the common law or the enactments of Congress.[19]

Without regard to the dicta in Lewis or to the authority of Story's opinion in United States v. Marchant, both cases decided implicitly as matters of federal common law, the Court treated the peremptory challenge simply as "a privilege granted by the legislative authority" which therefore "must be taken with the limitations placed upon the manner of its exercise."[20]

Before turning to the cases involving the jury and race, one further decision deserves mention. In the 1930 case of Patton v. United States, the Court ruled that it was the defendant's right to waive a jury trial without there resulting a violation of the constitutional mandate that "The Trial of all Crimes...shall be by Jury." Reading this passage as invoking the same "right to...trial by...jury" mentioned in the Sixth Amendment, Justice Sutherland's scholarly opinion notes that the courts of different states had decided the question in different ways as a matter of state law, but he finds greater force in the argument that, since the defendant can waive his right to trial altogether by pleading guilty, he can take the lesser step of waiving a jury trial, rejecting the claim that as a matter of public policy the people have an interest in insuring a jury trial that can override any claim of the defendant to waive a jury.[21] For our purposes, the opinion is of interest on two counts. First, the jury trial is defined as a right to which the defendant is entitled, not as a process that the state can impose. Second, Sutherland's

reasoning contains an important paradox, for while he "demonstrate[s] the unassailable integrity of the establishment of trial by jury in all its parts, and make[s] clear that a destruction of one of the essential elements has the effect of abridging the right in contravention of the Constitution," he also acknowledges that in English common law the right to trial by jury could not be waived as he now would allow.[22] Citing the maxim, "It is contrary to the spirit of the common law itself to apply a rule founded on a particular reason to a law when that reason utterly fails -- cessante ratione legis, cessat ipsa lex," Sutherland finds that the disallowal of waiver at common law depended on several now-abandoned conditions of the ancient common law: "the accused could not testify in his own behalf; in felonies he was not allowed counsel...; and conviction of crime worked an attaint and forfeiture of official titles of inheritance," thus implicating third parties whose own rights a defendant could not be presumed to waive. He concludes: "These conditions have ceased to exist, and with their disappearance justification for the old rule no longer rests on a substantial basis."[23] The right to trial by jury is a right of the accused, but the form of the jury, though largely fixed, can in some particulars be altered by the course of reasoning characteristic of common law.

III. RACE AND THE JURY: THE EARLY YEARS

It was one of the glories of English law, wrote Blackstone in 1765, that to it slavery was unknown: "[T]his spirit of liberty is so deeply implanted in

---

[22] Ibid., at 290. At issue in this part of the case is whether the issue of complete waiver must be raised in order to allow the defendant to accept a verdict by an eleven-man jury when, as happened in the actual case, a juror took ill before deliberations. Justice Sutherland ruled it must: waiving a unanimous verdict by a twelve-man jury meant waiving the right to a jury.

[23] Ibid., at 307. Sutherland also notes that American practice in colonial times often differed from the English rule, allowing waiver of trial by jury.

our constitution, and rooted even in our very soil, that a slave or a negro, the moment he lands in England, falls under the protection of the laws, and with regard to all natural rights becomes eo instanti a freeman."[24] He had behind him the authority of Smith v. Gould, where the Court had written:

> ...the common law takes no notice of negroes being different from other men. By the common law no man can have a property in another, but in special cases, as in a villain, but even in him not to kill him: so in captives took in war, but the taker cannot kill them, but may sell them to ransom them: there is no such thing as a slave by the law of England[25]

-- suggesting not only that the common law conferred liberty but that it was, to use Justice Harlan's later phrase, color-blind. In 1772, Lord Mansfield's opinion in Somerset v. Stewart affirmed this view, writing that slavery was "so odious, that nothing can be suffered to support it but positive law."[26] Generally accepted as law in America, the Somerset doctrine kept common law relatively immune to the peculiar institution, requiring its establishment and regulation by statute. When slavery was abolished by the Thirteenth Amendment and its incidents in law insured against in the Fourteenth, and in politics in the Fifteenth, it was to be expected that the old policy of the common law would reappear.

This helps explain the 1880 case of Strauder v. West Virginia and its companions, which to the twentieth-century mind seem in such sharp contrast to the Court's decision three years later striking down the equal accommodations provisions of the Civil Rights Act of 1875, not to mention its decision

upholding segregation the following decade in Plessy v. Ferguson.[27] As I noted at the outset, the Court in Strauder overturned the conviction of a black defendant on the grounds that West Virginia law had excluded blacks from the jury venire. The Court used sweeping language frequently quoted in modern cases -- the Fourteenth Amendment established for blacks "a right to exemption from unfriendly legislation against them distinctively as colored" -- but it also paid particular attention to the special character of the institution in dispute:

> The very fact that colored people are singled out and expressly denied by a statute all right to participate in the administration of the law, as jurors, because of their color, though they are citizens, and may be in other respects fully qualified, is practically a brand upon them, affixed by law, an assertion of their inferiority, and a stimulant to that race prejudice which is an impediment to securing to individuals of the race that equal justice which the law aims to secure to all others.... The very idea of a jury is a body of men composed of the peers or equals of the person whose rights it is selected or summoned to determine; that is, of his neighbors, fellows, associates, persons having the same legal status in society as that which he holds.

After a quotation from Blackstone there follows the passage quoted by Justice Thomas in McCollum, acknowledging "that prejudices often exist against particular classes in the community, which often sway the judgment of jurors," and marking the command of the Fourteenth Amendment as the remedy against this mischief -- thus declaring unconstitutional the West Virginia law. Before proceeding to uphold a provision of the Civil Rights Act that allowed removal to federal court of a case where civil rights are denied in a state tribunal, the Court does add the following qualification:

> We do not say that within the limits from which it is not excluded by the amendment a State may not prescribe the qualifications of its jurors, and in so doing make discriminations. It may confine the

---

[27] Strauder v. West Virginia, 100 U.S. 303 (1880); cf. Civil Rights Cases, 109 U.S. 3 (1883); Plessy v. Ferguson, 163 U.S. 537 (1896).

> selection to males, to freeholders, to citizens, to persons within certain ages, or to persons having educational qualifications. We do not believe the Fourteenth Amendment was ever intended to prohibit this.... Its aim was against discrimination because of race or color.[28]

Strauder's companion cases, Virginia v. Rives and Ex parte Virginia, make clearer what the Court was and was not holding.[29] In the first of these, the Court rejects a request for removal to federal court of a murder trial of two blacks in Virginia who, alleging the existence of prejudice against them as black, sought a jury one-third of whose members belonged to their race. While the case is disposed of on the technical question -- removal is not appropriate because Virginia law did not discriminate against blacks, while error in practice could be reviewed on appeal -- the Court seems clearly indisposed to mandate racial balance on particular juries. In Ex parte Virginia, by contrast, it upholds federal criminal proceedings under civil rights law against a Virginia county judge accused of excluding all blacks from the jury list he is charged by state law with devising. As the Court put the matter in relation to whites in Strauder, "every...man is entitled to a trial by a jury selected from persons of his own race or color, or, rather, selected without discrimination against his color."[30]

Justice Field, joined by Justice Clifford, wrote separately in each case, concurring in Rives but dissenting in Strauder and Ex parte Virginia. The Rives concurrence makes clear his own theory of the Fourteenth Amendment: It reaches only discriminatory legislation, not the acts of state officials,

---

[30] 100 U.S. at 309.

except insofar as the latter are governed by state law. In the Ex parte Virginia dissent, which he applies also to Strauder, Field explains the fallacy he sees in the Court's reasoning as a failure to distinguish political from civil rights as well as a willingness to trample on the rights of the states, which, except for the new prohibition on race-directed legislation, he does not see altered from the original federal plan by the new amendments. The right to sit on a jury is a political right, to his mind, and thus its assignment is, like that of all office-holding, left to the discretion of the states. Indeed, he sees as significant the silence of the Fifteenth Amendment on jury participation, concluding that the only political right guaranteed was the right to vote, with the vote then trusted to secure all else.[31] The majority, by contrast, does not draw a distinction between political and civil rights, moving quietly, as the quotations show above, between the rights of jurors to participate and the rights of the accused.

Modern cases on race and the jury begin with Norris v. Alabama, one of the Scottsboro cases. Here and in a series of decisions over the next several decades, the Court threw out convictions when it was convinced that the process by which jurors were called was systematically discriminatory against blacks.[32] Although the Court came to show less sympathy than the Strauder Court suggested toward apparently neutral qualifications that had a disproportionate effect in excluding blacks from the jury pool -- no doubt the long experience with the devices used to restrict black suffrage was not lost upon the justices -- the Court nevertheless seemed committed to the same end as the

---

[31] 100 U.S. at 361.

[32] Norris v. Alabama, 294 U.S. 587 (1935); see the cases cited in Justice Goldberg's dissent in Swain, 380 U.S. at 228-29, and in Justice Scalia's dissent in Powers v. Ohio, 111 S.Ct. 1364, at 1374-75.

Court in Strauder, namely, that blacks not be excluded from the pool of available jurors and thereby from the venire. The Court's attention to the venire rather than to the actual jury seems intended to avoid any infringement of the traditional practices whereby veniremen were reduced into juries, but the eventual irony is that focusing on the venire turned the justices attention toward the right to sit on a jury, already evident in Strauder dicta, and away from the right of the accused to a jury that was, if not of his choosing, at least not imposed upon him without some exercise on his part of choice.

IV. FROM SWAIN TO BATSON

The discussion above of the peremptory challenge on the one hand and on the other of the Court's early opinions demanding the absence of racial discrimination in the selection of veniremen shows the two clearly on course for collision. The race cases aimed to remove race prejudice as a cause for disqualifying jurors, but the peremptory challenge is, in Blackstone's words, quoted above, "arbitrary and capricious," its usefulness consisting precisely in the license it allows to a defendant even, or especially, at the moment he is on trial for his life. In Swain v. Alabama the two principles indeed collide, and Justice White's Opinion of the Court seeks to have it both ways, allowing the peremptory to win out in the case at hand while reserving the racial claim for a better record. To his credit, White does not shy away from admitting the arbitrary character of the peremptory:

> The essential nature of the peremptory challenge is that it is one exercised without a reason stated, without inquiry and without being subject to the court's control.... It is...frequently exercised on grounds normally thought irrelevant to legal proceedings or official action, namely, the race, religion, nationality, occupation or affiliations of people summoned for jury duty.... In the quest for an impartial and qualified jury, Negro and white, Protestant and Catholic, are alike subject to being challenged without cause.

Recognizing that "to subject the prosecutor's challenge in any particular case to the demands and traditional standards of the Equal Protection Clause would entail a radical change in the nature and operation of the challenge," since a challenge "open to examination" would by definition no longer be peremptory, and describing the purpose of the peremptory as "not only to eliminate extremes of partialiity on both sides, but to assure the parties that the jurors before whom they try the case will decide on the basis of the evidence placed before them, and not otherwise," White upholds the right of challenge -- in the particular case before him, where there is, to the Court's mind, no adequate showing of systematic racial discrimination in its use.[33]

The final section of the Swain Opinion acknowledges that the claim that the Talladega County prosecutor has used the peremptory challenge systematically to exclude blacks "raises a different issue and it may well require a different answer." In Batson v. Kentucky that issue is brought to the fore and the different answer rendered. Because Equal Protection standards had changed in the interim to shift the burden of proof when black underrepresentation can be documented, and, as Justice White notes in his concurrence, because Swain "should have warned prosecutors that using peremptories to exclude blacks on the assumption that no black juror could fairly judge a black defendant would violate the Equal Protection Clause," the Court alters the balance between the two rights, allowing peremptory challenges themselves to be challenged for discriminatory intent.[34] Quoting extensively from Strauder at the outset of his Opinion and finding that "[w]hile decisions of this Court have been concerned largely with discrimination during the selection of the venire, the

---

[34]476 U.S. 79; the quotation is at 101.

principles announced there also forbid discrimination on account of race in selection of the petit jury," Powell concludes:

> The reality of the practice, amply reflected in many state- and federal-court opinions, shows that the challenge may be, and unfortunately at times has been, used to discriminate against black jurors. By requiring trial courts to be sensitive to the racially discriminatory use of peremptory challenges, our decision enforces the mandate of equal protection and furthers the ends of justice.[35]

Powell's Opinion in Batson might seem to follow in the tradition of Sutherland's rationalization of the ancient common law in Patton, but an important difference should be noted. While Sutherland pays attention to the niceties of form in the jury process, adjusting the old rule only in the light of established procedural innovations, Powell turns from the form to the end, the "reality," the apparent result, replacing the formal rule with a call for judicial sensitivity. In his dissent then-Justice Rehnquist quotes the passage from Swain explicitly permitting peremptory challenges for undefended racial suspicions, adding "there is simply nothing 'unequal' about the State's using its peremptory challenges to strike blacks from the jury in cases involving black defendants, so long as such challenges are also used to exclude whites in cases involving white defendants, Hispanics in cases invlolving Hispanic defendants, Asians in cases involving Asian defendants, and so on,"[36] but the reminder falls on deaf ears. That the peremptory challenge survived unimpaired for so long, despite having been denied constitutional status since Stilson, while the Equal Protection Clause is obviously a constitutional command, is testimony to the authority of common law in our constitutional system, especially when at issue is a matter related to a criminal trial. That the reasons

---

[35]476 U.S. at 88, 99.

[36]476 U.S. at 137-38.

once given in its defense now seem so inadequate to the modern sensibility suggests the frailty of the common law way of thinking in the contemporary mind.

V. AFTER BATSON: COMMUNITY CLAIMS OVER DEFENDANT RIGHTS

As noted above, Justice Scalia's Court Opinion in Holland v. Illinois seemed to breathe life back into the peremptory challenge, as, without overruling Stilson, it anchored the peremptory in the Sixth Amendment right to an impartial jury and rejected the claim that that right includes a command that the jury mirror a cross-section of the community where the crime took place. But Scalia could gain a majority only because the petitioner in the case explicitly rested his claim exclusively on the Sixth Amendment, precluding any reliance on the Fourteenth. When the following term a similar case came with the Fourteenth Amendment claim properly raised, the Court did not hesitate to extend the Batson rule, now to state challenges of blacks in a case involving a white defendant, despite explicit language in Batson requiring a defendant challenging the use of a peremptory to "show that he is a member of a cognizable racial group."[37] Justice Kennedy's Court Opinion emphasizes not the defendant's right to a fair trial but the jurors' right to judge: "The opportunity for ordinary citizens to participate in the administration of justice has long been recognized as one of the principal justifications for retaining the jury system," he writes, and he goes on to quote Tocqueville on the political value of the jury, including even Tocqueville's qualification, "I do not know whether the jury is useful to those who are in litigation; but I am certain it

---

[37] 476 U.S. at 96. The new case was Powers v. Ohio, 111 S.Ct. 1364 (1991).

is highly beneficial to those who decide the litigation"[38] -- as though a defendant facing life imprisonment had in mind to vindicate the benefits that would flow to his judges without considering whether his own interest is thereby served. The consequences for the doctrine of third-party standing were among the objections in Justice Scalia's dissent.

The clear shift in focus between Holland and Powers from the defendant's rights to the community's participation prepared the judgment in Edmonson v. Leesville Concrete Co., where the right to object on racial grounds to peremptory strikes was extended to civil litigants. Again speaking through Justice Kennedy, the Court was here obliged to extend the concept of state action -- since the basis of the claim was, after, the Fourteenth Amendment -- to include as state actors both the parties to a civil dispute and the jurors themselves: The judge, "who beyond all question is a state actor," is the one who actually excuses the jurors to whom the parties object, while the jury's ability to make final determinations of fact, to weigh the gravity of civil wrongs, and by their findings to preclude later dispute "are traditional functions of government, not of a select, private group beyond the reach of the Constitution." Indeed, pursuing the Tocquevillian analysis without further citation and with the modern rather than the Tocquevillian citizen in mind, Justice Kennedy remarks that "[t]he quiet rationality of the courtroom makes it an appropriate place to confront race-based fears or hostility by means other than the use of offensive stereotypes." As for the old common law rationale, it is openly overridden:

> It may be true that the role of litigants in determining the jury's composition provides one reason for wide acceptance of the jury

[38] 111 S.Ct. at 1368, quoting Democracy in America (Schocken, 1961), vol. I, p. 337.

> system and of its verdicts. But if race stereotypes are the price for acceptance of a jury panel as fair, the price is too high to meet the standard of the Constitution.[39]

The logic of the step from Powers to Edmonson is clear enough once one accepts that the rights of the litigants in the matter of jury composition are altogether secondary to the claims of jurors to be impaneled without regard to race. What went unnoticed by the Court, perhaps precisely because a civil dispute between two private parties was at issue, was that in Edmonson the objection to the use of peremptories was allowed for the first time against peremptories employed by a defendant. In Georgia v. McCollum scrutiny of criminal defendants' peremptories is upheld, generating Justice Thomas's objections quoted at the outset of this paper as well as dissents from Justices O'Connor and Scalia, the latter of whom comments on the absurdity of holding that "[a] criminal defendant, in the process of defending himself against the state,...to be acting on behalf of the state."[40] Here Justice White's willingness back in Swain to equate prosecutorial peremptories, which had been qualified at common law, with defendants' peremptories, which had been absolute,[41] now serves not to shore up the prosecutor's right but to dismantle the defendant's. Whether the peremptory challenge will survive in any form remains an open question. It is hard to see how, in the case anticipated by Justice Thomas where the state objects to a black defendant's use of the peremptory against a white juror he suspects of prejudice, the Court would be able to do anything but sustain the objection. As for extension of the Batson rule to the

[41]380 U.S. 202, at 222, quoting Hayes v. Missouri, 120 U.S. 68 (1887), at 70; see also Justice Marshall's concurrence in Batson, 476 U.S. at 107.

use of the peremptory to exclude members of one or the other sex, it seems almost certain, especially given the Court's 1975 decision in Taylor v. Louisiana striking down a law that made women less likely to be called for jury duty.[42] And if extended to sex, it is hard to imagine any class that now qualifies for heightened scrutiny under the Equal Protection Clause being immune to having its rights to serve on juries invoked by defendants eager to find some grounds to have their convictions reversed. At that point, the peremptory challenge, if not quite dead, will certainly have been retired.

What is lost with the end of the peremptory challenge? The lawyer would be better able to predict, or already able to recount, the effect on the courtroom: the peremptory challenges not risked, the trivialization of challenges for cause, and the like. My concern in conclusion is with the larger effect on our way of thinking about law. The modern discomfort in the face of an arbitrary challenge -- that is, a challenge to which no cause is expressly assigned -- belongs to the general trend toward rationalization in the law, but it thereby also belongs to the gradual weakening of respect for individual consent. It never was strictly a dictate of reason that the defendant have some role in choosing his judges, since pure reason would rather give judgment to a rational man; it was never strictly a dictate of reason that, granted some role in the choice, the defendant should be able to choose, albeit by exclusion, without giving a reason adequate to convince the rational authority in charge. But neither is it strictly according to reason that jurors be permitted to give their verdicts without having to render their reasons, much less that those verdicts be unreviewable. That the fabric of the law is full of moments where an absolute though circumscribed prerogative is allowed is due in

---

[42] 419 U.S. 522.

part to the necessity of finality in human affairs: Not every question can be debated endlessly in practice, as of course many can and indeed must in theory. But it is also due to the genius of our own law, and especially to its common law heritage, with its tender concern for the individual's conscience and dignity (think here of the privilege against self-incrimination) and its subtle insurance that such prerogatives are spread throughout the law and thus throughout society, instead of being concentrated, as the logic of modern rationalism always has it, in the reason of some sovereign, whether a representative assembly, a democratic majority, or an unelected judge. When one is sure of the presence of a wrong, as racial prejudice, the temptation to seek its eradication at whatever cost to constitutional forms seems irresistible. But if it happens that, after years of sustained effort, the prejudice itself seems not only not to disappear but sometimes even to be growing, it is reasonable to suggest that we might wonder whether our chosen instruments are adequate to the task. In particular, one might consider whether settled prejudice can better be countered by other men's reasons or by allowing, at some risk of its advancement, that it be permitted its assertion and thereby forced to stand on its own authority or to listen to the voice of reason from within. It would be foolish to see in the demise of the peremptory challenge the end of our constitutional order. But neither constitutionalism nor racial harmony will be served by the steady erosion in the law of individual responsibility for reflection and choice.

Electoral Bugaboos?
The Impact of Attitudes Towards Gay Rights and Feminism on the 1992 Presidential Vote

Introduction

The salience of conflict over gay rights, at least at the national level, has never been at all close to its recent high level. Issues of this sort only climbed high on the national political agenda during the 1992 election campaign, and especially with the emergence of the "gays in the military" issue shortly after the election and Clinton's subsequent inauguration. The Times Mirror monthly survey of news attention found in its February 1993 survey that the public reported paying an extraordinary amount of attention to the gays-in-the-military news story, almost as much attention as they paid to Clinton's budget plan that was presented at the time.[1]

Meanwhile, the political science literature is practically barren of any study of attitudes towards gays and gay rights policies, and thus also any analysis of the extent to which more general political attitudes, such as evaluations of candidates or parties, or political behaviors such as voting are shaped by attitudes towards this very politically active and highly controversial group. The relevant published literature is largely limited to work by Art Miller, et al, suggesting that animosity towards gays hurts support for the Democratic

---

[1]In the Times Mirror monthly News Interest Index survey (Feb. 20-23, 1993) 45% of the public said they paid "very close" attention to the gays-in-the-military story. That compares with 49% for the Clinton budget plan, 24% for the two failed Attorney General nominations, and 15% for the war in Bosnia. This gay-related issue seems to have been one of the most attention-grabbing domestic news stories in the recent history of the Times Mirror poll (going back at least to 1986). Thomas Rosenstiel, "Poll Finds 49% of Americans Focused on Clinton Plan," Los Angeles Times, March 3, 1993, p, A10.

Party, as well as a few pieces of research on tolerance for gays and people with AIDS.[2] No research analyzes the impact of gay-related attitudes on evaluations of political candidates or officeholders.

As such, the magnitude of any political impact of attitudes towards gays, its persistence, its mechanism, its electoral implications, the conditions under which it occurs, and important connections with other attitudes and broader dimensions remain almost completely unanalyzed by social scientists. Now, however, analysts have available extensive survey data on gay-related attitudes, from the 1992 American National Election Study, that enables an investigation into these questions.

This paper will begin such an inquiry, focusing on the 1992 electoral contest and ramifications of the Republicans' "family values" campaign theme. Moreover, it will suggest what the findings about voters in 1992 might tell us regarding basic concerns in the study of tolerance, American political parties, as well as the political connection of gender and sexuality. We will demonstrate that the "family values" conflict did indeed appear to have a number of important effects in 1992: (1) It pushed Republican and Democratic party identifiers substantially farther away from each other in their attitudes towards gays, gay rights, and feminist concerns, producing partisan gaps that had not existed just four years earlier; (2) It encouraged attitudes toward gays and feminists to become more tightly

Kenski, "Who Wants To Quarantine Persons with AIDS? Patterns of Support for California's Proposition 64", Social Science Quarterly, vol. 71, 1990, 239-249.

associated in minds of the voters; (3) It resulted in voting decisions more closely tied to attitudes towards gay rights and towards feminism; and (4) As the Republicans seem to have concluded, attacking the Democrats on gay rights appears to have been costly because it drove an appreciable portion of the Republican identifiers into the Clinton camp, and won over many fewer Democrats in return. This in turn, we believe, suggests that attempts to mobilize intolerance today could be harmful to the interests of those pursuing such an aim when the public does not find the target to pose a "clear and present danger."

Background

In the 1992 presidential campaign, gays and gay rights became the focus of national political conflict unprecedented in both salience and intensity. In southern states, Pat Buchanan ran primary campaign ads showing gays and lesbians parading in drag and leather, suggesting that George Bush indirectly supported gays through allowing funding for some homoerotic art. At the same time, Bill Clinton and Paul Tsongas were occasionally asked about their positions on gay issues.

Yet it was not until the Republican convention that a central, if not the central campaign issue became the "family values" theme. One New York Times journalist described the Republican campaign emphasis during August of 1992:[3]

> Beginning with a speech by Patrick J. Buchanan on Monday night and continuing with remarks by other Republicans over the last two days, the party made it clear that it would make its opposition to homosexual rights a major isue in the campaign, portraying Bill Clinton and the Democrats as wanting to give preferential treatment to gay men and lesbians.

---

[3]Jeffrey Schmalz, "Gay Rights and AIDS Emerging as Divisive Issues in the Campaign," New York Times, August 20, 1992

> The Republican comments -- coming after a strong endorsement of gay rights by Mr. Clinton during the primary season and by Democrats at their convention last month -- means that for the first time, the Presidential candidates are engaging in open debate over sharply different views on gay rights and AIDS. It comes as AIDS has made homosexuals a bigger poliitical presence as a result of increased fundraising and organization.
>
> 'It could be the wedge issue of this campaign, the Willie Horton issue,' said William Schnieder, a political analyst with the American Enterprise Institute . . . It's not clear how it is going to play out, because we've never had it in a Presidential race before."

The Republican "family values" rhetoric often tied together gay and gender-related issues. Buchanan's prime time convention address pointed to what he saw as the combined horrors of a Clinton America with abortion on demand, women in combat, and gay rights. The Reverend Pat Robertson voiced similar concerns from the same podium. As Thomas Edsall argued at the time, "family values" was "a convenient catch phrase for a series of deeply polarizing . . . conflicts arising from the changing role of women, the gay rights movement, the deterioration of the nuclear family, and the emergence of minority-preference civil rights policies."[4]

As it turned out, Edsall was prescient: the "family values" conflict does indeed appear to have polarized the electorate, particularly sharply, as we shall see in detail shortly, along partisan lines. But there has long been reason to expect that such a high profile campaign conflict over gay rights would resonate divisively with the American electorate. For one thing, the idea of homosexuality and homosexuals provokes a strong negative reaction on the part of many Americans. In a 1991 random survey of adults, social psychologist Gregory Herek learned that 60% of the public will tell survey researchers that they find homosexuals

---

[4]Washington Post, August 19, 1992, A1,A24.

"disgusting."[5] Moreover, many appear to find gays personally threatening in certain circumstances. In a 1993 New York Times survey, only 34% would permit their child to play at the home of a friend who lives with a homosexual parent.[6] Fifty-five percent would object to a gay or lesbian elementary school teacher for their child, and 49% would object to having a gay doctor. Furthermore, there is a strong moral component in opposition to homosexuals and homosexuality. The belief that homosexuality is "always wrong" has been held by a remarkably constant 73-77% of the American public for the last 20 years of surveying on that question in the NORC's General Social Survey.

Finally, the public has hesitated to support equal rights and liberties for gays. In their study of tolerance for gays during a referendum in Houston, Gibson and Tedin found that only 31% of Houston residents opposed all restrictions on the civil liberties of gays (such as outlawing gay organizations, requiring gay organizations to register with the government, and so on). They observed that "it is difficult to imagine a political minority that is more disliked in Houston than gays."[7] The general public seems more supportive, albeit with noteworthy restraint, when the frame of reference is "equal rights" or anti-"discrimination" in general terms. The New York Times survey above found 78% agreeing that gays "should have equal rights in terms of job opportunities". But at the same time, only 42% believed that it was "necessary to pass laws to make sure homosexuals have equal rights" (emphasis

added). In sum, there seem to be more intense, robust, and deeply-rooted emotions on the anti-gay rights side than on the side of those supporting gays, or at least the gay rights cause.

In a speech given in Boston the same day as the gay rights march in Washington, Clinton said that he had "paid a terrible political price" for calling for an end to the military's ban on homosexuals.[8] Leaving aside questions of the sincerity of that statement, the hostility and fear in the reaction of many Americans to homosexuality lead one to expect that Clinton might be right to at least some extent. And with the recent frustration of his attempt to allow gays to serve in the US military (at least openly), it appears that this opposition to fully equal treatment for gays and lesbians prevailed in this very recent political battle. Yet, apparently, the prevailing opinion among Republican strategists is that their campaign attacks on Clinton's support for gays were counterproductive. Although it seems counterintuitive, could an attack associating the Democrats with such a disliked group as gays produce a net electoral loss for those launching such an attack? Of what electoral consequence, then, were these attitudes toward homosexuality in 1992?

To address this question, as well as assess the electoral consequences of the salient conflict in the 1992 campaign over "family values" issues in general, we perform the following series of analyses: (1) In Tables I and II, we examine the 1988 and 1992 aggregate profile of voter opinion to see if we find the kinds of movements among voters that we would expect if the "family values" issues had resonated in the electorate. Here we will demonstrate that beneath a general liberal trend among voters on these particular issues,

---

[8]April Lynch, Dan Levy, and Carolyn Lochhead, "Huge Turnout at Rally for Civil Rights, Acceptance," San Francisco Chronicle, April 26, 1993, p. A1, A6.

a pattern of sharply enhanced party polarization has emerged -- uniquely evident in this particular category of issue and group-related attitudes, and especially prominent in the case of attitudes towards gays, gay rights, and feminists. (2) In Table III we examine the interconnections among the "family values" measures, comparing the pattern in 1988 with that for the same measures in 1992. Here the most noteworthy change is a surge in the association of feminists with both gays and gay rights in the minds of the average voter. (3) With Table IV we move to comparison of 1988 with 1992 in terms of the relationship between these same attitudes and voter evaluations of the major party presidential contenders in each election. The central finding here is that the association between these kinds of attitudes and the vote choice sharpened a great deal in 1992 relative to that found in 1988. Voters were clearly more engaged by "family values" issues in the more recent election, and these attitudes thus seemed to play a much greater role in the voting decision. (4) We conclude with Table V and Figure I, which present the results of a vote equation addressing the question of whether intolerant attitudes on gay rights were more electorally mobilized than were attitudes supportive of gay rights. We will see that the Republican strategy in retrospect seems to have been unwise, for it appears to have undermined their own party base.

Results

Table I displays the American National Election Study's findings on public support for gays and gay rights, comparing 1988 and 1992. As is clearly evident in these results, gay-related attitudes have changed substantially in the liberal direction since they were

assessed in 1988. On the feeling thermometer measure, gays in 1992 were somewhat less disliked than they were in 1988: their ratings increased by 8 points, on average -- a striking change for an ANES thermometer score over such a short period of time. The only historical precedent for such change that we have found is in the favorable trend line for "black militants" during the 1970s (not shown).

But note that the mean rating is still clearly on the "cool" side of a 0-100 scale. Indeed, the only group rating that comes close to being this negative is that for illegal aliens, who received the same average thermometer score from voters. All of the other groups asked about were rated either neiturally or positively, on average. About 20% of voters rate gays and lesbians at rock-bottom zero.

The electorate overall is also moving toward more support for gay rights, at least on the one comparison possible with 1988, a question asking: "Should there be laws protecting homosexuals against job discrimination?" (Responses ranged from strongly disagree on the negative side to strongly agree on the positive side.) In 1988 a majority of the electorate supported such antidiscrimanation laws for gays, but support exceeded opposition by only a small margin. By 1992, however, voters were much more clearly on the liberal side.

Underlying the overall liberal trend in the gay rights measure, however, is another important story: the party identifiers moved in opposite directions in their mean scores. This is what one would expect to see if these partisans were paying a good deal of attention to the campaign conflict over gays and gay rights. It is likely that they were responding to the conflict between the parties with either attitude change, some reshuffling of party identification (including movement to the ranks of the independents), or a combination of

both. It is otherwise hard to explain why the Republicans are so distinctive from the other two partisan groups in their conservative movement.

The magnitude of the party gap that emerged by 1992 needs to be understood comparatively. We have not been able to identify any issue measured by the National Election Study that surpasses this gay discrimination policy question in its degree of party polarization. The distance represents a fifth of the scale on which it is measured. Gay rights thus may be issue on which the parties differ the most, at least as of the fall of 1992. And more than half of this gap has arisen just since 1988. In the case of the feeling thermometer for gays, the large party difference that have appeared -- doubling since 1988 -- may also be unsurpassed by any other group feeling thermometer difference between the parties. One wonders whether there is historical precedence in recent decades for such a sudden and sharp polarization on attitudes towards a politically active group.

Table II places these findings in a broader context, showing that the party polarization seen with regards to gays and gay rights is part of a larger pattern of "family values" changes from 1988 to 1992. The electorate as a whole moved in a clearly liberal direction on 3 issues besides gay rights: abortion, the role of women, and, to a lesser extent, on the role of the government in guaranteeing jobs and living standards.[9] A similar large jump -- historically unprecedented in the history of the measurement on this question dating back to 1972 -- occurred on the role of women question.

The growth in the partisan gaps on questions concerning "family values" -- opinion on

---

[9] The change in the last dimension might be largely due to the poorer employment and general economic situation in 1992 compared with 1988. But in any case, its liberal change is small compared to that on abortion and the role of women.

abortion, the role of women, and themometer rating of feminists -- is, as with gays and gay rights, once again a cardinal phenomenon. On these issues the distance between Democratic and Republican identifiers has increased markedly. For example, the apparent overall stability of the feminist feeling thermometer from 1988 to 1992 masks a great deal of polarizing movement between Democrats and Republicans. The polarization is substantial, especially for a feeling thermometer scale, and it matches contrasting party movements on gay rights.[10] Republicans showed the most movement, losing 5 degrees in their thermometer score for feminists. Whereas in 1988 Republicans were only a bit below the neutral 50 degree mark on average, in 1992 they are almost at 40, clearly negative towards feminists. Democrats on the other hand have gained some additional warmth toward feminists and are now at a favorable 60. At the same time, similar gaps did not emerge on the other social issues represented in Table 2 -- questions about welfare, social services, and race. For instance, the party difference on the feminist thermometer was by 1992 twice the size of the party difference in the average rating of "people on welfare".

The central trend toward greater party polarization is represented in summary fashion by the clear polarizing changes found on the moral traditionalism index -- an index constructed from each individual's agreement or disagreement with 4 statements on morality and society that represent key components of the "family values" controversy.[11] On this

---

[10]For comparing the gay feeling thermometer, recall that although there was no partisan movement in opposite directions, the degree of positive movement for the Democrats was twice that of Republicans.

[11]For example, "The newer lifestyles have contributed to the moral breakdown of our society," versus "We should be more tolerant of people who choose to live by their own moral standards even if they are very different from our own." We do have some reservations about

measure the Republican and Democrat identifier moved strikingly in opposite directions between 1988 and 1992. The Republicans in 1988 were already giving conservative responses quite distinct from the Independents and Democrats, who were themselves almost identical in their group averages. Yet the Republicans found room for even more conservative moral views by 1992. Democrats, on the other hand, lost half of the extent to which they were on the conservative side of neutral point on the moral traditionalism scale.

To sum up, then, we seem to have substantial change over just a four year period in attitudes towards gays, gay rights and gender-related issues. These changes considerably exceed the changes seen in any other social issue or social group-related attitude. But most remarkable from our perspective is not so much the liberal changes on these items for the electorate as a whole, but rather the clearly contrasting and striking change when we compare the party groups. One consequence of the family values controversy in 1992, then, has been a growth in the extent to which these issues divided voters along partisan lines.

Table III turns to a related question about the implications of the campaign controversies about feminism and gay rights, showing the simple pearson correlations among "family values" issues and concerns. These are represented by measures of attitudes on gay rights, gays as a group (measured by the feeling thermometer), feminists (also with a feeling thermometer), the proper role of women in society, and abortion. The subtable at the bottom shows the change, if any, in the correlations between 1988 and 1992. (Since the correlations between gay-related and gender-related issues are of primary interest here, they are

---

the comparability of the 1992 measure with 1988's, since in the most recent National Election Study the moral traditionalism battery followed not long after the new gay policy battery in the question order.

highlighted in bold.) What stands out in Table III is the large and significant jump in the association in voter opinion between the thermometer rating of feminists and both the thermometer rating for gays and opinion on laws prohibiting discrimination against gays. This is our first piece of evidence that the public associations made in the 1992 campaign between gays and feminists has tightened the relationship between these two attitudes in the minds of voters. There is apparently something similar in the public perception of gay rights and feminists that makes this association easier than associations between gay rights and the other gender-related issues in the same table.

Table IV presents the same array of gay and gender related variables, but this time they are examined as predictors of comparative evaluations of the major party presidential candidates in 1988 and 1992.[12] These comparative evaluations are simply, for each voter, the difference between the thermometer score for the Democrat (Dukakis or Clinton) and that of the Republican candidate (Bush). Cell entries are bivariate regression results.

What is particularly remarkable about this table is that the simple bivariate relationships surge by 1992 from what they were in 1988. This pattern is true for almost every one of the family values components. For most of these issues we see a doubling in the strength of their relationships with the comparative candidate evaluation as we move from 1988 to 1992. This provides strong evidence that the salience of the family values package during the 1992 campaign not only enhanced the link voters saw between gender-related and

---

[12]In this table all presidential election voters for both 1988 and 1992 are included. Comparative candidate evaluations of the Democratic and Republican candidates, instead of vote choice, in order to facilitate the 1988-1992 comparison; a comparative vote analysis is made problematic by the role of Perot in the 1992 contest.

gay-related issues, as we saw above, but also helped to foster clear connections between attitudes on these issues and judgments about the candidates.

In Table V we turn our attention to a closer look at the electoral implications of the Republican's family values strategy, and the impact of gay-related attitudes on the vote in particular. This table presents the results of an ordinary least squares regression of our family values issues on the actual vote for major party presidential candidates in 1992.[13] Here, however, the variables measuring attitudes towards gays and gay rights have been divided into pairs of variables, one representing the positive and one representing the negative side of each scale (ranging from 0 [neutral] to 1 [negative / positive]).[14] Table V also shows the unstandardized regression coefficients for the feeling thermometer for feminists[15], attitude towards abortion, and attitude toward the role of women. Each of these attitudes is represented with a single variable, scaled from -1 (strongly negative) to +1 (strongly positive) so as to facilitate comparison with the gay-related results. The equation also controls for a large variety of other variables (see the table's footnote). The regression was run first for all major party candidate voters, then separately for Democratic and Republican identifiers.

---

[13]As noted above, Perot voters have been removed to simplify this preliminary analysis.

[14] This gay rights variable is constructed from an index composed of three items: whether the respondent favors or opposes job discrimination protections for gays, allowing gays to adopt children, and allowing gays in the military. These are each 5 point scales ranging from strongly disagree on the negative side to strongly agree on the positive side. They were averaged and then rescaled into two 0-1 continuous variables -- one representing variation from neutral (0) to stongly negative (1) and one representing variation from neutral (0) to strongly positive (1) -- as described in the text.

[15] In this analysis we employ an average of the respondents rating of "feminists" and "the women's movement".

As we see in Table V, the gay rights index was a very strong predictor of the vote in 1992. This is true for both the overall equation and that for just Democrats and Republicans. Its strength as a predictor is greater than that of the abortion variable, and indeed is the strongest predictor in this whole "family values" set of issues. The gay feeling thermometer washes out as a predictor in the presence of the gay policy variable; it's association with vote is no longer statistically significant. Feelings towards gays seem to have had their impact through attitudes towards gay rights.

Feelings toward feminists were also of consequence in 1992, although displaying a weaker association with the vote than did attitudes towards gay rights. The results suggest that how one felt about feminists lined up with one's presidential vote for either Clinton or Bush at least as well on its own as did attitudes toward abortion.[16] Moreover, when we look at the feminist rating in the same kind of negative versus positive format (compared with a neutral score) that we use with the gay rights variable, there appears to have been no particular "bugaboo" in feminism, i.e., the association with the vote is not stronger if a voter is negative on feminism than if the voter is positive on feminism. And most voters give feminists a positive rating to some degree at least.

But one of the clearest point of this table is that there was no particular electoral "bugaboo" in the case of gays and gay rights -- for there was no greater association with the vote choice for those opposed to gay rights than for those supportive of gay rights. Essentially, it was an electoral draw at the worst from the perspective of the Democrats.

---

[16] The variable representing attitudes toward women's role, however, has no significant impact here. Whatever impact on the vote choice it has probably flows through the feminist rating and/or opinion on abortion or gay rights.

Even more striking is the fact that the Republican attack on gay rights seems to have caused substantial damage to their own base of party identifiers. Republicans who were in favor of gay rights were stunningly less likely to vote for Bush than were Republicans who were either neutral on gay rights or positive on gay rights. This increased likelihood of Republicans defecting was not compensated for at all by the attraction of anti-gay rights Democrats. Importantly, this alleged "wedge issue" helped move Democrats over to the Republican ticket much less than it repelled Republicans from the ticket. This net loss holds up even when one takes into account that there were more anti-gay rights Democrats than there were pro-gay rights Republicans (by a factor of 2).

Figure 1 makes the partisan comparison, and the Republicans' net loss, clear. It displays the predicted vote for Republicans and Democrats as a function of their support or opposition to gay rights, holding all other variables at their average. As we see there, the average pro-gay rights Republican's score nearly places him or her into the Clinton voter portion of the scale, and so no doubt a considerable portion of this group actually voted for Clinton. On the other hand, anti-gay right Democrats were still well above the defection threshold on average, so a pro-gay rights position appears to have done little harm to Bill Clinton among his own party. It seems clear that considerably more partisan defection occurred on the Republican side than on the Democratic side due to gay rights opinions. Since the Republicans were damaging their own base of support -- voters whose loyalty is typically crucial to electoral success -- it appears that the Republican attack on gay rights was unhelpful at best, and probably a net loser.

Discussion

Several conclusions about the "family values" controversy in the 1992 election seem to emerge from our analysis. One set has to do with the change in public opinion and in the electoral landscape fostered by the 1992 campaign controversies about "family values." Three different changes, each plausibly spurred by the 1992 campaign context, were evident. First is the enhanced polarization on family values issues among partisans in the electorate -- particularly in terms of the opinions of Republican and Democratic party identifiers on gays, gay rights, and feminist concerns. Party cleavages widened on a wide array of issues by the end of 1992. But the "family values" opinions are distinctive in showing that identifiers with the opposing parties actually moved in opposite directions (rather than just becoming more liberal or conservative at different rates). More generally, large party gaps appeared among voters on attitudes towards gays, gay rights, abortion, the role of women, and feminists that did not exist at the time of the 1988 presidential election.

It remains to be seen what portion of this phenomenon of emerging party gaps on "family values" issues is due to actual change in partisan identification. The changes may be too great and systematic to be explained largely in terms of attitude change on the part of the average identifier with each party, especially on issues seemingly more rooted emotionally than most political issues. At least it seems clear that partisan voters have responded to the "family values" conflict that went on between their respective party elites, either by changing their average opinions or by changing their party identifications.

Second, the salience of the family values theme in the campaign seems to have heightened the association between gay and gender-related issues in the minds of voters; the

packaging in the campaign was matched by greater packaging in the minds of voters.

Third, questions about gay rights and feminism, as well as abortion, were clearly taken into account when voters made their choices in 1992. Moreover, the connections between attitudes toward these "family values" issues and presidential candidate evaluations were, as a general matter, much stronger in 1992 than they had been in 1988. Again, the campaign salience of these themes appears to have powerfully activated the connection of attitudes on these issues to how voters felt about the presidential candidates.

A second major conclusion of our analysis has to do with the direct electoral implications of the Republican "family values" strategy, and its anti-gay rhetoric in particular. As we have demonstrated, the "family values" conflict was more potent as a source of defection among Republicans than it was as a source of defection among Democratic identifiers. This "wedge issue" then seems to have failed to break off a chunk of Democrats and woo them to reelect George Bush. It succeeded instead in undermining Bush's support in a noticeable segment of the Republican's own base of identifiers.

Our suggestions as to why this phenomenon occurred in 1992 can at this preliminary stage of our investigation only be speculative and very tentative. Further data gathering should provide more grounds for confident theoretical inference. For now we infer that issues concerning homosexuality and gender touch such sensitive and connected nerves in the American public that voters will resonate in tune with salient elite conflict over these cultural issues, even when more political attention seems to be focussed on other concerns, such as "the economy, stupid", the budget deficit, taxes, or health care. Indeed, problems in these other areas might well foster increased sensitivity to cultural conflicts.

Nonetheless, the apparent absence of much mobilization of intolerance or fear of gays and gay rights through garnering electoral support from people who might be vulnerable to such appeals -- such as the so-called "Reagan Democrats" or "Bubba vote" -- could just have been because gays were not seen as threatening in 1992. Such a perception of threat is essentially a precondition for intolerance.[17] Only after Clinton tried to change the military's policy on gays did it become common to perceive that he "paid a terrible political price," as he himself put it.[18] In 1993, we suspect, President Clinton came to be seen as much more threatening in his promotion of gay rights -- when he was taking high profile, contentious action on the military issue -- than he was in the campaign, when gays and gay rights were entities with which candidate Clinton associated himself only occasionally and at a much lower profile than his position-taking on many other issues.

Finally, the backlash to the "family values" attack that appears to have developed among an electorally potent minority of Republican identifiers we would expect arose because the Republican party has a quite a number of nonreligious, highly educated, affluent adherents -- precisely the kinds of members of the public more likely to support the norms of democracy, equality, and tolerance.[19] Although we do not now have the content analysis data to support it, we recall political and media elites sending clear signals that the

Republican "family values" attack was inappropriate. This could very well have been sufficient to produce Republican party defection amongst those of its adherents predisposed by their high socioeconomic status towards supporting the tolerant norms of such elites.

[2] The dependent variable is vote for either Bill Clinton (+1) or George Bush (-1). "Overall" = all party groups who voted for either major party candidate. Party identifiers are defined by their answer to the root party ID question. This equation included the following additional variables as controls: gender; race; "political generation cohort" (whether first voted in 1930s-50s; '60s-70s, or '80s); south/nonsouth residence; education; family income; subjective social class (lower/working, middle, upper middle/upper); religious denominations, divided by religion very high importance/not very high; beliefs about the Bible; frequency of reading the Bible; marital status; index of ethnic group/immigrant ratings; attitudes towards blacks; thermometer rating of environmentalists; policy opinions on defense and aid to the poor; willingness to pay more in taxes; changes in family finances past year; perception of the state of the US economy past year; opinion on whether country is on right or wrong "track"; and partisan identification (in overall voter equation). The constant reported in the table is adjusted to represent the predicted vote score when all of these control variables are set at their means.

DAVID GERGEN AND WHITE HOUSE COMMUNICATIONS STRATEGY

Stuart Streichler
Johns Hopkins University

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

Over the last twenty years, David Gergen has formulated and implemented communications strategy in four administrations. This paper analyzes his role in the development of White House communications in this period. Section I examines President Nixon's 1972 re-election campaign, which became a model for Gergen on how to package the President and manage the news. This Section focuses on activities in which Gergen participated, using his handwritten notes of White House meetings. Section II describes how Gergen, countering President Ford's move dismantling the White House communications operation in light of its "notorious reputation" after Watergate,[1] revitalized the Office of Communications following the Nixon model. Professor John Maltese has observed that "Nixon's techniques were followed most successfully" by the Reagan administration.[2] Section III presents an in-depth study of the communications strategies employed to announce and defend a particularly illuminating policy decision during the early Reagan years, when Gergen was fully in charge of White House communications. Finally, Section IV explores the direction in which Gergen has taken the Clinton White House in the last two months as well as the Presidency in the last two decades.

I. White House Communications in the 1972 Campaign

Gergen began his in-and-out service in the White House during the Nixon administration, when the Office of Communications was in its infancy. He learned the art of White House communications from Charles Colson, who, though nominally Special Counsel to the President, gained control over communications functions in 1971. Colson's greatest achievement came in the 1972 campaign, when he masterminded public relations for the entire administration. As Colson

2 John Anthony Maltese, Spin Control: The White House Office of Communications and the Management of Presidential News (Chapel Hill: University of North Carolina Press, 1992), 3.

later commented, the Nixon White House came "as close to managing the news as you can do" in that year.[3]

In a word, control was the fundamental principle underlying communications strategy in the Nixon White House. When the Nixon White House announced the appointment and job description of the first Communications Director, Herbert Klein, the New York Times noted his unprecedented "broad mandate" to exercise "unusual supervisory powers over all Government information services."[4] When Colson took over, he extended that mandate to highly partisan political actions. Whether for national political campaigns or the administration of government, the task was the same--to centralize control over the communications of a sprawling apparatus.

The Nixon White House followed an important corollary principle--disguise the degree to which the White House exercised control. This enabled the White House to shield the President from attack. Agency officials touting the White House line could be lightning rods in the first line of defense. Also, disguising the actual degree of control held out the promise of exerting greater influence over public opinion. With careful orchestration, the White House created the illusion of apparently spontaneous public shows of support, an illusion that would be lost if it were known that the White House was the driving force behind the actions. For example, Republicans across the country submitted to their local newspapers letters to the editor which were in fact ghostwritten at the White House. Colson set up "supposedly independent" citizens' committees "as fronts for the White House" to circulate political advertisements in newspapers.[5]

Nixon's success in managing the news for the campaign was largely attributable to the so-called "attack group" which carried out White House communications under Colson's direction and supervision. As Colson described it, the group implemented the White House line by determining "who would say it and how we would get it out and who would release it

---

3 Ibid.

4 Ibid., 27. One of the most basic tactics in centralizing control over communications involves getting out the administration's "line-of-the-day." According to Haldeman, President Nixon specifically authorized the creation of the Office of Communications to address the "constant problem of the non-unified `line.'" Ibid., 24.

5 The White House also set up a telephone bank to "generate calls of complaint" to the media about news coverage. Ibid., 71-73. When Gergen and others wrote the script for the "whole" Republican convention in 1972, they choreographed demonstrations of support to make them look "spontaneous." Ibid., 96; Joseph C. Spear, Presidents and the Press: The Nixon Legacy (Cambridge: MIT Press, 1984), 181.

and which one of the Cabinet members would go where and what kind of surrogate program we'd have and how we would respond to attacks."[6] The surrogate program was "an essential part" of President Nixon's campaign strategy. The White House assembled a variety of Cabinet officials, Republican leaders, Congressmen, labor leaders, and others to travel around the nation speaking on Nixon's behalf.[7] According to campaign journalist Theodore White, the attack group "choreographed the movements of Nixon campaign `surrogates' across the country, and orchestrated with enthusiastic malice their statements, attacks and ripostes designed to take air time and headlines from George McGovern and make McGovern look like a fool."[8]

Gergen was a member of this attack group, and he recorded their discussions in handwritten notes which are kept by the Nixon Presidential Materials Project of the National Archives.[9] His notes provide documentary evidence of the particular communications techniques employed by the White House. Although many of these techniques are by now well-known, these notes offer an unusually detailed account of exactly how the White House endeavored to control news coverage, promote the administration's position, and enhance the President's image.

With the surrogate program, the White House was able to present a unified perspective on the administration's "line-of-the-day" through a diverse group of apparently independent-minded speakers. To carry out this strategy, the attack group set specific numerical goals of target surrogates for particular issues and actively searched for them. For example, Gergen records a discussion about putting

---

7 Lou Cannon, "35 `Stand-ins' Campaign For Nixon's Re-election," Washington Post, 1 September 1972, A1. Nixon had used surrogates previously. In the 1968 campaign, Herbert Klein coordinated surrogate speakers who campaigned for Nixon throughout the country. The White House continued to use surrogates after Nixon won the election. Armed with a daily news summary sent by the newly formed Communications Office, Nixon's surrogates handled a wide range of topics from policy issues to hardball political attacks. For example, President Nixon directed that a "system" be set up to supply "attack material on a daily basis to a group of key people on the Hill." Or surrogates promoted the President's policy agenda, discussing issues like Nixon's family assistance plan. Maltese, 18, 35 & 37.

8 Theodore H. White, The Making of the President 1972 (New York: Atheneum, 1973), 293.

9 The attack group included Gergen, Pat Buchanan, Ken Clawson, Gordon Strachan (principal political assistant to Chief of Staff H.R. Haldeman), Al Abrahams (Director of Communications for the Committee to Re-elect the President), and several others. Gergen Notes of Colson Meetings, WHSF, Nixon Presidential Materials Project.

together a statement by mayors to "attack" McGovern on urban affairs. Gergen wrote, "Need 10 mayors/4 on board." In another case, after considering polling data, the group coordinated attacks by Republican leaders and newspaper editors on McGovern's busing position while he was campaigning in Detroit. As Gergen notes the directive: "have [Senator] Dole out there to take him on. Call upon McG [McGovern] to state his position on busing. Also have newspaper eds and Mich delegation take it on."[10]

The White House calculated precisely where to get its message across to maximize the damaging effect against McGovern. Credibility was a key theme for Colson's group; it appears repeatedly in Gergen's notes (e.g., "credibility"-"Do you want to put your trust in this man").[11] The group planned a political advertisement for St. Louis which said "Welcome Sen. McGovern. We're A 1000% Behind You." This referred to McGovern's earlier statement of "1000%" support for his first running mate, Senator Thomas Eagleton from Missouri, who was dropped from the ticket after disclosures about psychiatric treatment.[12] The White House also targeted stories for particular media outlets. Ken Khachigian, another member of Colson's group, worked up "a brief line" about McGovern's replacement vice-presidential candidate, R. Sargent Shriver and his "Confederate ancestors." Khachigian advised Colson that he was trying "to get the story fed into certain segments of Black media and will give it to Black surrogates."[13]

The White House integrated its short-term focus on the line-of-the-day with long-range strategic planning.[14] At the height of the fall campaign, Gergen's notes map out a four-week plan of "Agreed-upon topics." The first week emphasized drugs with the line that "McGovern is weak, soft on drugs, PERMISSIVENESS." The following week, the group planned to turn to "very hard attacks on foreign policy, dangerous naive approach of McG," and the focus of the last two weeks included defense and economic policies.[15]

To execute their plans effectively, White House communications officials left little to chance in marketing President Nixon's appearance, paying close attention to seemingly minor details of presentation to anticipate and shape the news media's response. As a general rule, Nixon aides evaluated events in advance for their probable

15 Gergen Notes, 17 September 1972.

effectiveness as news stories. As Gergen later described this process:

> We had a rule in the Nixon operation that before any public event was put on his schedule, you had to know what the headline out of that event was going to be, and what the lead paragraph would be. You had to think of it in those terms, and if you couldn't justify it, it didn't go on the schedule.[16]

Prepared statements were tailored to the length deemed appropriate for maximum control over the news story. "It was a very rigorous system," Gergen recounted.[17] According to Gergen's notes, speechwriter Pat Buchanan was specifically directed to draft "1 1/2 pp." for Dole at one point.[18]

Colson's attack group also monitored the results from previous efforts, and if, as Gergen's notes record, there was "too little play last time" for an issue that deserved further attention in their view, they would "go w/ another TV statement." If one surrogate had not attracted attention, another could be found to make the point. Gergen notes, for example, that Nixon's campaign director Clark MacGregor "didn't get any news. Ask Reagan [then Governor of California] to hit hard."[19]

Colson's group recognized and exploited institutional constraints on news reporters operating on tight deadlines. Colson in particular understood that timing was critical, and he scheduled announcements to obscure bad news and achieve maximum play for good news, as well as to keep McGovern continually off balance. Gergen notes how Colson planned one response to the forthcoming indictments of the Watergate burglars: "Indictments=big story of day. Will delay release of financial reports until Saturday + to Monday then call by" MacGregor "for McG + Shriver to disclose their own."[20]

Colson unabashedly used leaks to gain favorable news coverage while simultaneously attacking unfavorable stories which resulted from leaks. He tried to manipulate news stories to help Maurice Stans, Nixon's campaign finance chairman, who was under investigation after it was discovered that a campaign contribution had ended up in a Watergate burglar's bank account. Taking the offensive, Stans was preparing to file a $5 million libel suit against McGovern's national campaign director, Lawrence O'Brien. Colson ordered a leak, as Gergen's notes describe it: "libel suit coming out

today leaking the fact that his [Stans'] wife is dying at CC's [Colson's] insistence, even though." Gergen mysteriously dropped the subject at that point.[21]

Just the previous day, Colson had ordered a speech "for Dole attacking GAO for leaks." While the General Accounting Office, the investigative body for Congress, was looking into Nixon campaign finance operations, Dole charged the Democratic Party with several campaign violations. Information was leaked to the Washington Post suggesting that Dole's allegations were unfounded. Colson directed Buchanan to prepare an attack for Dole, which was picked up by the Post, reporting Dole's charges of GAO's "unconscionable" news leak and "an outrageous breach of objectivity that casts a partisan pall over the GAO."[22]

When the election was over, the attack group remained a force in White House communications, "promoting counterattacks to the Watergate publicity" in 1973.[23] Gergen was promoted to head up Nixon's speechwriting staff, and he played an active role in coordinating the President's legal and public relations defense.[24] As Watergate ended Nixon's presidency, it also spelled the end of White House communications as practiced in the Nixon White House, at least in the short term.

II. Gergen in the Ford White House

This Section is designed to make essentially one point: President Ford, in the wake of Watergate, cut the Office of Communications down to size; Gergen then revitalized the Office. Gergen's model, as he says, was Colson's 1972 campaign operation.[25]

After Nixon resigned, President Ford quite naturally sought to make a clean break from Watergate and the Nixon presidency (notwithstanding his pardon of Nixon, which had the opposite effect). Robert Hartmann, in charge of Ford's speechwriting staff, fired all Nixon speechwriters, including Gergen, who moved to the Treasury Department to work for William Simon. Ford's staff determined to modify or

completely eliminate the Office of Communications. Margita White, who later served as Ford's communications director, said that "there was still a great deal of sensitivity to the impression of that office left by the Nixon White House."[26]

As a result of these concerns, the Office of Communications was reduced in size and power. On the organizational chart, the Office was made to answer to the Press Secretary. The Office was stripped of its name and its most significant responsibilities. As Professor Maltese has summed it up, the functions undertaken by the Office of Communications in the Nixon White House included: (a) control over the release of information throughout the executive branch; (b) a political role generating public support for the President; and (c) a role as liaison serving the needs of local news media outside Washington. Much of the Office's power came from its control and political functions. President Ford considered these two functions inappropriately exercised in the Nixon presidency. As a result, he directed his staff to eliminate the political function and modify the control function to a form of loose coordination.[27]

In December 1975, Gergen returned to the White House as special assistant to Chief of Staff Dick Cheney. Gergen advocated that the White House restore the control and political functions in one office charged with overall responsibility for communications. With two other aides, Gergen developed a plan to form a "Communications Group" to enhance coordination of news throughout the administration and to plan events in the White House. Particularly with the upcoming election, Gergen was not disturbed by the political function. In an interview with Professor Maltese, Gergen said, "I think it's part of how you run a decent White House. There are some people who think it's too political. But I think if you've got a president who's running for office, you've got to do it."[28]

Following Gergen's lead, the White House established the Communications Group. By April, Colson's model was put into effect, with the Group planning "lines" for surrogate speakers, deciding what the President would announce, and controlling announcements throughout the executive branch.[29] Three months later, Gergen was chosen to head up the completely revamped Office of Communications. Gergen reported directly to Ford's chief of staff, and he acquired control over several offices, including the Television

Office, the Presidential Spokesmen's Office, the Research Division, and Editorial Services. Gergen supervised writing the script for the Republican convention, a task which he had performed in the 1972 convention.[30] The "line-of-the-day" was planned and implemented. At a meeting on August 7, 1976, Gergen instructed his staff, "I would like to think everyday we can focus on the event for that day and the next day that we want to have on TV."[31] The White House made "aggressive use of surrogate speakers," which turned out to be an especially significant development in the 1976 presidential debates, where the spin doctor was born.[32]

III. The Reagan Administration's Bob Jones Decision

One of Gergen's former colleagues once said that Gergen "made a conscious decision" when Reagan was elected to "sell this presidency with whatever resources he could use."[33] Gergen's overall role in shaping "the communications strategy that sold the Reagan revolution" is well-known.[34] This Section takes a lesser-known case to analyze Gergen's role in White House communications during the Reagan administration. The vehicle chosen for study is the Bob Jones decision, when the administration abandoned longstanding IRS policy and announced that it would restore tax exemptions to racially discriminatory private schools.[35]

The Bob Jones case figures prominently in recent civil rights history.[36] In response to Brown v. Board of Education

35 The Bob Jones case presents several advantages for in-depth study of Gergen's role in White House communications. It occurred when Gergen was unquestionably in control of White House Communications. Frank Ursomarso was Reagan's first communications chief; Gergen served as Staff Director initially. When Ursomarso left, the communications and press functions were reorganized before Gergen officially became Communications Director. Additionally, an unusually detailed record consisting of key internal memoranda document the administration's public relations strategy and policy-making process in this case. Bob Jones is also helpful because White House communications strategy ultimately failed, and, like other cases of political communication failure, it provides "useful illustrations of several fundamental traits of political communication." Robert E. Denton, Jr. and Gary C. Woodward, Political Communication in America, 2d ed., Praeger Series in Political Communication (New York: Praeger, 1990), 8.

36 461 U.S. 574 (1983).

and subsequent federal desegregation efforts, many Southern communities established private all-white schools, sometimes called segregation academies. Ordinarily, private schools can qualify for tax-exempt status under federal law. Tax-exempt organizations avoid paying federal income tax, and gifts to these organizations are tax-deductible contributions. Recognizing that this tax break for all-white schools amounts to a subsidy for segregated education, the federal courts pressed the IRS to withhold tax exemption from private schools that discriminated on the basis of race. During the Nixon administration, the IRS adopted the policy declaring such schools ineligible for tax-exempt status.

When two fundamentalist Christian schools, Bob Jones University and Goldsboro Christian Schools, challenged this policy, the Justice Department defended the IRS at every step, until its brief on the merits was due for filing in the Supreme Court on January 8, 1982. On that day, the Treasury Department announced that it intended to revoke the IRS's antidiscrimination policy and restore exemptions to racially discriminatory schools, and the Justice Department filed a motion in the Court which argued that the case was now moot and should be dismissed.

At first, the administration's communications strategy was designed to control the timing and manner of the announcement of the potentially embarrassing news. As Gergen explained his formula, "It was one of the first rules I learned when I arrived in Washington. If you've got some news that you don't want to get noticed, put it out Friday afternoon at 4 p.m." The reason for this, as one Reagan official colorfully explained, is that a 4:00 p.m. Friday announcement typically vanishes into "the Bermuda Triangle of news." By then, Washington has closed shop for the weekend. Among other things, Saturday newspapers have low circulation, columnists have written their pieces for the Sunday papers, and potential opponents in Congress have left Washington for their home districts.[37]

The logic behind the timing strategy used in Bob Jones was described point-by-point in internal Treasury Department memoranda. Writing to Deputy Secretary R.T. McNamar, Assistant Secretary for Public Relations Ann Dore McLaughlin explained:

> A 4:00 p.m. release of documents allows time for wire service stories to meet a.m. newspaper deadlines and make 6:00 p.m. evening television broadcasts. Release of your statement at 4:00 p.m. insures that the first wire stories out--and thus the most widely used,

---

37 Stephen Engelberg, "The Bad News Hour: 4 P.M. Friday," New York Times, 6 April 1984, A20.

> especially by the broadcast media--will contain our rationale. An earlier release would give the media more time to conduct interviews with interest groups and thus politicize the story. A later release--one too late for the evening TV news--might cause the networks to hold the story until the next day, which would result in the same kind of expanded political story.[38]

The manner of the Bob Jones announcement was carefully planned. The documentary record reveals the degree of coordination between the White House and public affairs officials in the executive departments involved. Since Gergen had taken control of communications, the White House was in daily contact with public affairs officials in executive departments.[39] Reviewing the plan in a memorandum to Gergen and the Public Affairs Director for the Justice Department, McLaughlin stated that it was "still an open question whether the release should come from Treasury or Justice." She then described the "suggested strategy for the release." McLaughlin detailed precisely which documents would be given to reporters--a press release which she attached with her memo and a copy of the Justice Department's motion in the Court. The motion would be filed, McLaughlin said, "with simultaneous release of press documents" at 4:00 p.m. Finally, she discussed the need to hold "a background briefing" for selected legal reporters, in the belief that this was "necessary ingredient" due to the "complexities of the case."[40]

The administration used another tactic. The administration announced on the same day another important, and difficult, legal news story--the settlement of major antitrust actions against IBM and AT&T. Taken together, these two stories could overload the capabilities of even the best legal reporters.

Notwithstanding the administration's efforts to suppress coverage, the announcement was greeted by a "firestorm." The White House badly underestimated the interpretive abilities of the news audience and the potential for sustained political opposition.[41] To mollify the public and to evade

41 Martin Linsky, Impact: How the Press Affects Federal Policymaking (New York: Norton, 1986), 111-16. Gergen later suggested that the strategy backfired partly because scheduling the announcement late

accountability, the White House staff devised a fallback communications strategy. They started by framing the whole question in the best light possible.[42] This was accomplished by identifying two distinct issues (administrative agency abuse and civil rights) and playing one off against the other. In that way, the stage was set to claim that, with concern over IRS abuse driving the decision, the President and his staff had overlooked the civil rights issue.

Accordingly, the White House tried to provide the President with political cover. When Gergen briefed the press, he reportedly "portrayed the President as having undertaken an important initiative to curb the bureaucracy only to discover that his action had unfortunate fallout in race relations."[43] Gergen indicated that Reagan was not fully apprised of the civil rights aspects and had only concurred in the decision reached by Treasury and Justice. Other aides insisted that, at most, the President was informed about the decision two days before it was announced.[44]

A key public document in the fallback communications strategy is the "Statement by the President," which Gergen read to the White House press corps. This Statement is notable for its deployment of several rhetorical devices in such a small space. It states the President's views as incontrovertible general principles in strong, and unequivocal, language. Reagan's personal view on civil rights is emphasized: "I am unalterably opposed to racial discrimination in any form." Then, the Statement implicitly equates the problem of administrative abuse with civil rights concerns: "I am also opposed to administrative agencies exercising powers that the Constitution assigns to the Congress." That single sentence does a lot of work to counterbalance the civil rights issue. It expresses general concern for constitutional government and disclaims any self-interested play for power on the part of the President (Congress's role was at stake). With the following sentence, which states that agencies "cannot be allowed to govern by administrative fiat," the Statement exploits the fact that

---

Friday "is such an obvious device, you must be careful in using it." Engelberg, A20.

42 See Doris Graber, Public Sector Communication: How Organizations Manage Information (Washington, D.C.: CQ Press, 1992), 242.

43 The decision was solely designed, Gergen said, "to carry out the President's view that administrative agencies should not have unfettered authority to set national policy." Howell Raines, "President Shifts View on Tax Rule in Race Bias Cases," New York Times, 13 January 1982, A1.

44 Dean Reynolds, UPI Washington News, 12 January 1982, Nexis; Howell Raines, "Reagan Aides' Slip Blamed for Dispute on Tax Exemptions," New York Times, 17 January 1982, A1.

the IRS was involved. This is one administrative agency with which practically everyone comes into disagreeable contact. All of this is now arrayed against the civil rights concern. The Statement closes by emphasizing that administrative abuse was indeed "the sole basis" for the decision. This is coupled with the President's promise of action in the form of submitting legislation.[45]

Besides providing cover for the President, aides tried to distance the whole White House from the initial decision. Their strategy depended upon convincing the press and public that significant civil rights concerns escaped notice. This was made difficult by the fact that the case was discussed by senior staff at the White House before the announcement, including Gergen, Reagan's highest-ranking advisors--James Baker, Michael Deaver, and Edwin Meese--and Fred Fielding, White House counsel. To address this problem, Gergen explained to the press that the question presented at that meeting "sounded to us like a narrow legal issue." Gergen added that he personally "didn't understand its wider implications."[46] This specific language was repeated in several news stories, sometimes without attribution, giving it the appearance of a "line" devised and put out by the White House.[47] That line brilliantly exploits news audience preconceptions: the White House is a busy place; decision-making is fast-paced; who could keep tabs on everything going on, particularly when arcane legal issues obscured broader policy implications?

But these attempts to deflect accountability were undermined by the facts as they emerged. Eventually, it

---

45 This was the only legitimate remedy, the White House later suggested, because the IRS policy had "no basis in law." The Supreme Court took a different view, holding that the policy was "wholly consistent with what the Congress, the executive, and the courts had said." 461 U.S. at 512. The deputy solicitor general also disputed the White House on this point, as he signed the Government's brief only after adding a footnote noting his disagreement with the Reagan administration's position. Brief of the United States, 1.

46 Reuters, 19 January 1982, Nexis. Using agencies to issue public statements "has the prime virtue of `Deniability.' Some space or distance can always be placed between the statements of one official, and the views of the executive, if such a statement becomes a liability to the administration. It can be disowned, downplayed, ignored, `explained' in the proper context, and--on occasion--repudiated." Denton and Woodward, 131.

47 For example, Time reported that when Baker asked about Bob Jones at the meeting, "Meese assured him that he and Fielding had considered all the implications. Meese described the matter as a narrow legalistic change and seemed oblivious to the moral and political issues involved." Walter Isaacson, "Pirouetting on Civil Rights: Reagan Goes Round and Round on Tax Breaks for Schools," Time, 25 January 1982, 24.

became known that Reagan had approved the proposal to reverse the antidiscrimination policy several months before the decision was announced. At a press conference, President Reagan admitted that he was "the originator of the whole thing."[48] Moreover, many found Reagan's pro-civil rights claims difficult to believe in light of subsequent events. When a majority of attorneys in the Justice Department's Civil Rights Division protested the administration's actions in late January, a White House spokesman said that they could look for work elsewhere.

Significantly, while Gergen orchestrated communications strategies trying to demonstrate Reagan's strong support for civil rights, the Justice Department held fast to its official legal position opposing the IRS. Viewing the case as moot, the Justice Department continued to seek dismissal until a lower federal court blocked the administration indefinitely from granting tax exemptions to racially discriminatory schools. Only then did the administration accede to full hearing in the Supreme Court. Still, the Justice Department refused to defend the IRS position, leading to its unusual request that the Court appoint another party to represent that view.[49] The inconsistency between White House public pronouncements and the position before the Court prompted Harvard Law Professor Laurence Tribe to accuse the administration of an "attempted cover-up."[50]

The White House response was marked by a confusing set of halfway measures. The scope of Reagan's proposed legislation was unclear. When Gergen announced it, he could not specify whether Reagan's legislation would be as comprehensive as the IRS regulations. If Congress failed to enact new legislation, the Treasury's General Counsel stated, the administration would restore tax exemptions to racially discriminatory schools applying for exempt status. Initially, Gergen was unable to clarify whether the proposed legislation would apply against the two schools involved in the pending case, though the Justice Department had, before the policy reversal, labelled those schools "blatantly discriminatory." Later, the White House decided that it

---

48 "Reagan Accepts Onus over School Policy Change: Legislation Introduced," Facts on File, 22 January 1982, 25. Congressman Lott (R-Miss.) had pressured the agencies to reverse the IRS policy by pointing to Reagan's handwritten statement apparently approving reversal.

49 By order dated April 19, 1982, the Court invited William T. Coleman, Jr., former Secretary of Transportation under President Ford, to submit an amicus curiae brief defending the IRS position abandoned by the Justice Department.

50 Statement of Laurence H. Tribe, Congress, House of Representative, Committee on Ways and Means, Administration's Change in Federal Policy Regarding the Tax Status of Racially Discriminatory Private Schools, 97th Cong., 2d Sess., 4 February 1982, 15.

could not renege on a "pledge" made to these two schools, so they would be granted tax-exempt status, which could be withdrawn if Congress so provided.[51]

In this case, the Office of Communications had a difficult task to perform. It was not easy to convince the press and the news audience that a group of senior advisors including several lawyers (Gergen was a Harvard law graduate) completely missed the civil rights point when they considered the decision. In fact, Gergen had received an advance copy of the Treasury's announcement. This two-page press release stated explicitly that the IRS "will no longer revoke or deny tax-exempt status" for educational organizations which "did not adhere to certain fundamental national policies, such as those forbidding discrimination on the basis of race."[52] And the attempt to bury the announcement, of which Gergen was well aware, manifests the clear understanding that the decision was indeed bad news for the President.

IV. David Gergen, the Presidency, and Today's "Captive Public"[53]

In the belief that his "politics and policies" were suffering due to pervasive failures in communications, President Clinton reached out to David Gergen. Once hired, Gergen defined his position in the Clinton White House "at the intersection of politics, policy, and communications."[54] In Gergen's conception of that intersection, communications is at the forefront in the battle for a "successful presidency."[55] His thinking about White House communications has had a pronounced effect in the last two months. Some journalists have been quick to praise Gergen for reversing Clinton's early slide.[56]

It is too early for a scholarly assessment of Gergen's role in the Clinton administration. However, it is possible

to evaluate Gergen's role in the development of White House communications over the last two decades and the direction in which he has taken the Presidency up to this point. Gergen has previously indicated that his communications strategies comprise a response to his concern that the Presidency was an "institution that was failing."[57] Using examples mostly drawn from the Clinton White House, this Section raises questions about the precise effect Gergen's communications strategies have on the Presidency and the implications for institutional change.

Gergen's tripartite division of policy, politics, and communications suggests a mode of analysis. What effect does communications strategy have on policy and on politics at the Presidential level? Promoting sound policy is obviously beneficial. Less obvious are the ways in which communications strategies can undermine the development of public policy.

In some cases, White House communications strategy has a disabling effect on the policy process, assuming that policy stands a better chance of becoming more thoroughly developed and more widely accepted over time when the President engages in open debate about essential elements of a concededly necessary policy initiative. But with communications playing a central role, this kind of serious and open policy-making falls in disfavor. Clinton's economic policy, the centerpiece of his program to date, provides a recent example. Many voters turned to Clinton last November based on the economic issue, and change was the basic theme running through the election. Since Gergen acquired control over White House communications, administration officials were privately directed to emphasize the theme of change without providing any basic details of the economic plan. A secret White House memo entitled "Hallelujah! Change is coming!" was leaked to the press in mid-July. This memo directed officials to get out the message that "this is good, and this is change," while "demurring" on details. The basic idea was simply put--the policy was "good for the country, good for the economy and good for middle-class working families." The memo focused on how to present the case: "Never forget that the optimism, energy, enthusiasm you project is vital. . . . Your body language, attitude and confidence will be infectious." The White House declined to identify the memo's author, though, in accordance with Gergen's beliefs, the White House set up meetings with public affairs officials

---

57 Hoffman, A3.

in several departments to coordinate how to "spread the good news."[58]

A President who pays particularly close attention to communications can also become risk-averse in policy development. Either he may quash a bold policy initiative at its inception or flatten a risky policy beyond recognition. President Clinton's efforts regarding gays in the military illustrate this point. Whatever one's views on this issue, Clinton had taken a controversial stand in January. Although several factors were operating besides communications strategy, Gergen was a key player in redrafting the policy this summer, meeting with Pentagon officials shortly before the President outlined his watered-down version. By then, Clinton's position was rendered incoherent on key points. In testimony before Congress, Defense Secretary Les Aspin contradicted the President's statement on how the policy would be implemented. The question was essentially left for the federal courts to resolve. Whatever the contours of this policy, there was no question about the communications strategy when the President made his announcement. The White House staged the President's address before an audience composed of military leaders, including the Joint Chiefs. The occasion was designed to convert a problem issue into a demonstration of the President's strength.

Besides disabling policy development, communications strategies can have the effect of enabling the adoption of fundamentally flawed policy. This can occur where communications strategy holds out the promise of obscuring the policy from public view. The Bob Jones case provides a good example of this. Or, the decision to adopt a particular policy may be predicated upon the strategy of misleading the public. For example, Reagan's Budget Director David Stockman has said that the White House understood the "voodoo economics" underlying Reaganomics, yet misinformed the public with its public relations strategy. Stockman gives credit to Gergen particularly for "put[ting] the ball over the goal line" on this issue.[59] In some cases, the President may make a policy decision based on communications concerns which inappropriately reinforce or even trump other relevant factors. It may be difficult to resist the temptation presented by the right kind of military venture, with its likely uptick in the President's approval ratings.[60]

58 Ann Devroy, "Hallelujah! for Economic Change: New White House `Message Team' Aims to Sell Clinton Budget Plan," Washington Post, 17 July 1993, A4.

59 American Political Network, Hotline, 12 July 1993, Nexis.

60 Barbara Hinckley, The Symbolic Presidency: How Presidents Portray Themselves (New York: Routeledge, 1990), 29-30.

Besides the implications for policy, White House communications strategy can have a negative effect on Presidential politics. In its short history, the Office of Communications has engaged in a wide range of political activities, either immediately preceding an election or in an ongoing campaign to build public support for the President. At its worst, this disrupts the political process when it takes the form of systematic efforts to manipulate public opinion, as Charles Colson did. More subtly, Gergen's scripts for political conventions and other activities played a "major role" in Presidential campaigns.[61] Even the controlled deployment of surrogate speakers by itself alters the political landscape.

Moreover, White House Communications can indirectly affect the political process in its attempts to relieve the President of political accountability. This can take the form of deflecting attention from policies or problems that are known to be disfavored by the public. As in the Bob Jones case, one strategy consists in offering post hoc rationalizations to curry favor with the public. One condition for evading accountability is the White House's ability to take advantage of the institutional shortcomings of the news media. The White House uses several techniques to exploit the press. It can release potentially embarrassing information when the press will have difficulty covering it. The Clinton White House released its report on the Travel Office affair on the Friday before the long July 4th weekend, when attention was focusing on the upcoming economic summit in Japan. Or the White House can set one big story against another. President Clinton announced the policy on gays in the military on the same day that FBI Director William Sessions was fired. In this way, the White House turns aside the threat posed by a watchdog press.

* * *

In The Captive Public: How Mass Opinion Promotes State Power, Professor Benjamin Ginsberg complicates the conventional view about the role of public opinion in western political democracies. Essentially, he argues that, while public opinion rules in contemporary democracies, "it is precisely its deference to public opinion that functions to expand the modern state's power." Ginsberg traces a long-term historical process which has obvious differences from the subject of this paper.[62] Yet his theme aptly

---

61 Michael Baruch Grossman and Martha Joynt Kumar, Portraying the President: The White House and the News Media (Baltimore: Johns Hopkins University Press, 1981), 26.

62 Professor Ginsberg explains that "the transformation of mass opinion into a formal and institutional part of the political process"

characterizes David Gergen's White House communications strategy over the last two decades. The White House, under Gergen's leadership, has converted the President's deference to public opinion, driven by necessity,[63] into an exercise in self-empowerment.

In the end, though, the communications strategies which appear to bring greater power to the President may produce only short-term gains. Packaging seems indispensable, and abandoning presidential leadership on difficult policy choices a given. Such success is bought at the expense of long-term loss in genuine influence and power. Many of the communications strategies described in this paper bear the mark of an incomplete sense of Presidential power, ultimately self-deceptive. When the hard choices in policy debate are so often reduced to imagery, the cumulative effect fuels public expectations which are bound to exceed any President's abilities.[64]

---

enabled democratic governments to "domesticate mass belief, regulate the content of popular opinion, delimit the impact of mass opinion, and harness the power of mass opinion for their own purposes." For example, by extending the right to vote and holding regular elections, the state displaced actions, like rioting, which were less susceptible to government controls. Ginsberg, x, 6 & 48.

63 Recent trends in the President's "dependence" on public opinion have been noted, Maltese, 3, as the President has become "increasingly susceptible to the centrifugal forces of public opinion." CONSTITUENCY DESPERATION AND BUDGET CUTS:

HOW THE DESPERATE BECOME MORE POLITICALLY ACTIVE[1]

By Ruth Ann Strickland

Budget Reductions and Desperation

In his re-evaluation of the "Washington establishment" thesis, Morris Fiorina (1989: 111) asserted that members of Congress still rely heavily on constituency service to get re-elected and therefore, safe districts remain safe, which allows Congress to promote particularistic, parochial concerns and avoid major policy changes. Later in his evaluation of the Washington establishment, Fiorina (1989: 132-133) put forward an interesting set of hypotheses about the ironic effects of budget cuts on constituencies and casework. Specifically, Fiorina addressed what happened after the Reagan budget cuts by noting that particular interests became desperate and political activity increased. This raised the question of whether this reaction always happens after budget cuts and implied in Fiorina's assessment of the Reagan era is a theory that might apply to future administrations that engage in budget reduction activity. This theory may be broken down into four statements:

(1) Budget cuts produce desperate constituencies.
(2) These desperate constituencies become more politically active.
(3) Sentiment for less government declines after budget cuts, particularly after desperate constituents communicate their desperation.
(4) The importance of electoral constituency service increases after budget cuts.

This paper tests whether the desperate really become more politically active after budget cuts and whether sentiment for less government declines after budget cuts across two administrations--the Reagan and Bush presidencies. Given these two conditions, the importance of electoral constituency service is expected to increase after budget cuts.

Measuring Constituency Desperation

To test this, budget cut periods during the Reagan and Bush administrations are examined. Public opinion polls (when available) are used to test sentiment toward more or less government before and after three budget cut eras. In addition, periodicals and magazines analyzed for signs of increased constituent activity and constituency service before and after budget cut eras.

---

[1] I extend special thanks to my two research assistants, Matt Schweizer and Keith Erwin. Without their frequent trips to the library, this research would not have been possible. Of course, the author is responsible for the findings in this paper.

Peterson's (1990-1991: 544) measure of group influence serves as one way to isolate special interest group influence by looking at programs that are not of great importance to the political strategies of the two major political parties and their congressional and presidential candidates. In addition to this measure of interest group influence, desperate constituencies are identified where the linear trend in federal funding drops suddenly or if the spending trend were upward, the rate of increase could decline. It is not necessary for an absolute decline in expenditures to occur. Therefore, desperateness will partially be defined in terms of spending changes.

Constituency demand and desperateness will be measured indirectly by examining where various interests put their money. How much PAC money is spent in the three functional areas would be one indirect measure of constituent demand--assuming groups put their money where their interests lie and also expect some kind of constituency service for their donations. It is hypothesized that PAC monies from constituencies affected by budget cuts will increase after a budget cut.

At this exploratory stage of the project, Fiorina's hypothesis that the importance of electoral constituency service increases after budget cuts will not be tested here. In subsequent work I will test this part of the theory as well. Congressional response to constituency demand will be measured by examining the Congressional Record for the number of speeches aimed at placating demanding, desperate constituencies. Eventually, I will look at the number of bills introduced that affect the various demanding constituencies and will eventually collect congressional newsletters targeted at desperate constituencies.

Budget Cuts in the Reagan and Bush Administrations: Three Budgets Compared

In March 1981, President Reagan submitted President Carter's proposal to cut $56 billion to Congress. At the same time, the Reagan budget called for tax cuts, social spending cuts and a large increase in military expenditures. On March 23, 1981, the Republican controlled Senate Budget Committee approved the Reagan plan with only minor changes. Fourteen Senate committees were ordered to alter their programs to accommodate cuts of $36.4 billion for fiscal year 1982. In April 1981, the Democratic controlled House Budget Committee passed a budget resolution allowing for $15.8 billion in spending cuts. The tide turned in President Reagan's favor in May 1981 when 63 Democrats in the House joined forces with the House Republicans to substitute and accept the Reagan budget for the House Budget Committee version. The Senate followed suit and also passed the Reagan budget. In conference committee, the House and Senate members targeted the programs to be cut and worked out differences between the House and Senate budget bills. By the end of July 1981, the House and Senate adopted a reconciliation bill that reduced fiscal 1982 spending by approximately $35.2 billion, with overall reductions of $130.6 billion for fiscal years 1982-1984. At this time, total budget outlays were $695.5 billion and the deficit was $37.7 billion. (Congressional Quarterly Almanac, 1981: 257).

In 1985, Congress under pressure from the White House struggled to reduce the budget deficit. Not even one of the thirteen fiscal appropriations bills had passed by October 1, 1985. The budget for FY 1996 was laden with continuing resolutions since only six of the regular annual appropriation bills had been enacted into law by the December 1985. Programs funded under the remaining seven bills were covered by an omnibus spending package. Delays n passing funding bills forced Congress to use short-term continuing resolutions to prevent a governmental shutdown. President Reagan vetoed a $13 billion funding bill for Treasury, the Postal Service and other related agencies because he claimed more spending than he requested. At the same time, he signed several appropriations bills that exceeded his requests, including a funding measure for the Department of Housing and Urban Development, the Department of Labor, the Department of Health and Human Services, and the Department of Education and the Departments of Commerce, Justice, State and the judiciary (Congressional Quarterly Almanac, 1985: 315).

In February 1989, President Bush sent a budget package to Congress with a capital gains tax cut included. No specific spending cuts were designated. The sticking point in the FY 1990 budget was over how $5.3 billion in new revenues were going to be raised. The House and Senate conferees ask the House Ways and Means and the Senate Finance committees to find the $5.3 billion in addition to $28 billion in budget cuts. The conference report was approved in the House and Senate in May 1989. In September, the House Budget committee sent a new budget to the House without recommendation due to conflicts over the proposed capital gains tax cut. Through some gimmickry, this new budget met Gramm-Rudman-Hollings targets. Four days into the new fiscal year, the House passed a budget but it was $2 billion over the allowable deficit targets. The Senate Budget Committee proposed a similar budget. In mid-October, President Bush asked for Gramm Rudman automatic spending cuts to take effect. Congress in November voted to extend federal borrowing authority. Later that month, Bush took the capital gains tax cut out of his budget request and then the House and Senate acted quickly to pass a deficit reduction package, with some Gramm-Rudman cuts as well as $2.9 billion in taxes (Rosenbaum, 1993: 4).

Although most domestic discretionary spending rose by an eighteen percent real growth rate after the budget cuts of 1982, there were strategic cuts during the Reagan Revolution that accounted for 76 percent of all bureau level budget cuts (Cogan and Muris, 1990). The Reagan administration, in particular, sought to reduce the scope of the federal government's domestic policy sphere even more than Presidents Nixon or Ford. In the budget proposals, it requested retrenchment in all domestic spending as well as tax and spend devolution to the state governments. The Reagan domestic spending cuts were fairly extensive in that they reversed previous spending patterns. Although current dollar spending stayed stable from 1981 to 1989, real spending declined by one-fourth. The GNP share of expenditures for domestic programs was cut by one-third and closely resembled comparable levels of expenditures in the 1960s (Ippolito, 1990: 219-220). While domestic spending decreased, spending on defense dramatically increased and Reagan successfully whipped the 97th Congress into line with his budgetary priorities and cuts (Hogan, 1988; Peters, 1981; Schick, 1981; Webster, 1991). Generally the cuts were derived from three areas:

(1) programs not central to a national purpose but aimed at local communities, ie. the cuts in subsidies to Amtrak and the Urban Mass Transit system;
(2) programs whose budgetary allotments depend on the rise and fall of energy prices, i.e. the low-income home energy assistance program; and
(3) programs that had little or no effect on normal government operations, i.e. cuts in the Postal Service (Cogan and Muris, 1990: 40-41).

Of these areas, the energy, transportation and interior programs will be the focus of analysis. The trend in spending and cuts will be examined in these three areas because dramatic cuts were made in these areas and they provide a test of how affected interests react to cuts. Also, these areas represent activities engaged in by the federal government that are not of paramount interest to either of the two major political parties--they fit Peterson's residual category since they have not typically been central to the political platforms or strategies of the two parties, the presidential candidates or congressional leaders.

The Interest Group Society: Too Much Influence Peddling?

Many Americans are members or have expressed a desire to join or contribute to special interest groups. A 1981 Gallup Report found that as many as twenty million Americans were members of special interest groups and another twenty million had given money to these groups within a year's time frame (Gallup Report, August 1981).

Influence peddling and its impact on Congress has been a source of much speculation in the press and among academics. In the popular press, much has been made over the "can't do government" and the paralysis inspired by special interest groups and shortsighted leadership (Glazer, 1989; Goodgame and Hornik, 1989; Novack, 1989; Navarro, 1984; Parker, 1987). In an anecdotal case study, Green (1982) documented specific instances where members of Congress admitted the influence of PACs and PAC contributions on their votes. Much evidence presented in popular magazines reinforce the notion that special interest groups are storming the citadel and winning favor to avoid the budget cutter's ax ("Budget Cuts--Where the Ax Falls," 1980; "Lobbies Turn the Screws on Capitol Hill," 1980; "7 Who Work the Halls of Congress," 1980; Bethell, 1981; Corn, 1989).

Information presented on lobbyists often labels them as "hidden persuaders" or as the power brokers behind the scenes with almost unlimited influence (Sheler, 1983). Hubert Marshall, a political science professor at Stanford, has argued that public policy in the U.S. is determined by "subgovernments" or "iron triangles" where executive agencies, congressional subcommittees and interest groups establish close ties and dominate public policy in specific functional areas. The impact, in his view, has been to subordinate the public interest to a string of special interests ("Special Interests in Control," 1984).

Groups, who fear budget reductions, have expressed concern and have even developed a lobbying strategy to cope with their worst fears (Louviere, 1980; Pagliaccio and Gummer, 1988; Starobin, 1989). Various groups continue to toot their own horns, claiming they have an impact on governmental policy (Kaplan, 1988; Scheuring, 1982; Gersh, 1988). There is no doubt that interest groups will continue to be influential. Yet, how influential are they during budget cut eras? Do they become desperate and therefore more politically active?

Interest Group Response to Budget Reductions

In response to budget cuts, lobbyists often organize to counterattack or to either restore funding for their special cause or at least reduce the scope of the budget reduction. Immediately groups mobilized to counter the proposed Reagan budget cuts and in age old rituals started applying pressure from home in letter writing campaigns and in Washington D.C. through marches as well as giving campaign assistance to their political allies in Congress (Schiffres, 1981).

Because the costs of running for a congressional or Senate seat have risen dramatically since the first Congress convened in 1789, many have also wondered whether seats in Congress have been placed on the auction block. Some fear that the days of general campaign appeals to voters have been replaced by special interest campaigns where candidates have to respond to, make promises to, and meet demands of each special interest or face retribution in the form of electoral defeat (Lang, 1980). Even members of Congress, such as Senator David Boren (D-Oklahoma), worry that PAC monies and PAC ratings and the narrow focus of their agendas are distorting the decisionmaking process. As Boren (1990) stated: "Our decisionmaking process is being held hostage to special interests that PAC's represent." Another Senator, Robert Byrd (D-West Virginia), has also been a part of the backlash against special interests and influence peddling, and has engaged in efforts to gain control over the appropriations process through lobbying reform proposals (Alston, 1989).

The scholarly literature is divided over the impact of special interests on voting patterns or on the appropriations process. More than one study has concluded that PAC contributions have not affected the voting patterns of representatives (Grenzke, 1989; Wright, 1989). On the other hand, many have claimed we have the best Congress that money can buy and that on less visible interests, campaign contributions are more likely to have an impact on the legislative process (Schroedel, 1986; Jones and Keiser, 1987).

There are indications that moneyed interests do indeed hold sway in the legislative decisionmaking process by altering members' patterns of legislative involvement (Hall and Wayman, 1990). Despite these indications, studies caution against characterizing interest groups as the greatest threat to democratic government and labeling them as dictators of congressional outcomes. In recent years, scholars have noted a paradox--the more interest groups proliferate, the less influence they have (Salisbury, 1990; Petracca, 1992).

Some scholars have complained that special interest group activity has biased the U.S. Congress toward pork barrel spending and higher and higher rates of government spending. Because special interests are organized and have greater opportunities to communicate demands than the unorganized public, they will distort the amount and composition of government spending (Lee, 1989; Coughlin et.al. 1990; Mueller, 1986). Some economists have gone so far as to argue that as countries mature, special interests literally take over and distort the allocation process so badly that economic growth stagnates (Olson, 1965; Tullock, 1959).

Others claim that the impact of special interests on congressional candidates and their spending choices may be exaggerated and that spending of PACs when compared to the trillion dollar budget is minuscule (Abramson and Penner, 1990: 79). Depictions of groups wining and dining legislators and pumping monies into their political campaigns may distort the fact that interest groups have other policy goals besides increasing their budget shares. Many groups may not deal with budget concerns until a precipitating event, such as a proposed or actual budget cut in their funding levels (Rubin, 1993: 14). Further, it is asserted that interest groups themselves are so disorganized, not really understanding what their own interests really are, and juggling competing agendas, that they experience only minor legislative successes at best (Ornstein and Schmit, 1990).

Much of the literature has focused on how interest groups seek to assert control over Congress and how they lobby for pork barrel or legislation amenable to their interests, but less has been written about their response to budget cuts. The assertion raised by Fiorina (1989) that budget cuts produce desperate constituencies makes sense intuitively. The idea that they will become more politically active will be tested by examining general PAC expenditures, and when possible, functional spending in the areas of energy, interior and transportation before and after budget cuts. It is expected that PAC expenditures will rise, in reflection of a group's desperation, after a budget reduction has been levied against it. As the desperate interest groups communicate their desperation within and across their respective communities, it is expected that sentiment for less government will decline. This will be explored by analyzing public opinion toward government activity from 1980-1992.

Budget Cuts Produce Desperate Constituencies

In The Power of the Purse, Richard Fenno (1966) observed that proposals to cut specific programs tend to produce specific opposition. Even in 1965 many members of Congress were unhappy with the overall size of the budget but they were not particularly able to cut particular items in appropriations bills nor were they effective in reducing spending by cutting specific programs (Gilmour, 1990). Perhaps this is why the Reagan revolution, and the subsequent cuts that were made during his tenure, stands out as a landmark era in budgetary politics. Reagan's successes in 1982 represented the largest budget cuts in recent American history and some even compared his beginning as a new president to Franklin D. Roosevelt's first one hundred days in office (Savage, 1988: 207). As proposed, the 1982 budget meant that every American

from every sector of American life would feel the squeeze (Karmin and Morse, 1982; Davenport, 1981; Posner, 1981).

In contrast, President Bush often restored funds for programs that President Reagan tried to either abolish or significantly cut. In the first two budgets proposed by Bush, some program terminations were suggested but no domestic program was actually ended. In the last two years of office, the Bush administration put forward more than a dozen new and costly initiatives. Among some who had sympathies for the Reagan agenda, Bush earned the title of a "kinder, gentler, bigger spending president" (Moore, 1991). In the infamous Battle of the Budget in 1990 where President Bush agreed to tax increases in exchange for reductions in planned spending, many tough choices were not made and it illustrated that Republicans and Democrats alike did not have the courage to make major spending reductions (Gleckman, 1990). President Bush, on record for breaking his "no new taxes" pledge, may have made the compromise that sealed his electoral fate later in 1992 as the budget deficit issue loomed larger than life in the minds of anxious American voters--an image ironically created by Ronald Reagan's rhetoric throughout the 1980s.

To partially measure the effect of budget cuts on affected constituencies during the Reagan-Bush years, a literature search through popular press and interest group-focused journals was conducted from 1980 until 1991. Numerous groups reacted vituperatively to cuts--especially during the Reagan years. As spending cuts diminish and funding is restored, the reactions from affected interests demonstrate concern as always about funding levels but the level of rhetoric is noticeably toned down. Budget appropriations data was collected between FY 1980 until FY 1991 to provide the overall picture of percent increases and decreases in budgets for selected energy, transportation and interior programs. The data outlining budget appropriations for energy, transportation and interior programs are displayed in Tables 1-2.

(Place Tables 1-2 about here.)

Desperate Reactions from Energy Program Cuts: Heavily criticized and under scrutiny for dismantlement during the early years of the first Reagan administration, the Department of Energy was an easy target for budget cuts. First established in 1977 by President Carter, the Department of Energy (DOE) was slated to fade away due to neglect and a changing energy environment (Sheets, 1981). Controversy and hostility surrounded Reagan's proposed abolishment of the Energy Department. The process used to dismantle the Energy Department was referred to as "cannibalization"--whereby other agencies would be reorganized to takeover the former DOE's responsibilities (Raloff and Tangley, 1982; Velocci, 1982). Naturally many in the energy conservation industry and other energy related occupations or fields were concerned that once the Department of Energy was dismantled, there would be less concern about energy policy and a smaller market for energy related products or services. From 1980 to 1981, budget appropriations for the Energy Department decreased by 20.6 percent. But between 1981-1982, a whopping 59.2 percent decrease occurred.

After the 1982 budget cuts, the scientific community was befuddled by the priorities of the Reagan administration. From 1982 to 1983, energy appropriations declined by 26.5 percent. Funding for research was cut and numerous directors of laboratories and research projects reacted vehemently and immediately in their specialized academic journals (Peterson, 1983). Others complained about the proposed cuts in the 1983 budget in research and development and non-nuclear programs. John Tirman (1984), the senior editor at the Union of Concerned Scientists, criticized cuts in energy programs that dealt with the development of alternatives (such as solar, wind, biomass and other technologies) and noted the administration's bias against renewable energy sources.

Under proposed 1983 budget cuts, almost all non-nuclear programs were slashed and some DOE operations were eliminated altogether. Members of Congress began to coalesce against budget cuts and some such as Senator Charles Percy (R-Illinois) vowed to restore DOE funding the same way he helped kill the ABM system and the supersonic transport. The American Public Power Association (APPA), a group that represented approximately 2,200 electric utilities, was one group among the energy industry trade groups to lobby for DOE's survival. The APPA's executive director argued that abolishing DOE would convey the false impression that energy problems are no longer a matter for governmental concern. The renewable energy industry would be hardest hit since government's involvement was to be slashed drastically--thereby discouraging development of renewable energy sources. One spokesman for the Solar Energy Industries Association, William S. Bergman, claimed that the high technology side of the renewable energy business would collapse (Velocci, 1982). Budget appropriations for energy rose by 48.5 percent between 1983 and 1984. This could be attributed to interest group backlash against the budget reductions in previous years. Yet between 1984 and 1985, they decreased again by 18.2 percent.

Set up in the early 1970s to stockpile crude oil, the Strategic Petroleum Reserve was to be our insurance against future oil embargoes. Much controversy surrounded the Strategic Petroleum Reserve (SPR) and despite advice to the contrary, the SPR was drastically cut (Cameron, 1980; Stone, 1980; Stone 1981; Frank, 1982; "Keep on Filling," 1983; "Fill the Petroleum Reserve," 1985; "Don't Let Oil Reserves Slip Away," 1986; Marshall, 1986). Although most commentators supported increasing stockpiles in the SPR, the Reagan administration seeing no end in sight to the oil glut in the early-to-mid 1980s, wanted to stop filling the SPR in September as one of its cost-savings measures (a.k.a budget cut). Due to the SPR's management problems, even its most ardent supporters and possible allies could not defend it strongly due to the fact that much of the oil in reserve could not easily be moved an processed in the nation's refineries (Starr, 1985).

From 1981 to 1985, much of DOE's budget was diverted into military/defense spending. Research and development monies were continually cut, except in high energy and nuclear physics. Biomedical researchers were disturbed by the FY 1986 budget that would cut Biomedical and Environmental Research from $190.5 million in FY 1985 to $186.3 million in FY 1986 and by the proposed six percent cut in NIH funding (Tangley, 1985).

Taking an initial small budget reduction in 1989-1990 of 6.3 percent, and a larger decrease of 39.7 percent from 1990-1991, there were some rumblings particularly among those interested in the Super Collider and fusion energy programs (Hamilton, October 1990). Between 1991-1992, appropriations for many energy programs rose (overall by 43.8 percent) and some of those disgruntled by earlier cuts in research and development were markedly more optimistic in outlook. Funding for renewable energy sources and civilian research and development rose and even though some cuts took place, generally there was a feeling that there was an overall budget boost for energy science (Hamilton, 1990; Charles and Crawford, 1990; Hamilton, 1991; Norman, 1991; Goodwin, 1992; Crawford, 1990).

From 1981 to 1989, DOE's research and conservation programs were cut significantly and the fill rate of the Strategic Petroleum Reserve was also reduced dramatically. The low-income home energy assistance program was reduced by $1 billion. Reactions to these cuts at times bordered on vitriolic and could be characterized as desperate (Cogan and Muris, 1990).

Desperate Reactions from Transportation Program Cuts: Although appropriations rose for transportation programs between 1980 and 1981, fear was triggered among transportation constituencies by the Reagan budget for fiscal year 1982. President Reagan proposed massive cuts of up to $4.6 billion in mass transit across 1981 through 1986. During this same period, funds for airport expansion would be reduced by one-third under the Reagan plan. Between 1982 and 1986, $12.6 billion was to be cut from federal highway funds and states would have to take on more road maintenance responsibilities Maloney, 1981; McGrath, 1981; Kelly, 1981). Municipality leagues across the country were particularly concerned about the elimination of federal operating assistance and how they were going to meet public transit finance needs (Sharer and Garrity, 1982). Between 1981 and 1982, appropriations for transportation programs were reduced by 15.3 percent.

Congress agreed to cut $500 million from highways, $198 million from mass transit, $271 million from Amtrak, $355 million from Conrail, $152 million from airports and $14 million from ship construction subsidies. Few would escape the impact of such cuts. Rail passengers faced higher fares and subway and other mass-transit riders faced slowdown or abandonment of some projects under construction ("Those Budget Cuts--Who'll Be Hit Hardest," 1981).

Alarmed reactions came from the targets of budget cuts, such as Amtrak. Amtrak, since its beginning in 1971, had been subsidized by government but not without great travail. During the 1971-1981 period, it was the target of budget cutters in every administration. Twice before during this time frame presidents had targeted it and the Reagan administration was the third to seek vast reductions. Previous presidents had not succeeded in their efforts primarily due to constituencies who depended on passenger trains voicing their concerns in Washington (Doan, 1981).

Amtrak managers and some Amtrak supporters feared that the budget cuts would mean loss of passenger service in 36 states as less profitable routes were closed, raising fares and eventually strangle the company. The National

Association of Railroad Passengers expressed support for Amtrak, opposing the budget cuts, and held that Amtrak needed broad based political support to survive. This organization also argued that buses and airlines received government subsidies indirectly and cited that the U.S. was the only country in the world that expected its passenger railway system to turn a profit (Frailey, 1981; Doan, 1981).

Consistently the Reagan administration proposed canceling all subsidies to Amtrak. In debate in Congress on whether to end the federal subsidy to Amtrak, the American Bus Association president argued that Amtrak was not the issue--the real issue was whether there was a national commitment to a national transportation system. Senator Arlen Specter (R-Pennsylvania) argued that preservation of Amtrak was of great national importance and proposed a restoration of funding (Congressional Digest, 1985). For budget cuts in the Urban Mass Transit Administration alone, see Table 3.

(Place Table 3 here.)

In addition to cutting Amtrak, Reagan proposed in 1986 ending subsidies to other rail lines and even included elimination of air service to 142 small towns. Affected interests vocalized concerns about the elimination of the Essential Air Service program and advertised the names of the Senate Appropriations transportation subcommittee and in effect, asked the readership to note this ominous development (Alm and Morse, 1985; "Budget Omits Essential Air Service Plan," 1985). Doug Bandow (1985), a senior fellow at the Cato Institute and a former policy advisor to President Reagan, applauded Reagan's efforts to cut mass transit spending and argued that mass transit systems were not cost-effective.

Despite Reagan efforts to ban all funding for new rail systems, Congress, with the passage of a five cents gasoline tax with one penny set aside for mass transit, was able to thwart the ban. Still the competition for shrinking federal dollars was fierce--producing desperate constituencies from San Diego to Houston to New York City. As many as 31 cities sought federal assistance in the financing of about 50 rail projects by late 1985 (Tifft, 1984; Skrzycki, 1984). Managers of subway systems faced radical size reductions and in major cities such as Miami and New York, this represented a transformation of urban mass transit ("Massive Cuts for Mass Transit," 1986). After the budget cuts took effect, city officials, economists and policy analysts warned of impending disaster in the form of rising transportation costs and deteriorating infrastructure (Gleckman and Ichniowski, 1986). Although transportation appropriations from Congress rose between 1983 and 1985, they declined between 1985 and 1987.

The American Association of State Highway and Transit Officials called for a twenty percent increase in annual expenditures on the nation's highways in 1988; the Federal Railroad Administration simultaneously called for over $600 million to maintain short-line railroads and The Road Information Program published research that claimed that 62 percent of all paved highways were in fair to very poor condition. Thus, pressure for increased spending on transportation programs mounted (Marshall, 1989). From 1988 to 1991-1992, appropriations for transportation were increased with Secretary of

Transportation Skinner laying out plans for 10-20 new airports and supporting construction of light-rail surface-train lines (Barry and Glastris, 1989). Desperate constituents received some relief at last.

Desperate Reactions from Interior Program Cuts: Starting under the Carter administration, cuts were unveiled that alarmed conservationists and environmentalists. In particular, President Carter targeted the Land and Water Conservation Fund (cutting the budget request of $580 million to $223 million) and the Park Service (reducing its land acquisition budget from $187 million to $52 million). In blatant appeals, the National Parks magazine alerted members of the National Parks and Conservation Association (NCPA) to upcoming committee hearings in the House and urged them to write their representatives and ask them to "hold the line on the LWCF by providing at least $580 million" ("Administration Tries to Slash Funds for Parklands," 1980: 29). By August 1980, further updates were given on the status of budget cuts for the National Park Service, arguing that the cuts taking place in committees at that time would severely undermine the ability of the Park Service to continue routine maintenance. Progress was made on the Land and Water Conservation Fund (LWCF) as $160 million was added to the administration's requested budget. NCPA members were again urged to write their congress members and urge restoration of the cuts made in the Park Service and the LWCF ("Budget Cuts Would Impoverish Parks," 1980: 28-29).

In reaction to budget cuts, the NCPA instigated information campaigns--trying to convince Congress and the president that the Park Service needed more funds not less to meet its growing needs. Fears were expressed that politics and budget cuts would destroy the national parks (Lienesch, 1981; Frome, 1981a). When the Reagan administration proposed rescinding most of the remaining FY 1981 funds, the rhetoric from the NCPA and other affected constituencies sounded more desperate as they worried about how states that had not spent or obligated their share of funds would be affected. Secretary Watt's philosophy is criticized, as conservationists sought a more activist role in improving the infrastructure of the parks (Maguire, 1981; Frome, 1981b).

By 1982, the language is more vitriolic toward the Reagan administration:

> "The new Administration, while giving lip service approval to the program's effectiveness, has wielded its budget ax with a vengeance against the LWCF, proposing a massive 90 percent cut in fiscal year 1982 alone...Why is the Department of Interior so committed to crippling this program?" (Lienesch, 1982: 10)

With a $90 million rescission approved for 1981, conservationists faced multiple budget battles with the Reagan administration. Trying to counter the critics of LWCF, the NCPA discussed the LWCF's background and successes and expressed disbelief in Secretary Watt's type of "stewardship" (Lienesch, 1982; Hoffman, 1982). Watt's policy to sell of public lands to pay off the national debt was derided and ridiculed (Shanks, 1983). The president of the NCPA noted that its members should continue to step forward and convince the

Department of Interior to alter its destructive course (Pritchard, 1982; Pritchard, 1983). Between 1982 and 1983, funds for the Interior department rose by 8.3 percent and funding remained stable into 1984. The funding levels may have remained stable due to constant vigilance as conservationists noted the status of each bill in Congress and testified in Congress is support of various pieces of legislation (Malone, 1983).

By 1984, Watt was replaced with Secretary Clark and the NCPA met with him to ask for more funding and to air their environmental and preservationist concerns (Pritchard, 1984). Between 1984 and 1985, funding for the Interior department rose again by 10.2 percent. However in another round of budget cuts, it was reduced by 4.6 percent in 1985-1986. Patches of dilapidation began showing up in the parks--buildings that were run down and crumbling roads. Reagan's planned cuts for FY 1985 made many fear that these patches would expand and serious damage to wildlife, vegetation and buildings would be incurred ("Patches Showing Up in National Parks," 1985). For budget cuts in Fish and Wildlife Services alone, see Table 3. In fiscal years 1982, 1985 and 1986 it was cut dramatically. Efforts to get more funds to support the national forests were renewed with increased vigor after proposed budget cuts in 1986 (Hagenstein, 1986).

By 1988, budget appropriations for the interior department were on the rise again and most efforts of the NCPA were aimed at maintaining these funding levels. With rising fortunes, desperate rhetoric leveled off and more emphasis was placed on avoiding any more deep cuts (Lienesch, 1988; "Congress Takes Steps Toward LCWF Trust Fund," 1988; "Stewardship Meets the Bottom Line," 1988).

Hypothesis #1: As budget cuts increase constituency desperation, PAC expenditures from affected interests will rise after a budget cut cycle.

Studies show that interest groups who seek to exercise influence over Congress typically attach themselves and express their preferences to committees that deal with allocation of resources in their functional policy areas. The rational PAC or interest group realizes that they are more likely to encounter a more sympathetic set of legislators at the committee or subcommittee stage. Thus, the rational interest group seeks to invest its resources where the highest payoff is likely (Berry, 1984; Kingdon, 1981).

If interest groups believe that to get the maximum benefit, they must focus their resources on committee members who are relevant to their cause, then the same logic would seemingly apply when interest groups are threatened by budget cuts. When budgets are cut, it is expected that interest groups in desperation would re-double their efforts and try to restore budget allocations to previous spending levels by focusing their resources on appropriations-related committees. It is expected that interest group and PAC (non-party) spending in general and also specifically focused spending for or against particularly members of Congress who serve on appropriation subcommittees in the areas of energy, transportation and interior will increase dramatically after budget cuts. In the Appendix, the members of the appropriation subcommittees on energy, transportation and interior from 1979-1992 are listed. (See the Appendix.)

Communication costs data obtained from the Federal Election Commission from 1979 through 1991 will be used to measure specific interest group expenditures for and against specific members of Congress, those members on the appropriations subcommittees that handle transportation, energy and interior budgetary concerns.[1] In addition to an examination of communication expenditures for and against specific members of Congress. Independent non-party expenditures for U.S. Senators on relevant committees will also be analyzed from 1979 through 1990. (See Tables 4-7.)

(Place Tables 4-7 here.)

After examining this Federal Election Commission data on PAC spending and the communication costs data, there is mixed support for the hypothesis at best. Use of Federal Election Commission communication costs data was an effort to focus on how specific affected groups reacted to budget cuts but this data too is limited because it vastly underestimates the monies channeled toward members of Congress.

The communications costs data illustrate that from 1979 until 1990, the percentage of costs associated with transportation appropriation subcommittee members jumped from 9.2 percent in 1979-1980 to 13.8 percent in 1989-1990 in the transportation area. Overall, communication costs by specific PACs or interest groups directed at all Congress members rises to $23,349 in 1985-1986 and overall costs decline to none in 1991-1992. Communication costs directed toward energy appropriation members climbs from .9 percent in 1979-1980 to 12.9 percent in 1987-1988 of all costs expended, with no costs found in 1989 through 1992. Communication costs aimed at all members of Congress from energy-related groups remained stable at approximately $17,000 then dropped in 1985-1986 to only $1,745 but rose again to 13,741 in 1989-1990. With no communication costs recorded in 1979-1980 for interior-related interest groups, costs directed toward members of Congress in general were $6,449 in 1983-1984 with 6.3 percent of the expenditures directed toward interior appropriation subcommittee members. Communication costs directed toward members of Congress by interior-related increase from $4,429 in 1985-1986 to $6,369 in 1987-1988, with no expenditures found for 1989 through 1992.

Generalizations about interest group reactions to budget cuts are almost impossible to make from this initial examination of non-party contributions to Senators on appropriation subcommittees in the three functional areas of transportation, energy and interior. This data does not necessarily lend support to the hypothesis because there are numerous reasons for increased general PAC spending, such as the increased costs of campaigns, a tendency for PACs to donate more to entrenched, powerful incumbents and increased PAC spending during the year that an incumbent seeks re-election.

Nine Senators (or 43 percent of those serving on the transportation appropriation subcommittee from 1979-1990) evidenced increased PAC expenditures in at least three consecutive two-year election cycles. Seven of the eight experienced increased non-party contributions after the 1981-1982 budget cut era and two of these were running for re-election in the 1983-1984 cycle. No trend is discernable because after the 1986 budget cuts, non-party contributions did not increase for most of these Senators and when they did

increase there were three Senators seeking re-election in the 1987-1988 cycle.

Thirteen Senators (or 56 percent of those serving on the energy appropriation subcommittee from 1979-1990) evidenced increased PAC expenditures in at least three consecutive two-year election cycles. All of them experienced increased non-party contributions after the 1981-1982 budget cut era but five were running for re-election in the 1983-1984 cycle. No trend is discernable because after the 1986 budget cuts, non-party contributions increased for seven of the Senators; four were seeking re-election in the 1987-1988 cycle and three were not. There were no increased non-party contributions for six of the Senators in the 1987-1988 cycle.

Thirteen Senators (or 52 percent of those serving on the interior appropriation subcommittee from 1979-1990) evidenced increased PAC expenditures in at least three consecutive two-year election cycles. All of them experienced increased non-party contributions after the 1981-1982 budget cut era but seven were running for re-election in the 1983-1984 cycle. After the 1986 budget cuts, non-party contributions increased for seven of the Senators; three were seeking re-election in the 1987-1988 cycle and four were not. There were no increased non-party contributions for six of the Senators in the 1987-1988 cycle.

To supplement this PAC spending data and to obtain a better test of the hypothesis, an analysis of independent expenditures from the groups and PACs affected by the budget cuts on members of the House as well as the Senate will prove more useful in future research. At this writing of the paper, the author was unable to obtain and analyze all the available data.

Hypothesis #2: Sentiment for less government declines after budget cuts, particularly after desperate constituents communicate their desperation.

With the Reagan rhetoric aimed at "getting government off the backs of the people," calls for budget reductions and cuts in government waste became popularized. A Roper Organization and American Enterprise Institute poll taken in 1981 revealed that 53 percent of those polled thought the federal government had too much influence in their daily lives (American Enterprise, 1993). Various public opinion polls taken prior to the first round of Reagan budget cuts indicate a receptive public mood. In February 1981, a Gallup Report survey indicated that 48 cents of every dollar collected by the Federal government was wasted in the public's judgment (Gallup Report, February 1981). At the same time, the public has tended to support increased defense spending as 51 percent polled in March 1981 indicated that too little was being spent on defense--again, coinciding with the agenda of the Reagan administration (Gallup Report, March 1981).

By October 1981, during the Reagan Revolution, many of those polled embraced Reagan's New Federalism by putting more faith in state governments than the federal government. In addition, more Americans (46 percent) in 1981 than those polled in 1979 (43 percent) believed big government was a bigger threat to the nation than big business or big labor (Gallup Report, October 1981).

In September 1982, after the budget cuts were passed, the public still favored giving state governments more financial responsibility for social programs over the federal government but only 34 percent favored a decrease in government spending for social programs, such as health, education and welfare while 66 percent opposed such a decrease. When asked in January 1983 whether social programs should be cut further to help reduce the budget deficit, 52 percent disapproved and 41 percent approved of such cuts--a sign of disaffection with the Reagan agenda. By this time, the public was more amenable to reductions in defense spending, with 57 percent approving and 36 percent disapproving cuts in defense spending (Gallup Report, 1983).

When asked in 1984 about their awareness of the Reagan budget for 1985, 48 percent of those polled had heard of it and 48 percent had not. Based on those who were aware of the proposed budget, 69 percent felt the budget was too large and only four percent thought it was too small; seventeen percent thought it was about the right size. When asked where spending cuts should be made, 57 percent favored cutting the military and 22 percent favored cutting social programs; eleven percent favored cuts in both (Gallup Report, April 1984). Later in 1984, 74 percent of those polled nationally favored increased spending in social programs such as education an Medicare while 24 percent opposed it. Eighty-eight percent favored maintaining cost-of-living increases on Social Security benefits (Gallup Report, October 1984). Opinion once again was out of step with the Reagan administration's proposed cuts of social domestic programs.

As the Reagan budget in 1986 proposed deep cuts in social programs and greater increases in defense spending, public opinion seemed to solidify in the opposite direction. Of those polled in 1985, public opinion ran four to one (or 46 percent to 11 percent) that too much rather than too little had been spent on defense and military programs. On the other hand, the public (42 percent) stated in the Gallup poll that too little was being spent on social programs and only 22 percent felt too much was being spent on them (Gallup Report, March 1985).

Generally, of those polled on Reagan's record on reducing the size of government, 29 percent thought it had gotten much better or somewhat better; 26 percent believed it had stayed the same and 31 percent believed it was somewhat worse or much worse (Gallup Report, April 1985). In mid-1985, when asked on ways to reduce the deficit again, the public still disapproved of cutting government spending on social programs by 55 percent and a majority (66 percent) approved of cutting defense spending. A dramatic 87 percent disapproved of cutting entitlement programs such as Social Security and Medicare while only nine percent approved (Gallup Report, June 1985).

By 1986, the top priority for the nation (59 percent in the Gallup poll) was reducing the deficit by cutting defense spending. A slight majority disapproved of cuts in social spending (51 percent) and 88 percent disapproved of cuts in entitlements. As the Reagan budget called for deep cuts in education and welfare increases but sharp increases on military spending, it was clearly out of step with the priorities of most Americans polled. (Gallup Report, 1986).

With 76 percent of Americans in 1987 opposing cuts in social programs as a way to deal with deficits and 88 percent disapproving of entitlement program cuts while 58 percent approve cuts in defense spending, the trend that the Reagan administration is not in line with public priorities becomes more pronounced (Gallup Report, May 1987). By 1988, a poll of registered American voter indicated clearer, more fixed priorities as 67 percent advocated increased government spending for health care, 66 percent wanted increased federal expenditures to improve the quality of public education and 44 percent called for increased funding of food programs for low income families. Only 26 percent and 17 percent advocated increased spending on the space program and the military respectively (Gallup Report, 1988).

Previous to the Bush Administration, the public had by wide margins opposed higher taxes to reduce the federal budget deficit (Gallup Report, August 1987; Gallup Report, 1986; Gallup Report, June 1985; Gallup Report, October 1984; Gallup Report, 1983). By 1989, however, 71 percent believed that President Bush would be unable to avoid raising taxes; they did oppose raising of the federal income tax. A desire for increased government spending and intervention in government programs continued. When spending increases on social programs are linked to new and higher taxes, 63 percent still supported more expenditures on public education; 57 percent still supported greater funding for combatting drugs; 59 percent still sponsored more programs for the homeless and 57 percent still advocated more spending on long term health care programs (Kohut and Hugick, 1989). By this time, the pendulum of public opinion seemed to swing back toward more government activism, not less.

Despite the renewed interest for more government expenditures on social programs, seventy percent of Americans polled in May 1990 stated that budget deficit reduction was very important to them. Forty three percent believed reducing spending was the best way to reduce the deficit while fifty percent believed that a combination of tax increased and spending decreases was the preferred way (Gallup, Jr. and Newport, 1990).

Growing disaffection with government is reflected in 1992-1993 polls. During the election of 1992, polls indicated that of business corporations, government, the news media, community organizations and the average person, government was the least trusted to do what is right--fourteen percent trusted government most of the time to do what is right while 31 percent hardly ever or never trusted government to do what is right. Community organizations were the most trusted, with 54 percent trusting them to do what is right most of the time (Hugick and McAneny, 1992). Seventy percent of those polled in March 1992 were dissatisfied with the overall performance of the national government, with only 28 percent indicating satisfaction. At the same time, 41 percent indicated in 1992 that government should use its powers more vigorously to promote the well being of all segments of the people while 39 percent believed the federal government had too much power. By 1993, 69 percent believed that the federal government created more problems than it solved and 67 percent favored smaller government with fewer services with only thirty percent favoring larger government with many services (American Enterprise, 1993).

In the late 1970s and early 1980s, public opinion was almost equally divided on whether the federal government should expand its role in society and exercise more power. In 1978, for example, 38 percent believed the federal government had too much power and 36 percent wanted it to use its power more vigorously to promote the welfare of all citizens. In 1982, 38 percent again indicated that the federal government had too much power and only 30 percent desired it to use its power more vigorously. Yet by 1986, after major budget cuts in 1982 and 1985, a substantial plurality of Americans (41 percent) favored a more active federal government--one that would look after the well-being of all citizens (Gilbert, 1988: 199-200). By the 1990s, after many budgets for special interest programs had been restored, negative sentiment toward the federal government rises but even in 1992 41 percent still wanted the federal government to use its power more vigorously to promote the well being of all.

Conclusions: The Politics of Budget Cuts

Much has been written about pork barrel and budget allocations made to special interest groups. Less has been written about budget cuts and special interest reactions to them. This exploratory study makes an initial effort to evaluate the politics of budget cuts and the implications they have for interest group behavior and public opinion. Generally, interest groups become more vocal as budget cuts are threatened and after they occur. Heightened desperation is hard to measure directly. An examination of independent expenditures directed at specific members of Congress on key subcommittees where budget allocations declined may offer more insight to how groups exert pressure after budget cut eras. An expanded data base, including more budget cut periods, will also assist in efforts to analyze interest group responses to good times and hard times.

Because "special interests" have been made the pariah of American politics, many Americans perceive that the budget is filled with special interest waste and if only members of Congress would cut out the fat, the deficit would be reduced and we could maintain the status quo with bloated entitlements and all other middle class budgetary perquisites. The facts indicate, however, that not only must special interest group pork barrel be reduced or eradicated but middle class entitlements and social spending that benefits the middle class must also fall under the budget ax--herein lies the major paradox for members of Congress who feel it is their job to deliver the pork to their districts and states and address their constituent concerns.

Three out of four Americans in a Washington Post-ABC News poll believed President Clinton's economic plan did not reduce federal spending enough (Ingwerson, 1993). Yet if President Clinton and members of Congress cut their favorite program or subsidy, there might have been less eagerness from to public to "cut out the fat." Before President Clinton's first address, interest groups mobilized to thwart budget cuts aimed at them (Weisskopf and Mufson, 1993). The politics of budget cuts is fraught with harsh language, such as "shared sacrifice," "reinventing government" and "doing more with less." While Congress in unison agrees that spending needs to be cut more deeply, members can not agree on what spending to cut--surely not the spending for their district or state as recent 1993 budgetary politics clearly

indicated.

Washington's "nasty addiction" to deficits and empty promises fuel the fire of budget cutting politics, making cuts even harder to accept by giving the appearance that they will be arbitrary (the vulnerable, disorganized will feel the ax, not the powerful, well-heeled lobbyists). As stated by Mortimer Zuckerman (1992): "They operate on the theory that before you lead, you have to get elected. The problem is they don't lead after they get elected."

1. Communication costs are those monies spent from January of one year into December of the next year (e.g. January 1, 1985-December 31, 1986). Communication costs are treasury funds spent by interest group organizations to make internal communications which advocate the election or defeat of specific candidates for federal office. The organization does not have to report such costs to the FEC until they exceed $2,000 per election for all candidates. As a result, there is much under-reporting.

TABLE 1. BUDGET APPROPRIATIONS FOR TRANSPORTATION, INTERIOR AND ENERGY: 1980-1991
(in billions of dollars)

Fiscal Years	Transportation		Energy (Interior-Related)		Interior	
	Budget Request	Actual Approp.	Budget Request	Actual Approp.	Budget Request	Actual Approp.
1980	8.5	8.2	1.9	3.4	4.1	4.2
1981	12.1	11.1	3.8	2.7	3.8	4.1
1982	9.1	9.4	993*	1.1	3.1	3.6
1983	9.7	10.0	443*	808*	3.5	3.9
1984	10.3	10.3	667*	1.2	3.6	3.9
1985	11.1	11.0	899*	982*	4.0	4.3
1986	7.3	9.9	634*	974*	3.7	4.1
1987	6.5	9.8	337*	935*	3.6	4.1
1988	9.8	10.1	1.8	1.5	3.9	4.4
1989	8.8	10.7	1.6	1.6	4.0	4.6
1990	9.9	11.8	1.2	1.5	4.6	5.3
1991	11.7	12.8	531*	904*	5.0	6.1
1992	15.0	14.2	910*	1.3	5.8	6.1

SOURCE: Congressional Quarterly Almanac, 1980-1991

* = denotes that the dollar amount indicated in the table is in millions of dollars, not billions

NOTE: The transportation appropriations included funds for: Office of the Secretary, Coast Guard, Federal Aviation Administration, Federal Highway Administration, National Highway Traffic Safety Administration, Federal Railroad Administration, Urban Mass Transportation Administration, Research and Special Programs Administration and the Office of the Inspector General. The energy appropriations (related agency to Interior) included funds for: fossil energy, naval petroleum and oil shale reserves, energy conservation, economic regulatory administration, strategic petroleum reserves and emergency preparedness and energy information administration. The interior appropriations included funds for: Bureau of Land Management, Fish and Wildlife Service, National Park Service, Geological Survey, Minerals Management Service, Bureau of Mines, Bureau of Indian Affairs, Territorial and International Affairs and Departmental Offices. The budget appropriation data cited here does not include recissions or supplemental funding.

TABLE 2. PERCENT INCREASE/DECREASE IN BUDGET APPROPRIATIONS FOR TRANSPORTATION, ENERGY AND INTERIOR: 1980-1992

	80/81	81/82	82/83	83/84	84/85	85/86
Transportation	+35.4	-15.3	-6.4	+3.0	+6.8	-10.0
Energy	-20.6	-59.2	-26.5	+48.5	-18.2	-0.8
Interior	-2.4	-12.2	+8.3	*	+10.2	-4.6

	86/87	87/88	88/89	89/90	90/91	91/92
Transportation	-1.0	+3.1	+5.9	+10.3	+8.5	+10.9
Energy	-4.0	+60.4	+6.7	-6.3	-39.7	+43.8
Interior	*	+7.3	+4.5	+15.2	+15.1	*

* = indicates that funding level did not change from one fiscal year to the next

TABLE 3. APPROPRIATIONS FOR SPECIFIC PROGRAMS WITHIN TWO FUNCTIONAL AREAS: URBAN MASS TRANSIT AND FISH AND WILDLIFE SERVICES

FY	Urban Mass Transit Administration	Fish and Wildlife Services
1980	2.17 billion	not available
1981	4.61 billion	273.2 million
% +/- '80-81 =	+52.9%	
1982	3.49 billion	250.5 million
% +/- '81-82 =	-24.3%	-8.3%
1983	3.21 billion	not available
% +/- '82-83 =	-8.0%	
1984	3.01 billion	847.2 million
% +/- '83-84 =	-6.2%	
1985	3.03 billion	419.6 million
% +/- '84-85 =	+.7%	-50.5%
1986	2.62 billion	381.5 million
% +/- '85-86 =	-14.5%	-9.1%
1987	2.45 billion	396.3 million
% +/- '86-87 =	-6.5%	+3.9%
1988	2.08 billion	426.1 million
% +/- '87-88 =	-15.1%	+7.5%
1989	2.01 billion	456.7 million
% +/- '88-89 =	-3.4%	+7.2%
1990	1.91 billion	533.5 million
% +/- '89-90 =	-5.0%	+16.8%
1991	1.87 billion	697.5 million
% +/- '90-91 =	-2.1%	+30.7%
1992	1.86 billion	748.2 million
% +/- '91-92 =	-0.5%	+7.3%

% +/- = percent increase(+) or decrease (-) in budget appropriations

TABLE 4. COMMUNICATION COSTS FOR PACS DIRECTED TOWARD MEMBERS OF CONGRESS, 1979-1980; 1983-1992

APPENDIX: KEY CONGRESSIONAL MEMBERS, 1979-1992

96th U.S. CONGRESS, 1979-1980

HOUSE OF REPRESENTATIVES

Appropriations Subcommittees

Energy and Water Development:

Tom Bevill (AL)	John W. Jenrette (SD)
John T. Myers (IN)	Julian Dixon (CA)
John M. Slack (W.VA)	Clair W. Burgener (CA)
Lindy Boggs (LA)	Edward P. Boland (MA)
Bill Chappell, Jr. (FL)	Virginia Smith (NE)

Interior:

Sidney R. Yates (IL)	Bo Ginn (GA)
Joseph M. McDade (PA)	K. Gunn McKay (UT)
Gillis W. Long (ME)	Ralph A. Regula (OH)
John P. Murtha (PA)	Clair W. Burgener (CA)
Norman D. Dicks (WA)	Robert Duncan (OR)

Transportation:

Robert Duncan (OR)	Adam Benjamin, Jr. (IN)
Silvio O. Conte (MA)	Bennett M. Stewart (IL)
Lawrence Coughlin (PA)	Jack Edwards (AL)
Tom Steed (OK)	Edward P. Boland (MA)
Clarence E. Miller (OH)	William Lehman (FL)
Martin Olav Sabo (MN)	

U.S. SENATE

Appropriations Subcommittees

Energy and Water Development:

J. Bennett Johnston, Jr. (LA)	James A. McClure (ID)
Mark O. Hatfield (OR)	Milton R. Young (ND)
Richard S. Schweiker (PA)	Quentin N. Burdick (ND)
Warren G. Magnuson (WA)	Jake Garn (UT)
James R. Sasser (TN)	Dennis DeConcini (AZ)
Henry Bellmon (OK)	Harrison H. Schmitt (NM)
John C. Stennis (MS)	Robert C. Byrd (W.VA)
Walter Huddleston (KY)	Ernest F. Hollings, Jr. (SC)

Interior:

Robert C. Byrd (W.VA)	Quentin N. Burdick (ND)
Ted Stevens (AK)	John A. Durkin (NH)
Ernest F. Hollings, Jr. (SC)	Milton R. Young (ND)
Birch Bayh (IN)	Mark O. Hatfield (OR)
J. Bennett Johnston, Jr. (LA)	Henry Bellmon (OK)
Walter Huddleston (KY)	James A. McClure (ID)
Patrick J. Leahy (VT)	Paul Laxalt (NV)
Dennis DeConcini (AZ)	

Transportation:

Birch Bayh (IN)	Charles C. McC. Mathias (MD)
James A. McClure (ID)	John A. Durkin (NH)
Robert C. Byrd (W.VA)	Lowell P. Weicker (CT)
John C. Stennis (MS)	Thomas F. Eagleton (MO)

Abstract

PUBLIC FUNDING OF ABORTIONS FOR LOW-INCOME WOMEN IN NORTH CAROLINA: ONE LIBERAL LAW IN THE SOUTH

By Ruth Ann Strickland

This paper examines the history of the State Abortion Fund in North Carolina. The political forces behind the origins and continuation of appropriation of public monies for abortion are described and systematically analyzed. The role of political parties, the presence of women legislators, the public opinion of North Carolinians toward abortion and the role of modernizer versus tradtionalist legislators are a few of the political factors cited as contributing to North Carolina's liberal abortion law, especially when compared to restrictive abortion laws passed in other states in the South.

PUBLIC FUNDING OF ABORTIONS FOR LOW-INCOME WOMEN IN NORTH CAROLINA: ONE LIBERAL LAW IN THE SOUTH

By Ruth Ann Strickland

The Public Funding Debate: Morality Versus Redistribution

Common ground between those who favor choice and those who are against choice on the issue of abortion is difficult to achieve. The debate surrounding access to abortion is often framed in bimodal terms with opponents taking intense, mutually exclusive positions. These positions are illustrated by the fundamental dispute over when life begins: either the fetus is a person at conception or not and therefore, either the fetus has rights as a person or not. The moral arguments add intensity to this issue and make compromise difficult if not impossible (Strickland and Whicker, 1992).

The abortion debate is a political and increasingly a religious battle. It pits well-intentioned groups against one another as opponents disagree fundamentally about the scope and role that government should play in determining access to abortions or in protecting the rights of the fetus. Religious conflict is evident as the Catholic Church and some fundamentalist Christian denominations characterize abortion as murder. Beyond this, it is an issue that potentially embodies gender conflict as pro-choicers argue for reproductive choice and modifications of patriarchal control of female social and gender roles in society and anti-abortionists argue for continuance of traditional gender roles (Goggin, 1993; Guth et.al., 1993).

When the issue of public funding of abortion is raised, morality politics and redistributive policy questions make compromise and consensus even more unlikely. Studies that compare state policies on public funding of abortion have indicated that advocacy groups and political forces in the state play the dominant role in shaping outcomes in this policy area (Meier and McFarlane, 1992; Meier and McFarlane, 1993). The purpose of this study is to examine the historical and political forces that led to the passage of the liberal abortion legislation--particularly, the State Abortion Fund--in the the state of North Carolina.

The Hyde Amendments and the Public Funding Debate

In 1977, Congressman Henry J. Hyde (R-Illinois), sponsored the Hyde amendment which limited the use of federal Medicaid funds for abortions to those instances where the mother's life would be endangered should the fetus be carried to term. The U.S. Supreme Court upheld this restriction on access to abortions for poor women in Harris v. McRae, 448 U.S. 297 (1980), ruling that Roe did not institute a new entitlement which would guarantee equal access to abortion (Tatalovich and Daynes, 1988: 184).

Since 1977, the Code of Federal Regulations has specified differing guidelines funding Medicaid abortions varying from only in cases of medical

necessity to including rape and incest to endangerment of the mother's life. Currently the most restrictive interpretation of the Hyde amendment prevails, allowing Medicaid abortions only if the mother's life is endangered. Given this restriction on funding at the federal level, state governments that desired to guarantee low-income women equal access to the abortion right had to subsidize elective abortions with state funding (Tatalovich and Daynes, 1988: 204, 207; Craig and O'Brien, 1993).

Arguments Against Public Funding: The debate over public funding is characterized by morality and redistributive issues. The opponents of public funding of abortion typically rely on moral arguments and are opposed to most or even all abortions, holding that the fetus is a life--a human being--and therefore deserving of protection. Further opponents assert that taxpayer money should not be used to fund the taking of an innocent life and that if a person can not afford an abortion, other options, such as adoption, should be considered. Instead, government should be neutral and restrain itself from rendering any dictates about reproductive choices (Editorial in New York Times, 1993).

Other more moderate opponents claim that public funding encourages a procedure that should be used as rarely as possible and not as a means of birth control. Using public funds to pay for abortions is tantamount to endorsing them. Scarce public monies should be used to fund prevention programs, not to fund sexual recreation that leads to pregnancy. The more extreme opponents argue that abortions constitute mass murder at the taxpayer's expense (Roberts and Gest, 1993).

Argument For Public Funding: Those in favor of publicly funded abortions claim that Roe v. Wade gave women the right to obtain abortions. They also argue that it is immoral to deny someone access to a right simply based on income (Editorial in News and Observer, 1977). They further claim that a right is worthless unless one has the means or capacity to exercise it. An examination of women who sought therapeutic abortion under a very restrictive state law (which permitted abortions if pregnancy threatened the mother's life) revealed that under psychiatric evaluation, 79 percent lacked emotional support from the man responsible for the pregancy and the majority experienced great stress from the interplay of existing problems and an unwanted pregnancy (Belsky, 1992). Such studies verify the need for less restricted access to funded abortions.

Some argue that if other medically necessary procedures are funded under Medicaid, abortions should also be funded--to single out abortion is unconstitutional. Others claim that the Hyde Amendment is unconstitutional on the grounds that government expends monies for the costs of childbirth, but not for abortion. Since pregnancy is a condition that requires medical care, there are two ways to handle pregnancy--abortion or carry the fetus to term. Under the Roe decision, the government is to ensure privacy and under this reasoning, it has no legitimate interest in whether the woman chooses abortion or childbirth. Its primary interest is to protect the health and safety of the mother and if she gives birth, then it should protect the child as well (McConnell, 1991: 1003-1004). To remove abortion from the medical choices open to poor women places government on the side of pregnancy continuance, not

in a neutral position.

Others cite the commitment of time, energy and emotional support needed by a child and assert that the mother who is forced to carry an infant to term may harbor resentment and withhold time, energy and emotional support from the child. If there are no public funds for abortion, low income women, especially teenagers, would be forced into a long term commitment that they may not be ready to handle. Many proponents fear that low-income women, unable to procure an expensive private abortion, will resort to cheaper methods in dollar terms but costly in public health terms--the coathanger, the back-alley abortions (Slifkin and Allen, 1978).

Public Funding of Abortions in the South

Presently thirty states publicly fund abortions only if the life of the mother is at stake. Twelve states fund abortions in most or all circumstances; eight states will only fund abortions in cases of rape, incest or fetal deformity. North Carolina is one of twelve states that provides funds for abortion in most or all circumstances. It is the only southern state to provide funding for elective abortions (Congressional Quarterly Almanac 1989, 298).

All other southern states restrict access to abortion using a variety of techniques. Prior to the Roe v. Wade ruling, six southern states including Alabama, Arkansas, Louisiana, Mississippi, Oklahoma and Texas had laws on the books prohibiting virtually all abortions. Today, most southern states retain a number of restrictions on abortion. For example, five southern states including Alabama, Arkansas, Georgia, Louisiana and South Carolina require that minors notify one or both parents or obtain consent. In addition, Alabama, Florida, Kentucky, Louisiana, Mississippi, Tennessee and Virginia require women to be counseled on abortion and many women must wait 24 hours or more before obtaining abortion services. Three states--Florida, Kentucky and South Carolina--require that women obtain consent or notify their husbands prior to obtaining an abortion (Whitford, 1992; Lacayo, 1992: 29).

Kentucky and Louisiana prohibit usage of public facilities and or personnel in the performance of abortions. In 1992, four southern governors (those in Alabama, Louisiana, Mississippi and South Carolina) advocated criminalizing abortions. Louisiana prevents health care providers from giving advice or referrals on abortions. All southern states (except North Carolina) including Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, Oklahoma, South Carolina, Louisiana, Tennessee, and Texas refuse to fund abortions unless the woman's life is imperiled by continuing the pregnancy; Virginia also will not fund abortions unless a woman's life is in danger but will fund them if there rape or incest is involved in the pregnancy (Craig and O'Brien, 1993; Kanigel and Seese, 1992; Lacayo, 1992: 29).

In a study conducted by Halva-Neubauer (1990), North Carolina is labeled an "acquiescer state". The National Abortion Rights Action League (NARAL) has characterized North Carolina as a battleground state, although of these states, it poses the lowest risk for loss of abortion rights should Roe v.

Wade be overturned. It has been ranked the seventh most likely state in the nation to keep abortion services safe and legal (National Abortion Rights Action League, 1992).[1]

In the areas of public funding of abortions and allowing low-income women access to abortions, North Carolina might be labeled a "supporter state". Counting the number of restrictions enacted by state legislatures may not take into account the stringency or leniency of the measures enacted. Also, some restrictions place greater burdens on access to abortion than others. This should be taken into account when considering North Carolina's abortion legislation, a state with the most liberal abortion policy in the South.

Creating and Expanding North Carolina's State Abortion Fund, 1977-1984

With the passage of the 1967 abortion statute, North Carolina's General Assembly became the second state legislature (following Colorado's) to enact a liberal abortion law, permitting the women of North Carolina to terminate a 20 weeks old or less pregnancy if continued pregnancy impaired health, imperiled life or in case of rape, incest or a grave birth defect (Jain, 1972). In subsequent years, North Carolina has established a state fund for low income women seeking elective abortions, once again distinguishing itself as a liberal state.

In the period prior to the enforcement of the Hyde amendment (fiscal year 1976-1977), $1.8 million (90 percent federal funds) funded elective abortions for poor women in North Carolina (Vaden, 1977: 1A). When federal funds were eliminated by the Hyde amendment, state aid for abortions in North Carolina was temporarily suspended from August 1977 to January 1978. In response to the Hyde amendment, Human Resources Secretary Sarah Morrow recommended that state monies be used to assist poor women who could not afford elective abortions.

In January 1978, the N.C. Department of Human Resources shifted $442 thousand from other purposes to continue funding state abortions. At a state Social Services Commission meeting, Dr. Morrow recommended that the state of North Carolina begin paying for these abortions by February 1, 1978. She based her request on the Roe v. Wade decision and the idea that all women, not just the wealthy, should have access to elective abortions. The $442 thousand was exhausted by June 30, 1978 and consequently the department requested additional funds from the legislature ("Morrow to Recommend State Funding of Abortions," 1978: 19; May, 1978: 1, 2).

In February 1, 1978, the state of North Carolina established a State Abortion Fund. Abortions for eligible low income women were funded totally by state monies but at a lower rate than that sponsored by Medicaid funding. The average abortion payment of $442.30 for poor women in 1976-1977 was reduced to $201 (Relos 1993; Vaden, 1978: 26). Governor James B. Hunt in May 1978 gave his support for state funding of abortions for low-income women. In a press conference, he stated: "I don't think it's fair for the rich to have (access to abortions) and the poor not to have it." With Governor Hunt's approval,

Dr. Morrow recommended that the General Assembly appropriate $1 million for a State Abortion Fund (Carroll, 1978: 23).

During the short legislative session in the summer of 1978, state funding of abortions became one of the issues that was hotly debated. Numerous groups mobilized to protest for and against state funding of abortions (Brown, 1978: 17-1; "Abortion Funding Backed," 1978: 34). Interest group and citizen testimony was emotionally charged. Ms. J.C. Honneycutt of Charlotte testified that access to abortion saved her from giving birth to a child that would have been severely retarded and deformed and that approving public funding for low income women was not just a moral or legal issue but a question of survival. A Greensboro insurance man, David Osteen, characterized state funded abortions as similar to genocide under Nazi Germany. Anti-abortion foes sent a wave of letters asking legislators not to fund abortions (May, 1978: 1, 2).

By a 46 to 39 vote, the Joint Base Budget Committee voted to defeat a motion to remove $1 million of state funding for elective abortions. Senator Ollie Harris (D-Cleveland) who led the effort to eliminate the appropriation asked, "Is the North Carolina General Assembly becoming more liberal than the Congress of the United States?" Despite strong protest from anti-abortion groups, the measure prevailed with the support of black legislators and key committee leaders. Representative Harold L. Kennedy (D-Forsyth), in response to Senator Harris, stated that it was not a matter of liberality but rather a question of whether the state of North Carolina was going to discriminate against low-income women who could not afford abortions (May, 1978: 1, 14).

Later in 1978, the State Abortion Fund came under attack from Paul Stam, Jr., then an Apex attorney who was acting president of the Wake County Right to Life association. Stam filed a lawsuit challenging the constitutionality of state funding of elective or medically unnecessary abortions for poor women. Stam, a right-to-life proponent, claimed that a fetus is a person and also asserted that counties were not authorized to collect revenues via taxes to fund elective abortions. In particular, he was concerned about the use of Wake County funds, his home county, to supplement the State Abortion Fund. The North Carolina Supreme Court held in March 1981 that state funding of elective abortions was constitutional but county governments could not levy taxes to supplement funding of such abortions because no specific statute authorized such activity. State and local officials in reaction to the ruling stated that it would have little effect on state funding of abortions since only Wake, Guilford and Mecklenburg counties had some kind of supplemental program (Leland, 1981). Under the North Carolina State Abortion Fund, counties are now reimbursed for the cost of providing abortion services to poor women (Johnson, 1981; Christensen, 1989).

In the 1981 North Carolina General Assembly session, opponents of state funded abortions launched another attack on the State Abortion Fund. Senator Ollie Harris (D-Cleveland), one of the most outspoken abortion foes, tried to cut $900 thousand out of the proposed $1 million budget for elective abortions. His motion to reduce appropriations to the State Abortion Fund from $1 million to $100 thousand was narrowly defeated in a vote taken in the Joint Base Budget Committee. His proposal also specified that the $100

thousand only be used for abortions involving rape, incest or where the mother's life was threatened. Although some members called for a show of hands on the committee voice vote, the committee co-chairperson, Senator Robert Jordan, used the rules to prevent this by claiming that the request came after he had announced the vote (legislative rules hold that request for a show of hands must occur before the committee chair announces the voice vote results). The loss was the second and most critical one suffered by abortion opponents. At that time Senator Harris decided to desist in his efforts to delete abortion money from the state budget (Kelly 1981).

In July 1982, the state legislature increased annual State Abortion Fund appropriations from $1 million to $1,374,500. Between 1982 and 1984, there is a brief lull in the abortion funding controversy. The Democratic gubernatorial administration of Jim Hunt (1976-1984), sympathetic to the issue of public funding of abortion, was replaced by a Republican governor, Jim Martin. With the national mood clearly more conservative combined with a President who avidly opposed abortion rights, the atmosphere was ripe for conflict at the state level over this divisive issue.

Retrenchment of the State Abortion Fund, 1985-1992

Governor Martin (during his 1984-1992 administrations) publicly advocated ending state abortion funds for abortions except in cases of rape, incest or endangerment of the mother's life. In 1985, abortion funding became a visible contentious issue again. Under the Martin proposal, more draconian cuts in the State Abortion Fund were suggested than those proposed earlier by Senator Harris, reducing the fund from $1.3 million to $50 thousand a year (Winston, 1985).

In the 1985 legislative session, the Governor, members of his political party (and some Democrats) in the General Assembly square off against prominent Democratic leaders on the issue of publicly funded abortions. Those against funding for abortion such as Representative Coy Privette (R-Cabarrus), Senator Ollie Harris (D-Cleveland), Representative Frank J. "Trip" Sizemore III (R-Guilford), Representative Theresa H. Esposito (R-Forsyth) and Senator Wendell H. Sawyer (R-Guilford) voiced moral opposition to abortions and also asserted that they had the strength (the votes) to sharply reduce state funding of abortions. Pro-choice advocates such as Representative Liston Ramsey (D-Madison), Representative Daniel T. Blue (D-Wake), Representative Margaret Keesee-Forrester (R-Guilford), Lieutenant Governor Robert B. Jordan III and Senator Anthony E. Rand (D-Cumberland) publicly opposed cutting the fund and argued that abortion access should be equal, not based on class distinctions (Babington, 1985; Winston, 1985).

The interest groups were quite vocal. Paul Stam, still active in the Wake County Right to Life association, dismissed arguments that poor women should have equal access to abortion stating:

> The difference between having money and not is that the person with money can pay for things that others can't. We don't have a Cadillac fund. The choices in transportation are limited. Their choices all over the lot are different Winston, 1985).

Supporters of the abortion fund not only believed that poor women should have the same medical rights as their more affluent sisters but that eliminating the fund would cost millions of dollars. According to the Reverend Deborah J. Steely, coordinator of the N.C. Religious Coalition for Abortion Rights, an estimated $40 million in additional services for newborns and infants, including welfare services, would be drawn from North Carolina taxpayers if the State Abortion Fund was dramatically reduced (Winston, 1985).

Ultimately the State Abortion Fund was reduced in the 1985 legislative battle and compromises were made. The Joint Base Budget Committee narrowly voted to maintain funding. Funding was set at $924,500 (a 30 percent decrease in funding) and additional eligibility requirements were levied. Not only must recipients be North Carolina residents receiving Title XX Health Support Services but they must meet one of the following criteria: impairment of health as a result of pregnancy, victimized by rape or incest, be mentally retarded or younger than age eighteen.

Much debate ensued later when there was a sharp decline in access to and delay in obtaining abortion services for poor women as a result of the "health impairment" stipulation. Although doctors' statements certifying health impairment were not difficult to obtain because most doctors interpreted this phrase broadly to include mental and physical health, many women were confused and did not try to overcome the extra obstacle (White, 1985; Green, 1985). The health impairment stipulation was worded vaguely and did not state that health impairment must be physical. The state Department of Human Resources in its list of possible diagnoses that might warrant a state-funded abortion listed such things as "acute anxiety reaction" or "acute subrational reaction," inferring that emotional and mental disturbances in health are as impairing as being physically unable to carry a fetus to term (Drescher, Jr., 1985).

In July 1989, the U.S. Supreme Court upheld parts of a restrictive Missouri abortion law in Webster v. Reproductive Health Services (109 S.Ct. 3040), permitting restrictions on the use of public facilities and personnel in the performance of abortions and requiring viability tests on the fetus if the woman is twenty or more weeks pregnant. North Carolina legislators and interest groups reacted strongly to the decision. Representative Paul B. "Skip" Stam (R-Wake) stated that the North Carolina General Assembly would probably adopt a Missouri-type law. In fact, before the ruling, Representative Stam had already introduced a bill similar to the Missouri law and anticipated passage in the short 1990 legislative seession. A North Carolina Right to Life lobbyist expressed hope that momentum was on their side in the funding debate but also believed that passing a law like the Missouri law would be very difficult. Representative Sharon A. Thompson (D-Durham) responded that the Supreme Court ruling would activate pro-choice groups and

would force a major battle to guard against eroding North Carolina's liberal abortion law (Christensen, 1989). Pro-choice groups, including the National Women's Political Caucus, National Organization for Women, WomenElect and the National Abortion Rights Action League, reacted by targeting North Carolina state legislative campaigns and lobbied strongly to prevent the passage of more restrictive abortion legislation (Morrill, 1989; Seymore, 1992).

By 1989, state funds for abortions were cut from $924,500 (1985-1988) to $424,400 (1989-1992). Pro-lifers, particularly on the House Appropriations Committee, wanted to slash the fund by 78 percent from $924,500 to $200,000 but the Senate voted to cut the fund to $424,500. Leading the charge to reduce the abortion fund budget was Representative Paul Stam. At his urging, the House Appropriations Committee version would have drastically altered access to abortion services for poor women since it would have limited abortion to victims of rape or incest and those whose "lives" (not health) were imperiled if they tried to carry the fetus to term. It was estimated that under these criteria only 100 women would be eligible per year for state funded abortions (Funk, 1989).

In the 1989 extra session, access to abortion was limited but not as severely as Stam hoped. The General Assembly reduced the gestation time from 135 days to 112 days, thus limiting a state funded abortion to pregnancies of 112 days or less. It also passed a provision that adult women would be eligible for a state funded abortion once in a lifetime obtained under the reason of health impairment. The more liberal Senate version became the law and allowed eligible women to receive state-funded abortions if they were victims of rape or incest or if continuing their pregnancies would "endanger their health." These regulations went into effect in July 1990 (Session Law; Chapter 1066, Sec. 79: 827-828). For fiscal year 1991-1992, the General Assembly appropriated $424,500 for the budget of the State Abortion Fund and regulations and restrictions remained the same as those enacted in 1989.

A Return to Expanding State Abortion Funds, 1993

In the legislative session of 1993, the North Carolina General Assembly once again revisited the issue of state funding of abortions. In the reconciliation between the House and Senate Appropriations Committees, this issue became contentious. The Senate proposed to increase the state abortion fund from $440,000 to $1 million whereas the House plan sought an increase up to $1.4 million (Patterson, 1993: 3C; Patterson, 1993: 3A). In the compromise that emerged from the conference committee, the State Abortion Fund was almost tripled from $424,000 to $1.2 million for fiscal year 1993-1994 (Krueger, 1993: 1A, 10A).

Interviews conducted in June 1993 with various representatives and senators in the N.C. General Assembly indicated that some prior restrictions on access to abortion were removed, notably the "one abortion in a lifetime per adult woman" stipulation and the requirement that a woman visit a state certified physician, rather than the doctor of her choice when determining health impairment.

Of those state legislators that favored public funding of abortion for low income women, many claimed that minors in particular are harmed by families who have a punitive outlook on unplanned, unwed pregnancies and the tendency to punish, not assist, young women who are pregnant brings about great costs to society in the long run. Others who favored public funding argued that the abortion fund is a small investment when compared to the number of unwanted pregnancies that would occur, the AFDC and other welfare costs that would be incurred and the abuse of children by frustrated, unhappy mothers that might occur.

Those state legislators who were opposed to public funding of abortions often cited public opinion in North Carolina as one reason (the fact that 80 percent of North Carolinians polled opposed the use of taxpayer's money for funding of abortions for low income women). They also stated that public monies should not be used to fund private recreational activities and that such funding, if available at all, should be for cases of rape, incest or if the mother's life is at stake due to a continued pregnancy. Others who oppose public funding of abortions argue that abortion constitutes murder of an innocent human being and public monies should not be used for this purpose.

When asked if future restrictions (i.e. parental notification/consent or 24 hour waiting period) seemed likely, most state legislators who were interviewed felt that restrictions would be introduced but none would pass. Most cite the presence of Governor Hunt's administration as a force responsible for the continuation of a liberal abortion law and public funding of abortions in North Carolina. For a brief history of the state abortion fund in North Carolina, see Table 1.

(Place Table 1 here.)

Possible Restrictions on Access to Abortion Services

Since the passage of the liberal abortion law in 1967, numerous efforts have been lauched unsuccessfully to place limits on access to abortion services in North Carolina. See Table 2 for a brief summary of some bills that have been introduced and referred to committees for consideration. At this point, none of these bills have become law. By far the most freqeuntly supported, yet unsuccessful, proposed restriction by legislators is the requirement that unemancipated minors receive parental consent before obtaining an abortion. Arising in almost every legislative session, this restriction garners the most sponsors and if any additional restriction will gain passage in the future, this appears to be the most likely one.

(Place Table 2 here.)

Political Climate and Fluctuations in Abortion Funding

Political Party: The State Abortion Fund was reduced between 1985-1989 because the political climate had undergone a metamorphosis. In 1984, an anti-abortion Republican governor ascended to office. Prior to James G.

Martin's governorship, James B. Hunt, a Democrat, was pro-choice. In subsequent state legislative elections, Republicans, most of whom were pro-lifers, won seats in the General Assembly. At the same time, various strong pro-choice advocates such as Lieutenant Governor Robert Jordan and Senate Majority Leader Anthony Rand were replaced by abortion opponents such as Lieutenant Governor James Gardner and Senate President Pro Tempore Henson Barnes (Christensen 1989).

Modernizers vs. Traditionalists: North Carolina state legislators can be split into two categories: modernizers and traditionalists. The traditionalists tend to represent rural, small towns in North Carolina whereas the modernizers represent larger cities with a more cosmopolitan outlook. The fluctuating fortunes of the State Abortion Fund may be attributed to the basic differences between traditionalist and modernizer legislators. The traditionalist legislators on social issues stress the importance of the patriarchal family and typically oppose public funding of abortions (Luebke, 1990: 55). Traditionalist legislators, particularly on abortion rights, can be found predominantly in the Republican party but also among some conservative Democrats. Although the Democratic leadership has endorsed the State Abortion Fund, it has encountered opposition from socially conservative traditionalist Democrats on important committees, such as the Senate Human Resources Appropriations Committee.

In 1985 when a vote on whether to continue the abortion fund was held in the state senate, there was a tie with all twelve Republican senators opposing the bill and twelve of 38 Democrats also voting "no." All but one of the opposing male Democrats came from a rural area; the three black senators and the four women senators all supported the funding of abortions (Luebke, 1990: 56). This illustrates that if Republicans can ally themselves with social traditionalist Democrats the State Abortion Fund can be challenged and its budget dramatically reduced.

Public Opinion: When North Carolina residents were polled in June 1989, fifty percent supported the Roe v. Wade decision and 52 percent believed abortions should be legal. Sixty percent personally viewed abortion as wrong. Yet 58 percent of those questioned opposed a constitutional amendment that would outlaw abortions. When asked whether they would like to return to the pre-Roe days and allow each state to decide whether abortions should be legal, 54 percent opposed and 39 percent favored such a scenario. When asked who they would most likely vote for between a pro-choice and pro-life candidate, 49 percent would vote for the pro-choice candidate whereas 41 percent would vote for the pro-life candidate; ten percent were not sure who they would support (Mellnik, 1989; Effron, 1989).

When polled again in March 1990, sixty percent of North Carolina residents agreed that abortion should be legal under certain circumstances; 25 percent believed it should be legal under all circumstances and 13 percent opposed it under all circumstances. Over eighty percent agreed that the state should require a parent's permission for abortion if the mother is a minor. Sixty-one percent opposed the spending of North Carolina tax money on abortions whereas 31 percent supported it. In this poll, 98 percent supported abortions if the woman's health was endangered and ninety percent favored the

procedure in cases of rape and incest. Support declined for abortion under other circumstances such as allowing abortion if a child would be deformed or retarded (64 percent) and abortion for an unmarried teenager who would be seriously affected by a pregnancy (34 percent). Overall North Carolinians favor legalized abortion under certain circumstances and were not prone to reversing all abortion rights (Guillory, 1990; Geis, 1990).

Although most North Carolinians (61 percent) oppose public funding of abortion, the abortion fund has survived. Rarely has the issue of public funding of abortion been separated out from the current operations budget. Typically, state funded abortions are part of the general appropriations bill and the public therefore is not able to disaggregate a legislator's support for publicly funding abortions from a vote for the general appropriations bill. Consequently, legislators can protect themselves from a potentially unpopular direct vote on whether public monies should be appropriated for the purpose of state funded abortions for low income women.

Presence of Women Legislators: There has been much debate about whether women in positions of political power would behave differently than men (Saint-Germain, 1989). Typically, women legislators have placed greater emphasis on social and family issues than on economic or business concerns (Thomas and Welch, 1991). Studies have documented that female legislators are much more likely to be pro-choice on abortion than their male counterparts (Darcy, Welch and Clark, 1987); Hill, 1982; Welch, 1984). It has also been shown that at the aggregate level, female state legislators, if represented in state legislatures in large numbers, can have an impact on abortion parental notification policies at the state level but not on public funding of abortions (Berkman and O'Connor, 1993). This also seems to apply to North Carolina in particular.

Women in the North Carolina General Assembly have not been characterized as strongly feminist (Luebke 1990, 55). Historically they have not been represented in large numbers. On restrictive abortion bills introduced since 1979, North Carolina's women legislators have been divided. Republican female legislators are more likely than Democratic female legislators to sponsor restrictive abortion bills. Except for 1979, however, women legislators in the N.C. General Assembly have not sponsored bills that would end public funding of abortions for low income women.

In 1979, for example, two Republican women and one Democratic woman were listed as sponsors on bills that would have prohibited appropriations of public monies for providing or defraying the costs of abortions. These women were: Representative Edith Lutz (D), Representative Mary N. Pegg (R) and Senator Anne Bagnal (R). The N.C. state senate in 1979 had five female senators, four Democrats and one Republican. The N.C. house of representatives had fourteen female representatives, thirteen Democrats and one Republican. In the senate, Anne Bagnal constituted 20 percent of the female vote and was the only female senator to overtly sponsor a bill that would end public funding of abortions for low income women. In the house, one Republican woman and one Democratic woman were listed as sponsors for such a bill, constituting 14.3 percent of the support in the house for this restriction.

In 1985, six women in the state house of representatives, two Democrats and four Republicans, were listed as sponsors on a bill that required parental consent or judicial consent for an unemanciated minor's abortion. The following female legislators supported this restriction: Representative Betsy Cochrane (R), Representative Theresa Esposito (R), Representative Jo Graham (D); Representative Edith Lutz (D), Representative Charlotte A. Gardner (R) and Representative Doris R. Huffman (R). At this time in the house of representatives, there were fourteen women legislators with seven Democrats and seven Republicans. Approximately 43 percent of the female delegation in the house supported the parental consent restriction.

In 1987, when the consent for a minor's abortion bill arose again, six female sponsors in the House of Representatives were found: Representative Betsy Cochrane (R), Representative Theresa H. Esposito (R), Representatives Charlotte A. Gardner (R), Representative Doris H. Huffman (R), Representative Edith Lutz (D) and Representative Beverly M. Perdue (D). Of the nineteen women legislators in the house of representatives during 1987, 31.5 percent were sponsors of the parental consent restriction.

By 1989, eleven female sponsors in the house of representatives were listed as supporting the parental consent bill--eight Republican women and three Democratic women. Many of the same women tend to support the parental consent bill from year to year. Altogether there were 11 Democratic women and 10 Republican women. In total, there were 21 women legislators in the house of representatives during 1989--52 percent of these women sponsored the parental consent provision; 48 percent were not overt sponsors but some of these female legislators could have also supported the provision.

In 1993, one Republican of twenty women in the N.C. house of representatives (constituting five percent of the female population) sponsored a bill that would require informed consent of the pregnant woman before an abortion could be performed. Four Republicans of the twenty women (or 20 percent of the female delegation in the house) sponsored parental consent legislation. Fourteen of the twenty women are Democrats. Five Democratic women sponsored legislation to protect a person's access to health care facilities, a bill ostensibly aimed at the anti-abortion protesters who block access to abortion clinics.

<u>Interest Group Influence:</u> Various interest groups have been vocal and have periodically lobbied the legislature on behalf of or against access to abortion in North Carolina. Groups that have worked toward pro-choice causes include: Women's Health Organization, Planned Parenthood and local affiliates, N.C. Religious Coalition for Abortion Rights, the National Abortion Rights Action League of N.C., National Women's Political Caucus, WomenElect, N.C. Coalition for Choice, and National Organization for Women and local affiliates. Anti-abortion groups who have sought to eliminate and/or restrict abortion services include: Right to Life committees, N.C. Christian Action League, Operation Rescue, National Right to Life, and Life Advocates. These abortion rights' groups and anti-abortion groups were most vocal in the media. Their direct influence is hard to measure. At least two members of the General Assembly were executive directors of one of the groups. Representative Paul Stam (R-Wake) was director of Wake County Right to Life

and Represenative Coy C. Privette (R-Cabarrus) was executive director of the N.C. Christian Action League. Both legislators were opposed to public funding of abortions and were active in introducing additional restrictions on access to abortion.

Most Liberal Law in the South

In conclusion, a confluence of factors explain why North Carolina has maintained a liberal and almost restriction-free abortion law. The most important factor is a Democratically controlled legislature led by a Governor who has remained pro-choice. Except for the years of Governor Martin and the cuts in the abortion fund that occurred during that time, North Carolina's General Assembly has not pushed through any of the expected restrictive legislation that many states enacted after Webster v. Reproductive Health Services. This could be due to the presence of social modernizer legislators who have countered the traditionalists and have voted down measures such as parental notification.

The liberal abortion law could also be attributed to public opinion polls which indicate that North Carolinians largely view abortion as a right and do not wish to see the Roe v. Wade decision reversed. Public opinion polls in other southern states such as Tennessee show that North Carolinians are more supportive of abortion rights than their neighbors. A poll taken in Fall 1991 revealed that only 47 percent of Tennesseans believed the state's law on abortion should stay as it is while 41 percent believed abortion should be allowed only in cases of rape or incest. Forty-four percent of Tennesseans in 1992 indicated that the state should make it harder to obtain an abortion (Wade 1991; Wilkinson, 1992). In South Carolina, 80 percent held that they opposed abortion under all circumstances whereas 61 percent of North Carolinians supported abortion under certain circumstances Kroff, 1990).

With 50 total members in the state senate and 120 total members in the state house of representatives, the presence of women in the North Carolina General Assembly Women has not been large enough to have a significant impact on abortion policy or to launch a feminist agenda. Typically, women legislators in North Carolina have not been considered strongly feminist. In 1979, three female legislators sponsored a bill that would end public funding of abortions for low income women. Other than this exception, other women in the General Assembly chose to oppose abortion funding more quietly or support it behind the scenes.

Compared to other states in the South and even nationally, North Carolina has one of the least restrictive abortion law. The presence and support of crucial Democratic legislators and particularly the Democratic governor, Jim Hunt, has made the State Abortion Fund possible. Given the Jim Hunt was recently re-elected to serve as governor of the state, the support for a liberal abortion policy will most likely continue.

1. NARAL did its rankings by examining the positions of each state's governor and legislative bodies on legal abortion, using floor votes, surveys and assessments of abortion rights and anti-abortion organizations. They also examined the restrictions on abortion present in the state at the time and whether the state had responded to Webster v. Reproductive Health Services by enacting new restrictions. In their ranking, the higher the number (up to 50) the greater the likelihood that a state would seek to prevent or restrict abortion services.

TABLE 1. HISTORY OF N.C. STATE ABORTION FUND

Date	Event
1967	North Carolina abortion law limits elective abortions to the first twenty weeks of pregnancy
1973	Roe v. Wade ruling is issued by U.S. Supreme Court;
October 1975	Family planning becomes a mandatory service in N.C. under Title XX and abortion services are available as a resource
August 1977	Federal funding for elective abortions (or 90 percent of the total cost of providing abortion services) was eliminated under Medicaid and Title XX programs, thus ending elective abortions as an option for low income women in North Carolina
January 1978	N.C. Department of Human Resources shifts $442 thousand from other purposes to continue providing abortion services to low income women
February 1978	A State Abortion Fund is set up, utilizing only State money to reimburse low income women for abortion services ($150 in the first trimester and $500 for second trimester abortions)
June 1978	The N.C. General Assembly appropriated $1 million to support the State Abortion Fund for fiscal year 1978/1979
July 1979	Income eligibility level was lowered to contain costs within the $1 million appropriation
March 1981	N.C. Supreme Court upheld the use of state monies for elective abortions but struck down county expenditures for that purpose
February 1982	A four month shorfall occurred in the State Abortion Fund budget
July 1982	The N.C. General Assembly raised the annual State Abortion Fund appropriation to $1,374,500
July 1985	The N.C. General Assembly lowered the annual State Abortion Fund appropriation to $924,500 and added more eligibility requirements

TABLE 1. HISTORY OF N.C. STATE ABORTION FUND (cont.)

Date	Event
July 1989	The N.C. General Assembly reduced the annual State Abortion Fund appropriation to $424,000 for fiscal year 1989/1990
July 1990	The N.C. General Assembly limited access to abortion for low-income women by reducing the gestation time under which abortions could be obtained from 135 days to 112 days; the number of abortions that could be obtained due to health impairment were limited to one in a lifetime for women aged eighteen or older
July 1993	The N.C. General Assembly raised the annual State Abortion Fund appropriation to $1.2 million; restrictions on access to abortion services for low income women are reduced

TABLE 2. SAMPLE OF RESTRICTIVE ABORTION BILLS INTRODUCED IN N.C. GENERAL ASSEMBLY SINCE 1979

Bill	Description
H.B. 246 (1979) S.B. 214 (1979)	A bill prohibiting the appropriation or expenditure of public funds for the purpose of providing or defraying the costs of abortions
S.B. 690 (1981)	A bill to prohibit use of state funds for abortions
H.B. 917 (1985)	A bill to require parental or judicial consent for an unemancipated minor's abortion
H.B. 1055 (1985)	A bill to require that advertisements of abortion facilities contain suitable health warnings
H.B. 918 (1985)	A bill to enact the unborn children't civil rights act by limiting the use of funds for abortions
H.B. 1267 (1987)	A bill to allow taxpayers to contribute to the state abortion fund when filing their income tax returns, and to provide that no state funds may be appropriated for the state abortion fund
H.B. 1068 (1987)	A bill to require parental or judicial consent for an unemancipated minor's abortion
H.B. 157 (1987)	A bill to prohibit any state funds being used for elective abortions
H.B. 1231 (1989)	A bill to establish the abortion control act (similar to the Missouri abortion law)
S.B. 122 (1989)	A bill to provide counseling and educational services to adolescent parents and their families and for adolescents that terminate their pregnancies and to provide family-oriented procedures tor notification of pregnancy termination
H.B. 93 (1989)	A bill to require the consent from a parent or a county department of social services for an unemancipated minor's abortion
H.B. 1040 (1991)	A bill to require the social services commission to adopt specific rules to make fetal models available to state abortion fund clients upon request

TABLE 2. RESTRICTIVE ABORTION BILLS INTRODUCED

IN NORTH CAROLINA GENERAL ASSEMBLY SINCE 1979 (cont.)

Bill	Description
H.B. 236 (1993)	A bill to allow taxpayers to contribute to the state abortion fund when filing their income tax returns, to use these contributions along with other contributions to replace state appropriations for abortions, and to codify the guidelines used in determining who is eligible for assistance from the state abortion fund
H.B. 1026 (1993)	A bill to requiring informed consent of the pregnant woman before abortion may be performed
H.B. 1024 (1993)	A bill to require parental or judicial consent for an unemancipated minor's abortion
H.B. 872 (1993) H.B. 985 (1993)	A bill to protect a person's access to health care facilities

Oregon's Ballot Measure 9:

Religious Fundamentalism, Gay Activism, and the Political Center

Abstract

In this paper I examine the politics of identity through a case study of Oregon's Measure 9, a1992 Constitutional referendum which would have limited the legal status of homosexuals and given the state an affirmative duty to discourage that behavior. Two major interest groups clashed over the issue: The Oregon Citizens Alliance, a religious conservative organization, and NO ON 9, an association drawing support from a variety of gay rights, civil liberties, and privacy groups. This was a microcosm of a wider national political battle.

The politics of identity became strategy during the '92 campaign. The debate over Measure 9 was a struggle to define the basic values of Oregonians, and to establish what is mainstream and who is truly the outgroup.

The factions who battled over Measure 9 each sought to redefine the opposition as dangerous extremists. The O.C.A. views itself as a group of family oriented Christians upholding "basic, traditional American values." Their goal was to reverse what they saw as a trend toward favoritism or special rights for people whom they viewed as perverted and subversive of those values. NO ON 9 responded by describing the measure as a threat to all citizens, and to the democratic spirit upon which our society is based. They painted the O.C.A. as an intolerant group seeking to exclude from the community anyone who didn't adhere to a narrow, bible-based view of righteousness. Political success hinged upon which group could most successfully define the public image of the other. Ultimately NO ON 9 and a broad coalition of opinion leaders succeeded in isolating the O.C.A. and defeating Measure 9.

Preface

Ballot Measure 9 pitted two different value systems and world views against each other. The campaign was intense, often vindictive, with activists seeing the issues in absolute, black and white terms.

In this paper I am not seeking to prove or disprove the contentions or refute the philosophies of either group. I have tried to present each view fairly, as they themselves would present it, in order to better understand the issues and outcome of the campaign.

Charges of exploitation and hypocrisy were hurled in both directions. I had the opportunity to meet with leaders on both sides. To the best of my determination those I spoke to, while cautious in their conversations with this outsider, were sincere in their beliefs and commitment to the causes they espoused.

Writing this paper has required the use of terminology that is in itself contentious. Traditional conservatives such as the Oregon Citizens Alliance employ the term "homosexual." Liberal and equal rights groups prefer "gay" or "gay and lesbian." I utilize both, without intended prejudice. Generally I use "homosexual" when presenting the OCA views, "gay" when presenting the NO ON 9 outlook.

Text of Ballot Measure 9

The Constitution of the state of Oregon is amended by creating a new section to be added to and made a part of Article I and to read:

(1) This state shall not recognize any categorical provision such as "sexual orientation", "sexual preference," and similar phrases that includes homosexuality, pedophilia, sadism or masochism. Quotas, minority status, affirmative action, or any similar concepts, shall not apply to these forms of conduct, nor shall government promote these behaviors.

(2) State, regional and local governments and their properties and monies shall not be used to promote, encourage, or facilitate homosexuality, pedophilia, sadism or masochism.

(3) State, regional and local governments and their departments, agencies, and other entities, including specifically the State Department of Higher Education and the public schools shall assist in setting a standard for Oregon's youth that recognizes homosexuality, pedophilia, sadism or masochism as abnormal, wrong, unnatural, and perverse and that these behaviors are to be discouraged and avoided.

(4) It shall be considered that it is the intent of the people in enacting this section that if any part thereof is held unconstitutional, the remaining parts shall be held in force.

I. Introduction

On November 3, 1992 Oregon voters, after a long campaign, passed judgement on Measure 9, a referendum to amend the Oregon Constitution to "require that all governments discourage homosexuality, other listed behaviors, and not facilitate or recognize them." [1] When the votes were counted the measure had failed 57% to 43%. The losers vowed to refile and try again.

For Oregon, Measure 9 was the major political event of the year, overshadowing the other eight ballot measures, state and federal races, and even the Presidential contest.[2] The campaign, often compared to a similar debate in Colorado, drew international media attention. The heat of the campaign produced flaming rhetoric, verbal diatribes, and physical assaults. It involved virtually every major political, social, or economic organization in the state. While the issue deeply divided the people of Oregon, it also produced uncommon political alliances.

The author and primary supporter of Measure 9 was the Oregon Citizens Alliance (OCA), a conservative interest group/political party with a religious fundamentalist core. In opposition was an array of gay rights, privacy and civil liberty groups, under the leadership of an ad hoc organization called NO ON 9.

On one level, Measure 9 was a function of the demographics, public attitudes, political history and campaign laws of Oregon. On another, it was a reflection of a broader struggle over American political values. These two groups at odds in Oregon - homosexuals and Christian fundamentalists - are seeking acceptance as part of the mainstream of American life. Each has endured long struggles to make their voice heard. Each has recently moved closer to the center stage, a visible - but not universally accepted - actor in the political drama.[3]

The conflict was forcefully displayed at the 1992 national party conventions. At the Republican event, erstwhile Presidential candidate Patrick Buchanan was given the floor in order to condemn homosexuals and other enemies of American traditional values. Christian fundamentalists were a vocal and visible presence. In stark contrast, the Democratic meeting acknowledged for the first time gay activists and voters as part of their coalition.[4]

Gay rights measures also reached the ballot in Portland, Maine and Tampa, Florida. Voters in the former city chose to uphold an ordinance banning discrimination based on sexual orientation. In the latter, a similar ordinance was repealed.

The battle over Measure 9 was a debate on several questions of identity. One one level, it was a discussion of the proper influence of "gays" (or "homosexuals") and of religious fundamentalists in the Oregon polity. On another, it asked all Oregon voters, even those with no loyalty to either side, to declare who *they* were. Was Oregon the state that would take a step backwards and restore legalized discrimination? Was Oregon the state that would take a strong moral stand against immorality and social decay?

Each side sought to control the terms of the debate by defining themselves and their opposition. In other words, their common strategy was to present their own side in moderate terms, while portraying the opposition as dangerous and extreme. The leaders had an instinctive - if not a conscious - understanding of the old principle that American voters tend to reward the more centrist candidate. In this case, the issue was not a candidate, but two organizations and two societal sub-groups, each representing themselves as the mainstream.

The two factions viewed Measure 9 as a vital struggle of almost apocalyptic proportions. Lon Mabon, Chairman of the Oregon Citizens Alliance, proclaimed:

> This is the culmination of a cultural war that's been going on since the '60's. Oregon is at the cutting edge. We are the first troops of two opposing armies that are engaging each other. We are talking about fundamental questions, about what is right and what is wrong. [5]

On the other side, the Coalition for Human Dignity warns:

> In our estimation the threat of the religious right is both real and immediate. We believe that it extends not only to the rights of lesbian and gay men, not only to women's reproductive rights, but to the very fabric of our civil and human rights and democratic institutions.[6]

This study is based upon research conducted during the summer of 1993. My sources were:

- Interviews with interest group activists, political leaders and journalists (see appendix A)
- Pamphlets, newspapers and other publications from the interest groups active on this issue.
- Newspaper articles and editorials in the Portland Oregonian, the Eugene Register- Guard, and the Salem Statesman-Journal, among others.
- Television and radio newscasts, public affairs programs, and advertisments.
- The 1992 Voters Pamphlet published by the state, containing 34 pages of paid advertisements on Measure 9.
- Public documents filed by registered PACs with the Oregon Secretary of State's Office.

II. The Oregon Case

The Measure 9 campaign was conducted primarily by two organizations: the No Special Rights PAC of the Oregon Citizens Alliance in support, and NO ON 9 in opposition. These groups were the essential fundraisers, strategists and coordinators for their respective sides. However, it must be noted that a large number of additional political, professional, and religious associations contributed time, money, and prestige to the struggle. Each group had their own motives and their own approach. Likewise, a number of prominent individuals took public stands on the measure. The lead groups coordinated this effort, but could not (and did not seek to) totally control it.

The issues of the campaign were tied to the national agendas of religious fundamentalist and homosexual groups. However neither of the major players quite fit these labels. As discussed below, the OCA is not strictly a religious movement, and NO ON 9 was not primarily a "gay" organization.

A. History, organization, and goals of the Oregon Citizens Alliance

"The OCA is an organization of citizens who believe in a traditional understanding of right and wrong. We are organized to try to persuade the citizens that there is a need for a moral base to a healthy society," explains Lon Mabon, Chairman of the Oregon Citizens Alliance. [7]

The OCA is not exclusively a Christian or even a religious organization. However, their literature is replete with references to biblical values and injunctions. Leaders frequently express their philosophy in Christian terms. Churches have provided facilities and a natural audience for meetings and rallies. Mabon observes of OCA members that "Most believe in God.... the one true God, although we attract many who may not be religious, may not be Christian, but believe in moral absolutes." [8]

The religious underpinning is further illustrated by the OCA's connection with Christian Coalition, a national Evangelical political organization founded by Pat Robertson. In 1992 Mabon adressed the Coalition's National Conference. The group responded with a $20,000 donation to the Measure 9 campaign. After the election the two organizations attempted an official union, and the OCA Chairman was named head of the Christian Coalition's Oregon Chapter. This arrangement had collapsed by early 1993. Mabon observed that "the separation was more technical than philosophical." As both groups sought to expand their base in the Northwest they came into competition. It was hard to simultaneously be a competitor and an affiliate. They continue to cooperate where it suits their mutual interests. [9]

Another perspective comes from NO ON 9 director Peggy Norman, who views the OCA as more concerned with obtaining secular power than promoting their religious beliefs. "They're there for the politics, not the religion." [10]

The OCA traces its roots to the1986 Republican primary campaign of Joe Lutz - a fundamentalist minister - against Senator Bob Packwood, a strong supporter of abortion and reproductive rights. Lutz received 46% of the vote against the entrenched, well financed incumbent. This campaign brought together for the first time many of the future activists for the OCA. It also revealed a considerable conservative protest vote within the politically moderate state Republican Party.

A conservative faction, led by T.J. Bailey, won control of the state Republican Central Committee later that year. Running the party, however, proved difficult, as moderate Republican donors repudiated the new direction. The conservatives were forced to yield control in 1987 as the party neared bankruptcy. [11]

Bailey, Lutz, Lon Mabon and Dick Younts formed the Oregon Conservative Alliance in 1987. The name was soon changed to the more inclusive Oregon *Citizens* Alliance.[12]

Within their broad interest of restoring a "moral basis" to society the O.C.A. has expressed three specific goals or concerns: opposition to abortion, weakening of environmental and land use restrictions (what they term the restoration of private property rights), and preventing the official promotion of homosexuality.[13] The group has pursued these goals through grassroots organizing (often utilizing fundamentalist churches), pamphleteering, nominating candidates for office, and sponsoring referenda. They publish newspapers The Alliance, and Freedom Journal on a semi-regular basis, as well as other occasional pamphlets addressing specific issues.

Until 1992, abortion - rather than homosexuality - was their primary focus for organizing. However, their only statewide electoral success came in 1988 with voter approval - at 53% - of Measure 8, which overturned an executive order by Governor Neil Goldschmidt. The order had prohibited discrimination in state employment based on sexual orientation.

In 1990 they ambitiously expanded their activities, sponsoring both a referendum and a candidate for Governor. The referendum, once again called Ballot Measure 8, would have amended the state constitution to forbid most abortions. It was defeated by a considerable margin - 68% to 32%.

Their other action that year was to assume the role of a political party and nominate Al Mobley for Governor. Mobley ran as a "true conservative" against the "liberal" Republican Dave Frohnmayer and the "ultra-liberal" Democrat Barbara Roberts. His key issues were abortion (both major party candidates were pro-choice), environmental de-regulation, and opposition to a sales tax. Mobley garnered about 12% of the vote, mainly at the expense of Frohnmayer, and Roberts became governor.

In 1992 the Alliance chose to temporarily abandon the anti-abortion crusade in order to combat what they saw as the growing power of homosexuals in government, education, and popular culture. Building upon their success of the1988 Measure 8, and a city of Springfield initiative in early 1992, they began circulating petitions for the No Special Rights Initiative, which eventually reached the ballot as Measure 9.

While the OCA is strongly rooted in Oregon, it is clear that they seek influence beyond that state. Even before Measure 9 became widely known the OCA gained national attention because of a 1992 race they did not run. The group had threatened another challenge, this time with a third party candidate, to Republican Senator Bob Packwood. Packwood, well aware of what the Mobley campaign had done to Frohnmayer, entered into negotiations with the OCA. Mabon and other leaders were invited to Washington, D.C. for private sessions with conservative Republican Senators Orin Hatch and Phil Gramm. Reporter Robert Sullivan suggests that this "transformed him from a fringe figure making calls to The Oregonian into a power broker taking calls from the New York Times." [14]

This attention corresponded with the creation of sister groups: the Idaho Citizens Alliance and the Washington Citizens Alliance, and an umbrella group for all three called the United States Citizens Alliance. The latter name strongly implies a plan for further expansion. Chairman Mabon confirmed that they hope to enlarge and diversify: "We'll do maybe 3, 4 or 5 states next election cycle, and we'll stop growing..... where we stop growing." [15]

Whether the future of the OCA is as a party or an interest group is uncertain even to the leadership. Mabon's view is that "we are not a political party.... perhaps we're a quasi-political party. We believe in the strength of the two party system." However, he contends the two party system is endangered as it never has been before. In Oregon in particular candidates are often "Republicrats." Mabon noted that even though it is not a goal to become a political party: "If the Republican gubernatorial nominee in 1994 is a 'Republicrat' ... we will not accept two liberals as our candidates." [16]

Ultimately the OCA chose not to run against Packwood. A few days after the deadline for filing independent candidates, Packwood took a public stand against Measure 9.[17]

B. Oregon law and executive orders on sexual orientation

Nothing in Oregon's laws or Constitution explicitly grants special rights or status based on sexual preference or orientation. In 1988 then Governor Neil Goldschmidt issued executive order EO-87-20 forbidding employment discrimination in state government. This was repealed by the passage of Measure 8 that same year. Measure 8 in turn was nullified by the State Supreme in November1993 (after the Measure 9 vote), thereby restoring the executive order.

Oregon, like many states, has a hate crimes statute which increases the punishment for violent acts committed against individuals because they are members of certain groups. "Sexual orientation" is included along with race, national origin, gender, and religion. There is no statewide law granting any additional recognition or status to homosexuals. Several cities, including Portland, have ordinances which forbid discrimination in employment, housing, or use of facilities on the basis of sexual orientation.

There is currently no official statewide curriculum which supports or promotes homosexuality. Some districts are instituting a diversity curriculum, which teaches tolerance of sexual orientation differences - along with differences in race, gender, religion, and national

origin. Sex education and AIDS prevention classes do present some information on how homosexual intercourse takes place. Guidance counselors have been given materials and training to assist in advising (in a non-classroom setting) students who approach them with problems of sexual identity. The goal of the program is to give such students acceptance and support rather than rejection or moral condemnation. [18]

If Measure 9 were to pass, all such existing state and local laws would be nullified, and future ones prohibited.

C. The Oregon referendum process

Initiative refers to ordinary citizens placing an item on a legislative agenda or a public ballot. Referendum is a popular vote on a policy question. Measure 9 was both an initiative and a referendum.

Oregon pioneered the initiative and referendum process in 1902. Secretary of State Phil Keisling notes that the state "actively encourages the participation of its citizens in direct lawmaking."[19] Oregon voters have the power, without the need for legislative action, to make law and even to amend the state Constitution. Measure 9 was a proposed Constitutional Amendment.

To place an amendment on the ballot, sponsors must gather a number of signatures equal to eight percent of the total votes cast for governor in the most recent gubernatorial election. This meant that in1992 89, 028 signatures were sufficient. Signers must be registered voters. There are no regional or geographical distribution requirements. The No Special Rights petition qualified by the July 2 deadline with 129,000 names.

D. No on Nine groups:

A variety of organizations participated, in some fashion, in the campaign against Measure 9. They ranged from "Queer Nation" to the Catholic Archdiocese of Portland and included the Oregon AFL-CIO. (See appendix B) The largest and most influential player was originally dubbed No On Hate. This was changed to NO ON 9 once the OCA measure qualified for the ballot and was assigned a number.

NO ON 9 was directed by a steering committee elected at a Eugene public meeting. While members of existing civil liberties, privacy, and "gay rights" groups served on this committee, organizations per se were not officially represented. Day to day operations were directed by Peggy Norman, a veteran political organizer affiliated with the Oregon Chapter of National Organization of Women (N.O.W.). She brought to the task experience campaigning against the OCA, including the successful effort against the anti-abortion Measure 8 in 1990, and the failed attempt to stop Measure 8 (which repealed the governors executive order) in 1988.

The NO ON 9 campaign had no shortage of activists, and no shortage of critics both internal and external. Because of the many different groups involved, each with their own priorities and agendas, the coalition was fragile and meetings contentious. Norman described the leadership process as similar to "herding cats." This was exacerbated by some disputes about fundamental strategy, to be described below.[20]

One problem NO ON 9 did **not** face was a lack of funds. The organization collected nearly two million dollars, about 20% of which came from out of state donors. This surfeit of wealth allowed the campaign to implement whatever strategy it chose, and to spend heavily on television and radio.

III. The Strategies

Robert Landauer, editorialist for the Portland Oregonian, concluded early in the campaign that "most of the population would divide quickly on the controversy and could not be converted from the position taken. But the data also suggested that 15-20% of the population still might be swayed and induced to vote." He dubbed this segment the "wedge group." [21]

While Landauer was not involved in strategy making for either camp, his comment sums up the approach that both sides tried to take in the Measure 9 campaign. Each began with a guaranteed constituency which, taken alone, was too small to win the race. Each made a play for middle or moderate voters who were not yet committed on this issue.

The pro and anti Measure 9 forces were mirror images in their overall approach: appear moderate and reasonable with limited goals, paint the opponent as extreme, and accuse the opponent of having a broader, more dangerous agenda than what they admit.

A. The Oregon Citizens Alliance

The campaign for Measure 9 was officially conducted by the No Special Rights PAC, a creation of the OCA. The No Special Rights campaign was more organizationally cohesive than the opposition - which included efforts by dozens of groups. However, the OCA strategy contained contradictory elements, a "good cop - bad cop" duality which may have been a political choice, or may have reflected differences within the organization.

As elaborated below, some of the OCA messages used inflammatory language, clearly designed to appeal to those already hostile to homosexuals. Their other face was disarmingly reasonable and moderate. It's likely the organization was serving two occasionally conflicting goals: the desire to win the referendum, which meant putting together a broad based (but loose) coalition on election day versus the need to build the organization by attracting hard core conservative supporters and donors.

Peggy Norman (who cannot be considered an objective observer of the OCA) suggested that the group deliberately had taken a hard line position on both abortion and homosexuality in order to clearly differentiate themselves from other conservative groups and carve out their own political niche. The OCA wishes to carefully build a solid organization that can be a national player. In this scenario, she suggests, it's better in the long run to lose while affirming a strong position than to win by being moderate. [22]

Another view is offered by Sura Rubenstein, a reporter who has covered the group extensively. She suggests that the group sees themselves as "the 82nd airborne cavalry, the marines, the streetfighters" of the Christian crusade. As such they don't see the need to compromise even if they gain political advantage by doing so. [23]

The techniques employed by the OCA in the Measure 9 campaign had been field tested in Springfield, Oregon in May of 1992. In this case Measure 20-8, a local referendum with wording quite similar to the eventual Measure 9, passed by a vote of 55 to 45. In the Springfield campaign the group successfully utilized the "No Special Rights" slogan, and began emphasizing the creeping gay threat to schools and children. Springfield, however, is not a cross section of Oregon, being both poorer and less educated than the state as whole.[24] To win statewide the organization would have to refine its message and expand its base.

Presented below are the key elements of the OCA battle plan for Measure 9.

1. Use disturbing and provocative imagery to demonize homosexuals. Speak to the existing public discomfort with homosexuality in order to arouse public disgust and fear of them.

What do Oregonians - or Americans for that matter - think about homosexuality? The answer to that is complex, and not easily provided by polls and surveys. Based on my discussion with journalists, activists and pollsters a consensus emerges: A substantial number of voters have little personal knowledge of homosexuals or their practices. While not inclined to persecute this behavior they are *uncomfortable* with it, and are not disposed to give it official sanction or support. [25]

The OCA sought to build upon this discomfort and define homosexuals as a serious threat to society. This process began with the text of the measure itself. The word homosexuality is used three times, and is always accompanied by "pedophilia, sadism or masochism." These four behaviors are to be officially declared "abnormal, wrong, unnatural, and perverse." (Remember this was a *Constitutional Amendment.*) This, in fact, represents a toning down of the measure as originally filed, which included "necrophilia and bestiality" among the behaviors to be discouraged. In support of this connection the OCA cites several authorities, including psychologist Paul Cameron, chairman of the Family Research Institute[26] and Judith Reisman, author of Kinsey, Sex and Fraud: The Indoctrination of a People.[27]

The language of the measure was vividly reinforced by a series of video tapes circulated at OCA meetings, church gatherings and "No Special Rights" rallies. The tapes prominently feature the San Francisco Gay Pride parade, an event featuring public nudity, simulated sadomasochism, and the mocking of religious symbols. It draws a number of controversial and confrontational gay groups, including Queer Nation, Act-Up, and the North American Man Boy Love Association (NAMBLA). [28]

OCA makes it clear that they don't claim all or even most homosexuals are pedophiles, sadists or masochists. However, the people portrayed in the videos "represent the driving force in the homosexual community," according to Lon Mabon. "If you make an analogy to the homosexual community as a passenger car with 6 people in it, all representing different facets of the community, I would say what is represented in the video is the person driving." [29]

2. Warn of a homosexual dark agenda including subverting most major institutions of government and society, recruiting in schools, and lowering the age of consent.

The OCA needed to convince people that a constitutional amendment was necessary to prevent special status for homosexuals. This was difficult to justify based on the current level of homosexual visibility and influence in Oregon. The key point that the OCA made over and over was that homosexual activists *were on the move* seeking to force their lifestyle on every institution in society, and to actively recruit more members. Even if many homosexuals seemed harmless, extreme activists had a sinister agenda. [30] Measure 9 was a roadblock, "a line in the sand," designed to halt this dangerous trend. [31]

A key component of this strategy was to exploit the existence of the North American Man-Boy Love Association, a group that endorses pedophilia and advocates the lowering of the legal age of consent. While NAMBLA does not exist in Oregon, and was specifically excluded from the NO ON 9 team, the Association has marched in the San Francisco and Washington Gay Pride Parades. One OCA publication devotes two tabloid-sized pages to the history and goals of this group. [32]

The No Special Rights campaign constantly warned of the particular danger to children posed by official support of homosexual behavior. One of the most effective OCA weapons was a television ad attacking the Childrens Services Division for placing children in gay foster and adoptive homes. (The practice is rare - but legal) An excited young boy named Ryan is told by a counselor that he's about to meet his new parents. Out in the hallway a gay-male couple nervously waits. We don't actually see their meeting, but as the picture fades to black we hear a confused, plaintive Ryan saying "...but where's my mommy?"

An OCA tabloid entitled "Homosexuality, the Classroom and Your Children" contains the notorious "Billy and Chuckie" story where one twelve year old boy convinces another to engage in homosexual behavior by pointing out "The Police Chief says it's OK. Our teachers say it's OK. The newspaper says it's OK. Even the Governor says it's OK....." [33]

The schools have been a long standing issue for the OCA, above and beyond their current focus on homosexuality. They fear that the American education system is being warped and subverted (on a national basis) by a liberal conspiracy that includes homosexuals, environmentalists, abortion advocates, feminists, internationalists, and "social engineering bureaucrats." If successful, this group will essentially brainwash future generations.[34]

The above mentioned tabloid warns that "Not many parents would choose to allow homosexual activists to teach sex education to their children, however, that is exactly what some educators have planned for Oregon schools." Project 10 (a school counseling program for homosexual youth being considered by some Oregon school districts) is "nothing more than a Trojan horse for the aggressive 'gay rights' movement that recruits children into the homosexual life-style."

They cite many further examples. An eleven page leaflet entitled "Homopromo in Oregon Schools" cites 75 cases, including: The Oregon AIDS Education curriculum which presents homosexuality as another "lifestyle choice," the Portland school district "Outreach Program" for "lesbian and gay youth," and a Eugene High School "gay pride" week with participation from "the militant homosexual group Queer Nation." [35]

Again we see a mirror image effect at work. Opponents of the OCA warned of a conservative conspiracy to takeover the schools, eliminate self esteem and decision making programs, and substitute biblical indoctrination.[36]

It's strangely ironic that both sides also raised the spectre of fascism to condemn the opposition. While it's not unusual for liberals to use this rhetoric agianst conservatives, it is note-worthy when a right wing group calls their opponents "Nazis!" Perhaps this is a testimony to the enduring power of the imagery called up by this label. It was also an attempt on the part of the OCA to prevent the charge from sticking to themselves, instead hurling it back on homosexual activists. Scott Lively asserts that there is both a historical connection between homosexuality and fascism, and a contemporary use of Nazi organizing tactics by the more extreme homosexual groups.[37]

The OCA claimed that a campaign of intimidation was being waged against ordinary citizens who supported their goals. People were afraid to put up lawn signs, wear buttons, or publically promote the measure.[38] The amount of violence and harassment surrounding this Measure was indeed unprecedented, and seemingly directed at both sides. Group headquarters, activists homes, and even churches were vandalized. Prominent leaders faced continual threats.[39]

3. Deny that we are attempting to take away basic rights from homosexuals, or discriminate against them as citizens. Praise the historical struggle against racism in order to deny this ground to our opponents.

This was the heart of the debate. What would Measure 9 accomplish? The NO ON 9 groups insisted that it would mandate discrimination. The OCA replied that it would prevent reverse discrimination in favor of homosexuals. "No Special Rights" became the theme of the campaign and the name of the PAC formed to conduct it. Thus they played to egalitarianism and a general hostility toward affirmative action.

They vigorously refuted any connection between "Gay Rights" and the Civil Rights movement for racial equality. A photo caption in the OCA-PAC publication Freedom Journal reads: "Dishonoring Dr. King: 'Gay Rights' advocates seek to equate the powerful dignified courage of African-American Civil Rights leader Dr. Martin Luther King, Jr. with the militant homosexual agenda typified by sado-masochist proponents." Elsewhere the article invokes the "heroic struggle" of "great civil rights leaders Dr. Martin Luther King, Jr. and Malcom X." [40]

The OCA view can be summarized as follows:
We believe that powerful factions in government and the homosexual community wish to confer minority status upon homosexuals, entitling them to affirmative action and other legal preferences currently given to ethnic and racial minorities. We are seeking to prevent this. Our measure is not aggressive, we are simply trying to defend basic morality and decency. We did not start this fight, the homosexuals did by pushing for special rights. [41]

Homosexuality is a behavior not an "orientation." It is not genetically conferred as is race and gender. OCA Communications Director Scott Lively has commented "there are no homosexuals, only heterosexuals who engage in homosexual behavior." [42] It is a choice, and a bad one at that. As such it does not deserve civil rights protection, nor do homosexuals need such protection. Their right to speak, write and assemble are still upheld by the United States and Oregon Constitutions. [43]

4. Interpret the legal implications of the measure as narrowly as possible, in order to blunt opposition claims that this would have drastic implications for schools, libraries and other institutions.

According to the OCA Measure 9's total impact on society would be minimal: While we do not personally approve of homosexuality, it is not our intention to ban this behavior or to arrest, fire, or otherwise persecute homosexuals. No one should lose their job simply for being homosexual, unless they use their position to promote a homosexual lifestyle.

Furthermore, homosexuals are NOT currently being discriminated against. In fact they tend to be economically *more* successful than the average heterosexual. The Oregon and U.S. Bill of Rights protect homosexuals like anyone else, and will continue to do so. If they want more than this, it can only be seen as a demand for "special rights."

We do not intend to challenge or censor library books available to adults. The minds of children, however, must be protected. Books might be restricted or removed from libraries or curriculums if they promote the homosexual lifestyle.[44]

5. Dismiss critics (such as the press, mainline churches, medical and professional associations, and especially Hollywood) as homosexuals, or dupes of them.

A superb example of this is a cartoon appearing in a tabloid entitled "Vote YES on Measure 9!" A grinning puppeteer labeled "Homosexual Movement" manipulates figures named "Media," "Higher Education," "Politicians," and "Portland Police." An adjacent sign advertises the show: "A Streetcar Named Perversion." [45]

Anthony Falzarano, a minister and self-indentified ex-homosexual who spoke at No Special Rights meetings, declared that the media "are controlled by homosexuals in very high positions." [46]

The Alliance also seemed to take a certain pride in being the underdog, in fighting their righteous battle in the face of "the entire Oregon establishment.....every major institution." In their eyes, given these enormous odds against them, whatever public support they get is a heroic accomplishment. [47]

Lacking the funds for heavy media buys, the OCA message was carried by a grassroots campaign. The leadership, especially Mabon, Lively and OCA-PAC Director Philip Ramsdel, traveled frequently and maintained close contact with the local branches. The organization claimed five to six thousand hard core volunteers, organized at a county and precinct level. Activists reached voters through personal contact, church groups, and publications. Over 700,000 copies of the tabloid "Homosexuality, the Classroom and Your Children" were printed and distributed during the campaign.[48]

B. No On Nine

NO ON 9 recognized the importance of appealing to the middle ground. Peggy Norman, Campaign Director for the group observed, "My job as manager was to cast a net so wide that most Oregonians fit in my net. My job is to take in as many people as possible and leave them (the OCA) isolated." [49]

In pursuit of this goal the NO ON 9 leadership made a fundamental strategic choice: **Do not make homosexuality the issue.** Do not get into a battle with the OCA over gay rights or the moral standing of homosexuality. This is not a referendum on whether you like homosexuals! It is about discrimination.

This was a carefully considered decision based on practical experience, as well as polling and voter research. Norman explained:

> We didn't want the campaign to be about "are gay people good or are they bad?" You'd lose a referendum on that. People aren't there yet. You can't fight on those terms. You can fight about discrimination, you can fight about what kind of a state we want to be. Are we inclusive, or do we want to push people out?
>
> Our message, the thing that most people could support, was that they did not want discrimination, they did not want it even if they did not agree with homosexuality, even if they did not know a homosexual, even if they did not like homosexuality. That's where I think most people in this country are.[50]

NO ON 9 presented voters with moral, philosophical and practical reasons for opposing the measure, without having to support homosexuality. Norman again: "We made it possible for people who weren't ready to say homosexuality is OK to vote NO ON 9."

A particularly challenging aspect of this strategy was how to handle the issue of pedophilia. The OCA frequently sought to associate homosexuality with child sexual abuse (as well as sadism

and masochism). In publications and videos they cited the North American Man-Boy Love Association (NAMBLA) as part of the homosexual activist faction. NAMBLA in fact has no chapter in Oregon, and the NO ON 9 steering committee explicitly denied them a role in the anti-9 effort. Other OCA publications cited statistics on homosexual promiscuity and described alleged behaviors such as rolling in excrement.

Norman decided that to actively refute these charges would waste NO ON 9's time and emotional energy, and perhaps only reinforce the connection in voter's minds. Such a debate would have to be conducted on the OCA's terms and turf. Therefore, most of the "bizarre sexual practices" accusations were never acknowledged by NO ON 9. When gays were accused of pedophilia the standard response was: "pedophilia is a serious crime. If you know anyone engaged in this behavior, report it to the police."[51]

Not surprisingly, the strategy of not directly affirming homosexuality caused confusion and resentment among some gay organizations. Some animosity toward the NO ON 9 leadership still lingers.[52]

The tactics used by the groups opposing Measure 9 can be summarized as follows:

1. Emphasize that this is a civil rights issue, a question of arbitrary discrimination against a certain segment of society. Point out that this contradicts American traditions and Oregon traditions. It would be the first backwards step on civil rights in decades.

A slogan often seen on NO ON 9 literature reads "discrimination is not an Oregon value." [53] Former Republican gubernatorial candidate Dave Frohnmayer observed:

> It will give Oregon a really ugly name. It will be the first state in a century to authorize discrimination against a group that's not favored. The campaign seems a deliberate attempt to exploit differences, to exploit prejudice. And I don't like it. It don't think it's American. I don't think it's Oregonian. [54]

Worst of all, this discrimination would be part of the Oregon *Constitution*. It could compel state employees and ordinary citizens - against their will - to practice discrimination. Ironically, Measure 9 would expose people to the very sexual concepts that the OCA condemns. The fundamental law would contain words like "homsexuality, pedophilia, sadism, and masochism." A NO ON 9 pamphlet warns "We'd have the first X-rated constitution in America." [55]

2. Interpret Measure 9 as broadly as possible. Describe its potential impact on a variety of institutions including schools, libraries, and any professional or business requiring a state or local license.

Much of the Measure 9 debate centered on the practical, legal impacts of it becoming part of the Constitution. Each side tried to promote their own interpretation of this, with the OCA presenting the effects as limited and benign (a roadblock, not a rolling back of rights), and the anti-9 activists foretelling a legal and political nightmare, leading to a statewide witch-hunt for gays. Editorialist Landauer exemplified this by entitling his series "The Oregon Inquisition."

The consensus of the legal comunity was that the measure indeed was exceedingly vague. [56] This allowed the NO ON 9 group to plausibly foretell dire consequences if the measure were implemented. The crux of their argument was that the state would become more intrusive into the lives of ordinary citizens, gay or otherwise. In commanding that the state not "facilitate" homosexuality, the measure could be reasonably interpreted as forbidding the use of public buildings, parks or properties by homosexual groups. Even police protection might be denied to

them. Public employees were at risk of being fired or transferred. Furthermore, any doctor, nurse, lawyer, accountant, real estate broker, hairdresser, or other professional with this orientation might lose their licenses to practice. These sanctions could be imposed on anyone who was gay or perceived to be gay.

It was also suggested that any book or literary work written by a homosexual (including long dead ones) would need to be removed from publicly funded libraries. Moreover, since the state would have an affirmative duty to discourage homosexuality, books were in danger that presented gays in a favorable *or even a neutral light.* Public schools could no longer decide how - or if at all - to teach about homosexuality and related issues such as AIDS. They would have an affirmative duty to introduce the concept of homosexuality into the classroom in order to condemn it. [57]

Once these issues were laid down the next step was to personalize them. Rather than simply citing statistics, they used individual teachers, librarians, and other professionals in ads and press releases to give discrimination a human face. This was easy to implement since virtually all professional associations in the state were already supporters of NO ON 9. (See Appendix B for examples.)

Even if these extreme interpretations did not come to pass, the measure would generate lengthy and expensive court cases, tieing up the states money and legal talent for years to come. "It would provoke costly legal challenges that would drain Oregon's tax dollars at a time we should be uniting our resources to battle the real problems facing all of us." [58]

3. Argue that passage of Measure 9 would be the first step down a slippery slope to oppression. If we stand by and allow gays to be targeted, then ethnic and religious minorities will be next.

One of the most frequently quoted authorities was German cleric Martin Niemoeller, who is credited with a a famous poem warning of the folly of inaction when faced with the persecution of others.[59]

The OCA was identified as being part of a much larger, nationwide, religious conservative conspiracy trying to seize control of political institutions and institute a bible-based agenda that would be both regressive and repressive. This view is well stated in a booklet entitled Rolling Back Civil Rights published by the Coalition for Human Dignity:

> (I)t would be a grave mistake to think of the OCA as a narrowly focused "single issue" group intent only on attacking the rights of lesbians and gay men. Rather it is a *political* organization which is part of a *social movement* intent on rolling back civil rights, infiltrating and transforming secular institutions, and ultimately grasping for state power. [60] (emphasis in the original)

4. Make the Oregon Citizens Alliance part of the issue. Make it clear that Measure 9 is their tool and serves their ends.

As discussed above, the OCA questioned the sexual orientation of their critics, whether they came from the media or opposition groups. The anti-9 forces also sought to personalize the race by attacking the sponsors of Measure 9. Early polling done by NO ON 9 showed that the OCA had a strong negative rating (49%) among likely voters.[61] An Oregonian poll later in the campaign showed revealed that 39% saw the OCA as "an ultraconservative fringe group that does not represent mainstream Oregonians."[62] It therefore made good tactical sense to constantly keep the OCA in the spotlight.

This attack had two prongs. First, marginalize the OCA. Present them as being far outside the normal political spectrum. An early Campaign for a Hate Free Oregon pamphlet announces that

"we are a broad based coalition of individuals and groups," while "they are radical right wing political organizations." [63] A subsequent flyer quotes a Daily Astorian editorial which declares "Oregon's linear descendant of the Ku Klux Klan is the Oregon Citizens Alliance." [64]

Secondly, the fiscal and personal integrity of the group was questioned. NO ON 9 helped publicize the OCA's long standing financial disputes with the IRS, creditors, and landlords. Much was made of the case of fundamentalist minister and OCA co-founder Joe Lutz. Lutz, after unsuccessfully challenging Senator Bob Packwood with a campaign based on traditional values, deserted his wife for a married woman from California. [65]

The OCA were charged with manipulating the special rights issue to provide financial support for themselves and their organization. A NO ON 9 pamphlet pointed out that the OCA employed the entire Mabon family. (Lon Mabon's wife, children, and parents all have positions in the organization.) Although the Alliance is constantly pleading poverty, Peggy Norman asserts that Measure 9 has been a "cash cow" for the group. [66] Journalist Frank Mungeam concurred that the homosexual issue has been a "hot button in conservative wallets." [67]

NO ON 9 directly attacked the OCA as an organization, but generally avoided targeting individuals. Some gay organizations, however, have turned OCA leaders into negative icons. Gay newspapers and pamphlets often featured photographs of Mabon and Lively with the diagonal "no" symbol from international road signs. Political cartoons have been particularly vicious. One of the milder ones presents a profile of Mabon with the caption "This could have been prevented, wear a condom every time you have sex!!" [68] A broadsheet circulating in Portland presents the lyrics of "The Lon Mabon Rag" including lines such as "Lon Mabon started the OCA 'casue he said he had a better way, If you want to make the world a better place, you gotta hate everybody who's gay." [69]

5. Recruit moderate and conservative political, religious and cultural figures to oppose Measure 9. Make the OCA and their proposition appear extreme and isolated from mainstream life.

Measure 9 was opposed by an incredible roster of Oregon opinion leaders. Dave Frohnmayer, former state Attorney General, Republican gubernatorial candidate, and current Dean of the University of Oregon Law School is arguably "the most respected Republican in the state." [70] He condemned the measure both in editorials and in a NO ON 9 television ad.

Perhaps the high point of this phase of the campaign was a joint T.V. appearance by Carol Augur, Executive Director of the State Democratic Party and Craig Berkman, then Chairman of the Oregon Republican Party, jointly urging citizens to vote "No on 9." Other strange alliances included Senator Bob Packwood and his opponent, Representative Les AuCoin, who at the time were locked in a close and bitter Senate race.

While several conservative Catholic groups came out in support of Measure 9 (see Appendix B) Archbishop William Levada, head of the Archdiocese of Portland publicly condemned the measure and urged Catholics to vote against it.

6. Point out that "Measure 9 is bad for business." Suggest that Oregon would be damaged economically by boycotts and cancellation of tourist and convention business if Measure 9 passed. The film industry in particular would shun us. [71]

The boycott tactic had been applied by national organizations against Arizona for that state's cancellation of a Martin Luther King, Jr. holiday. More recently, and closer to home, Idaho was

threatened with economic retaliation by Pro-Choice groups of they passed a strict anti-abortion law. (Governor Cecil Andrus vetoed the bill.) Colorado, of course, would face a boycott after it passed Proposition 2 which denied minority status based on sexual orientation. The groups most likely to resent Measure 9 represent activities such as tourism, conventions, and film - growth industries for the state.

7. Refute the claim that gays are seeking special rights.

While the NO ON 9 organization avoided a defense of the homosexual community as such, it was imperative that they blunt the "special rights" charge by asserting that "Equal Rights are Not Special Rights." They asked rhetorically "Is the right to work a special right? Is the right to housing a special right? Is the right to public accommodation a special right?" [72]

8. Defend the right to privacy, the right to be left alone in your own home and bedroom.

This was not a theme pushed by the NO ON 9 campaign, but some ancillary groups - such as the previously established Right to Privacy PAC - did raise it. From a legal standpoint privacy rights cannot be used to protect homosexual activity due to the Supreme Court decision in Bowers v. Hardwicke (1986), which upheld a Georgia anti-sodomy law against privacy claims.

9. Attribute rising levels of violence toward gays to the atmosphere created by the OCA.

Police statistics show an increasing incidence of violence and intimidation against gays during the Measure 9 campaign. The offices of NO ON 9 and several supporting groups were ransacked. (On the other side, OCA members also claimed to be victims of threats and harassment. They repeatedly condemned the use of violence by either side.[73])

While not contending that the OCA directly sponsored violence, NO ON 9 nevertheless blamed them for creating a climate of hatred in which violence florished. A pamphlet citing the Oregon AFL-CIO and Ecumenical Ministries, respectively, asserts that "The Oregon Citizens Alliance efforts encourage divisiveness and hatred in the workplace and the community at large..." and "The OCA initiative promotes a climate of bigotry, hatred, and discrimination." Another leaflet states explicitly that the initiative "will exacerbate the fear and violence toward the gay and lesbian community."[74]

Measure 9 opponents made the most of an incident in October when OCA Communications Director Scott Lively physically ejected from a No Special Rights meeting a photographer for a gay and lesbian newspaper. While the degree of force did not warrant criminal charges, Lively was subsequently found liable for damages in a civil suit. (This case is now on appeal.) NO ON 9 presented this in a television ad as an example of OCA's latent violence and religious hypocracy. [75]

NO ON 9 delivered their message through pamphleteering, public rallys, networking with established interest groups, press releases, and television and radio advertising. Due to their extremely successful fundraising they could afford to utilize television to a much greater extent than the No Special Rights PAC. The OCA's Mabon claimed that "the opposition spent more on media *in the last weekend before the election* than we spent *in the entire campaign.*" [76]

IV. The Media

The news media were a powerful third force in the Measure 9 process. The breadth and volume of their coverage were virtually unprecedented. Their impact may have equaled that of the campaign organizations.

Measure 9 received heavy coverage in both print and broadcast media, almost to the exclusion of other ballot issues. A difficult issue for journalists was how to maintain fairness and neutrality on an issue of such great emotional resonance. More importantly: how do you remain fair when one faction (the OCA) is repeatedly condemning you and your entire profession?

The OCA, and the Christian Right generally, is highly critical of the mainstream media. As previously discussed, the media - along with Hollywood and much of the education establishment - are seen as part of the liberal conspiracy. The Measure 9 coverage only served to reinforce this judgement in the eyes of the OCA. By the end of the campaign the leaders of the Alliance had simply stopped talking to the press, (including The Oregonian, the state's largest newspaper.) Several papers faced advertising and circulation boycotts. Robert Landauer, in the process of writing the "Oregon's Inquisition" series was threatened by anonymous phone calls. These were serious enough that US West tapped his phones to in an effort to catch the callers. [77]

This obviously increased the difficulty reporters faced in being neutral. Most reporters, in hindsight, feel that they were objective, especially given the difficulty of working with the No Special Rights group. "The OCA got very balanced coverage. We bent over backwards to insure that we were being fair" commented The Oregonian's Rubenstein. [78]

One sign of this fairness is that several print journalists complained of being "hammered from both sides" in the campaign.[79] The Oregonian's Brian Meehan observed that "both sides were trying to manipulate the media." Editor Michele McClellan continued that "People in groups think we should present their message unfiltered, unchecked. We decided to be equally critical intellectually." [80]

Reporter Rubenstein elaborated on this. "We took extra pains to present their position carefully and accurately and not put spins on things. That does not mean that we report what they say without context or background, or that we report it uncritically. I think the OCA has a difficult time hearing that they might be wrong." [81]

Lon Mabon sees it quite differently. "The print media coverage was atrocious! outrageous! We could have gone down and put a sign over The Oregonian saying 'Headquarters for NO ON 9.' They lent their institution as a vehicle for our opponents." [82]

Some neutral observers, while not as intense as Mabon, agreed that the media was biased against Measure 9. "This ran through their reporting as well as the editorial side" suggested pollster Tim Hibbetts.[83]

ALL major (and most small) papers in the state took an editorial stand against Measure 9. The Oregonian went to extraordinary lengths by running the12 part editorial series "Oregon's Inquisition." Essayist Landauer pulled no punches in his condemnation of Measure 9 and the OCA. "A vote for 9 ... will express approval for the OCA deceivers and manipulators who bear false witness against our neighbors." "(T)heir ghastly gospel.... is a bizarre, sloppy mixture of stereotype and malice toward homosexuality and homosexuals." [84] Measure 9 "would be like a knife severing an artery and draining the life blood of our national declaration of freedom." [85]

This culminated in an unprecedented front page editorial by the President and Publisher, Fred Stickle. His description of his own attitudes on this issue showed him to be the sort of voter NO ON 9 was trying to reach: "I do not and cannot endorse homsexual acts." However, "(a)nyone fearful of any erosion of our basic rights as Americans must ask, "Where will this lead? What section of our citizenry will be singled out next? I urge you to join me and Oregon's religious,

political, educational, business and community leaders, and clear thinking citizens throughout the state in defeating Measure 9." [86]

V. The Outcome

On November 3, 1992 the voters gave their evaluation of the Measure 9 campaigns. Statewide the proposition was defeated 57% to 43%. Support for the measure was strongest in rural counties and smaller cities. It was weakest in the three major metropolitan regions of Portland, Eugene, and Salem. In the city of Portland it was crushed more than 2 to 1.

Exit polling conducted for the Oregonian shows that supporters of Measure 9 tended to be rural, religious, Republican, and lacking a college education. This is the traditional support base for the OCA. The education question illustrates this graphically. The measure *won*, with 55% among those with high school education or less, but received only 35% from college grads, and 22% from voters with post-graduate degrees.

The religion question also yielded some interesting results. The measure passed with over 70% from those calling themselves "born again" fundamentalists. "Regular church goers" approved it with 60%. Catholics voted *against* the measure by over 66%, suggesting that the stance of Archbishop Levada played a crucial role in the measure's defeat. [87]

The results also reflected Oregon's deep-seated split between traditional rural and expanding urban cultures. The measure won in a majority of counties in the state, but was defeated badly in the Portland metropolitian region. Multnomah County, most populous in the state, rejected it with 69%. More critically, suburban voters in Washington and Clackamas county opposed the measure with 65% and 58% respectively.

VI. Analysis

Why did Measure 9 lose?

Ellen Lowe, spokesperson for Ecumenical Ministries and NO ON 9, concluded that Oregonians "agreed with (the) campaign message that Measure 9 was discriminiation in disguise and that it affected every single person, not just the gay and lesbian community. They recognized that it was a matter of basic civil rights and equal rights." [88]

Editorialist Landauer echoed NO ON 9's self analysis. "A moral majority, including many who do not condone homosexuality, saw the measure as repugnant to their ethical standards of fairness."[89]

Private polling done by NO ON 9 indicates that voters heard the messages put out by the two campaigns. According to Peggy Norman, the number one reason given by respondents who voted against Measure 9 was "they believed it would cause discrimination." The second most common response was that they feared "the danger to us all" if such a measure passed.[90]

The main response given by yes voters was "if they didn't pass Measure 9, homosexuals would get special rights." [91] The OCA's emphasis on pedophelia and recruitment in the schools also found fertile soul. While women on a whole were more likely than men to vote against Measure 9, women with school-aged children tended to support it. [92]

There is a consensus of opinion from activists, journalists, and this observer as to some of the reasons for the outcome.

1. The extreme wording of the measure alienated many moderate voters who otherwise may have been supporters. Even Lon Mabon conceded that the phraseology of the measure was bad from a political - but not a moral - standpoint. "The language allowed them to create secondary issues and divert our energies from the main things." [93]

2. NO ON 9 was more politically skilled both in the content of their message and in their use of the media. They tailored their message to the median or wedge voter. They successfully defined the issues and their opposition so as to make Measure 9 appear extreme and dangerous.[94]

3. While money alone does not win elections, financial superiority enabled NO ON 9 to dominate the media campaign. The OCA claimed they were outspent six to one by their opposition. Figures in the Secretary of State's Office show a more modest edge: NO ON 9 spent $1,754,054 compared to $537, 795 by the OCA. [95]

4. Virtually all major political and institutional figures opposed the measure. The coalition of parties, unions, industry groups, civic leaders, newspapers, religious groups, and prominent individuals was overwhelming. A particularly vital piece of this coalition was Archbishop Levada. Oregonian reporter Brian Meehan felt that Levada's stand influenced a large number of middle-of-the road voters who needed guidance on this issue.[96]

The OCA recognized the power of their opposition. Mabon observed that "an unprecedented array of institutions, associations, media, and public officials took a stand against Measure 9. Almost literally the whole establishment of the state was against us." [97]

5. A more controversial suggestion is that Oregon, at least in the urban regions where a preponderance of the voters live, is a liberal, tolerant state. In the absence of any campaign efforts the natural vote would support gay rights. In other words the campaign - for all its sound and fury - signified little.[98] This point can be somewhat rebutted by pointing to the conservative direction the voters took on Measure 8 (1988), the only previous statewide referendum involving gay rights.

The Measure 9 opposition tried hard to de-emphasize homosexuality, and reach out to a mainstream audience. However, several journalists who covered the campaign felt that NO ON 9 was unsuccessful in these efforts. They were guilty of "preaching to the choir" both ideologically and geographically. Reporter Meehan observes: "The NO ON 9 campaign takes a lot of credit for defeating the measure. I'm not sure that credit is well placed. Most of their stuff was tailored to basically the gay community, a spirit of gay affirmation." Editor McCllellan ads that "the NO ON 9 campaign was very Portland based. Most of the switchable votes were outside that area." [99]

Other observers felt that gay groups were too visible and too assertive, making a number of moderate voters nervous.[100] A particular problem was the early Anti-9 slogan of "No on Hate." Many ordinary citizens who were not natural partisans of the OCA nevertheless felt uncomfortable with homosexuality. Accusing them of "hate" only alienated them and made them more likely to vote "yes."[101] The anti-9 leadership themselves recognized this and eliminated "hate" from their name and literature.

Surveys taken during the race shed some interesting light on this question. It should first be noted that polls are often problematic when the respondent is being asked to admit a prejudice, or an attitude that may be seen as socially undesirable. This was demonstrated in Oregon back in1988. Surveys showed Measure 8, (which repealed the Governor's order banning

discrimination against homosexuals), losing by a significant margin. It eventually passed with 53% of the vote.[102] More recently, polls in Springfield had shown Measure 20-8 losing. It too won.

Nevertheless, the surveys taken in the 8 weeks before the Measure 9 election show surprising consistency. On September 15 The Oregonian found that 57% were ready to vote "no," with 27% yes, 16% undecided. On October 4 the "no" figure remained the same, with 8% having moved from "undecided" to "yes." A KATU-TV poll in late October found 60% opposed, 34% in favor, and 6% undecided. The variation between the "no" vote in the polls and the actual election figures are all within the survey's 3.5% margin of error.[103]

One could make a prima facie argument that all of the money and effort expended by the Measure 9 opponents had little effect on public opinion. They were unable to add to their early support. In fact, virtually all of the undecided voters went to the other side. This casts serious doubts on the strategy (or perhaps *the execution of the strategy*) employed by NO ON 9.

However, some good counter-arguments can be made in support of NO ON 9. As noted above, polls on this sort of issue are notoriously unreliable. The seeming consistency of responses may actually mask substantial movement in opinion. In other words, a certain percentage of the respondents who claimed to oppose Measure 9 in September may actually have been lying in order to cover potentially embarrassing views. In the subsequent weeks some of these voters may have changed their real opinions to match their previously declared views.

It is not necessarily surprising that the OCA gained the votes of the early undecided respondents. Studies have shown that voters who make up their minds late in an election tend to be those with lower levels of education, income and political interest. This is exactly the demographic in which the OCA was most successful. In other words, the undecideds were natural "yes on 9" votes, and it's unlikely that the "no" forces could have won them over by any means.

Lastly, while the No on 9 forces may have failed to add to their early edge, they also did not lose any of it. The importance of holding a lead is not to be dismissed. If the group had been complacent, or had employed tactics that backfired (such as more aggressively defending homosexuality) it is quite possible that less committed supporters would have moved to the other side. As NO ON 9's Norman admitted "their people bought theirs. Our people bought ours, and we had more of a population going our direction." [104]

VII. Conclusions

There is an ongoing struggle by religious and secular conservatives to define the terms of political debate in this country. The catchword for this range of issues is "traditional values."

At the same time, the gay community is gaining in economic and cultural significance. [105] The struggle for political recognition and societal acceptance continues. This is a situation sometimes known as "stratification inconsistency" and is a precursor to political activism.

There is likely to be a continuing battle at the national, state and local level, both in legislatures and - where possible - through referendums. A substantial segment of the voting public is not committed to either camp. They are uneasy with homosexuality, yet offended by the narrow moralizing and exclusionary rhetoric of the religious right. As in Oregon, this is the swing group that both sides must attempt to reach out to.

The OCA continues to organize around this issue. The day after the Measure 9 loss, Chairman Mabon announced plans for a revised statewide measure in 1994. Oregon Christian Coalition

head Darrell Fuller added "this is one salvo in a cultural war that Americans will be fighting in the next decade." [106]

In Oregon this war is being waged on two fronts. Recognizing the substantial gap in urban versus rural support for Measure 9, a series of local city and county measures are being promoted in those regions which gave that measure its strongest support. The OCA have also been true to their word concerning the 1994 statewide ballot. Petitions are already being circulated for a new measure, "The Minority Status and Child Protection Act," which avoids some of the more controversial language of Measure 9 while pursuing the same goals.

The OCA's Mabon is confident about the prospects for this new measure, given that it is unlikely to face the massive unified opposition that sunk Measure 9. Meanwhile, NO ON 9's Norman is confident that the OCA has revealed their true nature, and the voters will not be fooled by a redesigned measure. Moreover, the forces that defeated Measure 9 are ready to continue the fight. [107]

The failure of Measure 9 did not end the battle, it only gave the voters a momentary breather.

APPENDIX A

Interviews conducted in June-July 1993.

(note: titles and positions are those held during the Measure 9 campaign)

1. Lon Mabon. Chairman, Oregon Citizens Alliance. Wilsonville, Oregon. June 22, 1993.

2. Phillip Ramsdell. Political Director, Oregon Citizens Alliance. Wilsonville, Oregon. June 22, 1993.

3. Scott Lively. Communications Director, Oregon Citizens Alliance. Wilsonville, Oregon. Phone Interview. June 27, 1993.

4. Peggy Norman. Campaign Director, No On 9. Beaverton, Oregon. June 22, 1993.

5. Marge Work. Steering Committee, No on 9. Member of Parents and Friends of Lesbians and Gays. Portland, Oregon. Telephone Interview. June 10, 1993.

6. Denise Thompson. Director, Right to Privacy PAC. Portland, Oregon. Telephone Interview. June 9, 1993.

7. Craig Berkman. Chairman, Oregon Republican Party, Portland, Oregon. June 24, 1993.

8. Robert Landauer. The Oregonian, Portland, Oregon. June 2, 1993. Phone Interview.

9. Michelle McLellan. Assistant City Editor, The Oregonian, Portland, Oregon. June 21, 1993.

10. Sura Rubenstein. Reporter, The Oregonian, Portland, Oregon. June 21, 1993.

11. Brian Meehan. Reporter, The Oregonian, Portland, Oregon. June 21, 1993.

12. Mary Jackson. Assistant Producer, Northwest Week, KOPB TV, Portland, Oregon. June 23, 1993.

13. Claudia Brown. Host, Northwest Week, KOPB TV, Portland, Oregon. June 23, 1993.

14. Morgan Holm. Radio News Reporter, Producer, KOPB (radio), Portland, Oregon. June 23, 1993

15. Frank Mungeam. Producer-Town Hall. KATU-TV (Ch. 2, ABC). Portland, Oregon. June 24, 1993

16. Jackman Wilson. Editorial Columnist, Eugene Register-Guard. Eugene, Oregon. June 25, 1993.

17. Scott McFetridge. Reporter, Salem Statesman Journal. Salem, Oregon. June 25, 1993

18. Dick Hughes. Editorial Writer, Salem Statesman Journal. Salem, Oregon. June 25, 1993

19. Mark Hass. Reporter, KATU-TV (Ch. 2, ABC). (interviewed in Salem, Oregon). June 28, 1993

APPENDIX B

A Partial List of Groups Taking Public Stands on Ballot Measure 9.

In Favor

No Special Rights Committee
Oregon Citizens Alliance PAC
V.O.I.C.E
Catholic Oregonians for Truth
Oregon Catholics for Life
Christian Coalition
American Family Association Foundation
Concerned Women for America
Eagle Forum

Opposed

American Federation of State, County and Municipal Employees (AFSCME)
Oregon Public Employees Union
Coalition of Labor Union Women
Oregon AFL-CIO
Northwest Farmers Union
Associated Oregon Industries
Urban League of Portland
Democratic Party of Oregon
Ecumenical Ministries of Oregon
Clergy and Laity Concerned
Roman Catholic Archdiocese of Portland
Jewish Federation of Portland
NAACP
American Civil Liberties Union
Oregon NARAL
Planned Parenthood
National Organization for Women
Oregon Psychological Association
Physicians for Social Responsibility
Portland Board of Realtors
Oregon Library Association
Oregon Education Association
Oregon State Bar Association
Oregon Psychiatric Association
Parents and Friends of Lesbians and Gays
Lesbian and Gay Pride
Feminist Women's Health Center
Lesbian Community Project
Phoenix Rising
Right to Privacy PAC

Abstract

During 1961, South Vietnam moves from one status to another. It begins the year as an ordinary client state in the U. S. empire; within months, it has become a state with extraordinary problems. In the views of many U. S. officials, only the United States can solve these problems; and such a solution requires the use of significant American military means. To other officials, it is imperative to avoid a commitment of U. S. troops. The way in which debate unrolls clearly indicates, however, that as the policy space shifts, it also shrinks in size to a single course of action—albeit one with major consequences.

5 An End to Determination? 13

In 1961, the U. S. empire was near its apogee. American fleets circled the globe; American armies were stationed on every continent. Scores of countries were on the U. S. "side" of the cold war "truce lines,"[1] countries whose internal affairs as well as external alignment were looked after by officials in Washington. When John Kennedy took office as President and pledged to "pay any price, bear any burden, meet any hardship, support any friend, oppose any foe to assure the survival and the success of liberty,"[2] he was simply expressing an attitude shared by thousands of U. S. officials and, no doubt, by millions of ordinary citizens as well.

1 Client States

The basic building blocks of the empire were client states. These were recognized by policy makers in Washington as countries with, minimally, non-communist regimes; in most cases, client states were governed by anti-communist rulers. For U. S. policy makers, the operative rule was to maintain client states as non- or anti-communist. This, as it turns out, was a constant task, not because each client was in imminent danger of overthrow, but because, like Gatsby's green light, a completely satisfactory regime was a goal that always receded over the horizon. Client regimes could always be improved upon: suspect ministers evicted, leftist unions suppressed, democratic forms observed more carefully. Add to this the fact that the vast majority of client states were located in what was then known as the "underdeveloped areas"[3] and we can begin to understand just why the array of imperial tasks was apparently endless.

All empires have bureaucracies, but that of the U. S. empire was particularly extensive. Each client state had, located within its boundaries, a U. S. administrative apparatus whose size dwarfed the diplomatic machinery of other states. The central figure,

[1]The expression is from a memorandum from Walt W. Rostow to President Kennedy, 11 November 1961. This document, along with the other archival materials cited in this paper, is entered in a document flow that we have constructed. Each entry in the flow is marked with its provenance (in this case, the John F. Kennedy Library, NSF Country File, Vietnam) and title (in this case, none), and that information is available from us on request. It should be noted that many documents are contained in two or more archives; for 1961, a large number of documents (about a third of those in our flow) have been published in *Foreign Relations of the United States, 1961–1963. Volume I: Vietnam 1961* (Washington: United States Government Printing Office, 1988).

[2]Theodore C. Sorensen, *Kennedy* (New York: Harper & Row, 1965), 246.

[3]The phrase is ubiquitous in the early 1960s. A classic example is W. W. Rostow, *The Stages of Economic Growth: A Non-Communist Manifesto* (Cambridge University Press, 1960), 140. Strictly speaking, the "development" status of states was independent of their imperial status. Thus, industrialized countries with fairly high levels of per capita income could have regimes whose composition and rule was a matter for continual action by U. S. officials; a good example is Italy. By contrast, countries like Britain were not clients in most senses of the term, even though they were part of the empire. The notion of empire that we are using here is linked to a concept of rule that is more Weberian than Leninist. See Max Weber, *Economy and Society* (Berkeley: University of California Press, 1974), vol. 2, ch. 9, pts. 3–4. As regards the U. S. empire, our ideas have much in common with Franz Schurmann, *The Logic of World Power: An Inquiry into the Origins, Currents, and Contradictions of World Politics* (New York: Pantheon, 1974); see also Bruce Cumings, *The Origins of the Korean War, Volume II: The Roaring of the Cataract, 1947–1950* (Princeton: Princeton University Press), chaps. 1–5.

of course, was the U. S. ambassador; as head of mission, he (the number of women ambassadors in those years was minuscule) was at least nominally in charge of all U. S. governmental activities in the client state. Typically, those activities involved officers of the State Department (political, consular, public affairs, and commercial); the Agency for International Development, the United States Information Agency, the Central Intelligence Agency, and the Defense Department. This last group included not only military attachés, but also officers (and enlisted men) involved in military assistance. To be sure, most U. S. missions were the scene of considerable bureaucratic infighting: each agency jealously guarded its administrative authority and worked to undercut other offices. Nonetheless, the ambassador was usually given the legal authority to oversee the activities of all U. S. officials.

However, the real importance of the ambassador lay in personal contacts rather than organization charts. For the ambassador was appointed by the President of the U. S. and was his representative to the head of state (and head of government) of the country to whose government he was accredited. In client states with weak economies or shaky regimes, the U. S. ambassador was effectively a proconsul, more powerful than any local officials. Time and again, we find ambassadors meeting with Prime Ministers and Presidents of "their" client states, often on short notice, and on an extraordinary array of subjects. It follows from this that the ambassador was often a participant in the culture of high level foreign policy making regarding that particular client state; indeed, for ordinary client states, high level Washington policy makers not only deferred to the ambassador but rarely bothered even to think about, much less make, policy.[4]

The other administrative machinery involved in running the empire was located outside the client state. Some of it was in intermediate locations, such as military bases in other countries. The largest of these bases were often small fiefdoms of Pentagon and other officials, responsible for contingency plans and monitoring cable traffic between various client states and Washington. A classic example was (and is) located in Hawaii: the Commander in Chief, Pacific (CINCPAC) not only controlled the 7th Fleet, but had attached to his command army, air force, and marine officers, CIA officials, and even a "political adviser" from the State Department. Since the 1950s, CINCPAC had as a principal task the oversight of U. S. military and other efforts in East Asia.[5]

Washington, of course, was the center of the empire. Every agency, and often sub-agencies as well, had "desks" devoted to client states—usually one desk per state. Desk officers were assigned to monitor developments in the clients, both as they were reported from the missions and, to a lesser degree, through other means. Desks, in turn, were grouped by region, and regional officers were the go-betweens by which high level officials stayed in touch with the field. From time to time, desk and regional officers would be brought together from different agencies onto "task forces" or "working groups" concerned with particular countries or areas. In this way, we can see that the very

[4]It is hard to say whether U. S. ambassadors are still as important as they were in the heyday of the empire. On the one hand, modern communications make it easier for Washington officials to give instructions and receive information in "real time." On the other hand, ambassadors to client states are usually considered by Washington to have a certain expertise by dint of their location, and this no doubt leads to a certain deference toward them.

[5]See Schurmann, *Logic*, for an interesting account of CINCPAC.

structure of the U. S. foreign policy apparatus, in spite of its formal functional divisions, was built around the operation and oversight of the empire.[6]

The notion of client states, and of administrative machinery concerned with such states, helps to explain the existence of numerous U. S. foreign policy doctrines during the cold war. Thus, the Truman doctrine and the doctrine of containment were not concerned so much with the protection of abstract geographical coordinates but instead with how particular non- or anti-communist regimes could be maintained against both internal attack and external subversion.[7] In fact, many doctrines and policies couched in general or universal terms turn out, on closer examination, to have been elaborated as arguments about problems in particular client states; it is precisely when client states cease to be ordinary that high level policy makers get involved and formulate policies that, subsequently, are elevated to the level of doctrine for other, ordinary, clients.

2 South Vietnam as Ordinary

Until the Kennedy Administration, South Vietnam was an ordinary client state. In 1960, for example, the standard collection of U. S. officials could be found in Saigon: the State Department officers, of course, along with foreign aid officials, military assistance personnel, foreign aid staff, intelligence operatives, and so on. To be sure, the South Vietnamese state was new. It had been created in 1954, as a consequence of the Geneva Accords that put an end to the French war (and empire) in Indochina. This newness, however, was hardly distinctive in an era of rapid decolonization. Indeed, the newness was an asset for the regime of President Ngo Dinh Diem, whose freshly created country was a locus of U. S. attempts to show that here, at least, was a place where things could be done right the first time around. Diem's survival as the head of an independent state, in the face of domestic enemies and next door to a communist regime, was taken as evidence for how other U. S. client states should be run. "President Diem," one liberal senator said, "is not only the savior of his own country, but in my opinion he is the savior of all Southeast Asia."[8]

However, by late 1959, the South Vietnamese government was facing a guerrilla war. U. S. officials gradually linked the insurrection not only to the supposedly inherent proclivities of communists to make trouble, but to the dictatorial and repressive nature of the Diem regime. In March of 1960, for example, the U. S. ambassador to South Vietnam

[6]In a world of territorially demarcated sovereign states, one might expect foreign policy officials to divide their tasks by states. However, the U. S. policy making apparatus is built not so much around the simple reporting of information between headquarters and the field as around the (attempted) solution of client state problems. Hence the extent of the apparatus and the concern with regional and agency coordination. In this sense, recent claims about "nonterritorial functional space" are precisely incorrect. John Gerard Ruggie, "Territoriality and beyond: problematizing modernity in international relations," *International Organization* 47, 1 (1993), 165.

[7]This is a distinction that standard treatments of the cold war usually elide. See, for example, the misleading discussion of "drawing lines" in John Lewis Gaddis, *The Long Peace: Inquiries into the History of the Cold War* (New York: Oxford University Press, 1887), ch. 4. Elsewhere, we have dealt with the process of how policy making involves the prior constructing of places as states: "Rhetorics of place characteristics in high level U. S. foreign policy making," in Francis A. Beer and Robert Hariman, eds., *Refiguring Realism: International Relations and Rhetorical Practices* (forthcoming, 1994).

[8]Mike Mansfield, *Congressional Record*, vol. 103, 6759.

complained that "the government has tended to treat the population with suspicion or to coerce it and has been rewarded with an attitude of apathy or resentment."[9] This analysis led to greater political oversight by the American embassy; it also led to increases in the number of CIA and military officials. The latter, of course, had to report to CINCPAC, and so the U. S. administrative machinery quickly took on the appearance of a miniature Washington in the middle of Saigon.

Up to this point, the guerrilla war was not a novel experience for the U. S. Many American clients states were beset by guerrilla wars which, though they would heat up from time to time, were usually able to be kept at a manageable level. Guerrilla wars, it was thought, were to be expected in "underdeveloped areas" and the U. S. had a fair amount of experience in dealing with them.[10] The Philippines was considered a particularly good example of an ordinary guerrilla war; indeed, at the time, Southeast Asia was considered a region in which such wars were to be expected.[11] In South Vietnam, though, the war began to broaden and shows few signs of being kept at an acceptable level. By September of 1960, the U. S. ambassador wrote that the "Diem government is in quite serious danger" and that if "Diem's position in country continues deteriorate...it may become necessary for U. S. government to begin consideration alternative courses of action and leaders in order achieve our objective."[12]

Nonetheless, Diem's government was not yet in imminent danger of collapse. The Americans on the spot—notably the ambassador and the chief of the Military Assistance Advisory Group (MAAG)—were able to devise plans without extensive involvement by Washington. When Kennedy conferred with Eisenhower immediately before taking office, the Asian client state presented to him as distinctly extraordinary (and warranting U. S. intervention) was Laos, not South Vietnam.[13] Laos, indeed, occupied far more of the new administration's time during its first few months in office than did South Vietnam. Still, South Vietnam was moving into a different status. Six days after he was inaugurated, Kennedy told an aide that "this is the worst one we've got, isn't it?"; two days later, he set up a "Vietnam Task Force."[14] If the time that Kennedy and his officials had to spare on South Vietnam was initially less than for Laos, this was not so much because the former was less important to them than the latter, but because, as the quip at the time had it, the situation in Vietnam was critical but not hopeless, whereas the situation in Laos was hopeless but not critical.

By 1961, then, South Vietnam had moved from being an ordinary client state into a more worrisome status. High ranking officials in Washington began to concern themselves with the details of local currencies, cabinet squabbles, topographical features, and the dates

[9]Durbrow to State, 7 March 1960.

on which rainy seasons would start and end. South Vietnam, in short, had become a subject of high level policy making.

3 Quid Pro Quo or Reassurance

The initial phase of high level policy making toward South Vietnam opened when a counterinsurgency program (CIP) put forward by the U. S. mission was accepted. What the mission proposed was essentially to reorganize the South Vietnamese military and other security-related agencies for more efficient anti-guerrilla work; a 20,000 man increase in the armed forces was also called for, as were various political reforms. Kennedy approved the plan early in office, on the very day that the Vietnam Task Force was set up, and the mission in Saigon was notified of this approval several days later.[15]

The State Department and the embassy then set about getting the South Vietnamese government to accept the CIP. This was a somewhat difficult process, as Diem and his officials balked at both the budgetary costs of the plan and the political reforms demanded of them. As time wore on, some U. S. officials began to become impatient. They asked the ambassador why at least certain aspects of the plan could not be "implemented as promptly as possible to further strengthen defenses Viet-Nam." Durbrow replied that the CIP called for the concurrence of the South Vietnamese government on numerous points, and that until Diem gave his approval, things could not move ahead. He promised to keep pushing Diem and Thuan, but feared that it might be necessary to ask that a strong personal message be sent by Kennedy to Diem.[16] Matters continued in this vein for some time, with Durbrow continuing to recommend the use of pressure so that Diem would give in on political reforms.

These delays, and occasional suggestions that military aid be withheld to coerce Diem's agreement to the CIP, led some in the military to propose an alternative policy. Thus the MAAG chief, Lionel McGarr, recommended implementing the U. S. portion of the plan by such means as shipping new equipment to South Vietnam. A high-ranking general from the Pentagon traveled to Southeast Asia and recommended the same thing; so too did the Joint Chiefs of Staff (JCS).[17] Eventually, Durbrow's tour of duty was over and, immediately after he left, Diem signed several of the directives Durbrow had been pushing. Even then, Diem dragged his feet and some in the State Department wanted to maintain pressure; this led to an explosion from General Lemnitzer, chairman of the Joint Chiefs of Staff, who insisted that the U. S. move forward regardless of what Diem agreed to do or actually did.[18]

As these bureaucratic struggles were going on, the administration was racked with concern over Laos. Upon taking office, Kennedy had changed U. S. policy: instead of aiming for an anticommunist Laos, American efforts would henceforth be directed at a

neutral Laos. This policy, however, presumed that communist guerrillas could not be permitted to take over the country; otherwise, a coalition or noncommunist government would evidently be impossible. Given the incompetence of rightist Laotian forces, Kennedy and his people thus had to aim for a ceasefire, behind which negotiations for a neutral government could then take place. How, though, to get a ceasefire? Evidently by military pressure; and so for six weeks, from mid-March to early May, the primary issue was whether, and if so, how, to send enough U. S. forces in the direction of Laos that the Soviet Union would pressure communist guerrillas to agree to a ceasefire. Kennedy subsequently came to believe that his saber rattling had been pointless (the ceasefire apparently began when a colonel from the rightist forces accidentally ran into a guerrilla patrol; the two sides negotiated a local ceasefire on the spot); even so, the first phase of Vietnam policy making is overshadowed by Laos.[19]

Frustration, then, is what motivated Kennedy to order that a special report on South Vietnam be produced for him in eight days' time. Frustration, that is, at both the slowness with which the State Department was recommending that the CIP be implemented, as well as at the chaos in Laos.[20] The report went far beyond what State and Defense had until then been advocating. Its authors argued that the U. S. objective was not only to "prevent Communist domination of South Viet-Nam" but to "impress on our friends, the Vietnamese, and on our foes, the Viet Cong, that come what may, the U. S. intends to win this battle." To this end, they proposed increasing the size of the MAAG, engaging in covert operations and unconventional warfare, paying for increases in South Vietnamese forces, working on a financial plan (which implied more U. S. economic aid), starting negotiations on a bilateral treaty, and sending Vice President Johnson to South Vietnam (and elsewhere in Southeast Asia) to build confidence in the U. S. Kennedy approved these recommendations, thereby relegating the CIP quarrels to the background.[21] South Vietnam was decidedly no longer an ordinary client state.

Johnson returned from his trip saying dire things. Diem and other leaders, he claimed, were worried about whether the U. S. would support them when the chips were down. The time for pressure had gone; the agenda now was one of reassurance. Kennedy's pursuit of a ceasefire in Laos and his refusal to engage in a massive military intervention in that country were so worrisome that if "these men I saw at your request were bankers, I would know—without bothering to ask—that there would be no further extensions of my note." Johnson thus urged an even more expanded program of assistance for South Vietnam than Kennedy had just approved, namely, a three-year plan of increased military and economic aid; he called for "decisive action" and "plung[ing] deeply into the Vietnamese internal situation." This, Johnson said, could face the U. S. at some point in

[19]The Kennedy claim may be found in National Security Council Meeting Notes, 15 November 1961; the patrol story is recounted by Rusk to Senate Foreign Relations Committee, 3 May 1961. Most published accounts of Laos policy making in 1961 are hopelessly out of date and the best that one can do (until the relevant *Foreign Relations of the United States* volume appears) is to consult the archival holdings in the Kennedy Library.

[20]Bundy to Battle, 14 March 1961; McNamara to Kennedy, 20 April 1961; NSC Meeting of 27 April 1961; NSC Meeting of 29 April 1961. We might surmise that Kennedy was also affected by the Bay of Pigs fiasco of 17 April.

[21]Gilpatric to Kennedy, 8 May 1961; National Security Action Memorandum (NSAM) No. 52, 11 May 1961.

the future with the decision to commit major U. S. forces or, instead, to cut U. S. losses and withdraw.[22]

Our image of Johnson as an outsize character should not lead us to the conclusion that this is pure bombast. For Johnson effectively had opened a new phase of policy making, one in which the main policy line he proposed (large increases in expenditures and programs beyond those just decided on) was echoed by a far more pallid character. One of the recommendations Kennedy approved in May was to carry out a financial study. The man chosen for this task was Eugene Staley, research director of the Stanford Research Institute. Staley and his team of experts headed to South Vietnam in mid-June. Within a month, they had produced a report stating that South Vietnam was "under attack in a bitter, total struggle which involves its survival as a free nation." What was needed, in spite of its budgetary cost, was major increases in the level of effort of both Viet Nam and the United States." Such increases would revolve largely around stepped up military and police action (including a possible increase of 30,000 in the size of the armed forces); the group also called for increases in economic and social programs. Given South Vietnam's economic weaknesses, such recommendations meant that the U. S. would have to foot the bill.[23] Doing what Johnson and Staley asked would evidently cost significant money.

Some U. S. officials were not satisfied with the "do more inside South Vietnam" approach. Their concern was that it "may be impossible to save Viet-Nam unless neighboring Southern Laos is secured against the serious Viet Minh/PL penetration which has been building up during the past three months." Accordingly, South Vietnamese, Thai, and Lao troops should move into Laos from South Vietnam and Thailand, secure a major east-west road in Laos, "smash" communist concentrations, and "escape." They would receive support by U. S. arms and advice, "but not U. S. troops." If this operation in turn succeeded, it could be followed by "Operation Porkchop": U. S. and other forces would move into and attempt to hold the Mekong River Valley and as much of Laos to the north as feasible; U. S. occupation forces would "move temporarily" into several Laotian cities.[24] This plan was actively studied, reworked, and debated in the bureaucracy, and though subject to harsh criticism, it was nonetheless a point of reference for some time.[25]

Other planners took the logic still further. If North Vietnam was the source of infiltration into Laos and hence into South Vietnam, why not attack it directly? One idea, put forward in numerous forms, was for the United States to "capture and hold the port of Haiphong." Another, somewhat less spectacular, idea was to institute "maritime control measures" against North Vietnam, up to and including a blockade. Other suggestions were to attack Hanoi, perhaps by amphibious means.[26] The diffuseness of these ideas may be

misleading; for although Kennedy rejected them, they continued to surface episodically over the next few years, eventually being implemented in Johnson's "Rolling Thunder" bombing campaign.

In 1961, things were different. At a meeting called to discuss the Staley report and the combat recommendations, Kennedy's questions

> showed that the detailed aspect of this military plan had not been developed. It was not clear how great an effect action against Haiphong or Hanoi would have on Northern Viet-nam, nor whether it would be easy to hold what had been taken in a single attack. Similarly, no careful plan has yet been developed for an operation to take and hold Southern Laos. Planning is proceeding, and General Taylor is in close touch with General Lemnitzer. But the President made clear his own deep concern with the need for realism and accuracy in such military planning. He had observed in earlier military plans with respect to Laos that optimistic estimates were invariably proven false in the event.[27]

By contrast, spending more money so that there could be more South Vietnamese soldiers and policemen was considered realistic, and Kennedy approved the Staley recommendations (including the 30,000 man force increase, though without agreeing to specific budget figures as of yet).[28] The goal of reassurance was evidently operative for both South Vietnamese and American presidents.

Notice now how the policy space has shifted. In 1959, South Vietnam was seen as having a rather routine guerrilla movement; by 1960, the situation had grown more serious and U. S. officials had to oversee the war more carefully, for the South Vietnamese could not be trusted to do what they needed to without an explicit quid pro quo. By the spring of 1961, the client state had engaged the attention of high level U. S. officials, who were more concerned with proffering than with pressuring. By the middle of the summer, significant budget outlays were being proposed and American planners were seriously contemplating large scale military attacks outside the borders of the client state. In effect, an entire "business as usual" spectrum of activities has now been excised from the policy space.

4 Frontiers and Floods

One might think that with the large aid increases Kennedy approved, policy making regarding South Vietnam would have become once again the province of lower level officials. In fact, discussions went on unabated at the highest levels of the U. S. government. To some degree, Kennedy had authorized such discussions when he permitted contingency planning to continue. A significant shift in planning occurred, though: officials began to focus on what could be done inside South Vietnam to counteract infiltration. Thus, although the principal plan on the table continued to be some variant of a move into Laos, that main line had a rather shadowy existence, serving mostly as a jumping off point for other proposals. Three such alternatives were put forward.

[27]Memorandum of discussion, 28 July 1961.

[28]NSAM 65, 4 August 1961.

First, recommendations for a "border patrol force" were made. The idea was to have SEATO forces (including U. S. troops) stationed along the borders of South Vietnam with Laos and North Vietnam. The force proposed would not have been large; its function, rather, would have been that of a "plate glass window": allied forces could help "see" infiltration; if they were attacked, they would "shatter," being too small to protect themselves. In essence, this was a plan to have a force that would be both observer and tripwire.[29]

Second, planners in both the State and Defense Departments put forward recommendations for SEATO forces to be sent to the high plateau region of South Vietnam. From there, they could patrol the areas in which they were stationed, thereby freeing South Vietnamese forces to concentrate on engaging the Viet Cong. As the high plateau region is near the Laotian border, SEATO forces could expect to engage in "hot pursuit" of Viet Cong units retreating into Laos. These plans would involve around 5,000 U. S. troops along with contingents from other countries; however, if they were attacked overtly by North Vietnamese or Chinese forces, these numbers would quickly grow. Advocates claimed that the plan could be implemented if there was continued delay in reaching a satisfactory Laos settlement and that a high plateau intervention would complement nicely any SEATO military intervention that might occur in Laos.[30]

Given Kennedy's comments in July, one would expect him to have been opposed to both the border patrol force and the high plateau plan. In fact, both plans had a more glaring problem than one of mere lack of realism. They were predicated on the use of SEATO forces, thereby implying consultation among allies, some of whom (Britain and France) were notoriously cool on any hint of military intervention against guerrillas. If the situation in South Vietnam was urgent enough to require acting before aid programs could be fully implemented, then that meant that other policies would have to be put forward. Ironically, one of the principal advocates of the plateau plan, U. Alexis Johnson, presented enough evidence of the need for rapid action that any SEATO moves began to appear not only uncertain but downright slow. The Viet Cong, Johnson said, had increased in numbers from 7000 in January to 17,000 in September. They had begun to appear in large units and, in September, staged three attacks of over 1000 men apiece. The South Vietnamese government had begun to suffer numerous defeats, and infiltration was on the upswing.[31]

Faced with this urgency, a third recommendation was cobbled together by Kennedy and his advisers. An "unconventional" air force squadron, the "Jungle Jim" team, was to be sent to South Vietnam for training the South Vietnamese (within two months, it was authorized to start bombing operations, using U. S. airmen, inside South Vietnam). Special Forces units of the South Vietnamese army were to be trained and accompanied by U. S. soldiers on missions against Soviet air supply operations inside Laos (this would involve attempts to shoot down Soviet planes). A "white paper" on infiltration was to be prepared for presentation in international forums (thereby influencing public opinion in favor of

[30]JCS to McNamara, 9 October 1961; U. A. Johnson to Kennedy, 11 October 1961.

[31]U. A. Johnson to various, 3 October 1961; U. A. Johnson to Kennedy, 11 October 1961; Kennedy press conference, 11 October 1961; Draft instructions for Taylor, 12 October 1961.

intervention against the North Vietnamese or Viet Cong). Most importantly, Maxwell Taylor, Kennedy's military adviser, was to visit South Vietnam (accompanied by Walt Rostow) to look into the feasibility of various forms of U. S. military intervention and any alternatives to it that might be effective in pursuing U. S. goals.[32]

Armed with the presidential mandate, Taylor left for Saigon. There, he found that the recent string of Viet Cong victories had contributed strongly to a slump in morale. When added to the uncertainty in Laos and the increasingly dictatorial tendencies of Diem, the atmosphere in Saigon was "bordering on panic."[33] On top of this, the government of Saigon seemed incompetent to conduct a war, its armed forces frozen into immobility and seemingly incapable of taking the war to the enemy. The answer, therefore, had to be a two part program: one to restore confidence; the other to remold the South Vietnamese army.[34] Taylor proposed to address the second task by encadring the government and the military of South Vietnam with Americans. These latter would be assigned to military and administrative units at low levels; they would accompany those units on missions; they would infuse those units with American spirit and know-how. This proposal, of course, would require vast increases in the number of advisers, far beyond any kind of MAAG support that had until then been suggested. Along with U. S. personnel would come U. S. equipment: helicopters and light aircraft (to be flown at first by Americans, as no South Vietnamese were yet trained to do so) that could be used for ground support, reconnaissance, and other tasks vital to a truly mobile military force. Thus, the South Vietnamese would learn to fight (and administer) as Americans did.

To restore confidence, Taylor proposed that U. S. troops be sent. Only an action of that sort, he argued, could be "so convincing of U. S. seriousness of purpose and hence so reassuring to the people and Government of SVN." Yet, as Taylor emphasized, the point was to motivate the South Vietnamese forces to fight; this precluded sending a large number of U. S. troops. The way to square the circle was to send a moderate force whose principal task would not be combat. As it turned out, the Mekong had recently flooded in the south of the country. Taylor proposed sending a team of engineers to engage in flood relief and rehabilitation operations. As this unit would be a target for the Viet Cong, they would have to be accompanied by combat troops. Presumably, the latter could at some point be shifted to the plateau or the coast and serve as the opening wedge of larger forces. Alternatively, the detachment could easily be withdrawn after their work on the flood had finished. Such flexibility was appealing to Taylor, and, he thought, to other U. S. officials. South Vietnam, Taylor assured the President, was "not an excessively difficult or unpleasant place to operate"; the "most unpleasant feature in the coastal areas would be the heat and, in the Delta, the mud left behind by the flood."

For all its flexibility, the option of sending troops was understood by Taylor to be a serious matter. It would engage U. S. prestige even further than was already the case. If the 8000-10,000 man force he proposed sending was not enough to accomplish the necessary results, it would "be difficult to resist the pressure to reinforce." For this reason,

[32]U. A. Johnson to Kennedy, 11 October 1961; Memorandum for the record by Gilpatric, 11 October 1961; NSAM 104, 13 October 1961.

[33]Mendenhall to various, 22 October 1961.

[34]Taylor to Kennedy [2 cables], 1 November 1961; Taylor to Kennedy, 3 November 1961.

even though the "risks of backing into a major Asian war by way of SVN are present but are not impressive," Taylor's recommendation presented Kennedy with a policy that clearly involved a "hard commitment to the ground in Vietnam."

Confronted with this Janus-faced recommendation, Taylor's Washington colleagues fell into two camps. On one side were those who approved of a commitment (as well as the encadrement plan) and followed Taylor's reasoning to its logical terminus. Secretary of Defense McNamara, for example, argued strongly that "major units of U. S. forces" should not be introduced into South Vietnam unless U. S. officials are willing to "commit the U. S. to the clear objective of preventing the fall of South Vietnam to Communism and that we support this commitment by the necessary military actions."[35] Those actions, McNamara made clear, were quite extensive: he reckoned that if "Hanoi and Peiping" intervened overtly, 205,000 U. S. troops might have to be sent (40% of the number reached in 1968). Secretary of State Rusk, after first opposing the flood relief plan, then turned around and, with McNamara and Lemnitzer, drafted a recommendation that would have placed U. S. forces south of the 17th parallel (i.e. not in the Delta for flood relief) so that South Vietnamese forces could be relieved and so that an overt invasion could be countered.[36] This plan, it will be recognized, bears a certain resemblance to the plateau plan debated a month previously.

On the other side were those to whom the idea of sending troops was ludicrous, dangerous, or both. This group was a curious collection of country specialists, military men, and dovish political appointees. All agreed that a small detachment of U. S. troops would be shot at and harassed; all agreed that calls would then arise for further intervention, which would, by its nature, have to be large scale and long term. References were made to the U. S. experience in Korea and the French disaster in Indochina. Fears of Chinese intervention were expressed, as of U. S. domestic extremism. Most of the members of this group agreed with Taylor's other proposals, though some wanted to go beyond to overthrow Diem, while others wanted to negotiate.[37] The most important member of the group, though, was Kennedy himself. He was, as Taylor recognized, "instinctively against the introduction of U. S. forces."[38] And so, between 8 November and 10 November, the President engineered a dovish recommendation out of Rusk and McNamara.[39]

[35]McNamara to Kennedy, 8 November 1961. McNamara would make the same argument in 1965 regarding U. S. combat troop deployments.

[36]Rusk draft to Kennedy, 7 November 1961; Rusk, McNamara, and Lemnitzer draft to Kennedy, 8 November 1961. Neither memorandum was formally submitted to Kennedy, although he likely was informed of both.

[37]Felt to Washington, 18 October 1961; Cottrell to Taylor, 27 October 1961; Galbraith to Kennedy, 3 November 1961; Ball to Kennedy, 7 November 1961. Others not in the charmed circle of high level policy makers made similar arguments to the President: Mike Mansfield, for example (2 November 1961); Chester Bowles (3 November 1961); Indian Prime Minister Nehru (6 November 1961); and John McCloy (9 November 1961).

[38]Meeting, 4 November 1961.

[39]Rusk and McNamara to Kennedy, 11 November 1961.

Their memorandum began with a series of statements about how bad it would be if South Vietnam, a nation of 20 million, were to be "transferred" to the "communist bloc." However, what followed was an interesting piece of reasoning:

> It seems, on the face of it, absurd to think that a nation of 20 million people can be subverted by 15–20 thousand active guerrillas if the Government and people of that country do not wish to be subverted. South Viet-Nam is not, however, a highly organized society with an effective governing apparatus and a population accustomed to carrying civic responsibility....the employment of United States combat forces...involves a certain dilemma: if there is a strong South Viet-Namese effort, they may not be needed; if there is not such an effort, United States forces could not accomplish their mission in the midst of an apathetic or hostile population.

As a result, although the U. S. government should "take the decision to commit ourselves to the objective of preventing the fall of South Viet-Nam to Communism" and thus "recognize that the introduction of United States and other SEATO forces may be necessary to achieve this objective," the Pentagon should only "be prepared with plans for the use of United States forces in South Viet-Nam." The rest of Taylor's recommendations—encadrement, helicopters, and so forth—were echoed, but on the critical point of sending U. S. combat troops, the recommendation was, once again, to wait.

We do not wish to leave the impression that Kennedy's ghostwriting left only a collection of minor changes from the status quo. When, later that day, Kennedy approved the other Taylor recommendations, he was setting in motion a massive military assistance program that Americanized the war in most senses of the term. By the time of Kennedy's death, nearly 20,000 advisers had flowed into South Vietnam for encadrement, helicopter flying, and other of the activities that Kennedy approved. In 1965, when Viet Cong regiments began to annihilate South Vietnamese Army units, they were armed with the weapons that Kennedy's approval had made possible; and they were facing a country in which the United States presence was so overwhelming that to withdraw seemed to officials in Washington to be the height of humiliation. In the meeting at which he approved the Taylor recommendations, Kennedy explicitly demurred at making the commitment his advisers called for.[40] It appears that he was fooling himself.

By 11 November, then, the policy space had both shifted and shrunk. Shifted, in the sense that recommendations were no longer concerned with oversight, as in early 1961, or with "more of the same," as in the spring and summer. The issue at hand was now one of Americanizing the war, while pumping up morale enough that the regime did not collapse around the U. S. cadres. But the policy space had also shrunk. Gone (at least for the time being) were the ideas of sending troops to Laos or to North Vietnam itself. Gone too were the various plans for sending troops to South Vietnam. Already, we can see this shrinkage in the fourth (most recent) phase of policy making: the main line (flood plus other recommendations) and the subsidiary lines (some troops in the north plus other recommendations; other recommendations only) chased each other around a region far smaller than in the preceding two phases. The options, though escalating, were narrowing.

[40]Kennedy, list of questions, 11 November 1961; Meeting notes, 11 November, 1961.

5 An End to Determination?

Two days after the decisions of 11 November, a draft NSAM circulated throughout the circle of high level policy makers. The draft had been prepared by the President's Special Assistant for National Security Affairs, McGeorge Bundy, who by this time had some rather caustic comments about his boss.[41] With good reason, one might think, as the document deleted the reasons for U. S. policy (the dangers from the fall of South Vietnam, etc.) along with the commitment that concerned Kennedy so much. Bundy's draft simply began with Kennedy's approval that the Defense Department be prepared to come up with plans; then segued into the by now standard list of other Taylor recommendations. Then, however, came a remnant of the 11 November memo: it was to "be considered" (by whom, one wonders) that "at the appropriate time" there be made a "private approach to the Soviet Union that would include: our determination to prevent the fall of South Viet-Nam to Communism by whatever means is necessary." The idea of raising South Vietnamese morale had disappeared; but the Soviet Union was still to be warned off.

Again, hawks and doves pulled at this document in opposite ways. Rostow, in a veiled fashion, and McGeorge Bundy, more overtly, tried to put back on the agenda some type of commitment to use force.[42] Bundy went so far as to say that with such a commitment, "the odds are almost even that the commitment will not have to be carried out." Rostow contented himself with a list of cases in which the U. S. use or threat of force "on our side of the line" got the U. S. "home free."

On the other hand, figures such as Harriman and Galbraith proposed to augment the Taylor recommendations with political strategies: diplomacy, for Harriman (an approach to the Soviet Union); or a jettisoning of Diem, for Galbraith; or a multilateral approach, for both.[43] Of necessity, such strategies would involve softening or dropping the language about determination. Kennedy was sympathetic to these arguments, commenting repeatedly that the issues in South Vietnam were vague (so much for U. S. determination or the dangers of the fall of South Vietnam) and that it was no wonder the U. S. had little support from its allies or from world public opinion. Under these circumstances, it was imperative that U. S. actions seem unprovocative so that not only world but American public opinion (and Democrats in Congress) could be brought along.[44]

These last comments were made in a meeting on 15 November (two days after Rusk had informed the French and British of the encadrement decisions); later that day, Kennedy was still worrying over the lack of allied support and the reactions of the enemy.[45] Small wonder, then, that when he wrote to Khrushchev on 16 November, he described support for Diem's government only as a "serious obligation" and said only that "we will

[41]"His feeling is the Pres does not know what he is approving." Conversation between Rusk and Taylor, 13 November 1961.

[43]Harriman to Kennedy, 12 November 1961; Galbraith to Kennedy, 20 November 1961, 21 November 1961.

[44]Kennedy to Rusk and McNamara, 14 November 1961; Notes on National Security Council Meeting, 15 November 1961.

[45]McG. Bundy points for discussion with Rusk, 15 November 1961.

undertake such measures as the circumstances appear to warrant." Both Laos and Vietnam, Kennedy went on to write, "are at a distance from our own countries and can be considered areas in which we ought to be able to find agreement."[46] Such wording suggests a decision on Kennedy's part to drop any reference to determination to prevent the fall of South Vietnam; this is precisely what we find in the NSAM finally issued with reference to the Taylor report. "The U. S. Government," we read, "is prepared to join the Viet-Nam Government in a sharply increased joint effort to avoid a further deterioration in the situation in South Viet-Nam." After that comes a simple list of the Taylor recommendations that have been approved—without, of course, any reference to U. S. troops. That is the end of the document.[47]

Thus, the final phase of 1961 Vietnam policy making is one that ends in a single point. The policy space has shrunk drastically, and all that is left is quibbles over whether an intent to carry out a commitment might excuse the intender from having actually to carry out the commitment. From this point on, at least until Diem's death, policy making about U. S. forces and who (if anyone) shall fight the war consists of pirouettes about technical (if morally important) issues: defoliation, napalm, forced resettlement of villagers, and so forth. Small wonder, then, of the shock that Diem's death causes: it, and the disintegration of the South Vietnamese army, finally force U. S. policy makers to confront the world that they have made.

Muted Radicals: The Emerging 'New Populism' in West European Party Systems

The Washington Hilton, September 2-5, 1993.

1 INTRODUCTION: THE NEW POPULISM

The 1980s and early 1990s have witnessed, not without some sense of alarm, a rising tide of right-wing extremism.[1] Attacks on foreigners have occurred with an ugly regularity in countries like Germany and France. Anti-immigrant sentiment on the streets has been matched by electoral success of parties like the French National Front and the German Republicans. At the same time, many new parties have sprung up, some of which share an agenda with the racist right, but others stress radical regionalism, anti-political sentiments, or frustration with taxation polices more than immigration issues.

The Austrian Freedom Party has come up from near dissolution to gain 16.6% of the vote -- its best ever share of the national vote -- in the 1990 election with a charismatic leader and an agenda focused against immigration. The meteoric rise of the Northern Leagues in Italy has provided the only rising star in an otherwise imploding political system with the party stressing its distance from Rome and professing a radical regionalism. Switzerland has seen its own regional league in the Ticino League which has joined the Automobilist Party as two of the newest parties in the political system, both clearly on the right. In Scandinavia the long established Danish and Norwegian Progress Parties that emerged as anti-taxation parties finally found a sibling in Sweden were New Democracy broke through in a seven month period to gain election to the Riksdag in 1991. In Belgium, the radical nationalist Flemish Bloc achieved its best national electoral performance in the 1991 election. All these parties have combined elements of nationalism with neo-liberal economic policies, and have presented this package in a style that confronts political systems while, simultaneously, operating comfortably within the realm of parliamentary politics.

It has been tempting to see a tide of right wing extremism sweeping across Western Europe, but a closer examination reveals two trends. The success of avowedly racist and neo-fascist movements has been limited in its parliamentary aims, and has gained most publicity in street battles rather than in ballot box contests. Those parties that have been electorally successful have shared certain features that cast doubt on their simple

---

[1]With this tide of political activity has also come a wave of academic studies. Much of the academic coverage has been of an explicitly comparative nature. There have been a number of special issues of prominent journals devoted solely to this issue. In West European Politics, Vol.11, No.2, 1988 an issue was devoted to Right-Wing Extremism. More recently the European Journal of Political Studies, Vol.22, No.1, 1992 and Parliamentary Affairs, Vol.45, No.3, 1992 have followed suit. For comparative books consult Merkl & Weinberg (1993), Hainsworth (1992), Cheles, Ferguson & Vaughan (1991) and Ford (1992).

categorization as being of the far right. Betz has termed these parties the "radical populist right" (Betz, 1993) and Ignazi has called them the "new right-wing" parties (Ignazi, 1992). We wish to suggest in this paper that they represent the "New Populism". In order to justify the use of this term, this paper presents a definition of the New Populism and a theory of their emergence.

2 DEFINING THE NEW POPULISM

In order to cut across the different dimensions of the New Populism we will address the beliefs of its elites, the organization and strategy that those beliefs engender and the electoral bases to whom the incarnation of these beliefs, as a party, appeals.

2.1 Ideology

In ideological terms, the New Populism is *on the right, against the system, and yet in the 'mainstream'*. It is right-wing, anti-system and populist. It is of the people but not of the system. It sees its own existence as the repudiation of any idea that politics as usual is a politics that has worked. This anti-system orientation has had implications for how the party both organizes and behaves. It enjoys "breaking the rules" because they are the rules of a system it sees as defunct.

The term "populism" is a notoriously difficult term. It is employed here (admittedly guardedly) to stress two elements that seem to run throughout the various meanings. These two elements are its negativity and its breadth. It is these factors that place the New Populism on the right and "in the mainstream". The anti-system element is drawn from the same sources from which have also sprung the New Politics.

Hofstadter emphasized in his examination of American populism that it was nativistic and anti-Semitic (Hofstadter, 1955). The idea of intolerance often seem to central to analyses of populism. We see, in populism then, a strong element of the negative. It is opposed to the system. It is opposed to those that run the system. And it frequently invokes a notion of "the people" that is characterized more by who it excludes than by who it includes. High on the list of the excluded for the New Populists are politicians, immigrants, bureaucrats, intellectuals and welfare recipients. While the list varies slightly from country to country according to circumstances, the core logic of exclusion remains a constant. In his examination of the Kansas populists Walter Nugent terms this a "selective nativism" (Nugent, 1963: 9) and we see something of that in the New Populism with its emphasis upon the politics of race and immigration. When the New Populists talk of the "ordinary man" and his exclusion from contemporary politics it sometimes seems to be an evocation of the excluded rather than the included.

The "people" have always been central to the rhetoric of

populists. As Lawrence Goodwyn notes, it is this mass nature of populism that has been so vital to the accepted academic interpretations of populism (Goodwyn, 1991). It is the breadth of New Populists' constituency that is the well-spring for the New Populists' indignation at their exclusion from political life. While they may not of the elite ("the political class") they are the many ("the mainstream").

The reason for describing the New Populism as "New" is two-fold. First, it is to stress that this is a historically-contingent manifestation of populism that, although bearing strong similarities to other populist movements, has some idiosyncratic features that render it distinct. The second reason for the "New" lies in the common basis that it shares with New Politics movements. In many ways, the New Populism lies across the same fault lines which have given rise to the New Politics movements. It clearly faces a different direction but it shares the same anti-system orientation and is a consequence of the particular social, political, and economic changes that we may characterize as the "post-war settlement". This settlement can be portrayed as the consensus that grew around ideas such as social democracy, the welfare state, corporatism and Keynesianism in most West European countries following the end of the Second World War. The New Populism has emerged as the post-war settlement has effectively broken up. The crises of the post-war settlement have served as the facilitators of the New Populism.

The reason that many observers conflate the New Populism with neo-fascism is that they both lie somewhere on the right of the political spectrum. Although many New Populists seek to deny the efficacy of the left-right distinction, there is more tenacity in that distinction than they would like to see.[2] The denial of being on the right may well be a rhetorical device that serves to avoid alienating those on the left that are attracted by parts of its appeal. There is a good strategic reason for the New Populists cultivating an electoral base that crosses from the left to the right. In terms of activist beliefs and program orientation, there can be little doubt that the New Populism lies on the right.

The New Populism is markedly neo-liberal in its economic orientation. The market is the legitimate and effective site for conflict resolution. The state is viewed as largely illegitimate, over-extended and ineffective. Liberty is a key concept for the New Populism. This liberty is defined in negative and individual terms. For the New Populists, freedom consists largely of the absence of state restraints on individual action. They are unmistakably parties of the right.

---

[2]Some commentators also have argued that the left-right distinction is now little short of meaningless. See, for example Krejcí (1991).

The leader of the Lombard League, Umberto Bossi declared after their election success in 1992: "This was just the first blow against the system, the second will be decisive" (quoted in Ruzza & Schmidtke, 1993: 1). New Populism exists as a reaction to certain systemic and political factors (which we shall explore below). It is therefore not surprising to find that a core belief for them is that the "system" has failed. In identifying the "system" which those who people it, the New Populists are betraying their populist roots. This anti-system attitude can manifest itself in an anti-party ideology. Such a position has important implications for the way they operate as parties. It also gives rise to the quintessential dilemma that they share with New Politics parties: how to be an effective party at the same time as being an "anti-party".

It is the exclusionary element of their ideology that justifies their description as populist. In rhetorical terms, this exclusion is usually expressed in terms of their representation of the "mainstream". The New Populism is an appeal to majority politics: it argues that corporatism and the growing strength of interest groups have, in effect, excluded the middle ground and alienated the "ordinary" voter. Of course, such an appeal makes some very contentious assumptions. It assumes that the multi-cultural vision of society is illegitimate and implies that the ordinary person is working in the private sector, white and probably male.

The New Populist parties differ from neo-fascist parties in a number of ways. The most concrete difference is also very difficult to verify but is related to historical continuity: neo-fascist parties tend to have some direct link to the fascist parties of the previous era while New Populist parties appear to lack such a historical link. For example the Italian Social Movement was formed in 1946 by Fascists set on maintaining the tenacity of their ideas in the face of the defeat of the regime (Chiarini, 1991). Other neo-fascist parties have been associated with a fascist tradition. Ignazi makes a similar point in his differentiation between old and new extreme right parties (Ignazi, 1992: 9-11) and provides us with a list of those extreme right parties linked to fascism.

Table 1 Extreme Right Parties with Fascist Connections

Country	Party

	DVU
Greece	EPEN
Italy	MSI
Netherlands	CP'86
Portugal	PDC
Spain	FNs
United Kingdom	NF
	BNP

Source: Ignazi (1992: 10)

The second difference is that, while New Populist parties often have an explicit of implicit anti-immigrant stance, this is rarely the sole source of their identity. The anti-immigrant stance is often conflated with other salient issues. For example the Swiss Automobilist's Party was formed as a reaction to the demands of environmentalists. The Scandinavian New Populist parties are most famously associated, sometime primarily, with an anti-taxation agenda. The Italian Lombard League has, as its ideological centerpiece, a commitment to regional devolution and is often analyzed primarily as a regional movement -- albeit an exceptional one (Ruzzo & Schmidtke, 1993). In contrast, the neo-fascist parties, while they do develop other policy positions, are almost exclusively anti-immigrant parties.

New Populism, like neo-fascism, is an ideal type party. We should consider both as ideals towards which parties of the far right may gravitate. Some parties are more unequivocally New Populist than neo-fascist. A further complication is that New Populism and neo-fascism are not *necessarily* contradictory in theory. A neo-fascist party may assume a New Populist orientation, or a New Populist party may move towards a neo-fascist agenda if it begins to stress the immigration issue to the effective exclusion of all others. However, in practice, parties do tend to be either neo-fascist or New Populist. The examples of parties that blur the distinction are the Republicans in Germany or the Flemish Bloc in Belgium.[3]

2.2 Organization

New Populist parties have two qualities that pertain to their organization: they are very centralized and they set great store in the leadership which is both personalized and charismatic. These characteristics are not, in themselves, peculiar to New Populist parties, but they do point to a central point about such parties: that they can reconcile anti-systemic elements with organizational

[3]We will explore individual cases in more detail below.

elements that ensure their institutional and electoral survival.

The element of charismatic leadership is essential to the nature of the New Populism. New Populism is an explicit attempt to offer models of party *qua* party that differ from prevailing models, and because the prevailing party model is that of the "catch-all" professional-bureaucratic party, charismatic forms are themselves a form of protest. The other alternative, of course, is the New Politics model of devolved, decentralized leadership.

A simple rule of thumb to decide whether to exclude a party from the list of New Populist parties is to see if there is a name of an individual leader that comes to mind with the name of the party. If there is no such association, then the party will probably not be a New Populist phenomenon. In identifying such parties across Western Europe it is easy to single leaders whose names seem inextricable from the parties they lead (or led). In one case the name has been more than identified with the party: the Norwegian Progress Party was originally called the Anders Lange Party. In its latter incarnations it was revived under the leadership of Carl I. Hagen. Mogens Glistrup's name goes with the Danish Progress Party, Veikko Vennamo's with the Finish Rural Party, Le Pen's with the French National Front, Ian Wachtmeister and Bert Karlsson's with the Swedish New Democracy Party, Umberto Bossi's with the Lombard League, Jörg Haider's with the Austrian Freedom Party and Franz Schönhuber's with the German Republicans. Clearly other non-New Populist parties are also identified with particular leaders so this is merely a minimal criteria for New Populist parties. For the New Populist parties, the charismatic basis of their leadership is an essential element because it represents a symbolic challenge to the prevailing models of party organization.

It is partly a consequence of the centralized structure that New Populist parties employ charismatic leadership. In seeking to reject the traditional idea of a political party, the New Populists construct a party organization that explicitly challenges the model of bureaucratic and hierarchical structure associated with mass parties. This means that they employ centralized organizational patterns. Where the traditional parties are strictly hierarchical, New Populists aim to be selective and small in structure. An example of this would be Sweden's New Democracy which has striven to make its national party independent of the encumbrances of the local or county levels, with the justification that this allows a direct line of communication between the "people" and the national elites (Taggart & Widfeldt, 1993). The regional basis of some of the New Populist parties (the Italian Northern Leagues and the Swiss League of Ticino, for example) can also be seen as an attempt to reject the basic rules of party organizing that usually result in parties that are explicitly national in scope. It is an essential element of the Lombard League that it has advocated a radical form of federalism and of "macroregions" (Miglio, 1991;

Thompson 1993). It is a combination of unorthodoxy with centralization and personalized leadership that leads Dwayne Woods to describe the Lombard League as "a centralized political movement with decision-making concentrated in the hands of Bossi and national committee of his supporters" (Woods, 1992b: 125). Such a description is typical of the organizational form favored by the New Populists.

2.3 Electoral Base

The final element of New Populists that makes them distinct is their electoral profile. The contours of the New Populist base clearly overlap with profile of the extreme right that has traditionally been drawn. Neo-fascist movements have traditionally been portrayed as having an inner city, working-class, protest constituency (e.g. Whitely, 1979), or as poor and under-educated and predominantly male (e.g. Husbands, 1992: 120). In terms of some basic demographic characteristics we can summarize from the literature that neo-fascist parties draw from poor, under-educated, urban and male constituencies (Falter & Schumann, 1988). The New Populists are drawing from that constituency but the net is cast somewhat wider.

The reason for assuming that New Populists will draw from a wide range of electors than neo-fascists, is that New Populism is, at root, at least in the electorate, a protest phenomenon. If the parties are successful at portraying themselves as a different type of party, then they will be at relative liberty to attract voters from across the political spectrum because they have not defined themselves out of any particular ideological milieus. In a similar vein, they aim to mobilize the citizens who have previously expressed their dissatisfaction with the dominant parties by simply not voting. It is because their ideology contains the idea that they are a "mainstream" phenomenon that they can, and do attract voters from across a broad range. Within this swathe there is a clear propensity for some demographic groups to be attracted to the New Populists. This means that, at one and the same time, they can portray themselves as beyond the sullied constraints of normal class-centered electoral base-building, and yet count on the support of a core group of voters -- albeit a small group.

The New Populist constituency is predominantly male. On a wider note than neo-fascism, it is not necessarily poor or unemployed, but is employed in the private sector. It is not poorly educated but does draw from the middle to low educational strata. It also draws from a wide range of prior voting positions and may draw in those that previously did not take part in elections. It is also predominantly young with those who are voting for the first time having fewer ties to break with the established order. We may see examples of this in a number of parties.

Mitra's study of the French National Front demonstrates how there is an over-representation of the youngest cohort (18-24) in the party's electorate (Mitra, 1988: 54; cf. Safran, 1993) and also shows that the National Front's vote actually increases with higher levels of education (Mitra, 1988: 56). Nonna Mayer and Pascal Perrineau also demonstrate that Le Pen's voters "cross the left-right divide more often than any other electorate" (Mayer & Perrineau, 1992: 127-8). Andersen demonstrates that the Danish Progress vote is predominantly from the private sector (Andersen, 1984; Peters, 1991: 180). This author has shown that Sweden's New Democracy crosses from left to right, draws the previously apathetic and is predominantly male and private sector in its support (Taggart, 1992). Eva Kolinsky demonstrates that the German Republicans are disproportionately male (Kolinsky, 1992: 82) while Veen, Lepszy and Mnich concur with this conclusion and also point out that the voters are disproportionately young "'homeless' pool of voters" (Veen, Lepszy & Mnich, 1993: 31). There is a clear profile that emerges when we compare New Populist voters.

Summarizing we can say that New Populist parties are recognizable along three dimensions:

- ***Ideologically*** *the parties are on the right, anti-system in orientation, and claim to be speaking for the "mainstream" of society.*
- ***Organizationally*** *the parties are characterized by strongly centralized structures with charismatic and personalized leadership as an integral component of their development.*
- ***Electorally*** *the parties are defined by a constituency that is disproportionately male, private sector, young and which draws from a wide range of political orientations.*

Table 2 below provides us with a typology of New Populist and Neo-fascist parties in seventeen West European countries. The differentiation is based upon the above three criteria. It includes those parties on the far right that are still active or have been active in the past. The focus is primarily upon those parties that have taken part in elections. This is essential to all New Populist parties as they do not usually derive from a social movement basis. It excludes extra-parliamentary far right movements whose focus is racist violence (see Ford, 1991). The table includes, with the names of the parties, their best national electoral performances. The reason for this is that we are focussing on those parties that can truly said to be national phenomena.

Table 2 allows us to draw some important conclusions. The first conclusion is that the table illustrates why the New Populism is such a pertinent topic at this time: the New Populist parties are clearly in the ascendancy. The best election results have been gained mostly in the past few years. The two parties which seem to buck this trend by gaining their best result at an earlier time have both experienced revivals. The Danish Progress party dropped to 4% in the 1984 election but revived its support to 9% in 1988. Similarly the Finnish Rural Party dropped to a low-point of 4% of the vote in 1975 but pushed this back up to 10% in 1983. There does seem to be a wave of New Populism sweeping across West Europe.

In contrast, the neo-fascist parties have not, on the whole, been as successful as the New Populist parties in the recent period with many of them gaining their best results in the period before the success of the New Populists. The other comparison allows us to conclude the neo-fascist parties have never been as electorally competitive as the New Populists. Where most of the New Populists have garnered over 5% of the vote at one time or another, the neo-fascist parties have consistently failed to gain this level of support. By conflating these two tendencies commentators have confused what is, in reality, a very clear picture. New Populism is growing in electoral muscle and has been more successful than neo-fascism among voters.

The second conclusion that may be drawn from table 2 is that the electoral strength of German neo-fascism and New Populism has been unduly stressed. It has to be acknowledged that the far right have done very well at gaining representation at the Länder level.[4] This has yet to be translated into a national shift. Clearly, with Germany's Nazi legacy, any rumblings of the far right are bound to incur more attention than they would in other countries. But the electoral performance at a national level does not yet merit such attention. Indeed the danger is that an over-emphasis on the German case has occluded those cases where the far right has assumed a more dangerous position. The emphasis on Germany's far right may well follow from the rise of extra-parliamentary violence against immigrants which may be at the highest level of any European country. But this does not amount to the same thing as a rise of the far right in electoral terms. It behooves us to be clear about which phenomenon we are addressing: racist violence or the electoral rise of the far

---

[4]Their greatest successes have so far been in Baden-Württemberg where the Republicans took 11% of the vote and 15 seats and the DVU took 6% of the vote and 5 seats in Schleswig-Holstein in 1992 (Financial Times, April 6, 1992: 1; Financial Times, April 7, 1992: 1). In a state election in Bremen the DVU gained 15% of the vote and six seats in the parliament in 1991 (Financial Times, October 1, 1991: 22).

right.

The third conclusion can be drawn from the fact that none of the three countries which have experienced transitions from authoritarian rule in the post-war period have given rise to New Populist movements and, perhaps even more surprising given the fascist past, none of the neo-fascist parties have gained more than a single percentage of the vote. Panayote Elias Dimitras concludes a study of the extreme right in Greece with the comment that "most observers...agree that in the near future, unless there are dramatic developments, no extreme right party will play a significant role on the Greek political scene" (Dimitras, 1992: 267). In the same volume, Tom Gallagher describes the marginalization of the far right in Portugal that has resulted from Salazar's period of military dictatorship in which he suppressed any movement of the far right as he saw this as a threat: the result was that the contemporary far right has been denied a historical basis (Gallagher, 1992: 243). John Gilmour concludes his study of the Spanish far right with the observation that the extreme right "wallowing in nostalgia and traditionalism, is now nothing more than a marginalized movement which appears to be set on a downward course into oblivion" (Gilmour, 1992: 229).

These three countries, due to their authoritarian periods, did not experience the consensus of the postwar settlement in the same way as the rest of Western Europe. There do seem to be common elements to the three countries' experience. We can perhaps speculate that in periods of consolidation of liberal democracy there is a tendency for the public to eschew extreme alternatives (Gillespie, 1990). Another common feature was the discrediting of highly personalized fascist regimes. We can observe that an extreme form of both populism and fascism had been given a long period in command of a regime. The fact that these states experienced revolutions can be seen as a repudiation of the extreme right. As a result Spain, Portugal and Greece have seen the right forming broad-based alliances to gain wider support and to lose the taint of fascist legacies.

In the following section we will build up a theory that will account for the different levels of New Populist mobilization. In order to do this we can differentiate between three levels of New Populist mobilization: there are those countries with high levels of the vote for New Populist parties; those countries with low levels of the vote for such parties; and those countries that do not have any significant parties that fit the New Populist description. Table 3 below lays out the three clusters.

Table 3 Levels of New Populist Mobilization

	Country	Best Vote(1)	Year

3 TOWARDS A THEORY OF THE NEW POPULISM

The New Populism has grown as a consequence of the crises of the post-war settlement. It is in the changed socio-economic context that has provided a fertile soil for a nascent New Populism. This means that we can identify variables that indicate this change and they should be correlated with New Populist mobilization. In this section four variables are examined to illustrate a potential basis for a theory of the New Populism. No one set of factors explains the emergence of the New Populist parties alone, but in the nexus of the four, we have an explanation that is theoretically grounded and relatively accurate. The four variables we will examine are levels of postindustrialism, economic strength, party system "cartelization" but we can start with the welfare state.

3.1 Welfare State

The New Populism is contingent upon a developed welfare state. The welfare state is one pillar of the post-war settlement and its growth is therefore an essential pre-requisite for laying the terrain for the New Populists. We would expect therefore to see developed welfare states corresponding with high

levels of New Populist mobilization. The reasons are two-fold: the more developed the welfare state is, the more the traditional class divisions will have been undermined, leaving space for New Populist parties to mobilize these newly dealigned electorate. The second reason gives the reason for the emergence of protest: the more developed the welfare state, the greater the level of crisis that is engendered. As welfare states develop more fully, so we can see more clearly the contradictions inherent within it (O'Connor, 1973). To put this more simply: the social goods provided by the state as legitimation are in greatest demand when legitimacy is low, and legitimacy is lowest at the times that the state can least afford to provide those social goods -- in times of economic crisis. In is into such settings that the New Populists emerge to challenge some of the basic premises of the welfare state.

Gosta Esping-Andersen makes a powerful case for arguing that it is insufficient to catch such a complex phenomenon as the welfare state under one indicator. He argues that there are three different clusters of welfare states that have very different emphases in their social welfare spending: liberal regimes which have a low level of benefits which are targeted at the poorest sectors of society; corporatist regimes where the rights of social citizenship were more broadly attached to class and which use states rather than markets to distribute social goods but without radical redistributive effects; and finally social democratic regimes which, based on ideas of universalism, attempted to extend social goods to all of society and therefore brought welfare as improving mechanism for those who lived below the mean rather than seeing social benefits as a last-ditch safety-net (Esping-Andersen, 1990: 27-28).

The clustering of regime-types is a consequence of Esping-Andersen's central idea that the measure of the welfare state is how far it "de-commodifies" social status: in other words, as the market categorizes citizens in terms of how much they are worth as commodities, so the welfare state, through its universalism, treats each citizen with the same weight thereby detaching them from their commodity value. He constructs a scale out of the de-commodifying potential of social policies in various countries. The scale takes account of the rules and standards of welfare patterns and he includes how wide the eligibility rules are, how much income replacement is allowed for, and how much protection there is for the basic social risks of unemployment, old-age, disability and sickness (Esping-Andersen, 1990: 47). Combining the de-commodification effects of pension, sickness and benefits, he comes up with a ranking of welfare state regimes. The

relevant results are laid out below.[5]

Table 4 Rank Ordering of Welfare State in Terms of Combined De-Commodification, 1980

Country	De-Commodification Score
Sweden	39.1
Norway	38.3
Denmark	38.1
Netherlands	32.4
Belgium	32.4
Austria	31.1
Switzerland	29.8
Finland	29.2
Germany	27.7
France	27.5
(Japan	27.1)
Italy	24.1
United Kingdom	23.4
Ireland	23.3
(Canada	22.0)
(New Zealand	17.1)
(United States	13.8)
(Australia	13.0)
Mean	27.2

Source: Esping-Andersen (1990: 52)

As we can see from the clustering that Esping-Andersen identifies around the mean, we can make some geographical generalizations about where we will find the different regime types. The liberal regimes are basically the Anglo-American democracies, while the corporatist regimes are those of contentional Western Europe, and the social democratic regimes are, not surprisingly, those of the Nordic region. However, for the purposes of New Populist mobilization we can dichotomize the listing around the mean giving us "high" and "low" levels of welfare state de-commodification. Figure 1 below illustrates that strength of this relationship between welfare state development and New Populist mobilization.

[5]Esping-Andersen deals with nations outside the purview of this paper and does not include all the countries with which we are dealing.

Figure 1 New Populist Mobilization and Welfare State De-Commodification, 1980

Levels of New Populist Mobilization	Welfare State De-Commodification, 1980: HIGH	Welfare State De-Commodification, 1980: LOW
HIGH	Austria Denmark Norway France Finland	
MEDIUM	Switzerland Germany Belgium Sweden	Italy
LOW	Netherlands	United Kingdom Ireland

Correlation Coefficient = .478
Source: Tables 3 and 4.

Figure 1 above demonstrates a strong relationship between the most de-commodifying welfare states and New Populist mobilization. The Netherlands is the only country definitely in the wrong box, while Italy also demonstrates that there is not a pure fit (remembering that those categorized as having LOW New Populist mobilization do not have any relevant New Populist parties). We can however speculate that those countries with either social democratic or corporatist welfare regimes are likely to give rise to significant New Populist mobilization. Thus, this factor may be a good explanation of negative cases of New Populist mobilization.

3.2 Postindustrialism

One of the most important changes in the socio-economic context of Western Europe in the past few decades has been the shift to a postindustrial economy. As the economies have transferred their foci from industrial manufacturing to the service sector, the surrounding societies have been profoundly changed. With this change has come economic restructuring, industrial class decomposition and the emergence of new cleavages. And with these changes has come the undermining of the pillars of the post-war settlement. The weakening of labor movements undermines corporatist structures. The globalization of the economy and the attendant growth of supra-national governing bodies (e.g. GATT and EC) weaken the ability of national governments to control domestic economies through old-

fashioned demand-management tools.

As the New Populist parties are a postindustrial phenomenon, we would expect to find a relationship between how postindustrial the economy has become and how much New Populist mobilization we can see: the higher the level of employment in the service sector the higher the rate of New Populist mobilization. The reasons for expecting a relationship between postindustrialism and New Populist mobilization are two-fold. First, at the more abstract level, it is the postindustrialization of the economy that has contributed to the undermining of the post-war settlement. Second, and more substantively, this undermining has been effected through changing class constellations and thereby whittling away the power of the labor movement, upon which social democracy and corporatism were dependent. It is not so much what postindustrialism has created, but rather what it has undermined, that justifies our attention on the shift to a new economic base.

Daniel Bell categorized those countries which have more than half the total work-force employed in the tertiary sector as postindustrial states (Bell, 1974). Since Bell first established this criteria all but two of the West European countries under examination here have become postindustrial. This gives us a very low amount of variance. We can therefore use the criteria of employment in the service sector of the economy but we need to supplement this with additional information.

Simply measuring the percentage in the work-force employed in the service sector does not measure the degree to which the individual lives of citizens have been transformed by the information revolution. As we are focusing on mass politics, we need to capture the degree to which the work and domestic spheres have been transformed by the macro changes of a shift to services. One way of doing this is to provide a measure of postindustrialism that includes both the percentage of those employed in the service economy and also the spread of information technology. This can be done by including the number of telephones in a country as a statistic. Telephones are an essential instrument of informationalizing economies and the greater their presence, we can also assume that they have become greatly incorporated into everyday (i.e. non-working) lives. Table 5 below provides a ranking of the postindustrialism of our seventeen countries through a combination of these two statistics.

We can see from the table that Switzerland and the Scandinavian countries are the most highly postindustrialized, while the newer West European democracies of Portugal, Greece and Spain represent the extremes at the other end of the spectrum, along with Ireland. We can dichotomize the results so that those above the average can be categorized as having a (relatively) "high" level of postindustrialism and those below as having a (relatively) "low" level of postindustrialism.

Table 5 Levels of Postindustrialism, 1988

Country	Service Sector Employment(1)		Telephones(2)		
Switzerland	59.2	x	1 334	=	78 972.8
Sweden	66.7	x	890(3)	=	59 363
Denmark	67.1	x	783	=	52 539.3
Norway	67.1	x	622(4)	=	41 736.2
France	62.9	x	614	=	38 620.6
Finland	59.6	x	615	=	36 654
Germany	56.1	x	641(5)	=	35 960.1
United Kingdom	68.0	x	521(4)	=	35 428
Belgium	69.3(3)	x	414	=	28 690.2
Netherlands	68.8	x	410(5)	=	28 208
Luxembourg	65.0	x	425(5)	=	27 625
Italy	57.7	x	448	=	25 849.6
Austria	54.5	x	460(6)	=	25 070
Spain	53.1	x	381	=	20 231.1
Greece	46.2(3)	x	273	=	17 232.6
Ireland	56.8	x	235(6)	=	13 348
Portugal	44.2	x	166(6)	=	7 337.2
Means	60.1		548.9		33 697.9

New Populism will tend to emerge in postindustrial societies because the traditional right has become identified with the interests of corporate capital. Lost in the gap between the corporatized economy and the bureaucratized state lies the central rhetorical constituency of the New Populists - "small business". The globalization and dependence upon high-cost high technology of the postindustrial economy forces companies to operate in an environment that is conducive to large-scale operations. The "small people" of which the New Populists speak are those that operate in small businesses. The New Populists are rightist reaction to the displacement of political and economic norms that has taken place under the shift to a postindustrial society and that has engendered profound crises of the post-war settlement. The relationship between New Populist mobilization and postindustrialism is illustrated below in Figure 2.

Figure 2 New Populist Mobilization and Postindustrialism

Levels of New Populist Mobilization	Postindustrialism: HIGH	Postindustrialism: LOW
HIGH	Denmark Norway France Finland	Austria
MEDIUM	Switzerland Sweden Germany	Belgium Italy
LOW	United Kingdom	Netherlands Luxembourg Ireland Greece Spain Portugal

Correlation Coefficient = .421
Source: Tables 3 and 5 above.

Predicting New Populist mobilization on the basis of postindustrialism does present us with a number of cases that seem to go against the expected relationship. Finland and Austria do not have the levels of postindustrialism that we might expect, given their high levels of New Populist mobilization. Whereas Finland is only just below the average with 59.6%, Austria is very low on the scale (54.5%). At the other end of the scale the United Kingdom, Luxembourg and the Netherlands all qualify as being highly postindustrial but are without New Populist mobilization. Postindustrialism does however work in differentiating the new Mediterranean democracies of Greece, Spain and Portugal which cohere on other variables in the same way.

3.3 Economic Strength

Underlying the post-war settlement has been the premise of economic growth. With a strong economy comes the ability to construct and to fund a strong and universal welfare state. With the resulting levels of stability comes a greater likelihood of corporatist modes of decision-making. It was with the oil shocks of the 1970s that a death blow was dealt to the unquestioned economic growth of Western Europe, and so came the crisis of the post-war settlement. It is reasonable to expect that those countries that have been most economically successful are to be

more prone to the emergence of new protest movements that stem directly from the crises of the post-war settlement. We can compare the relative economic strength of seventeen West European countries. The results of such a comparison are laid out in Table 6 below.

Table 6 Relative Economic Strength, 1988

Country	GDP Per Capita(1)
Switzerland	27 581
Sweden	21 546
Finland	21 287
Norway	21 241
Denmark	20 926
Germany	19 581
Luxembourg	17 592
France	17 002
Austria	16 748
Netherlands	15 461
Belgium	15 180
Italy	14 430
United Kingdom	14 413
Ireland	9 182
Spain	8 722
Greece	5 244
Portugal	4 265
Mean	15 905.9

Source: OECD (1990).
(1) US $.

The table clearly shows how the Scandinavian states generally rank very highly whereas the new Mediterranean democracies are grouped together at the bottom of the table with Ireland. As a more all embracing measure we can categorize those countries above the mean as having "high" relative economic strength and those below as "low".

We can systematically lay out the relationship between relative economic strength and New Populist mobilization. This is done is Figure 3 below. The figure demonstrates a very clear relationship between New Populism and economic strength. Luxembourg represents the only clear exception to the relationship. The case of Italy might perhaps give strength to those who argue that the Northern Leagues are peculiarly Italian phenomena whose rise is unrelated to the far right elsewhere in West Europe (Thompson, 1993: 8). While the strength of the rise of the Lombard League in recent years might well be accounted for by the particular decomposition of the Italian party system in

the past two years, the similarities that exist with other New Populist parties justifies its inclusion in this category. The case of Italy demonstrates that the socio-economic factors can be enhanced by particular national contextual factors.

Figure 3 New Populist Mobilization and Economic Strength

Levels of New Populist Mobilization	Economic Strength: HIGH	Economic Strength: LOW
HIGH	Austria Denmark Norway France Finland	
MEDIUM	Switzerland Germany Sweden	Belgium Italy
LOW	Luxembourg	Netherlands Ireland United Kingdom Greece Spain Portugal

Correlation Coefficient = .557
Source: Tables 3 and 6 above.

A consideration of the variable of economic strength in the different cases demonstrates that the New Populist parties are not a function of economic weakness. The New Populists have emerged on the crest of economic prosperity. While many of the strongest economies of Western Europe have seen profound downturns in recent years, they have turned down from a position of economic height. This is not to imply that the New Populist parties are the result of the increased prosperity of the protestors. The figures are aggregate and, as relative deprivation theory suggests, the result of an increased disparity between individual feelings of satisfaction and aggregate levels of prosperity can be increased political activism.

3.4 Party System Cartelization

T.J. Pempel has noted how some liberal democracies have become subject to one-party dominance and he refers to such cases as "uncommon democracies" (Pempel, 1990a). In these countries the dominant parties "must dominate the electorate, other

political parties, the formation of governments, and the public policy agenda (Pempel 1990b: 4). The two West European cases that fit Pempel's criteria are Sweden and Italy with their dominance exercised by the Social Democrats (SAP) and Christian Democrats (CD) respectively. But he also makes the point that we need to examine not only the party that is dominant but the relationship of the party to the regime in which it is dominant (Pempel, 1990b: 30). Such one-party dominance has an important impact on social coalitions: Esping-Andersen illustrates how Sweden's SAP has used its position of dominance to ensure its continued longevity in government by creating social alignment favorable to the party (Esping-Andersen, 1985). Such dominance raises doubts about the nature of representative democracy (Pempel, 1990b: 7) and it clearly represents systems which have a high degree of unresponsiveness to demands from both left and right. But differentiating between one-party dominant regimes and others does not allow us to contrast the degree of responsiveness of West European states because it only applies to two cases.

Recent observers have suggested that Kirchheimer's model of the catch-all party has been superseded by a new form of party which is dominant. Richard Katz and Peter Mair suggest that we are witnessing the emergence of the "cartel party": this party type is "characterized by an interpenetration of party and state which has developed to a degree which increasingly transforms the party into a part of the state, and by a pattern of inter-party collusion in which the need for collective organizational survival appears to assume priority over individual partisan gains or losses" (Katz & Mair, 1992: 20). This description can be given a wider sweep. What we are here suggesting is that many West European party systems are becoming "cartelized". The challenges that the established parties have had to face from social changes that have robbed them of the security of their electoral bases and given rise to issue-oriented, volatile voters, has forced many major parties into the situation where it is only through inter-(old)-party co-operation that they can prevail in office or in power. We can define the "cartelization" of the party system as the securing of power for a small number of parties through overt or covert co-operation and premised upon a foreshortening of the "policy distance" between the affected parties.

Perhaps the best example of a "cartelized" party system is the of Austria. From 1949 until 1966 a Grand Coalition of the Austrian People's Party (ÖVP) and the Socialist Party of Austria (SPÖ) held office and the SPÖ has been in the cabinet continuously from 1945 until the present except for a period when the ÖVP ruled alone for four years (1966-70). Explaining the two main reasons for the importance of parties in Austrian politics, Kurt Richard Luther writes: "First, it is primarily the parties who mobilize their respective subcultures and it is through party

structures that subcultural interests are aggregated and the subcultural political elite recruited. Second, it is above all between the elite of the political parties that the overarching accommodation occurs" (Luther, 1992: 46). To put it more bluntly the accommodation of elites that is inherent in consociationalism requires established major parties to act as a cartel.

Those countries that are usually described as examples of consociationalism are prime candidates for having cartelized party systems. The requirements of elite co-operation and a broad consensus about the need to maintain the long-term stability of the political system that consociationalism requires, will push such systems to party systems which will see cartelization. Thus, with Sweden and Italy, we may include Switzerland, the Netherlands, Austria and Belgium in our list of cartelized party systems. But this process of increased cartelization is not confined to consociational and "uncommon" democracies.

The situation of the Federal Republic of Germany presents us with another potential case of cartelization. In the post-war period we have only seen one "Grand Coalition" (1966-69) but we have, in recent years heard frequent calls for another such arrangement to deal with many of the serious difficulties facing the newly-unified Germany. Regardless of this, we also have the reality of center-left and center-right coalitions alternating in power at the behest of the Free Democratic Party. This small party has had its position described as that of "Kingmaker" because of the power that its position of balance gives it (Financial Times, June 12/13, 1993: 2). From the outside, especially with new parties breaking through to the Bundestag (the Greens in 1982), it appears that three parties have dominated German government positions and have done so with a degree of conformity on basic policy questions.[6]

The final group of countries that we can include in the list of cartelized party systems are those famous for being "consensual" polities -- the Nordic states. Elder et al. define consensualism as having three dimensions: a low level of conflict over the basic rules of the political process; a low level of conflict over the exercise of power; and a high degree of concertation in the creation of public policy (Elder, Thomas & Arter, 1988: 10-11). Although they do conclude that there has been, in recent years, some decline in consensus, it is clear that, for most of the post-war period Norway, Denmark and Sweden have been characterized by "the distinctively Scandinavian culture of consensus and the structures for conciliation and arbitration which have been built up during the twentieth

---

[6]The most obvious example recently would be the SPD's co-operation in amending the Basic Law to change the rules regarding immigration (Financial Times, May 27, 1993: 1).

century" (Elder, Thomas & Arter, 1988: 221).

Denmark perhaps deserves some more articulation of the argument as to why it is cartelized. If we look at the party system of Denmark it can be divided into two periods: before and after 1973. The 1973 election completely changed the party system by breaking away from the heavily cartelized hold of the five major parties over the Folketing. However, despite the "earth-shattering" nature of the 1973 election, this has not been repeated and, while there are more parties now represented at the national level, Borre points out that this has not affected the basic stability of the bloc system (Borre, 1984: 361). In addition, Pedersen argues that the position of the Social Democratic Party comes close to being one of dominance (Pedersen, 1991: 95). Also we should note the emergence of New Populism in Denmark with the Progress Party followed hard on the heels of that period of strong cartelization.

We can therefore conclude our list of cartelized systems by adding Norway, Finland and Denmark. Figure 4 below tabulates the relationship between cartelized party systems and New Populist mobilization.

Figure 4 New Populist Mobilization and Party System Cartelization

		Party System Cartelization: Cartelized	Party System Cartelization: Non-Cartelized
Levels of New Populist Mobilization	HIGH	Austria Denmark Norway Finland	France
	MEDIUM	Switzerland Germany Belgium Sweden Italy	
	LOW	Netherlands	Luxembourg Ireland Greece Spain Portugal UK

Correlation Coefficient = .511
Source: Table 3 and text.

Figure 4 clearly displays a strong relationship between

cartelization and New Populist mobilization. The only two anomalies are the Netherlands and France. The French case is complicated by the shift from the Fourth to the Fifth Republic in the 1960s. Prior to that the dominance of De Gaulle could be seen as an example of one-party dominance. The picture is however further confused by the constitutional division between president and prime minister and the resulting two periods of "cohabitation" (1986-88 and 1993-) that have taken place under the Fifth Republic. France, during the whole post-war period, cannot be unequivocally described as either one-party dominant or as having a cartelized party system and therefore must stand as an anomaly here.

The figure does demonstrate that, once again the new Mediterranean democracies are grouped together in the company of Ireland. There is a clear relationship between party system cartelization and New Populist mobilization.

Table 7 below places all the variables we have examined together and groups the countries in the three sets according to their levels of New Populist mobilization. By looking at some of the countries in turn we can demonstrate the efficacy of the theory.

The chart predicts with complete accuracy the levels of New Populist mobilization in eleven countries. Of those countries with high levels of New Populist mobilization only France does not fit exactly. In the middle range only Belgium and Italy, both countries that have been experiencing constitutional debates recently, do not match exactly. Of the other countries with a high level of New Populist mobilization, there are high levels of welfare state, economic strength, postindustrialism and party system cartelization. At the other end of the spectrum Ireland, Greece, Portugal and Spain fit the theory perfectly with low levels of postindustrialism, economic strength, welfare state development, and low levels of party system cartelization.

The three cases which are the most anomalous are Italy, Belgium and the Netherlands. Party system cartelization appears to be an important factor in the case of Italy. Italy would not have New Populist mobilization on the basis of only the socio-economic factors. Its high level of party system cartelization has resulted in medium levels of New Populist mobilization with the Northern Leagues (Woods, 1992a; 1992b; Thompson 1993). The current dissolution of the Italian political system into the morass of criminal and legitimacy crises seems to lend weight to the thesis that the cartelization has been a crucial factor. Public dissatisfaction with the political class as a whole seems to have been a consequence of a highly cartelized political system and the ensuing demise of the power bases of these parties.

4 CONCLUSION

In dealing with the New Populism, we have argued that, by separating this phenomenon from that of neo-fascism, we can see that the growing strength of the far right at present largely derives from the growing strength of the New Populism. We can identify the ideological, organizational and electoral facets of the New Populism. Having done this we can see how the New Populism is explicable as the result of a nexus of socio-economic, and political factors.

In conclusion we can stress three points. The first conclusion that we can draw from all this is that the rise of the New Populist far right is tied to long-term economic success (in the sense of a strong, welfare state economy) rather than to the phenomenon of economic down-turn. This again demonstrates how the bases of neo-fascism (often assumed to be rooted in economic depression) are distinct from those of New Populism.

The second conclusion that we can draw is that cartelization of the party system seems to have a strong bearing on the degree of New Populist mobilization. While states can have all the socio-economic factors associated with New Populism, having a highly cartelized party system can be as important as all those factors combined. We can see this in the meteoric rise of the Northern Leagues in Italy. The New Populism is therefore a profoundly political phenomenon both reflecting and seeking to change the politics of Western Europe.

The final conclusion that we can draw is that, by separating the electoral facets of the New Populism from the racist violence of neo-fascism, we can see that an over-emphasis on the German situation has obscured the real picture: this picture is of efficient, centralized parties operating across Western Europe. The success of these sharp-suited far rightists is not unrelated to the growth of extremist violence of the boot boys, but we have a clearer picture if we separate the two phenomena. Defining New Populism is a start to such a process.

The New Populism is important because it sometimes explicitly shares, and sometimes hints at, the agenda of the extra-parliamentary extreme right. The muted radicalism of the New Populists has lead to great success at entering parliaments and has the potential to transform party systems. As a nascent, but apparently effective force for change -- perhaps radical change -- the New Populism represents a formidable protest force. It both reflects changes in contemporary society and also is attempting to enact political change. In its potent cocktail of muted radicalism, anti-system attitudes and a right-wing populism, the New Populism is set to make its presence felt across Western Europe.

Prepared for presentation at the Annual Meeting of the American Political Science Association, The Washington Hilton, Washington D.C., September 2-5, 1993.

THE U.S.-JAPAN DISPUTE OVER RICE LIBERALIZATION: INSIGHTS FROM PROSPECT THEORY[1]

The current round of world trade negotiations (the so-called Uruguay Round) of the General Agreement on Tariffs and Trade (GATT) is now in its seventh year. The negotiations have repeatedly stalled over agriculture - a sector that accounts for only thirteen percent of world trade. The question of agricultural liberalization within the international trade regime is an area in which domestic politics place constraints on agreements reached at the international level. Previous GATT negotiating rounds excluded agriculture. Due to domestic politics, which are the root of agricultural trade barriers and export subsidies, GATT members considered the farm sector beyond the scope of the negotiations.[2] This is no longer the case. When representatives of the GATT member states met to launch the latest round of negotiations in Punta del Este, Uruguay in September 1986 they agreed that trade distorting agricultural policies would be included.

The United States has been the principal advocate of agricultural liberalization in the Uruguay Round much to the consternation of its main trading partners, the European Community (EC) and Japan. Japan's almost total ban on rice imports has become a source of contention with its GATT partners, particularly the United States. The Uruguay Round was due to conclude at the December 1990 GATT meeting in Brussels. American trade negotiators were on the verge of accepting a minimum access solution to the closed Japanese domestic rice market, before the talks collapsed

over a farm subsidy dispute with the EC. In June 1991 Prime Minister Toshiki Kaifu was supposed to announce that the Japanese government would agree to a minimum access solution during a scheduled meeting with President George Bush in Maine. A few days before Kaifu's visit the U.S. hardened its position. The Bush Administration said that it would regard a three, five, or even a ten percent partial opening of the Japanese rice market as insufficient. What accounts for this shift in the American negotiating position? I will argue that prospect theory, as opposed to a rational choice (expected utility model) can better explain this shift in the American position.

Prospect theory is a cognitive psychological theory of decision-making under risk. It posits that actors evaluate outcomes with respect to deviations from a reference point than with respect to net asset levels, that their identification of that reference point is the key variable, and that they give more weight to losses than to comparable gains. The theory predicts that individuals are generally risk averse with respect to gains and risk acceptant with respect to losses.[3] A shift in the reference point can lead to a reversal of the actors' preferences among several outcomes. This hypthosized pattern of loss aversion and the importance of framing has received tentative confirmation in a series of laboratory experiments.[4] The shift in the American negotiating stance is consistent with many predictions of prospect theory including a reversal of preferences due to a change in reference point and the selection of risk averse options in the domain of gains and risk

acceptant options in the domain of losses. If Kaifu had presented Bush with a minimum access solution (which is what the U.S. had been prepared to accept at Brussels) the result would have been a disaster for either the entire American negotiating stance on agriculture in the Uruguay Round or for U.S.-Japan relations. The Bush Administration insisted on a full liberalization solution, knowing that such a solution would be unacceptable to Japan.

The first section of this article will briefly review the historical background of agricultural protection in postwar Japan, the constraints that various Japanese domestic actors place on agricultural negotiations at the international level, and how the rice issue became included on the agenda for the Uruguay Round. The next section will discuss two critical junctures in the negotiations: the collapse of the Brussels meeting in December 1990 and the Eagleburger Memorandum of June 1991. This will be followed by a discussion of what a rational choice model would lead one to predict about the American negotiating stance and why such a model does not fully explain the change in that stance. Finally, the last section will show that prospect theory provides a better explanation for the seemingly anomalous shift in the American negotiating stance on the opening of Japan's rice market.

AGRICULTURAL PROTECTION IN POSTWAR JAPAN

Before discussing why the rice liberalization issue became a source of contention in the Uruguay Round it would be helpful to discuss how Japanese domestic politics created and perpetuate

protectionist agricultural policies. These agricultural policies led the conflict between Japan and its principal trading partners. Various Japanese domestic actors, both in the state and society, decided Japan's preferences in world trade negotiations and placed constraints on Japanese leaders.

Japan has a long history of government intervention in the production and marketing of basic food stuffs, including rice, beginning in the 1920s'. [5]Sharp declines in average farm income throughout the 1950s' and the political influence of the farmer's cooperative (Noyko) led to calls for agricultural protection. [6]The over-representation of rural districts in postwar Japan made the ruling Liberal Democratic Party (LDP) dependent on the support of rural voters. This made Japanese elites particularly vulnerable to these demands for agricultural protection. The government responded by enacting the Basic Agricultural Law (ABL) of 1961, which sought to create equity between farm and non-farm incomes through structural adjustments.[7] The government also enacted an import ban on commodities that provided the largest percentage of farm income, including livestock products, fruits, vegetables and rice.[8] Any short falls in rice earnings for Japanese farmers (most of whom are part-time and cultivate small plots of land) are made up by a subsequent increase in government's purchase prices for rice.[9] This policy created an engine for rapid increases in rice prices.[10] In 1960 the producer price of rice was slightly over the import price. By the late 1970s' the producer price had risen to three or four times the world price.[11] Japanese policy makers came

to rely on increasing rice prices as a vehicle to maintain farm incomes at levels commensurate with urban incomes.

The rice import ban has had domestic and international consequences. Yujiro Hayami writes: "The same economic forces that have raised agricultural protection in Japan has increased foreign protest against it. The rapid shift in comparative advantage from agriculture to manufacturing has resulted in a surge of industrial exports from Japan: this has created severe industrial adjustment problems in the countries whose market have been penetrated by Japanese manufacturing products."[12] In the 1980s' Japan's agricultural protection became a source of conflict with its major trading partners, particularly the U.S. How agricultural protection, particularly Japan's rice import ban, became included on the Uruguay Round's agenda will be discussed below. By the mid 1980s' agricultural protectionism, particularly the rice ban and high domestic rice prices, produced deep cleavages in Japanese state and society. Certain domestic actors have benefitted from the continuation of these policies, while others have not. These actors can be divided into two groups: a status quo coalition and a market opening coalition.

<u>The Status Quo Coalition</u>:

The ruling Liberal Democratic Party (LDP), which is dependent on rural voters, has an interest in agricultural protectionism. The agricultural sector's influence is enhanced by the inclusion of agricultural interests in the Policy Research Council (PRC), the

party's policy-making body. Within the PRC, the agricultural "policy tribe" is the most influential.

The Recruit Scandal damaged the LDP's reputation among rural voters, resulting in the party's July 1989 defeat in elections for the House of Counselors. Stunned by the election results, the LDP attempted to stop the erosion of its support among rural voters. LDP leaders pledged that they would not allow even a "single grain of rice" to enter Japan.[13] Within the party, the barriers to agricultural liberalization and rice liberalization in particular, are both political and psychological. Many LDP politicians believe that their party would court disaster if it opened Japan's rice market.[14]

The Japanese Cabinet has traditionally opposed any liberalization of the rice market. "Japan proposed in the GATT negotiations in November 1989 that basic food stuffs should be exempt from import liberalization requirements, arguing that countries heavily reliant on food imports need to maintain self-sufficiency in basic food stuffs in the interests of food security."[15] For rice, the cabinet has interpreted "food security" to mean 100 percent self-sufficiency. Government officials have used this "food security" argument to justify the closed rice market and high domestic rice prices to both Japan's trading partners and Japanese consumers.

The Ministry of Agriculture, Forestry and Fisheries (MAFF) is the strongest governmental advocate of continued agricultural protection. MAFF derives its power from a mutually beneficial

client-patron relationship with the agricultural sector. Full liberalization of the rice market could drastically reduce the ministry's direct influence over the economy.

The opposition Social Democratic Party of Japan (SDPJ), the Kometio ("Clean Government" Party), the Democratic Socialist Party (DSP) and the Japan Communist Party (JCP), like the LDP, agree that Japan must not liberalize its rice market. They support agricultural protection to lure rural voters away from the ruling LDP. Nokyo, the national farmers' cooperative, is another strong opponent of rice liberalization. The organization, which functions as a semi-administrative arm of MAFF, would loss much of its income if the rice market were ever liberalized. Most farmers also support the rice import ban. Rice provides a source of income for the large number of small, part-time farmers. Liberalization would force many of these inefficient farmers to leave agriculture altogether. Finally, consumer organizations, support the rice import ban on the grounds of "food safety," despite that the fact the ban results in higher food prices.

<u>The Market Opening Coalition</u>:

Other actors in Japan are or at least perceive themselves to be disadvantaged by continued agricultural protectionism, particularly the rice import ban. The Ministry of International Trade and Industry (MITI), like the domestic manufacturers its represents, has begun to support rice liberalization. MITI and many in the business community do not want Japanese manufacturers'

access to markets abroad to be jeopardized by closed agricultural markets at home.[16] The Ministry of Finance (MOF) has long opposed protectionism because of the tremendous strains that agricultural subsidies place on the national budget. The Ministry of Foreign Affairs (MOFA) opposes protectionist policies because of the strain that they place on Japan's bilateral and multilateral relationships.[17] Although they lack an effective role in the policy process, some Japanese farmers and consumers oppose the rice import ban. Finally, some of Japan's national daily newspapers, have become vocal supporters of opening the rice market.[18]

The elimination of Japan's rice import ban would require the approval of both houses of the Japanese Diet (parliament). Neither the LDP nor any of the opposition parties would support the complete opening of the domestic rice. The members of the market-opening coalition do not have the power to eliminate the import ban. MOFA, MOF and MITI have limited influence in setting national agricultural policy. Given the preferences of various Japanese domestic actors, Japanese trade negotiators could not agree to the complete liberalization of the rice market. With the preferences of these Japanese domestic actors in mind, let us turn to how the rice issue became included on the Uruguay Round's agenda.

CONFLICT AT THE URUGUAY ROUND:

The idea for the next round of world trade negotiations under the auspices of the GATT emerged from a 1982 meeting between President Ronald Reagan and Prime Minister Yoshiro Nakasone. Japan

and the United States jointly sponsored the call for a new GATT round at the 1985 G-7 summit in Bonn. At a 1984 meeting of GATT members in Geneva the Japanese representatives said that their agenda for the new round included: the improvement of the trade prospects for LDC's; the reversal of the erosion of discipline within the GATT system, and; the reform of the GATT to improve its ability to cope with the trade challenges of the 1980s' and 1990s', including strengthening its disputes settlement procedures and widening LDC participation.[19]

One of Japan's principal objectives was to use the negotiating procedures of the GATT to place restraints on the American tendency to deal with industrial disputes unilaterally. The Japanese lacked incentive to include agriculture in the bargaining, since doing so would call into question their "food security" doctrine. Other GATT members had different priorities. At the opening session of the new round at Punta del Este, Uruguay in 1986, the United States, with the support of the newly formed Cairns Group of agricultural exporters, placed agriculture on the round's agenda (along with fourteen other issue areas).

Japan's rice import ban clearly violates existing GATT rules. "Without firm footing in either GATT legality or exceptionalism, the Japanese government has augmented its international defense of the food security position with more oblique economic and political rationales, some more tenable than others."[20] Japanese officials emphasized their recent record of farm market opening measures (eg, beef and citrus) as evidence of their unilateral contribution to

world agricultural trade expansion and the need for Japan to maintain self-sufficiency in rice. Japan unsuccessfully tried to incorporate the "food security" doctrine as a GATT regime principle.

Putting Rice on the Bargaining Table:

The American farm sector placed the rice issue on the Uruguay Round's agenda. In September 1986 the U.S. Rice Millers' Association (RMA) filed an "old" section 301 complaint against Japan with the Office of the U.S. Trade Representative.[21] Neither the American nor the Japanese governments wanted to discuss the rice issue in a bilateral context. Trade Representative Clayton Yeutter rejected the RMA petition on the grounds that the rice issue should be resolved in the Uruguay Round, rather than in bilateral negotiations. "Yeutter, however, did set a one year deadline for the Japanese to be forthcoming on the issue."[22]

In the following months Japan did make some concession on other products, including the importation of American beef and citrus products, in the hopes that such actions would cause the U.S. to ignore the rice issue. The Reagan Administration had a different viewpoint. "In order to get concessions from Japan on beef, citrus, and processed products, U.S. trade negotiators had been forced to provide assurances that Japan would not be placed under comparable bilateral pressure any time some to open up [sic] its rice market."[23]

In September 1988, just two months before the presidential election, the RMA filed a petition under section "super 301" of the 1988 Trade Act with the U.S. Trade Representative. The petition requested a modest ten percent opening of the Japanese rice market over the next four years. "The rice millers erroneously assumed that the passage of the tough new U.S. trade law and its 'super 301' provision for attacking bilateral market access problems, plus the heightened political sensitivity of farm and trade issues in the 1988 presidential campaign, would oblige the administration to launch an attack on Japanese rice policy.[24] Yeutter came under intense congressional pressure to take action under "super 301" to force Japan to open its rice market.[25] Again, Yeutter rejected the RAM's petition and reiterated the administration's wish to resolve the rice issue in the Uruguay Round negotiations, than in bilateral talks.

U.S.-_Japan Multilateral and Bilateral Roles in the Rice Issue:

Japanese leaders had hoped that little attention would be devoted to the rice issue since the principal source of disagreement over agricultural trade in the Uruguay Round was between the U.S. and the EC on the issue of farm subsidies. To them, since the U.S.-EC dispute remained to be resolved, there was little to fear with respect to the rice issue. The American trade negotiators had a completely different set of motivations.

The U.S. had hoped to win Japanese concessions on rice liberalization was a way to isolate, and thus bring greater

pressure to bear on the EC to liberalize its own agricultural markets.[26] The Reagan and later the Bush Administration linked Japanese rice concessions, to EC agricultural concessions and general GATT agricultural reforms, and both areas to the successful completion of the Uruguay Round. Figure 1 illustrates these strategic linkages from the American viewpoint.

(Figure 1 about here)

Rapkin observes that the U.S.'s role as demanduer in the Uruguay Round's agricultural negotiations derives from two mutually reinforcing motivations. First, the U.S. wants to use liberalization within GATT to arrest or reverse the loss of world market share to the EC's heavily subsidized agricultural exports. Second, both the Reagan and Bush Administrations hoped to use liberalization to trim the mounting budgetary costs of their agricultural support policies, including the growth of American export subsidies used to combat EC agricultural subsidies.[27]

To get these objectives, American trade negotiators introduced the so-called "zero option" at the July 1987 Uruguay Round meeting in Geneva. Their proposal called for the complete abolition of production and trade-distorting agricultural subsidies and non-tariff barriers. Non-tariff barriers were to be eliminated through "tariffication" - the initial conversion to tariffs of non-tariff barriers, followed by the reduction of tariffs to "zero" within ten years. Not surprisingly, the American "zero option" did not receive an enthusiastic reception from the EC and Japan.

Rapkin notes that the U.S. also played two overlapping roles vis a viz Japan on the rice issue. First, the U.S. cast itself in the role of "good cop" by acceding to Japan's wish to handle the rice issue within the multilateral context of the Uruguay Round. The U.S. also cast itself in the role of "bad cop" by hinting at the possibility of bilateral pressure if Japanese concessions were not forthcoming. "For instance, Under Secretary of Agriculture Richard Crowder's warning in Tokyo of 'all kinds of bilateral action (if Japan fails to make concessions on rice in the Uruguay Round) makes explicit the sense in which the threat of eventual ('super') 301 action on rice has loomed over the whole negotiating process."[28] U.S. Trade Representative Carla Hills warned that Japan would be partially responsible for the failure of the entire Uruguay Round "[I]f Japan finds itself unable to negotiate on agriculture, which includes rice."[29] At times Bush Administration officials cloaked their "bad cop" role in larger multilateral concerns and played upon Japanese fears of international isolation. For example, Hills stated: "If the second largest industrialized market in the world, a market spreading the rest of the world with manufactured goods, but refusing to take the agricultural output of poor nations that having nothing to sell, you can be sure that the poor nations will not stay at the bargaining table."[30]

There were still some factors that placed limits on the effectiveness of American pressure. First, while the U.S. and Japan may disagree on agricultural trade, both countries have an interest in the general success of the Uruguay Round. Second, "another

consideration is the fact that Japan's large and growing market for agricultural products provides Japan with countervailing leverage."[31] Third, there has at least the possibility that if American pressure on the rice issue became too intense Japan might retaliate in an unrelated area that is of concern to the U.S. For example, a group of Diet representatives warned then-Secretary of Agriculture Yeutter that if the U.S. chose to deal with the rice issue in a bilateral format Japan might decrease its purchase of U.S. treasury bills and its economic aid to developing countries.[32]With these events and factors in mind, let us examine the two critical junctures in the Uruguay Round negotiations: the collapse of the Brussels talks in December 1990 and the Eagleburger Memorandum of June 1991.

Collapse in Brussels:

The Uruguay Round was scheduled to conclude at a meeting of GATT members in Brussels, Belgium in December 1990. While agreements had not yet been concluded in the other fourteen issue areas, the agricultural talks proved to be the most contentious.

Reductions in internal agricultural supports, imports barriers and export subsidies were the items on the table. Table 1 summarizes the negotiating positions of the U.S. the EC, Japan, and a last minute compromise proposal submitted by the chair of the GATT's agriculture working committee, Swedish Agriculture Minister Mats Hellstrom. (Table 1 about here)

By this stage in the negotiations the U.S. had softened is

TABLE 1: COMPARISON OF THE NEGOTIATING POSITIONS AT BRUSSELS (December 1990)

	Internal Support Reductions	Internal Barrier Reductions	Export Subsidy Reductions
U.S. Proposal	75% (1990-2000)	75% (1990-2000)	90% (1990-2000)
EC Proposal	30% (1986-1996)	conditional introduction of tarrifs no targets pledged rebalancing	no concessions offered
Japan's Proposal	30% (1986-1996)	no opening of rice market	elimination in phases
Hellstrom Proposal	30% (1990-1995)	30% (1990-1995) 5% compulsory minimun access	30% (1990-1995)

Adapted from David P. Rapkin, "Rice Liberalization and Japan's Role in Uruguay Round: A Two-Level Game Approach." Paper presented at the annual meeting of the International Studies Association, Atlanta, Georgia, 1992.

"zero option" position. American trade negotiators no longer demanded the complete end of all agricultural supports and protection, although the targets that they proposed were still considerably higher than the EC and Japan were willing to entertain.[33] The U.S. insisted on a seventy five percent reduction in both internal supports and important barriers, with a ninety percent reduction in export subsidies. These reductions were to take place over a ten year period beginning in 1990. In other words, at this point the U.S. was willing to accept a minimum access solution to foreign agricultural markets, including the Japanese domestic rice market.

The EC refused to offer any concessions on the reduction of export subsidies and would only agree to a thirty percent reduction in internal supports over the course of ten years, retroactive to 1986. Using 1986 as a "base year" was completely unacceptable to the U.S. because in that year world farm prices had been particularly low, therefore subsidies had been particularly high.[34] Also, the EC insisted upon "rebalancing" - a provision by which some protection or support currently at low levels would be allowed to rise to create a balance with those that are reduced from considerably higher levels.[35]

The Japanese proposal also conceded very little. Japanese negotiators were willing to agree to a thirty percent reduction in internal supports for various products (including rice). Their proposal, like the EC's, would be retroactive to 1986. "While calling for a phased elimination of export subsidies, Japan, which

does not subsidize its scant agricultural exports, made no specific demands on this count - probably holding this card in abeyance until it could be used to bargain down any concessions on rice it might be forced to make should the U.S. and the EC reconcile their differences."[36] MAFF Minister Tomio Yamamoto and other Japanese trade officials still refused to make any concessions on the rice issue, citing the "food security" doctrine.[37]

The last minute compromise "Hellstrom" proposal called for thirty percent reductions in internal supports, import barriers and export subsidies over the next five years. The U.S. delegation supposedly considered this proposal, but in the end neither endorsed nor rejected it.[38] The compromise "Hellstrom" proposal caught the Japanese delegation, which had hoped the rice issue would not be discussed at all, completely off guard. If the proposal had been included in a new set of GATT rules, Japan would have been forced to accept a five percent (of domestic consumption) minimum access for rice imports, which would have amounted to the importation of 500,000 tons of rice each year.[39] The Japanese refusal to make any concessions on rice amounted to a rejection of the best deal they could have received at the Uruguay Round. The Japanese delegation neither formally rejected nor endorsed the Hellstrom proposal, but instead sat on the sidelines of the American-EC dispute.[40] The EC delegation refused to make any further concessions and the U.S. delegation walked out of the talks on December 10.

After the collapse of the Brussels talks, many in the Japanese

government and the ruling LDP began to recognize the need for some concessions on the rice issue to secure a successful completion of the entire Uruguay Round. MITI Minister Kabun Muto publicly said that his ministry supported a partial opening of the rice market; remarks that ran awry of MAFF and led to his replacement.[41] Foreign Minister Taro Nakayama cast the issue in terms of the need to complete the GATT round to counter the trend toward European and North American regional trading blocs. LDP Executive Council chair Takeo Niskioka, who came to favor a partial opening before the July G-7 summit in London, argued: "If Japan has to compromise (on the rice issue) anyway, it should get the upper hand at the Uruguay Round negotiations by making concessions voluntarily and at the earliest possible date."[42] MAFF officials opposed any attempt to deal with the rice issue bilaterally during the winter and spring of 1991.[43]

The Eagleburger Memorandum (June 1991):

In the months following the collapse of the Brussels talks, Japan's non-negotiating stance drew harsh criticism abroad. According to a report by the Japan Economic Institute: "[C]ommentators on three continents feel that Japan, at best, had earned a grade of 'incomplete' on perhaps even failed in an early test of its willingness to play a world leadership role."[44] Some in the Japanese media linked Japan's passive stance in the GATT agricultural talks to the government's late and reactive response to the Persian Gulf Crisis. Privately some government and LDP

officials said the Hellstrom proposal would have been better that an American tariffication proposal, since the latter would require the reduction of tariffs later.[45]

In the spring and early summer some government, LDP and private sector officials hinted that Japan might be ready to agree to a partial (quota based) opening of its rice market.[46] In late May Prime Minister Kaifu, LDP boss Shin Kenemaru, Chief Cabinet Secretary Misoji Sakamoto, former Prime Minister and LDP faction leader Noburo Takeshita, and LDP Secretary General Keizo Obuchi made a series of pro-market opening statements.[47] Just before a scheduled meeting between MAFF Minister Kondo and U.S. Secretary of Agriculture Edward Madigan in Denmark an unnamed MAFF official hinted to the press that Japan was prepared for a partial rice market opening.[48] When questioned about the validity of the statement, Kondo said that it was too early to make any political decisions on rice.[49]

In early June Kaifu was scheduled to meet with President Bush at Kennebunkport, Maine, a few weeks before the G-7 summit in London. Topics on the agenda included aid to the Soviet Union, the situation on the Korean peninsula, and the lack of progress in the Uruguay Round. There was a wide speculation that Kaifu might deliver a "gift" of partial rice market opening during the meeting with Bush.[50]

Just before Kaifu's visit the U.S. intervened to thwart this "gift" of a partial rice market opening. Deputy Secretary of State Lawrence Eagleburger sent a memorandum to the American Embassy in

Tokyo, the contents of which were promptly made known to both the Japanese government and the press. The memorandum reiterated the American insistence on tariffication and said that the Bush Administration would regard a three, five or even a ten percent opening of the Japanese rice market as insufficient.

Why did the United States, which appeared to have been prepared to accept a partial opening of the Japanese rice market at Brussels, harden its negotiating stance just days before Kaifu's visit? The following sections present two competing theoretical explanations for this seemingly anomalous shift in the American negotiating position.

A RATIONAL CHOICE EXPLANATION:

Rational choice or expected utility models are powerful tools for examining microeconomic and political decision making. Rational choice models have been defended on the grounds that people are generally effective in the pursuit of their objectives and that the axioms of expected utility theory are intuitively compelling.[51] Bruce Bueno de Mesquita notes that expected utility models' rationality assumption means: "[a] policy maker will never chose an action that is expected to bring less value - or utility - than some alternative policy . . . Being rational simply implies that the decision maker uses a maximizing strategy in calculating how best to achieve his goals. The rationality assumption tells us nothing about how actors form their preferences, but rather shows how actors behave, given their preferences."[52] Expected utility

theory views choice as a maximization process. Neoclassical economics (from which rational choice originated), in its treatment of rationality, is silent about the content of goals and values, and postulates global consistency of behavior. It also postulates "one world" - the notion that behavior is objectively rational in relation to its total environment.[53]

Expected utility theory has four substantive assumptions: cancellation, transivity, dominance, and invariance.[54] Cancellation refers to the elimination of any state of the world that yields the same outcome despite one's choice. Only one state of the world will actually be realized, which makes it reasonable to evaluate the outcomes separately for each state.[55] Choice between outcomes should therefore only depend on states in which such choices yield different outcomes. The transitivity of preferences assumption is satisfied if it is possible to assign to an option a value that does not depend on other available outcomes. Transitivity is likely to hold when options are evaluated separately, but not when the consequence of an option depends on the alternative to which it is compared. The dominance assumption holds that if one option is better than another in one state and at least as good in all other states, the dominant option should be chosen. Finally, the invariance assumption holds that different representations of the same choice problem should yield the same preferences. That is, the preference between options should be independent of the description of those options.[56] Invariance and dominance are deemed essential to rational choice models.

An expected utility model of the U.S. negotiating stance with respect to the Japanese rice market would represent the choice problem facing the Bush Administration as follows.

$$Pf \times Uf > Pm \times Um$$

Pf: the probability of full liberalization of Japan's rice market

Uf: the utility (for the U.S.) of full liberalization

Pm: the probability of a minimum access solution

Um: the utility of a minimum access solution

An expected utility model would argue that the United States needed a full liberalization of the Japanese rice market to isolate and thus pressure the EC into reducing its own trade distorting agricultural policies. Japanese and EC concession would lead to a successful completion (for the U.S.) of the agricultural negotiations and of the entire Uruguay Round. In the minds of American officials the agricultural negotiations with Japan were linked to the agricultural negotiations with the EC and the general success of the Uruguay Round. A minimum access solution to the rice issue would have a lower utility for the U.S. than would a full liberalization solution, though the probability of obtaining the former was much greater than the probability of obtaining the latter. At Brussels Japanese trade official did not explicitly accept, nor did they reject the Hellstrom proposal, which would have required a partial liberalization of the Japanese rice market. In the spring of 1991 Japanese leaders publicly said that they

would be willing to accept a minimum access solution. The decision to thwart Kaifu's "gift" of a minimum access solution could be seen as an attempt by the Bush Administration to force Japan back to the bargaining table in the hopes that Japanese trade officials would eventually concede to a full liberalization solution.

If a full liberalization solution would have yielded a higher expected utility for the U.S. throughout Uruguay Round negotiations, then why were American trade negotiators prepared to accept a minimum access solution at the last minute of the Brussels' talks? At that point it would appear for the U.S. the utility of a minimum access solution was greater than that of a full liberalization solution. From the December 1990 to June 1991 the U.S. negotiating stance shifted from an option that offered a higher utility (full liberalization) to one that offered a lower utility (U.S.compromise proposal at Brussels; minimum access) and then back to one that offered a higher utility (as expressed in the Eagleburger Memorandum). This appears puzzling from a rational choice standpoint. The American side knew that a full liberalization solution would be unacceptable to the Japanese throughout negotiating process. The only new information that the U.S. received in the months between the two crucial junctures was that the Prime Minister and other senior LDP leaders would be willing to entertain a minimum access solution - a proposal that American trade negotiators had been prepared to accept at Brussels.

Throughout the agricultural negotiations at the Uruguay Round the United States American faced a single choice problem: both the

rice dispute with Japan and the farm subsidies dispute with the EC had to be resolved to complete the talks successfully. Yet, the Bush Administration appears to have viewed the Brussels talks and Kaifu's proposed "gift" as two different choice problems. At the last minute of the Brussels talks American trade negotiators considered accepting any deal that they could get with respect to the rice issue. By the summer of 1991 the administration realized that a minimum access solution to the rice issue would have ramifications for the farm subsidy dispute with the EC. This shift in the American negotiating position seems to violate the invariance assumption of rational choice. If the Bush Administration linked the outcome of the rice dispute with Japan with the outcome of the other agricultural disputes with the EC then the administration should have selected the outcome that offered the highest expected utility at <u>both</u> junctures in the Uruguay Round negotiations. To account for the shift in the American negotiating stance one must employ a different model.

A PROSPECT THEORY EXPLANATION:

Prospect theory offers an alternative model of decision-making under risk. In sum, "the theory predicts that individuals evaluate outcomes with respect to deviations from a reference point rather than with respect to net asset levels, that their identification of this reference point is a critical variable, [and] that they give more weight to losses than to comparable gains . . . "[57] Prospect theory predicts that people are generally risk averse with

respect to gains and (surprisingly) risk acceptant with respect to losses. The importance of loss aversion and how individuals frame decision problems have received tentative confirmation in a series of diverse and robust tests using large numbers of subjects.

Prospect theory has two phases: a framing and editing phase and an evaluation phase. During the framing/editing phase the individual does a preliminary analysis of the decision problem, which in turn "frames" the various options, contingencies and possible outcomes.[58] In other words, people first chose a reference point (or aspiration level) and then assess the gains and losses of the various options/prospects from that point. During the editing phase the individual evaluates the edited options and selects preferred one. As Janice Gross Stein notes:

> Outcomes that are above the reference point are treated as gains while those outcomes that fall below are considered losses. Because people are generally averse to loss, whether an outcome is treated as a gain or a loss has a significant impact on the choice they make. When an identical outcome is reframed as a loss as opposed to a gain, people reverse their preferences and make a different choice.[59]

Stein provides a good example of the impact of the reference point on the assessment of gains and losses.[60] An author had expected to write ten pages of an article in one day but, instead wrote only five. She is more concerned with the "loss" of five pages than the "gain" of five pages in the total length of the article to be completed. The author's reference point was her expectation. Instead of considering how much she had written (net gain), the author estimates loss (here five pages) from the

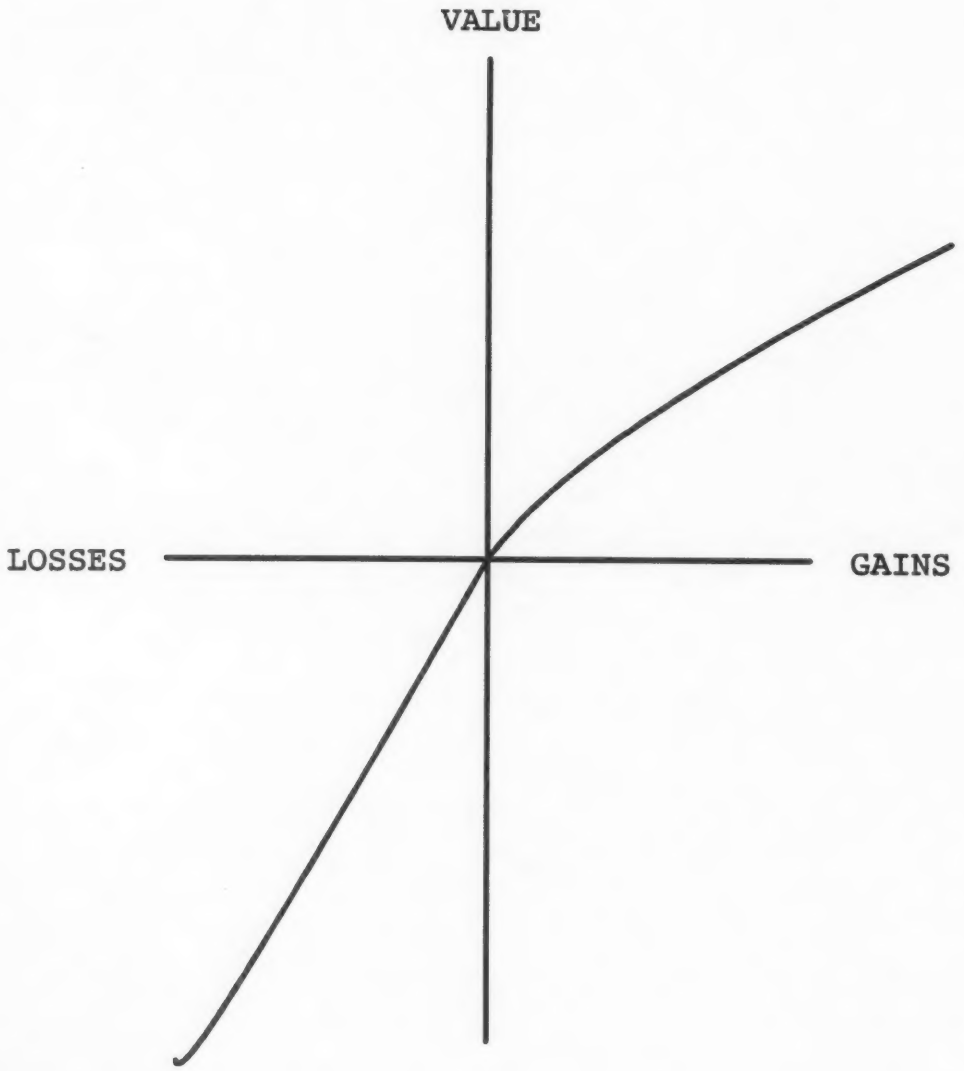
reference point she had chosen (the expectation of writing ten pages in a day). She did not consider her total assets (the five pages she actually wrote) but instead the deviation from her reference point.

Quattrone and Tversky observe that expected utility theory and prospect theory yield very different predictions. "The classical theory predicts risk aversion independent of the reference point, whereas prospect theory predicts risk aversion in the domain of gains and risk seeking in the domain of losses (except small probabilities)."[61] Also, shifts in the reference point will have predictable effects on individual's preferences. This violates the invariance assumption of expected utility theory. If a decision problem is framed as a gain (ie, the problem is a matter of achieving a gain) people tend to chose more risk averse options. Conversely, if it is framed as a loss (ie, the problem is a matter of averting a loss) people tend to chose more risk acceptant options. Levy notes, that the marginal utility of gains decreases faster than the marginal disutility of losses.[62] Figure 2 illustrates a S-shaped value function:

(Figure 2 about here)

Finally, prospect theory posits that people tend to outweigh outcomes that are certain as opposed to those that are merely probable. This certainty effect often magnifies risk aversion with respect to gains and risk seeking with respect to losses, unless the probabilities involved are very small. Individuals will chose

FIGURE 2: HYPOTHETICAL VALUE FUNCTION



a "sure" gain rather than take a chance with a "larger gain" that is probable, even if the larger gain has a higher expected utility.[63] Individuals also take a chance on a larger loss that is merely probable rather than face a loss that is certain, even when the certain option would minimize expected loss.[64]

Although cognitive psychologists developed prospect theory in recent years several political scientists had applied it to examine decision-making in both domestic politics and international relations.[65] There are, still, some potential problems with the theory's application to political contexts that should be considered. First, there is no formal theory of framing that identifies the reference point decision makers are likely to chose when faced by a particular decision problem.[66] Unlike laboratory experiments where the researcher sets the frame, a political scientist must rely on empirical data regarding the aspirations and expectations of actors. In the present case, such data includes press accounts of how the U.S. perceived the problem and personal interviews with Bush Administration official who were either involved in the negotiations or who reported to those who were.[67] Second, prospect theory is a theory of individual decision making. In international relations decisions are often made in group settings. But, here the problem is somewhat mitigated by the fact that the notification that the U.S. rejected a minimum access solution came from a single official: Deputy Secretary of State Eagleburger. There appears to have been little disagreement within the administration concerning the Brussels talks and Kaifu's

proposed "gift" of a minimum access solution. The Bush Administration chose a single option and Eagleburger executed it. Third, some may object to the application of a theory developed in one discipline to eluminate problems in another. Still as Barbara Farnham notes, one came make the same objection about the application of expected utility theory. Fourth, there are problems associated with the application of a theory developed in a highly structured environment to a political setting. Again, this problem is not confined to the use of prospect theory. Farnham comments: "The fact that differences between the laboratory and the political arena clearly do matter, however, does not necessarily mean that theories about decision-making developed in experimentally derived settings should be avoided when explanations are sought for behavior in the vastly more complex environment characterizing the political context. This, after all, is where many of the most interesting problems are found."[68] Finally, Levy observes that there is the extremely difficult problem of defining what we mean when we say that one prospect is riskier than another and learning how decision makers actually compare relative risks among options.[69] In multilateral trade negotiations, the definition of "risk" and how decision makers compare relative risk is a much easier task than in other international relations context, such as war and deterrence.

To apply prospect theory to the present case, one must assume that the Bush Administration had an interest in reaching some agreement on the rice issue and concluding the Uruguay Round. In

multilateral trade negotiation, "risk acceptant" means adopting a negotiating position at the bargaining table knowing that the odds of one's bargaining partners accepting it are small. This also includes the selection of an option in the knowledge that one's bargaining partners could not win domestic ratification, even if a tentative agreement were reached at the bargaining table.[70] A "risk averse" option involves the adoption of a negotiating stance that one knows the other side could agree to, even if such a stance will bring a lower expected value than other possible options.

To operationalize the terms "risk averse" and "risk acceptant" in a trade negotiation the researcher must show that one side's trade negotiators were aware of the preferences of and the domestic constraints facing the other side's trade negotiators. Here, American officials were very much aware that while a full liberalization scenario was not acceptable to Japan. They were also aware that the Japanese would agree to a minimum access solution in the spring and early summer of 1991.

At the last minute of the December 1990 Brussels talks the reference point or aspiration level for the Bush Administration was the expectation of reaching any agreement on the rice issue and then isolating the EC with respect to farm subsidies and import barriers. Recall that at this point American trade negotiators had dropped their insistence on the so-called "zero option." The actions of the American negotiators suggest they did link the outcome of the rice issue with the greater problem of EC agricultural liberalization and the completion of the Uruguay

Round. By June 1991 the reference point for the administration had shifted to a full liberalization of the Japanese rice market. This shift in the reference point might be explained by the fact that officials began again to see the linkages between the rice issue, the greater problem of EC agricultural liberalization, and the successful completion of the Uruguay Round.[71] The pro-partial opening statements of Kaifu, Nakayama, Kanemaru, and other prominent Japanese leaders in May and June, prompted this shift in the American reference point.

In June 1991 the Bush Administration was in the domain of losses with respect to the rice issue and the agricultural talks as a whole. The decision to intervene unilaterally to thwart Kaifu's attempt to resolve the rice dispute is consistent with the predictions of prospect theory. The administration faced a loss if Kaifu had been allowed to offer his minimum access "gift" to Bush in July. The acceptance of the "gift" would have been the risk adverse strategy for the United States. Such a strategy would have resolved the U.S.-Japan rice dispute, but it would have also forced the Americans to make concessions to the EC with respect to the ongoing farm subsidy dispute. The Americans, in making a bilateral deal with one bargaining partner, would have been forced to make concessions to the other. Since the administration's aspiration (at this time) was to get the Japanese and EC to eliminate all trade distorting policies such a strategy would have had a lower expected value for the United States. Yet, had the administration adopted this strategy, it would have resolved an ongoing dispute with one

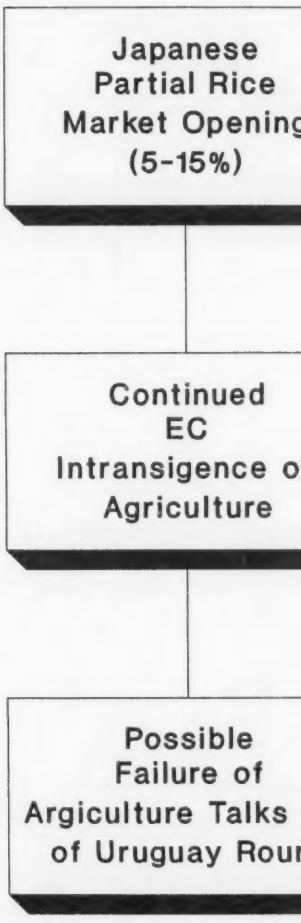
of its trading partners and could have focussed its full attention on the other.

(Figure 3 about here)

If Bush had accepted the Prime Minister's gift the President would have undermined the entire American negotiating strategy on agriculture at the Uruguay Round. An American-Japanese bilateral deal would have caused the members of the EC (particularly France) to insist on smaller or no reductions in internal and export subsidies. The EC would have also remained intransigent on the question of import barrier reductions. This option would have produced smaller losses in that while American rice producers would have gained partial access to the Japanese rice market, the administration wanted a full access solution. In addition, the EC would have remained intransigent under this scenario. On the other hand, if Bush had explicitly rejected Kaifu's gift the result would have been a disaster for U.S.-Japan relations. Kaifu would have been embarrassed and his power base within the LDP and the Diet (which was already weak due to his government's handling of the Persian Gulf Crisis and War) would have been further undermined. In either scenario, if Kaifu had been allowed to offer the "gift" the result would have been a disaster for the United States.[72]

In sending the Eagleburger Memorandum, the administration adopted a "risk acceptant" strategy. The memorandum clearly signalled that the administration would not handle the rice issue in bilateral negotiations, since doing so would undermine the

Figure 3: U.S. Risk Av



Averse Strategy

e
ning

d

e on
e

f
ks and
Round

entire American negotiating stance at the Uruguay Round.[73]

(Figure 4 about here)

By saying that it would regard a three, five or even a ten percent opening of the Japanese rice market as insufficient, the administration risked certain Japanese rejection of a full liberalization option to preserve the general American negotiating strategy on agriculture at the Uruguay Round. On the other hand, at least the EC and other GATT members could not use an American-Japanese minimum access deal as a precedent to insist on partial liberalization or continued protection for their agricultural markets. American unilateral action to thwart Kaifu's "gift" might have harmed U.S.-Japan relations. The Eagleburger Memorandum did not increase the probability that the EC would be willing to make further agricultural concessions at future Uruguay Round meetings. By insisting on full liberalization as a way to resolve the rice dispute the Bush Administration risked the possibility that neither Japan nor the EC would make further concessions in the agricultural talks.

In terms of persuading Japan to liberalize its rice market the Eagleburger Memorandum was a failure. Just after the memorandum became public Chief Cabinet Secretary Sakamoto insisted that Japan would not agree to a partial liberalization solution and that rice and other agricultural issues should be handled in the Uruguay Round, not bilaterally.[74] The Kaifu and later Miyazawa governments reverted to their traditional reactive stance on the rice issue.

assumption. Bush Administration officials began to see the resolution of the rice issue had implications for the ongoing agricultural dispute with the European Community and the general success of the Uruguay Round. This reframing of the rice issue caused a reversal of American preferences that cannot be explained given the substantive assumptions of rational choice.

The shift in the American negotiating position is consistent with many predictions of prospect theory including a reversal of preferences due to a change in the reference point, and the tendency for individuals to select risk averse options in the domain of gains and risk acceptant options in the domain of losses. From the perspective of prospect theory, the shift in the American negotiating stance does not seem anomalous. In sending the Eagleburger Memorandum, the Bush Administration chose a gamble with smaller but certain losses. If Kaifu had been allowed to present the "gift" of partial rice market opening the result would have been a certain disaster for either the entire American negotiating stance on agriculture at the Uruguay Round or for U.S.-Japan relations. Had the Bush Administration accepted the "gift" it would have received partial access to the Japanese rice market but the EC would have remained intransigent on the elimination of farm subsidies. The U.S. would have gained over the status quo, but such a solution would have fallen short of the American reference point. If the U.S. had rejected the "gift" the status quo would have been preserved, but relations with Japan would have been strained. By thwarting Kaifu's move the U.S. risked Japanese rejection of a full

liberalization solution to the rice issue to preserve its total negotiating stance at the Uruguay Round. The chosen strategy did not increase the chances that the EC would make further concessions at the bargaining table. Finally, this paper has sought to build upon the growing number of works that have applied prospect theory to problems in international relations. The paper offered definitions for "risk averse" and "risk acceptant" options in international trade negotiations. Both definitions require that one sides negotiators be aware of the preferences and constraints placed on their opposite numbers by domestic politics. Here American officials knew that a full liberalization solution would be unacceptable to the Japanese, given the repeatedly stated preferences of various Japanese domestic actors. The pro-partial opening statements of Japanese leaders in the spring of 1990 led to a change in the American reference point. Although American officials had been prepared to accept a minimum access solution at Brussels, the pro-partial opening statements of Japanese leaders caused the Bush Administration to remember that the outcome of the rice dispute was linked with the ongoing farm subsidies talks with the EC and the successful completion of the Uruguay Round. This study suggests that in international trade negotiations knowledge of the other side's preferences and motivations might trigger a change of frame. The attempt to apply prospect theory to this case not only explains an anomalous shift in the American stance on the liberalization of Japan's rice market, but also suggest a possible direction for advancing the theory itself.

70. See Robert D. Putnam, "Diplomacy and Domestic Politics: The Logic of Two-Level Games," International Organization. 42 (1988), pp. 427-460.

71. To date very little work has been done on the source of frames or the causes of frame change in real life situations. Several scholars have suggest various sources of frame including affect (Farnham, 1992; Cusimano, 1993), and analogical reasoning (Richardson, 1992). I am suggesting that information regarding a previously ignored portion of the decision problem might trigger a change in frame. In this case, the pro-minimum access solution statements made by Kaifu and other Japanese leaders might have caused Bush Administration officials to remember that the outcome of the rice dispute was linked to the talks with the EC and the overall success of the Uruguay Round. American officials seem to have forgotten this fact in Brussels.

"...I will do what I have to do to be reelected."

--George Bush, December 23, 1991[1]

With this statement, remarkable in its candor if not in its sentiment, George Bush set the tone for his reelection campaign. However, the meaning of this Machiavellian-sounding statement is unclear. One interpretation of this statement is that President Bush is expressing an intent to draw on all available resources related to the office of the president which might benefit his reelection campaign. If so, President Bush is neither the first nor the last president to use the presidency to his electoral advantage.

Since 1956, seven out of eight first-term presidents have sought to retain their office for another four years.[2] Interestingly, however, research on the subject of presidential campaigns tends to treat these events solely as electoral phenomena (e.g. assessing the electoral process, campaign strategies or structure), rather than examining the institutional issues that arise when presidents seek reelection. That is, how does the quest for reelection alter the behavior of the president and thus the institution of the presidency? Or, how does this external event which requires substantial presidential time and resources affect the president's capacity to govern? Addressing both of these questions, however, would produce several papers, so I have chosen to focus on behavior associated with presidents as candidates.[3] More specifically, I will adopt a theoretical construct as a means of explaining aspects of presidential behavior during a reelection campaign.

Even a casual observer can see that the reelection campaign alters the behavior of incumbent presidents as they engage in campaign speeches, debates, fundraising and increasing domestic travel. Recognizing that such changes occur as a result of the president's pursuit of reelection, it is worthwhile to study this phenomenon in more

---

[1]Devroy, Ann, "New Hampshire Awaits Latest Edition of Candidate Bush," The Washington Post, January 15, 1992, p. A1. Ann Devroy is quoting a statement made by President Bush during an interview with David Frost.

[2]Note that President Kennedy was in fact intending to seek reelection had he not been assassinated. Thus it might be fair to say that President Johnson in 1968 was the only president in the past 36 years who intentionally did not run for reelection. It is also important to point out that the cases of Johnson in 1964 and Ford in 1976 are cases in which presidents were actually seeking **election**, not reelection, because they were not initially elected to office (both were vice-presidents who served the remainder of their predecessors' term in office).

[3]I have addressed these issues in a manuscript entitled, "Presidents, Politics and the Pursuit of Reelection," which is currently under review. Thus, much of the research conducted for this project is utilized in this paper. In terms of research sources, I conducted over fifty interviews with former White House staff and national party staff members, examined documents from presidential libraries and relied on secondary sources and periodicals related to this topic.

theoretical terms. This paper adopts the principal-agent model as a theoretical means of explaining various aspects of presidential behavior which occur during a reelection year. The principal-agent model, an economic model often used to describe business relations, can also be used in the study of politics by conceptualizing the citizenry as the principal and the elected official as the agent.[4] According to Terry Moe, "Democratic politics is easily viewed in principal-agent terms. Citizens are principals, politicians are their agents."[5] This paper begins by providing an overview of the model's principal features. It is then followed by an explanation of its application to the study of presidents as candidates and a discussion of its contributions to the study of the American presidency.

I. Background

Political scientist Terry Moe provides a concise description of principal-agent theory:

> The principal-agent model is an analytic expression of the agency relationship, in which one party, the principal, considers entering into a contractual agreement with another, the agent, in the expectation that the agent will subsequently choose actions that produce outcomes desired by the principal.[6]

Ultimately, this model seeks to explain why organizations (or those involved in a contractual relationship) behave as they do. While this model is typically applied to studies of corporations or firms, conceptualizing the manager as the principal and the employee as the agent, one can also apply it to presidential behavior by conceptualizing the citizenry as the principal and the president as the agent. The model assumes that the citizenry select the presidential candidate (agent) whom it believes will choose actions that will produce outcomes the citizenry desires. In a sense, the citizenry and the president have entered into a contractual agreement in hopes that the agent (president) will produce outcomes desired by his principal (electorate). The theory also assumes that seeds of conflict are inherent in this arrangement. The agent, as a self-interested and rational actor, will sometimes act in ways which are to his (the agent's) benefit; ways which will not always bring benefit to the principal. The self-interested agent will work to maximize his self-interest, and, if detected, such behavior will create a conflict between the principal and the agent. Even if such behavior is not detected, so that no overt conflict arises, the theory suggests that self-interested behavior will reduce the agent's effectiveness as a tool for achieving the principal's objectives.

The principal-agent model possesses three major elements. The first is that a hierarchical relationship must exist between the two parties, that is, it must be understood that the agent's proper obligation is to work in his principal's interest. Second, the

---

[4]Moe, Terry, "The New Economics of Organization," in the American Journal of Political Science, 28:4, 1984, p.739.

[5]Id.,p.765.

[6]Ibid.

principal and agent must occasionally have divergent individual interests. And third, the agent must have an informational advantage over the principal.

The theory's first requirement is that a hierarchical arrangement between the principal and the agent exists. Common hierarchical relationships are client and lawyer, stock-holder and shareholder management, and patient and doctor. In this particular case, the hierarchical arrangement consists of the citizenry as the principal and the president as the agent. Under this view, the president, as agent, is accountable to the citizenry for his actions. In theory, the citizenry is equipped with sanctions (e.g. voting against the president when he is up for reelection) and monitoring devices (e.g. following presidential behavior through media coverage) so that it can control the agent's behavior, maximizing efficiency and avoiding conflict.

The second requirement is that principal and agent have divergent interests. It is important to emphasize that the principal-agent model assumes that conflict will arise between the principal and the agent because the agent's self-interest will not always coincide with that of his principle. In many situations, this divergence of interest between the principal and the agent has little importance because the principal can successfully monitor the agent, detecting any agent behavior that is contrary to the principal's best interest and sanctioning "bad" behavior. In other words, using monitoring and sanctions to change the risks and rewards that the agent faces, a principal in many circumstances can insure that the principal and the agent have compatible self-interests. But in other cases, where detection is impossible or expensive, or where no cost-effective sanction exists, principal-agent theory predicts that the agent, as a rational actor, will act in his own self-interest often to the principal's detriment. Such conflicts exist in the relationship between presidents and the citizenry and are this paper's principal subject of analysis.

The theory's third requirement is that the agent must have an informational advantage over the principal. The agent, by virtue of his position, tends to know more about the nature of his job than the principal and to know more about the avenues for achieving the principal's preferred outcomes. How the agent uses this informational advantage depends upon the particular principal-agent relationship. However, it is important to note that the agent as "insider" has knowledge that could potentially assist in his "shirking" (i.e. in pursuing actions that are to the agent's advantage but not to that of his principal).

These three requirements are essential elements of any principal-agent relationship. As a result, the relationship between the electorate and presidents as candidates must possess each of these features if it is to be explained in principal-agent terms.

Before moving on to a particularized examination of presidential behavior, two other concepts -- monitoring and sanctions -- critical to principal-agent theory, deserve special attention. As just pointed out, principal-agent theory suggests that in an effort to maximize efficiency, principals will attempt to prevent agents from acting in their own self-interest. To do this, however, the principal must devise effective methods of monitoring agent behavior. That is to say, a principal who is unable to supervise his agent's behavior is likely to end up with an agent who ignores, rather than maximizes, the principal's interests. Monitoring can be accomplished in many ways. For example, by

requiring the agent to report his activities such as when a lawyer reports the number and content of the hours he has worked, or by looking at indices thought to be good proxies for performance, such as sales volume or total profits. According to Terry Moe, "Employ monitoring and other methods to eliminate 'illicit' shirking, and this in turn encourages efficiency."[7] As this paper demonstrates, however, it is sometimes extremely difficult, if not impossible, to monitor agent behavior.

In addition to monitoring, the principal should have a means of sanctioning what he considers "bad" behavior so as to discourage self-interested behavior that is contrary to the principal's interest. Examples of sanctioning can come in the form of denying bonuses or promotions, or even loss of employment. Whatever their form, their mere existence is thought to deter self-interested behavior, or, in cases where it is used as punishment, to prevent future self-interested activity which is contrary to the principal's best interests.

The difficulty, of course, is that mechanisms for monitoring agents and imposing sanctions are costly. The principal will want to minimize such costs in devising and implementing monitoring strategies or sanctions. Employing monitoring devices and sanctions raises a principal's costs, but their absence raises the risks of agent ineffectiveness in pursuing the principal's objectives. With this background in hand, we can now turn and apply the principal-agent model to the study of presidents as candidates.

II. Presidents as Candidates and the Principal-Agent Model

As mentioned above, the principal-agent theory assumes that the agent, as a rational actor, will act in a self-interested manner. It does not seem controversial to suggest that a president seeking reelection sees reelection as being in his self-interest and we should expect such a president to take actions designed to achieve this goal. The comment by President Bush, ("I will do what I have to do to be reelected."), provides casual evidence of how a president defines his self-interest. Support for this assertion is also provided by Reagan staff member, Lyn Nofziger:

> During the last two years, everything is really aimed at getting reelected. There is more of a focus on politics and less of a focus on principle. There is more of an emphasis on doing things that will help you win even if it's not good for your own policies.[8]

This quote demonstrates the degree to which the president and White House focus on reelection and the degree to which they equate "reelection" with "maximization of the president's self-interest."

In addition to the assumption that the agent is a rational actor inclined to act in his

---

[7]Moe, p.763.

[8]Interview with Lyn Nofziger, May 5, 1992.

own self-interest, principal-agent theory assumes that the principal will have a unified, or consistent view as to what outcomes the principal desires. It is my argument that often the president has the opportunity to take actions that are not the ones which the contemporary electorate would prefer, but which nonetheless may enhance the president's prospects for reelection. When detection mechanisms or sanctions are missing, principal-agent theory leads us to expect the president to act on such possibilities, maximizing his reelection chances at the expense of the principal's interest. This section documents two common examples of this: the practice of White House staff tending to non-governmental campaign business at taxpayers' expense, and the selective doling out of government resources in an effort to win votes among particular constituencies.

Reelection-related Behavior

Their seems little doubt that White House staff participates in campaign-related business at taxpayers' expense. According to Republican strategist, Stu Spencer, "The reelection effort overwhelms White House operations. Everyone gets caught up in it."[9] Taxpayer subsidization of non-governmental, campaign-related business is par for the course in modern presidential reelection campaigns. Perhaps the most recent example which highlights this practice was the appointment of Secretary of State James Baker as chief of staff and counsellor to the president. News accounts repeatedly reported that Mr. Baker would "leave his post to oversee the president's reelection campaign."[10] No one could deny that Mr. Baker would play a formidable role in reelection strategy, despite his efforts to maintain a low profile over the course of the campaign. White House press secretary, Marlin Fitzwater defended this "political role" stating "... that there were no legal impediments to Mr. Baker's serving as chief of staff and handling political matters at the same time."[11]

In 1984, Mr. Baker also watched over the reelection campaign from the Reagan White House, though his role was much less publicized. In 1980, however, Hamilton Jordan left his position as chief of staff to run the general election portion of the presidential campaign. If indeed Mr. Baker "ran" the president's campaign in 1992, it seems that he should have been paid by the Bush-Quayle headquarters, not the Bush White House. In addition, it is important to note that such participation is not limited to the highest echelons of the White House staff, a number of lower level White House staff members also tend to campaign business on government time. Such examples can be as subtle as a member of the policy staff reviewing campaign literature pertaining to presidential policy.

Whether legal impediments exist is not the issue. But the lack of legal

[10]"Election Notes," The International Herald Tribune, August 13, 1992, p.3.

[11]Horvitz, Paul F., "Bush Appoints Baker As His Chief of Staff, New Agenda Pledged," International Herald Tribune, August 14, 1992, p.2.

impediments to such a practice does not answer whether from the electorate's view, it is a desired practice, and, if it is not, why the practice is able to continue. Since a separate campaign organization, subsidized by public contributions (and eventually federal monies), is created solely for the purpose of getting the president reelected, it seems appropriate that taxpayers should not also be subsidizing White House staff involvement with the campaign, nor does there seem to be any reason to expect that the contemporary electorate would endorse such a practice. Rather, it seems that most members of the polity would prefer that those who engage in such activity should do so at the expense of the campaign organization.

Controlling such behavior through monitoring and sanctions is made difficult, however, due to the agent's substantial informational advantage. In this particular case, the president and his staff are able to conduct much of the business of government, and the business of campaigning, without the electorate monitoring their behavior. Much of what a president does in the course of a day is information that remains within the confines of the White House and access to this type of information is limited, if not completely unavailable. This, of course, is even more true for the president's staff. Voters are simply unable to monitor the nature and degree of White House staff activity.

A second example of agent behavior diverging from the principal's interests is the practice of awarding governmental resources to electorally strategic states. Often in a reelection year, the president, regardless his views of the merits of such actions, strategically allocates grants to key primary states. For example, in the most recent election, President Bush announced millions of dollars of aid and programs for key primary states. Among others, the White House agreed to help finance a project to restore the natural course of the Kissimmee River, shortly before the Florida primary. Similarly, prior to the New Hampshire primary, President Bush doled out a transportation grant to that state. The New York Times described this latter administration action as "engineering a windfall of Federal aid for New Hampshire."[12] Nor was Bush alone; such behavior is par for the course when presidents seek reelection.[13]

The use of government resources for electoral gain is exactly what Tocqueville feared would happen if presidents were eligible for reelection:

> When a simple candidate seeks to rise by intrigue, his maneuvers must be limited to a very narrow sphere; but when the chief magistrate enters the lists, **he borrows the strength of the government for his own purposes**...All public negotiations, as

[13]As previously mentioned, research for this paper was part of a much broader project in which I examined presidential reelection efforts from Eisenhower through Bush. Thus, assertions of this kind are made on the basis of previous research efforts.

well as all laws, are to him nothing more than electioneering schemes.[14]

Such behavior is also what has fueled support for the single six-year presidential term.[15] By eliminating the prospects of reelection from the president's "to-do" list, proponents of the six-year term claim that the president will be more focused on policy and less on self-aggrandizing politics. In principal-agent terms, proponents of the single six-year term would solve the problem by changing the president's "self-interest calculus." By eliminating reelection as a plausible presidential alternative, they would reduce the appeal, from the president's perspective, of actions that would otherwise contribute to his reelection prospects.[16]

In any case, examining this practice in light of the principal-agent model, the problem in controlling such behavior is one of sanctions, or the lack thereof. Many citizens may know, for example, that New Hampshire was the recipient of generous transportation grants two weeks before its primary.[17] Within New Hampshire, such a dispersal is likely to be a net political plus for the president. Outside New Hampshire, the voter in California may disapprove, but that disapproval may not produce any consequences, because that voter lacks an effective way to register his or her disapproval, or may be willing to ignore the behavior once the California primary arrives. It is difficult, if not impossible, for the principal to communicate such information. Other options, such as writing directly to the White House to object or registering disapproval in public opinion polls, may do better in communicating to what behavior the principal

[15]For information about the single six-year term, see How Long Should They Serve?, American Enterprise Institute Forums, John Charles Daly, moderator, Charles Bartlett, Walter Berns, John C. Danforth and Jeane J. Kirkpatrick, American Enterprise Institute, Washington, D.C.: April 17, 1980.

[16]Of course their appeal might not be eliminated completely; a president might, for example, still take such action in order to try and help his party's nominee. According to Harold F. Bass, who wrote an article on presidential party leadership transfers, "The general pattern [of presidential participation in the party nominee's campaign] has the retiring incumbent expressing a willingness to be of assistance, then deferring to the nominee regarding the extent and logistics of participation." (p.122) In the case of President Reagan in 1988, Bass noted that, "Reportedly, it [the White House] put its control over the disclosure of information to use on behalf of the campaign; and it sought to influence the timing and contest of regulatory decisions that might have campaign implications." (p.123) This is an example in which the outgoing president might politicize governmental actions in order to help his successor's campaign. See, Harold F. Bass, "Comparing Presidential Party Leadership Transfers: Two Cases," in Presidential Studies Quarterly, Volume XXIII, Number 1, Winter 1993, pgs.115-128.

[17]Indeed, the effectiveness of this as an electioneering strategy depends on people in New Hampshire knowing about it.

objects, but may be less useful in inflicting some "cost" on the president to cause him to change. Until this situation changes -- when better monitoring and sanctioning techniques are developed -- we are unlikely to see a change in the commonplace practice of presidents doling out government resources to electorally valuable states.

Monitoring and Sanctions: At What Cost?

Recognizing the reasons that self-interested agent behavior exists, perhaps it is worthwhile to discuss efforts to develop sanctions or monitoring devices. If such self-interested behavior is not in the "preferred interest" of the public, the principal-agent model would recommend devising methods to eliminate such behavior.

In regard to the first example of White House staff tending to campaign business, there are two principal reasons why the act of monitoring agent behavior is difficult. One reason is that many who serve in the White House have jobs that are inherently political. A second reason is the difficulty in obtaining information about the behavior -- there are no obvious sources which are suitable and available.

A first obstacle to monitoring White House activity in connection with the campaign is the political nature of many White House positions. "It is axiomatic that virtually everything a President does is political in some way, and Administration officials and campaign aides concede that it gets harder to draw the line in a campaign year."[18] For instance, those in the Office of Intergovernmental Affairs are hired for the purpose of maintaining lines of communication with state and local politicians. At many times, this may be a legitimate public function contributing to effective governance. But at other times, such as when an election is approaching, this activity may be pursued mainly to enhance the president's political position, for example to gain information on political concerns and conditions in a particular region where the president is planning to campaign. And, indeed, such contacts may sometimes have multiple purposes. As a result, even if one could discover on a regular basis what contacts and activity are occurring, the mixed nature of the work would still make it difficult to sort out official business from campaign business.

A similar phenomena occurs with members of the Cabinet, who frequently travel the country speaking on behalf of the president. Though they may be asked to deliver speeches in their capacity as Cabinet secretary, it would be difficult to stop them from vigorously promoting the administration line. The presidency is a political institution, and certain staff members are responsible for tending to "political" matters. According to Kennedy aide, Ted Sorenson,

> Were we performing political functions? Of course we were, from beginning to end. The presidency is a political office. I don't make any apology for that. It's intended to be a political office, and the president's senior staff must keep politics

[18]Rosenthal, Andrew, "Line Between Presidential and Campaign Trips is a Fine One," The New York Times, January 18, 1992, p. A7.

in mind at all times.[19]

More recently, Bush press secretary, Marlin Fitzwater scoffed at a reporter's question about his simultaneous roles as White House and political spokesman. He refused to address the ethical aspects of his dual position and instead blamed his role on the Clinton campaign:

> I tell you when a candidate, as Mr. Clinton did, calls the president Pinocchio and just in case you didn't get the point puts out a press release calling him a liar, what does he expect us to do? You think I'm going to say that sounds great Bill, sling a little more mud here, that's terrific.[20]

Most administration officials perceive such criticism to be lacking ground and simply avoid the issue when questioned as Marlin Fitzwater did.

A second reason it is difficult to monitor agent behavior is that such information is extremely difficult to obtain. Even if the principal conceded that in many cases it is difficult to separate campaigning from governing, one could still attempt to monitor in order to control the "easy" cases, where behavior is clearly campaign-related. The problem, however, is that there are no sufficiently complete, timely or accurate sources of how presidential, Cabinet and staff time is spent. The U.S. government publishes the president's schedule in the Public Papers of the President. However, these schedules are notoriously incomplete. Presidential libraries have schedule records for the president and various staff members, though these lack descriptions of what meetings were about, making it difficult to discern whether campaign planning was on the agenda. In addition, such libraries only serve to make such information available after the fact, limiting its utility for monitoring purposes. Thus there is no easy way to determine who in the White House is working on the campaign and how much time they are spending on it.[21] Such a state of affairs renders the prospect of monitoring agent behavior extremely difficult and maybe even impossible.

In regard to this study's second example, that of the president doling out "goodies" to key primary states, the problem with eliminating such agent behavior is two-fold: the

---

[19]Kernell, Samuel and Samuel L. Popkin (eds.), Chief of Staff, Berkeley: University of California Press, 1986, p.145.

[20]"Quote-Unquote," International Herald Tribune, September 2, 1992, p.3.

[21]In the spring of 1992, the House Subcommittee on Human Resources conducted a series of hearings on presidential travel. In particular, they were concerned about the small size of the budget allocation for travel relative to the expansive amount of presidential travel. Thus, they requested travel and time records from the White House personnel office for senior White House staff members. A Subcommittee staff member indicated to me that the information requests were not fulfilled for at least two reasons: first, it is not clear that the White House possesses such information and second, it is not clear that it is possible to track such information accurately.

principal's patch-work monitoring effort (voters in some states are aware that the president is utilizing government resources to advance his electoral position while others are not), and the absence of visible sanctions (some voters might sanction the president for such behavior by not voting for him, but the agent is not aware of this).

In this particular case, the absence of sanctions is due largely to the agent's ability to play the principals off one another. Essentially, the agent has a comparative informational advantage, in which he can dole out grants to one state without the knowledge of the principals in other states. Thus, while the principal in New Hampshire may know that the president awarded the state a grant two weeks before the primary, it is unlikely that the principal in Texas, who might oppose such action, will know of this event. The principals have different monitoring abilities and the agent can take advantage of this variation without penalty.

Complicating things further is the fact that while some principals might choose to sanction the president for attempting to "buy votes" by not voting for him in the election, the agent may not get the message because there is no "explanation" that accompanies the vote. Thus the value of the sanction may be lost because without the agent knowing the reason for the principal's disapproval, the sanction can neither serve to punish the "bad" act or deter such behavior in the future. The circumstances surrounding this "conflict of interest" between the principal and agent make it difficult to develop a means for effectively monitoring and sanctioning such behavior.

Given the difficulties associated with monitoring and sanctioning White House staff activity and presidential campaign activity, it is unlikely that the principal will be able to discourage the practice of White House employees tending to non-governmental business or the president doling out government largesse to key primary states. It is important to note, however, that the principal-agent model does not prescribe cures for eliminating self-interested agent behavior (except to suggest broadly that the key is always to develop cost-effective monitoring and sanctioning techniques); it simply provides an explanation for why such behavior occurs (the absence of monitoring or sanctioning techniques). It is beyond the bounds of the principal-agent model to provide solutions once it is discovered that self-interested agent behavior diverges with the principal's best interests; responsibility for finding the means to eliminate such activity lies with the principal.

III. Contributions of the Principal-Agent Model

While this paper has focused on two examples in which presidential (agent) behavior is dominated by self-interest at the expense of the citizenry (principal), one might wonder why the principal-agent theory provides any more insight than a purely descriptive analysis of these events. Furthermore, in an effort to adapt the principal-agent model to the study of presidents as candidates, this paper makes a series of rather basic assumptions about the political environment in which the president and electorate operate.[22] Realizing

[22]For example, this paper assumes that the electorate must do its monitoring directly, not through its surrogates (other presidential candidates, Congress or the press).

that the political context is indeed much more complicated, however, such a first step is necessary in order to bring some theoretical rigor to the study of presidents as candidates. I argue that this theoretical construct is useful for four reasons: it helps account for reelection-related presidential behavior, the model has a predictive component so that we can expect similar behavior from successive presidents, the case demonstrates that the problems of monitoring agent behavior and sanctioning, which are commonplace in many other principal-agent relationships, exist in the political sphere also, and the theory explains limits on presidential behavior as well as accounting for certain types of behavior.

First, by defining the president as a self-interested actor, the principal-agent model accounts for reelection-related behavior. The president as agent "is induced to pursue the principal's objectives only to the extent that the incentive structure imposed in their contract renders such behavior advantageous."[23] During the reelection campaign, the principal's interest is not always at the forefront of a presidential agenda. George Bush's statement that he would "do what he has to do to be reelected" is simply a frank admission of a fact endemic to all presidencies: the primacy of this event and the willingness to overlook the principal's interest in order to get reelected. Thus, the behavior that is associated with presidents seeking reelection should be expected; as a rational, self-interested actor, the president will seek to maximize his own interests, often at the expense of the electorate.

A second contribution of the principal agent model is its predictive component. The theory seeks to explain **why** organizations or members of a contractual agreement behave as they do, allowing one both to look at past behavior and to predict future behavior. If monitoring devices and sanctions do not vary, principal-agent theory leads one to expect successive presidents to act as their predecessors did in the midst of a reelection campaign. Thus it is likely that in preparation for the 1996 campaign, White House staff will participate in campaign planning, and President Clinton will dole out government largesse to electorally strategic states.

Third, applying principal-agent theory to the presidency demonstrates, in a political context, the difficulties of sanctioning and monitoring agent behavior. In regard to White House staff tending to campaign business on government time, the principal has difficulty monitoring such behavior because such information is practically impossible to obtain. In the case of presidents doling out government largesse to electorally strategic states, the agent's informational advantage and the principal's lack of effective sanctions make it difficult for the principal to eliminate such behavior. These monitoring and sanctioning problems are endemic to many principal-agent relations, but it is nonetheless useful to illustrate them in the political context.

Finally, the principal-agent theory explains limits on presidential behavior as well as accounting for self-interested activity. Why is it that certain campaign-related tasks take place in the White House while others are delegated to the campaign committee? Why are there any limits at all to White House involvement in the reelection campaign? For example, why is it that the president does not raise money from the White House for

---

[23]Moe, p.756.

the campaign? Perhaps because of the existence of the Federal Election Commission ("FEC"), which monitors campaign contributions and has the ability to sanction illegal campaign financing activities. This Commission may act both as monitor, and as a body with authority to impose sanctions, thereby deterring undesirable presidential and staff behavior in regard to campaign fundraising. The principal-agent model suggests that the principal's ability to monitor certain behavior and the threat of sanctions discourage certain types of self-interested behavior. This theory helps us understand why some reelection-related tasks are performed within the bounds of the White House and why others are not. In summary, rather than relaying such information in descriptive terms, the principal-agent model provides a theoretical construct within which one can understand certain aspects of presidential behavior during a reelection season.

IV. Conclusion

This paper began with a statement by President Bush in which he stated a willingness "to do what he has to do to be reelected." While no one but the President knows exactly what he meant, this theoretical discussion brings us closer to understanding reelection-related presidential behavior. The quest for reelection has a formidable impact on the institution because the president, as a self-interested rational actor, seeks to continue his political career and can only achieve this goal by winning reelection. Given that this event is of paramount importance to the president, it is therefore not surprising that it has a substantial impact on presidential behavior and thus the institution of the presidency. This paper focuses on two examples of self-interested behavior and, in the process, demonstrates the reelection campaign's potential impact on governance: the business of reelection often supersedes the business of governing as staff members turn their attention to the reelection campaign and, the campaign's impact on presidential decisionmaking as decisions become increasingly politicized in light of the forthcoming election.

This contractual paradigm enables one to examine the presidency from a theoretical, rationally-based perspective and, in the process, sheds light on the behavior of presidents seeking reelection. Further, by identifying the electorate as the principal and the president as the agent, this paper introduces a useful perspective from which to study the presidency. To date, scholarship in the field of the presidency has been lacking theory. While this paper by no means eliminates this criticism, it seeks to advance the theoretical discussion of the modern American presidency.

NEW SOCIAL MOVEMENTS AND NEW IDEAS

Sylvia N. Tesh
University of Michigan

Prepared for delivery at the Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

ABSTRACT

New Social Movement theory improves on earlier theories of social movements by calling attention to ideology. But NSM scholars have been more interested in the ideas that members of social movements share than they have been in the ideas that social movements promote. A broader picture of social movements would 1) recognize that one of the major tasks for social movements is to develop and advance new ideas, 2) define movement membership widely enough to include all the people who create the ideas, and 3) acknowledge the importance of debate over the social policies the ideas imply. The environmental movement provides an example.

During the last thirty years, the landscape of American politics has been, if not transformed, at least significantly altered by social movements. While organized citizens' campaigns to achieve real equality, peace, and democracy are not at all new in this country, they have been newly visible since the 1960s, shattering the post-war assumption that all Americans share the same values and goals. Members of the civil rights, anti-war, feminist, environmental and other social movements have demanded, and continue to demand, that both government and private institutions make fundamental changes in the ways they distribute wealth and power, and in the criteria by which they define success.

All of this activity has inspired scholars to develop new theories to understand social movements. The old theory defining social movements mainly in terms of mobs and violence--the theory that explained them as the consequence of relative deprivation (Gurr, 1970; Smelser, 1962)--this got tossed out. In its place we have two different kinds of analyses. One concentrates on social movement organizations and one on movement ideology. The first one, called resource mobilization theory (RM), argues that regardless of how deprived or disenfranchised people are, they don't mobilize without leaders and a variety of other resources. It investigates the structures, tactics, and tensions of the formal movement

associations (Oberschall, 1973; McCarthy and Zald, 1977; Tilly, 1978). The second analysis, usually called new social movement theory (NSM), argues that what truly characterizes contemporary social movements is not their form of organization but their ideological orientation. It examines the shared beliefs, collective identities, and common social background of movement members (Touraine, 1981; Klandermans, Kriesi, and Tarrow, 1988; Dalton and Kuechler, 1990). (Recently some resource mobilization scholars have begun to consider the role of ideology in social movements, developing what they call a "social psychology" of movement organizations, thus bringing the two schools closer together. See Morris and Mueller, 1992)

While each of these new theories provides important insights into social movements, their definitions of social movements are too narrow. Both RM and NSM scholars tend to confine their analyses to the activities and ideologies of people in movement organizations, thus they fail to include in social movements most of the writers, orators, journalists, and public officials who develop and promote movement principles and social goals, and they also leave out ordinary people who advance the movement in countless ways but have never joined a formal movement association. This focus limits our ability to understand the successes social movements have had over the past quarter century in changing the standards by which we judge ourselves as a nation. In addition, because they look primarily at the observable actions and shared

beliefs of the members of movement organizations, most scholars in both traditions pay inadequate attention to the conflicts within movements over the movement's guiding ideas. These scholars thus fail to develop criteria for evaluating the goals and successes of specific movement campaigns.

In this paper I sketch out a broader picture of social movements aimed at addressing these deficiencies. My picture reflects the view of NSM scholars that ideology plays an important part in social movements, but instead of emphasizing the ideas social movements share, it highlights the ideas social movements promote. Instead of concentrating on the ways that social movements recruit new members, it looks at the ways that movements affect non-members. The picture comes in three parts. Part one focuses on movement ideas (noting the dialectic between those ideas and actual events); part two is on the movement members who promote the ideas (extending the definition of membership well beyond social movement organizations); part three examines movement conflicts over the ideas (pointing to their importance for public policy).

In this attention to ideas, I am inspired by Steven Lukes' description of power as the ability of A to influence, shape or determine B's wants and desires (Lukes, 1974)[1]. In Lukes' formulation (which draws on Gramsci's concept of hegemony) the people and institutions who have this power to control other people's thoughts and wishes use it to justify and maintain

inequalities. They subtly promote a way of thinking about the world that is taken by most people for common sense, and which advantages the people and groups already in power, at the expense of others. The effects of this power can be seen in widely accepted but inequitable rules, policies, and practices in both public and private institutions. A number of other scholars develop the same idea. Charles E. Lindblom says there is a "constant elite struggle to win minds to a commitment to such values as order, obedience, the status quo, deference, political docility, and inequalities of income and wealth...(Lindblom, 1990: 89). Murray Edelman describes how governments use language and symbols "to maintain support for policies that deny the great majority the values they cherish..." (Edelman, 1977:151)

But the power to influence what others think and desire can also be employed with the intent of redressing injustices. This is where social movements come in. As Carl Boggs points out, social movements can "constitute counterhegemonic struggles in the Gramscian sense" when they promote "an alternative ideological framework that subverts the dominant patterns of thought and action...(Boggs, 1986:5)." And as Eyerman and Jamison argue, "social movements provide a challenge to the dominant assumptions of the social order, making problematic the self-image of societies...(Eyerman and Jamison, 1991:165)." If this promotion of an alternative ideology is successful, and large numbers of people unconsciously adopt a new common sense consistent with a more

equitable society, then we can expect more just policies and practices to result. I argue in this paper that for social movements one of the major tasks is to develop and foster this kind of new common sense. In order to accomplish their goals, social movements have to get others to change their ideas about what society is and ought to be. A chief way they do so is to promote new moral principles. The principles do two things: they give new meaning to people's lived experiences and they serve as the ethical foundation for new public and private rules, policies, and practices.

IDEOLOGY IN SOCIAL MOVEMENT SCHOLARSHIP

By definition, scholars writing in the NSM tradition are keenly interested in the contemporary movements' values. They typically see these values, however, as the glue that holds a social movement together, not as its creative product (Kuechler and Dalton, 1990; Snow et al. 1986). Their viewpoint is logical and useful, of course. As Kuechler and Dalton point out, once you turn away from studying social movement organizations, you face the problem of defining social movement membership. The concept that movement members are people sharing certain beliefs solves the methodological problem (Kuechler and Dalton, 1990: 280). The concept however, is too thin, too static. In the first place it implies that all the values and beliefs shared by movement members

existed previous to the movement. It does not recognize the role social movements play in creating and developing new values and beliefs. In the second place, it bestows importance on social movements in and of themselves, rather than because of what they do for, or to, other people. It's a inward-looking concept. It's concerned with the way that values influence members of social movements, not the way that social movement values influence the general public. This view of social movements thus ignores not only the question of human agency in social change, but the role social movements play in bringing it about.

The New Social Movement literature is full of examples. Ronald Inglehart, who has documented changes in Western values without paying much attention to their origin, says that a major reason for the rise of the ecology movement is simply that "the public has become more sensitive to the quality of the environment than it was a generation ago (Inglehart, 1990:45)." And Karl-Werner Brand notes tautologically that social movements flourish "in times of spreading cultural criticism," then going on to say that the times themselves "heighten public sensitivity to the problems of industrialization, urbanization, commercialization, and bureaucratization (Brand, 1990: 39.)." Similarly, Cotgove and Duff think that "to support an attack on the central values... of industrial capitalism," the environmental movement just "harness[es] the beliefs about environmental dangers (Cotgrove and Duff, 1980:339)." And Sidney Tarrow fails to consider the

movement's generative role when he says that it is "the collective identities, core discourses, and frames of meaning that link members of social movements and movement networks to one another (Tarrow, 1992:187)."

I do not mean to denigrate the insight that members of social movements share ideologies and ways of seeing the world. Nor am I discounting the importance of social movements in the formation and expression of collective identities. But the reasoning quoted above does not ask how it is that people come to regard conditions as problems, nor does it consider by what process problems become political issues (Gusfield, 1981; Goffman, 1974). Thus it bypasses the actor [2]. If Inglehart and Brand are right, however, and the public is more sensitive now than it once was to the environment and more aware of the problems of industrialization and urbanization, then the environmental movement should get some credit. And if Cotgove and Duff and Tarrow are right and movement members share beliefs about the environment and assign similar meanings to events, then specific people and groups in the movement deserve recognition for developing the ethical principles on which the beliefs and meanings rest.

The environmental movement is, in fact, a good place to start when considering the role social movements play in creating new ways of thinking. A main reason is that it is new. Most Americans over the age of about thirty-five can easily remember a time when

environmental ideas were held only by a few romantics and cranks. Today environmentalist concepts are so widely embraced (Mitchell, 1990) that even when public figures oppose new environmental laws or regulations, they first have to pay obeisance to environmentalism. What makes this transformation in American thought so remarkable is not merely the brief period of time in which it took place, but its uniqueness. Other social movement have only addressed people's ethical relationship to one another; this is the first social movement in history to contend that people have a moral obligation to nature [3]. One common expression of that contention is found in the grassroots toxics groups.

MOVEMENTS INFLUENCE SOCIAL IDEAS

Since the late 1970s many thousands of community organizations have formed to protest local chemical waste sites on the basis that exposure to the waste is dangerous to public health. When, as is almost inevitably the case, epidemiological data fail to demonstrate a relation between exposure to the chemicals and serious diseases in the community (National Research Council, 1991; Tesh, 1993), the members of the organizations invariably reject the scientific findings[4]. What they say, in neighborhood after neighborhood, is that they know <u>intuitively</u> that exposure is dangerous. Whether they explain the lack of scientific corroboration in terms of sloth, incompetence, or corruption

(Gibbs, 1982; Van Strum, 1983) or, more charitably, in terms of scientific insufficiency (Cohen and O'Conner, 1990) they never question their "instinct." They simply know that exposure to synthetic compounds endangers health. It follows that the weakness of the scientific evidence is some sort of a cover-up, and citizens must organize and fight for their health.

Usually the media accounts of neighborhood campaigns against pollution imply that the members of these groups are environmentalists, but the members themselves rarely think so. And in most cases they don't have any of the usual identifying characteristics. They have never sent money to or in any way joined any political organization, citizens' association, or pressure group, let alone teamed up with one devoted to environmental issues. Indeed, the typical grassroots toxics group member has been apolitical up to the time she or he (and it is usually "she") got involved in the neighborhood group (Masterson-Allen and Brown, 1990; Goldsteen and Schorr, 1991; Edelstein, 1988; Levine, 1982). These people do not fit the profile of environmentalists: they are not the upper middle class, college educated liberals who reject American core values, so frequently described by analysts of public interest groups or social movements in general and the environmental movement in particular (McCann, 1986; Schlozman and Tierney, 1986; Paehlke, 1989; Milbrath, 1984). And lest they should take on a new Sierra Clubby identity along with their fight against neighborhood pollution, they are specifically told by at least some of the

political organizers who come to their aid that grassroots toxics groups are not environmentalists [5]

So if they are not environmentalists, it is worthwhile asking where their intuitions and instincts about the dire health effects of environmental pollution come from. They were not born with them. Only a few years ago almost everyone regarded synthetic chemicals fairly benignly. Local industries might emit foul smoke, or pollute local streams with their waste, municipalities might build huge mounds of household and commercial refuse, and while residents may have objected on aesthetic grounds and been aware of the link between exposure and some acute health conditions (Mills, 1954) most people did not, apparently, have an innate feeling that environmental pollution explained cancers, birth defects, or miscarriages. Certainly one reason for thinking differently now is that since 1970 we have an Environmental Protection Agency, symbolizing a need for the environment to be protected. The EPA not only regulates the disposal of chemical wastes, but does so partly on the basis that exposure can cause serious disease. Because of EPA regulations we have new conceptual categories: "hazardous waste landfills" and "hazardous air pollutants," for example, not just city dumps and factory smoke.

But why do we have the EPA and why has it continued to grow? One group of scholars identifies the migration to the suburbs, changing demographics, new expectations about the role of

government, and the pure self interest of political parties, political figures, television broadcasters, and environmental organizations (Landy et al, 1990). Another group assumes that the EPA is a response to a dangerous increase in polluted air, foul water, contaminated soil, species extinction, deforestation and other harms to nature (Silver, 1990; Hays, 1987). It would be foolish to argue that either of these answers is entirely false. But we cannot fully understand the establishment of the EPA or the eventual existence of grassroots toxics groups, without recognizing the writers, scientists, public figures, and political activists who initially developed and promoted radical new ethical principles about nature, and warned that violating the principles has drastic consequences.

Rachel Carson's Silent Spring (1962), was, of course, supremely important. Other publications in the 1960s supported her concepts: for example, Aldo Leopold's A Sand County Almanac (1966), and Rene Dubos' Man, Medicine, Environment (1968). Public interest in these books undoubtedly was partly due to a whole array of earlier writings and activities. As Robert Paehlke notes, environmentalism today owes a debt to Henry David Thoreau (Paehlke, 1989); Anna Bramwell locates the roots of the movement in the period around 1880 when the science of ecology began to acquire normative meaning (Bramwell 1989); Samuel Hays traces the history of environmentalism to the conservationists in the early 20th century (Hays, 1987); Barry Commoner credits the writings of anti-

nuclear scientists in the 1950s (Commoner, 1971).

Whatever the ancestry of the movement, the principles introduced in the 1960s by writers like Carson, Leopold, and Dubos established it in our time. Their tenets were soon enlarged and developed by other people--in books and in magazine articles, in conferences and public fora, in speeches at rallies, in government reports, and Congressional debates (Reich, 1970; Borelli, 1988, Sandbach, 1980). The precepts eventually informed the text and subtext of the magazines, pamphlets, and newsletters produced by the new movement organizations. And they were subtly advanced by sympathetic TV and newspaper reporters. All of these writers and orators had, in fact, been creating environmentalism. Their combined message was that nature belongs in an ethical category, not in a biological one. The message advanced the proposition that the balance of nature is fragile and has its own integrity, existing not for human purposes but simply for itself. It charged people who violated nature's delicate balance with moral shortcomings. And it argued for a new, ecological comprehension of the earth with four principal tenets: everything is connected to everything else, everything must go somewhere, human interference in nature is likely to be detrimental, and anything extracted from nature by human effort must be paid for.[6]

Of course, the writers and orators I refer to did not create these principles in the abstract. Real events inspired them. Plant

and animal species were becoming extinct at an increasing rate, oil tankers were breaking up and fouling beaches, acid rain was killing lakes, ancient forests were disappearing, buried chemical dumps were contaminating drinking water. But these events themselves had no intrinsic meaning, nor did they have any relation to one another. Significance had to be bestowed upon them (Berger and Luckman, 1967; Edelman, 1964). Someone had to say they meant something in the light of some unifying theory or set of mores.

Before environmentalism there was no handy theory. Familiar as they now are, environmentalist principles diverge radically from the concept of humans' relation to nature held by most western peoples up to the mid 20th century. And, in light of, say, today's devastating floods in the Midwest, hurricanes in the South, and drought in the West, it is still reasonable to find bizarre the idea that humans are obligated to protect a fragile nature. If today we "automatically" think of nature as needing protection, if when we think of the environment we "naturally" concentrate more on oil spills, acid rain, chemical dumps, and vanishing species than on floods and hurricanes, these turns of mind are a tribute to the vigor of the environmental movement. If when we learn that someone is worried about pesticide residue in food, we assume she also cares about recycling newspaper, this mental link demonstrates a success of environmentalism.

All social movements try to assign new significance to

experiences, and tie together singular events. Some times they re-invigorate and give moral urgency to familiar but radical concepts (like equality, or democracy) by applying them to new situations and peoples and leavening them with fresh insights. In this way they transform and unite many once-disparate phenomena by making them signifiers of those principles. Take feminism for example. Before there was a feminist movement no one saw any particular relationship among, say, abortion laws, the term Mrs., Playboy centerfolds, and the fact that few men become elementary school teachers. Today feminism, promoting the new concept of sexism and the principle of full humanity for women, connects these things and designates them as public problems[7].

Sometimes social movements develop new moral creeds altogether. Before there was an environmental movement people did not associate the decline of condors with leaking municipal landfills, unusually hot summer weather, pesticide residues in food, logging on federal lands, and lead poisoning among poor children. Today environmentalism, promoting the concept of biological interconnectedness and the principle that human interference in nature is likely to be harmful, merges these phenomena, making them all aspects of one vast social problem, and giving each individual event added significance.

I am arguing here that an analysis of the environmental movement suggests that social movements do more than tie issues

together, and they do more than "frame" them. Many social movement scholars employ Goffman's frame concept to show that movements "punctuate or single out some existing social condition or aspect of life and define it as unjust, intolerable, and deserving of corrective action (Snow and Benford, 1992:137)." But this description overlooks the social movement task of articulating the ethical principles according to which the condition becomes unjust. And it does not recognize the possibility that a movement might actually generate new principles in the first place.

My reasoning means that social movements have two major tasks. One is to develop, enrich, and promote the movement's moral principles so that they come to be seen by non-movement people as simple common sense or as taken-for-granted ethical precepts. The other task is to continually press for the kinds of social change the principles call for, by identifying instances where the principles are violated[8].

The fact that these two tasks are intertwined enriches our understanding of the trouble social movement organizations have inducing legislatures, government agencies, and private institutions to make favorable laws, rules, and policies. Social movements are fighting two battles simultaneously. They have to get policymakers to accept new moral premises, and they also have to get those same policymakers to take actions reflecting the premises. Legislators and heads of industry who still think of the

earth as tough instead of fragile, who are unmoved by ecological concepts of balance and harmony, who view nature largely in terms of its usefulness to human beings--these folks reject environmentalist presuppositions. At issue for them is not merely a particular legislative or policy proposal, but the whole rationale for changing current practices. If environmentalists have been unable to convince these people of the movement's initial principles, the unbelievers are unlikely to accept any aspect of the environment-alist agenda except as a pawn in political trade-offs or when it otherwise serves their self interest.

But public policies arrived at exclusively through trade-offs and bargaining among self interested actors are fragile. They are more susceptible to changing political coalitions than are policies firmly rooted in widely-held moral principles. So it is crucial for environmentalists not only to press for new policies, but to promote the new ethical concepts about nature that sustain them.

All this takes us back to the grassroots toxics groups. The very fact that they do not think of themselves as environmentalists attests to the extraordinary success the movement has had in formulating and championing environmental ideas. The grassroots groups' "intuitive" knowledge that all chemical waste causes disease in the neighborhoods exposed to it--an intuition, I repeat, that is both historically new and still largely unsupported by scientific evidence--is one of the main messages environmentalists

set out to send. The grassroots groups' battles are evidence that environmentalists have successfully classified the discovery of chemical waste or the detection of excess disease as a political issue. Grassroots toxics groups typically care little about other parts to environmentalism (Gibbs, 1982; Brown and Mikkelson, 1990; Edelstein, 1988; DiPerna, 1985) but they have heard and internalized the message that human interference in nature is likely to be harmful. And they are willing to fight hard to defend it.

This helps to explain why members of these groups are never relieved when a new epidemiological study concludes that the synthetic chemical to which they are exposed is not noticeably toxic to humans[9]. It enriches our understanding of why, when waste incinerator companies show that their air emissions are safe, opponents simply switch their fight to concentrate on ash disposal. People in local toxics groups are quite different from the person who learns that the backyard mushroom she has just eaten is not, after all, poisonous. That person probably takes great comfort in the news, attributes whatever symptoms she has to something else, and gets on with her life. Nothing much is at stake for her or anyone else, for no group in our culture promotes a political theory or ethical principle related to mushrooms that could be diminished or advanced by any particular experiences with mushrooms[10]. In the case of synthetic chemicals, however, if a grassroots toxic group abandons the idea that their health could be

harmed by exposure to a particular chemical, they weaken an entire ethical postulate and thus the ideological foundation for the social changes they support.

People's understanding that their fight against exposure to a particular chemical forms part of a much bigger battle may be especially acute in the case of what is now being called environmental justice[11]. Citing data which shows that hazardous waste facilities are more likely to be sited in minority communities than in white communities (United Church of Christ, 1987; General Accounting Office, 1983) a number of activists have extended environmentalism to include a fight against racial inequality (Bryant and Mohai, eds., 1992). In this situation, for a community of African Americans, Latinos, or Native Americans to accept studies demonstrating no link between exposure and disease is to threaten not only environmentalism, but the civil rights movement as well.

BROAD DEFINITION OF MEMBERSHIP

The view of social movements which pictures them at the task of developing and promoting new ethical principles is unconvincing unless it is based on a very broad definition of social movement membership. Most social movement theory--even when it is critical

of the idea that movements can be reduced to organizations--uses language, as Pamela Oliver points out, which assumes movements are formal associations (Oliver, 1989). Along with other NSM scholars, Oliver argues that the concentration on organizations leaves out consciousness--or what others refer to as values, cognition, or ideology (Dalton and Kuechler, eds., 1990; Ferree and Miller, 1985; Cohen, 1985; Morris and Mueller, eds., 1992). But the focus on organizations also defines out of membership large numbers of the movement's most powerful spokespeople as well as many of its most effective promoters.

If it is true, as many social movement scholars say, that one goal of social movement theory is to understand better the formation and communication of collective beliefs (Klandermans, 1992; Tarrow, 1992), we have to look beyond the membership of organizations to see it happening. More precisely, we have to develop a theory of movement membership which has places for all the people who articulate the movement's collective beliefs. And such a theory must recognize the difference between a movement's need to recruit members to its organizations, and its need to recruit new adherents to its ethical principles. When scholars concentrate on the beliefs of members of organizations they cannot account well enough for the social change which is, after all, a movement's basic purpose. Organizations are only a means to that end[12].

As I argued above, social critics begin to articulate the moral principles, ethical beliefs, and social goals that are eventually developed by and characterize a social movement before the movement really forms. They take events and actions which most people had previously seen as unremarkable aspects of conventional life, and transform them into problems. The principles they articulate call new attention to these events, give them fresh meaning, and tie them together. The movement develops as new people interpret and add to these ideas and form organizations to promote them and to press for their expression in public and private policies[13]. But the movement also grows when people unconnected to the organized groups act in ways congruent with its ethical base and articulate new movement ideas.

Consider the every-day activities of ordinary people which promote the movement's principles. Feminists who may never send any money to the National Organization for Women, never participate in a Take Back the Night march, and never join the women's caucus of anything, nevertheless foster feminism when they keep their own names on marriage, call sexist language to the attention of friends and colleagues, or take on traditionally male jobs and attitudes. Environmentalists who may never affiliate with any group dedicated to environmental protection, or participate in the activities such groups sponsor, pave the way for the policies movements work for in such mundane ways as putting recyclables out on the curb, wearing T-shirts with environmental messages, asking grocers to stock

"environmentally friendly" products, and defending the environmentalist position in arguments at home or work.

These are consequential acts. If it is true that the ideology of sexism and racism can be legitimated and perpetuated in thousands of small, individual gestures, turns of phrase, and subtle hints (Martin, 1987; Moraga and Anzaldua, 1981) along with the more obviously discriminatory laws, regulations, and policies, then it should be true the more positive ideology of environmentalism can also transmitted this way. If political power itself can be maintained by the use of language and other symbols (Edelman, 1964, 1977) then the category of "political actor" extends well beyond the boundaries of formal political institutions, and the everyday activities of unorganized environmentalists can be interpreted as mini-challenges to the status quo. A complete picture of the environmental movement would include them among the members.

A complete picture would also include the government actors who propose or promote movement concepts or movement-friendly laws and regulations. Instead of merely reacting to pressure from movement groups (as pluralism would have it) elected and appointed government officials and their staffs regularly take actions that strengthen social movements. It would be a scant picture of social movements which left them out. Consider three examples of such movement members members at work.

During the summer of 1993 Gregory Button, a Congressional Fellow in Senator Paul Wellstone's office, initiated and did all the work on a bill which would create an Office of Environmental Justice at the EPA. No one from a movement organization had asked him to do this. In fact, Button lobbied them, telephoning over a dozen activists in the environmental justice issue--some academics, and leaders of church groups, civil rights groups, and environmental organizations. He described the bill and asked them to pressure key Senators and the White House.

Button says he is not a member of any environmental organization, but he had followed closely the research and the conferences on the unequal citing of hazardous waste facilities and had taken the job with Wellstone partly because he "hoped to be able to influence the debate on environmental justice."[14] He knew that the EPA had already established a small (seven-person) Office of Environmental Equity in the Bush administration, but "wanted to give the office a real Congressional mandate."

The bill he created easily passed the Senate, and Button believes that even if a version does not get through the House, "our bill has already succeeded. Just the processes of introducing it and passing it in the Senate has set off a whole series of events. It's rearranged the interaction between the EPA, the White House, and the Senate. It's legitimated the issue of environmental racism. The major environmental groups are on record about it. The

EPA now has to take the unequal distribution of toxic wastes more seriously."

Button judges that a debate in the Senate about minorities and toxic waste would have occurred eventually, so the point here is not that this particular staffer was crucial. The point is that a government actor--not a member of an organized environmental group --strengthened the fledgling crusade against siting hazardous waste facilities in minority neighborhoods and thus altered the trajectory of the environmental movement.

Joel Hirschhorn is another example of someone who has advanced the movement from a government position. A staff member at the Office of Technology Assessment in the 1980s, Hirschhorn introduced a new concept into the environmental movement. For an OTA report in 1983, he had been researching the waste issue and, in his words, "saw there was the potential for a paradigm shift. I realized that environmentalism was based on reaction, not on prevention."[15] So he began to promote the ideas of pollution prevention and waste reduction. Instead of regulating wastes after they are produced, he argued, it is economically prudent and environmentally logical to prevent, or at least reduce, their production in the first place. "I knew what I was attempting to do. I set out with an agenda. I wanted to change the way environmentalists had thought of the problem. I deliberately tried to influence the movement." He and a colleague gave "hundreds of talks over several years. We traveled

all over the country."

His influence, he thinks, is mixed. "The pollution prevention concept is powerful, but it's not entirely embraced. Industry is afraid of it. And the Big Ten environmental groups didn't back us up. They thought we'd threaten their recycling programs." Nevertheless, the major environmental organizations now uniformly pay at least lip service to the concept of pollution prevention. And so does the EPA [16]. The term has become part of the environmentalist rhetoric. The eventual report Hirschhorn wrote for the OTA has been widely circulated (Office of Technology Assesment, 1986). Four years later, Congress passed the Pollution Prevention Act of 1990. (Hirschhorn wrote some of the key language.) And the idea that industries should prevent waste from being produced, not just try to deal with it afterward, is no longer startling.

The ideas of government actors in even more prominent positions have of course also influenced the environmental movement. Mark Moore argues that when William Ruckelshaus was appointed to head the new Environmental Protection Agency in 1970 he "fostered a general social movement in the direction of environmental protection (Moore, 1988:70)." As the first head of EPA, Ruckelshaus had considerable latitude. He could have directed the agency mainly toward research; or concentrated its efforts on one particular medium--water, say, or air. He could have emphasized health risks, or focussed instead on preserving natural beauty. He

could have established an agency where industry's welfare predominmated. Instead of any of these things, says Moore, Ruckelshaus resolved to concentrate on "pollution abatement," a term meaning that the agency would emphasize setting standards and fining polluters.

It was a decision that would come under Hirschhorn's fire a decade later, and may from some perspectives not have been the right one. But the point is that it was made by a prominent government actor, not by the organized environmental groups (in 1970 most of the current groups had not been started yet), and that it set environmentalism on a particular course. Rucklelshaus' decision reflected a set of principles. Among them were that the general environment was endangered, that risks to public health deserved more attention than the destruction of natural resources, that the quantity of chemicals which industry discharged and emitted should be reduced even without strong scientific evidence of their effect, and that the proper focus of government should be more on what industry does with its waste than on what it does in the production process. The new agency's policies implicitly advanced these principles, affecting the trajectory of the environmental movement.

All the essays in the volume in which Moore's essay appears argue in one way or another against the old pluralist idea that government policymakers do and should merely register the public's

wants and then try to satisfy them[17]. A similar celebration of activist government appears in the analyses of other social scientists who see members of interest groups working together with legislators and executive officers who share their normative and causal beliefs (Sabatier and Pelkey, 1987; Kingdon, 1984; Kelman, 1987). It is time to join these criticisms of pluralism with an analysis recognizing that sometimes government actors actually inspire social movement ideas.

I am not proposing that any member of Congress or any agency employee who acts in some way supportive of environmentalism is as much a member of the movement as is the president of a local Sierra Club chapter. Nor are the ordinary citizens who express their devotion to environmentalism solely by wearing Mother Earth t-shirts in the same league with people who lie down in front of bulldozers. Clearly there are degrees of social movement membership. My point is that members can be identified by their acts, not solely by their institutional affiliations. If the real goal of social movements is to make social change, and if an important means to that end is to change public mores, then the membership of a social movement includes all the people who help to change those mores.

One more such group deserves at least brief mention here. Journalists in both the print and electronic media have enormous influence on social movements. What they cover, how they cover it,

what pictures accompany (or comprise) their stories, who they quote, and when they decide to stop covering a story all help to determine the success or failure of social movements (Gitlin, 1980; Linsky, 1988; Gamson, 1992). Although most studies of the media's influence on politics describe its bias toward the status quo and the constraints on individual reporters who try to present other points of view, interviews with current and former journalists reveal another aspect. Reporters who are committed to a new idea or who consider themselves members of social movements often work hard and successfully to get their perspective out to readers and viewers. No portrait of environmental movement members is complete without including the journalists who use whatever power they have to advertise and legitimate environmentalist ideas.

Some studies of the media provide tidbits along this line. Gamson argues that, depending on the ways that journalists frame issues, media discourse can help to develop political consciousness, and thus aid in the formation of collective action (Gamson, 1992:chap 10). Linsky, noting that the media "are a functional element of the world of public deliberation and decision making (Linsky 1988:213)," offers an anecote showing how a news report on the assasination attempt on President Ford helped to advance the gay rights movement (Linsky, 1988: 219-220). And Gitlin identifies a few journalists who, on their own initiatives, wrote positive stories about SDS in the early years of the student movement. But a really detailed study of the activities of movement

members in the media has yet to be done.

My reasoning in this section implies that people who join grassroots toxics groups are members of the environmental movement by virtue of the fact that they promote movement principles. They have internalized the principles, too, of course, at least some of them. As I argued above, their intuition that exposure to synthetic chemicals harms health is largely a result of taking for granted the environment-alist principle that interfering with nature is wrong. But they also promote and advance that environmentalist axiom every time they base a demand on it.

CONFLICTING IDEAS WITHIN SOCIAL MOVEMENTS

All this talk about environmentalist principles glides over the fact that the principles in any social movement are always in dispute. Environmentalists do agree on a few very basic ideas, but they are in a constant state of implicit and explicit disagreement about what might be called the second layer of principles and about the kinds of public policies the principles dictate. The disagreements reflect different assumptions about the causes of environmental degradation.

One camp ascribes environmental degradation to the public. Scholars and activists in this group chiefly analyze or work more

directly to change what they see as an insufficient commitment by non-environmentalists to environmentally sensitive behavior. The public policy this perspective supports is "environmental education:" a general schooling in ecology and environmental ethics. Because ecology and ethics usually lack political content, the message the public tends to hear is that the environmental problem is caused by their own carelessness and can be halted if they act differently. This is the camp which prescribes recycling, tree planting, and the other Fifty Things You Can Do To Save the Planet. Their perspective individualizes responsibility for environmental progress (Devall and Sessions, 1985; Leopold, 1966; Rolston, 1991).

A second camp assumes the environmental problem is predominantly the fault of the political economy. These scholars and activists analyze or work more directly to transform the nation's distribution of power and resources. They do not count movement progress in terms of participation in recycling campaigns. They reason that the problem originates with the industrial production process (and, even more fundamentally, with the hierarchical social relations which support and generate it). Preaching radical social change, they assign primary responsibility for environmental cleanup not to ordinary citizens but to the owners and managers of industry (Freudenberg, 1984; Bookchin, 1986; Gorz, 1980; Bahro, 1986). A third camp assumes the problem is mainly governmental. Scholars and activists in this group chiefly

analyze or work more directly to eliminate weak laws, poor regulations, inept public officials, or ineffectual government structure. This camp regards government action and pressure by citizens on government actors as the key to environmental cleanup, placing most of the responsibility for environmental improvement in the lap of Congress and the bureaucracy (Kraft and Vig, 1990; Rosenbaum, 1991; Borelli, 1988; Rabe, 1990).

These differing assumptions about causality are important. They hold different communities accountable for failure, favor different public policies for keeping the environment clean, and prompt people and groups within the movement to adopt different criteria for success. Thus, as Deborah Stone notes about public problems in general, there is a "great tug of war between political actors asserting competing causal theories...(Stone, 1989:293)." Only when movement analysts skim over these debates can they fail to be critical of any particular movement goal or accomplishment. Consider the implications if one or the other of the camps predominates.

If the public comes to believe that the environment is endangered because of the ways industrial and agricultural goods are produced and their wastes discarded, then projects aimed at convincing shoppers to buy long-lasting light bulbs or teaching school children to recycle newspapers will seem peripheral at best. On the other hand, if the public thinks that the real cause of

environmental degradation is the demand by consumers for garden pesticides, big cars, redwood decks, and throw-away diapers, then few people will be likely to consider it worthwhile to press Congress to pass laws restricting logging or industrial emissions. Or if everyone agrees that the environmental problem can be pretty well addressed by strengthening the Clean Air Act, the Superfund, and the other environmental laws, then hardly any one will consider it an <u>environmental</u> goal to work for a less hierarchical society.

So while the entire environmental movement believes in and promotes the same basic ecological view of nature and the same lesson that humans have an ethical obligation to protect nature, what those beliefs and ideas come to mean in practice is crucial. Policy analysts who simply celebrate the movement's success in spreading environmentalism (Paehlke, 1989; Milbrath, 1984) miss the point. The critical issue is what variation of environmentalism is being spread, and what public policy goals will predominate among the general public.

When a prominent political figure writes a well-promoted book laying the environmental problem at the foot of Congress (Gore, 1992), when several major industries sponsor an Earth Day television extravaganza defining environmental activism as recycling household waste, when a prestigious mainstream magazine publishes a long article arguing that some form of socialism would best protect the environment (Commoner, 1987), social movement

analysis should take note. These are political actors exercising power to try to affect American ideology. They hope to influence the way nonenvironmentalists construe the cause of environmental problems and respond to policy proposals.

CONCLUSION

I have been sketching out a broader picture of social movements than most New Social Movement scholarship presents. Instead of placing NSM organizations in the foreground and asking about the values and identities shared by members of these organizations, I have begun with the issue of social change. My question has been, "How do social movements affect public and private policy?"

My perspective draws on those scholars who argue that social movements provide new frames for familiar events, promote new social ideas, and propose new cultural values, thus serving as agents of political change (Abrahams, 1992; Boggs, 1986; Eyerman and Jamison, 1991; Gamson, 1992; Klandermans, 1992; Scott, 1990; Snow and Benford, 1992; Tarrow, 1992; Touraine, 1981, 1985). This perspective supplies social change with human agency. Instead of pointing to "forces" and "conditions" to explain change, it identifies actual people and groups of people who behave in specific and public ways to try to alter society's distribution of

resources and power, and its concepts of success and failure. More precisely, this perspective credits social movements with bringing about (at least some of) the social change which distinguishes our age from the past.

I have been arguing that this bringing-about-of-social-change is the task of social movements, and that a principal way they carry out that task is to develop and advance new ideas. Social movements do other things, too. They create organizations; they recruit members; they provide collective identities to certain citizens; and they press policymakers to make new policies. Many scholars have analyzed these functions and realities. But to be really successful social movements also have to change significant aspects of what the general public has always believed to be good, true, and important.

A portrait of social movements which recognizes this formidable task avoids the mistake of confusing movements with movement organizations, credits social movements with victories they themselves seldom advertise, broadens the concept of social movement membership to include the activites of a very wide range of people, and becomes sensitive to the debates within movements over their ethical principles and social goals.

NOTES

1. Lukes contrasts this kind of power with two far more visible sorts. In one, A gets B to do something B would not ordinarily do. In the other, A prevents B from registering B's grievance. See also Gaventa, 1980.

2. It also comes very close to reproducing the old relative deprivation school which explained social movements as a simple response to social events.

3. I am implicitly dating the environmental movement from the late 1960s because, although it clearly has roots that go back at the very least to the turn of the century, before the late 1960s a concern for the environment had not developed into a genuine social movement with goals for major social change.

4. It is important to note that not only do epidemiological studies of exposure on specific sites fail to find much evidence that environmental pollution causes serious disease in humans, but so do general morbidity and mortality data. Cancer mortality rates (with the exception of lung cancer) have been decreasing for the past 40 years. Cancer morbidity rates, some of which have been increasing, are not easily correlated with exposure to environmental toxins. Adverse reproductive outcomes have not changed since the mid-1960s when statistics began to be kept. For a review of the literature see Tesh, 1993.

At the International Congress on the Health Effects of Hazardous Waste, held in Atlanta in May, 1993, investigators described studies showing a wide variety of health effects from exposure, but the effects were confined to such things as nausea, dizziness, sinus trouble, irritability, and sleep disorders. For a report see "Hazardous Incineration" in Science News 143(21):334, May 22, 1993.

5. At a regional conference of local groups which I attended in 1990, Lois Gibbs, former head of the Love Canal Homeowners Association, and now the executive director of the Citizens' Clearinghouse for Hazardous Waste said to the audience, "We are not environmentalists. Environmentalists eat yogurt and beansprouts and play tennis. We drink Budwieser and go bowling."

6. As I will argue later, there is much debate in the movement over what environmentalism really is, but these basic ideas, (the four "principal tenets" of which I take from Commoner, 1971 chapter two) seem to form the foundation. See also Devall and Sessions, 1985; Nash, 1989. Callicott, 1989.

7. Kristin Luker makes a similar point when she shows how feminists changed the social meaning of abortion, linking it to concepts of rights and freedom. See Luker, 1984.

8. As John Forester points out, "The daily work of social movements...may characteristically take the form not only of strategic and instrumental action, but of communicative action and interaction as well...[B]oth factual and normative claims may be established, shaping belief and political consent..." (Forester, 1982:45)

9. Other explanations are that the public is skeptical of expertise (see Goldsteen and Schorr, 1991) and that the information threatens collective identity (see Friedman and McAdam, 1992).

10. In the case of AIDS, most people were relived when scientists said the virus is not transmitted by casual contact. A minority, however, rejected that research, probably because it undermined their crusade to define homosexuality as immoral.

11. The term environmental justice has been used for nearly a decade by the Citizens Clearinghouse for Hazardous Waste to refer to the goal of all grassroots environmental groups. It was appropriated by activists working against "environmental racism" in the early 1990s.

12. Movement organizations, of course, have internal purposes. For example, they have to keep reproducing themselves. They also have functions. For example, they confer an identity on members. (For a discussion of this dimension see Friedman and McAdam, 1992.) But from a public policy perspective, what is essential about social movements is their role in bringing about social change.

13. Ferree and Miller (1985) provide a detailed and sophisticated description of this process.

14. This and other quotes are from a interview with Button in Washington, July 15, 1993.

15. This and other quotes are from a telephone interview with Hirschhorn on July 13, 1993. Hirschhorn currently heads an environmental consulting firm in Maryland.

16. For an example see the article by Fred Krupp, head of the Environmental Defense Fund, in the EPA Journal for September/October 1990, titled "Win/Win on the Environmental Front."

17. Moore's essay celebrating activist government goes farther than most of the others, however. The book's theme is set down by the editor in the introduction: "The core responsibility of those who deal in public policy--elected officials, administrators, policy analysts--is not simply to discover as objectively as possible what people want for themselves and then to determine and implement the

best means of satisfying these wants. It is also to provide the public with alternative visions of what is desirable and possible, to stimulate deliberation about them, provoke a reexamination of premises and values, and thus to broaden the range of potential responses and deepen society's understanding of itself (Reich, 1988:3-4)."

Public Enemy:

People's Perceptions of Congress

Elizabeth Theiss-Morse

John R. Hibbing

University of Nebraska, Lincoln

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton and Towers, Washington, DC, September 2-5. This research was supported by the National Science Foundation (SES-9122733).

Abstract

The American public is currently upset with politics and, especially, with the Congress; on this point there need be little debate. But we do need a debate on explaining this unrest and placing it in context, and we find such a debate sadly absent from the political science literature. Instead, the major finding relating to public attitudes toward Congress is the curious fact that many citizens like their individual legislator but dislike Congress itself. We must do better than this limited and slightly misleading shibboleth. In this paper, we draw on a major new data collection to provide the first thorough exploration of people's attitudes toward the three major political institutions and particularly toward the Congress. Our results show that people actually are quite fond of Congress as an institution but when they think of Congress as a collection of individual members (which they do most of the time) their opinion turns extremely negative. We proceed to analyze the causes of variations in approval of Congress and we conclude by examining the reasons people support term limits as a mechanism to make Congress better.

People in the U.S. are disgusted with politics and are more than willing to let the world know how they feel. Indeed, the popular press has devoted considerable coverage to public dissatisfaction, the movement to limit legislative terms has met with great success, and Ross Perot in his run for the Presidency certainly tapped into and benefitted from the public disgust. A feature article in the Atlantic Monthly notes, "the signs of discontent with the political status quo are everywhere" (Lind, 1992).

The focal point of this intense public unrest is the first branch of government, the U.S. Congress. Some of the most vociferous congressional critics have been former members. Dennis Hertel (D-Mi.) retired saying he was "angry and frustrated with Congress." Lawrence Coughlin (R-Pa.) similarly cited a "demeaned" Congress as one of the reasons he was leaving. And Edward Feighan (D-Oh.) explained his retirement decision by referring to "a small group of partisan extremists who have set out to destroy the institution" (all quoted in Katz, 1992). Public opinion holds Congress in similarly low regard as recent polls detect record low levels of approval (see, e.g., The Public Perspective, 1992: 86-87).

Yet even given the attention lavished on public disaffection with politics, surprisingly little is understood about people's perceptions of the institutions of government and of Congress in particular. How and what do people think about the institutions

and about Congress? Exactly who is upset and who is satisfied? And finally, who supports major reform proposals and why?

We address these questions drawing on an extensive, new data set that allows us to assess citizens' perceptions of the political institutions in the U.S. and of Congress in particular. After discussing various explanations for public dissatisfaction with the national government, followed by an overview of our own theoretical approach, we investigate people's evaluations of Congress and the other institutions, provide a portrait of the kind of individual who is satisfied (or dissatisfied), and examine in some depth people's support of government reforms, in particular term limits. We conclude with a discussion of the implications of our research for understanding how people think about national political institutions.

EXPLAINING PUBLIC DISAPPROVAL

Two problems immediately confronted by anyone trying to get a handle on public perceptions of Congress in particular and political institutions in general are the lack of strong theory on attitudes toward political institutions and the absence of good data on the topic. We begin by focusing on what might be considered a theoretical vacuum in this area and then consider the lack of good data.

Theoretical Explanations

Most studies of institutional support have relied heavily on

David Easton's (1965) distinction between specific and diffuse support. Specific support occurs when the public is pleased with a particular decision, policy output, or event whereas diffuse support is deeper and not contingent on recent popular actions. This Eastonian view permeates much of the work on attitudes toward the U.S. Congress and other legislatures (see, e.g., Davidson and Parker, 1972; Parker, 1977; Patterson, Hedlund and Boynton, 1975; Patterson and Caldeira, 1990; and Ripley et al., 1992), the Supreme Court (see, e.g., Caldeira, 1986; Tanenhaus and Murphy, 1981), presidential popularity (see, e.g., Mueller, 1973; Kernell, 1978; and many others), and trust in government generally (Miller, 1974; Citrin, 1974).

Easton's theory, however, was designed to apply to the overall political system rather than individual institutions, and is not easily transported to the study of institutional support. First, diffuse support refers to the political system in general whereas specific support refers to specific outcomes and events. Where does support for institutions fall into this theoretical framework? Specific support is too shallow to constitute true institutional support and diffuse support too broad. Relatedly, Easton treats the governmental structure itself as a black box. Since no attempt was made to look inside the black box at its particular institutional parts, it is difficult, if not impossible, to use Easton's theory to gain an understanding of the institutions themselves unless we assume that support for individual institutions follows the same pattern as support for

the entire political system.

In the absence of a firm theoretical grounding, explanations for public attitudes toward political institutions (and especially for recent public unrest) have emerged from every angle and are often superficial and contradictory. We illustrate by briefly summarizing six largely distinct explanations.

The first explanation holds that public dissatisfaction with politics and Congress simply represents what might be termed perennial pique. In essence, people always have a distaste for politics and political institutions, so the recent dissatisfaction is nothing new. Evidence supporting this view can be found in the fact that people in the 1950s favored term limitations at the same level as today (Ladd, 1990). The implication of this view is that, while lack of public esteem for politics and politicians is not something we should ignore, we certainly should not overreact to chronic disappointments over the understandable failure of our political institutions to please everyone all the time.

Contrary to this first view, proponents of the second view hold that something fundamental did in fact change in recent years, thereby causing confidence in political institutions, including Congress, to plummet. However, this "crisis of confidence" is widespread, encompassing political and social institutions. As Lipset and Schneider (1987) point out, confidence in just about all institutions, including medicine, labor, big business, religion, education, among many others,

declined sharply between 1967 and 1971. Confidence since 1972 has varied only modestly, declining after Watergate and increasing briefly around 1984. Proponents of this view argue that explanations for the "crisis of confidence" must address both political and social institutions to be of value.

The third view posits that something is most definitely and seriously amiss with the political system specifically. The clearest explication of this position is found in the widely-cited Kettering Foundation Report (1991), which is based on numerous focus groups conducted around the country. The basic message of the report is that the American public, far from being apathetic and disinterested, eagerly wants to get involved in politics but feels estranged from the political system because of the excessive influence of political insiders and special interests. While the Kettering report does not address the precise cause of the system malfunction, it definitely judges the people good and the system bad.

E.J. Dionne (1991), an advocate of the fourth view, believes "Americans hate politics" because leaders of the political parties and the idea people behind the current strains of liberalism and conservatism are too divisive. Instead of serious talk on serious issues, instead of a willingness to admit that the other side may be correct at times, that issues are complex and that there are shades of right and wrong, the present ideological and party apparatus in the U.S. pushes us toward negative campaigning, banalities, artificially dichotomous

choices, and unnecessary polarization. Indeed, according to this view, the proponents of traditional ideologies and party politics are busy fighting their own internecine battles and the public is left out. According to Dionne, the left and the right must pay attention to middle America and move toward the middle if the public is to cease "hating" politics.

A proponent of the fifth view, Alan Ehrenhalt (1991), argues that it is not the parties or idea people who are the problem but professional politicians themselves. He believes the main source of the problem in the minds of the public is the absence of citizen politicians. The public does not like professionalized politicians nor does it like the professionalized (or institutionalized) nature of the political system as a whole. Government is increasingly defined by long careers, elaborate infrastructures (staffs, perquisites, resources, committees, etc.) and boundedness (unique language, special rules and norms, etc.). None of this plays well with the public. The public wants citizen legislators who serve to promote the commonweal.

Finally, the sixth view holds, contrary to the Kettering report, that the people themselves are to blame for the problems currently facing the political system. Even though the political system is gamely struggling along, citizens are not contributing their fair share--many people do not vote, pay attention to policy initiatives or have much if any knowledge about their member of Congress or about the political system in general. Moreover, according to this view, public demands are often

unrealistic and even contradictory. Citizens decry pork barrel politics in general but are delighted when their own representative is successful in playing the game. They want to decrease their tax burden but increase government benefits. In essence, people are too eager to criticize the political system but not willing to do their part to make the system work.

While these explanations provide a useful array of potential sources of public dissatisfaction, taken together they are more confusing than enlightening. First, the focus of people's disgust remains something of a mystery. Are people upset with the politicians themselves? With the political parties? With the political system in general? Or are people simply upset with some amorphous "everything"? The prevailing explanations do little to clarify the focus of discontent, and we receive minimal help from the traditional literature in political science.

For example, the well-known debate between Miller (1974) and Citrin (1974) over the source of the decline in trust for government centers on whether people are rejecting the political system or the people (leaders) in government. Part of the confusion apparent in the trust literature is no doubt produced by the vague referent "government." To what exactly does this refer? What does a respondent do if he or she trusts the Supreme Court to do what is right most of the time but does not trust Congress to do what is right any of the time? We contend that it is essential to make a distinction among the various elements of government if we are to understand public dissatisfaction. We

must try to sort through people's attitudes toward the three federal institutions, with their distinct structures and standard operating procedures.

A second confusion emerging from the listed explanations results from the muddying of the distinction between government and the people in government. These explanations disagree about whether citizens are upset with the people in government (whether they be politicians, party people or idea people) or with government structures, procedures, and so on. It is essential that we clarify what people are upset about when it comes to political institutions. Is the public dissatisfied with the people who inhabit the institutions or with the institutions themselves? Extant research has not been diligent in making this distinction.

Each institution has its own structure and these structures are bound to affect support. In the case of the Executive Branch, almost no research exists on public support for the institution itself. Since ordinary citizens almost certainly think of the president when they are passing judgment on the White House or the Executive Branch, scholars have done the sensible thing by concentrating on explaining support for the sitting president. An impressive literature has grown around the topic of presidential popularity. We know, for example, that most presidents enjoy high public support early in their term before watching that support dwindle with the passage of the months. Temporary adjustments in this pattern can be produced by

decisive presidential actions, by economic conditions, by wars, and by other relevant conditions and actions (see Mueller, 1973; Kernell, 1978; MacKuen, 1983; and Ostrom and Simon, 1985, to name a few).

Existing research on the Supreme Court looks quite different. Perceptions of the Court are not centered on people at all. Ordinary citizens are not particularly familiar with the personnel of the Court. However, lacking the legitimacy of elections and given its occasional responsibility to act against (or without substantial regard for) public opinion, scholars have been concerned with the ability of the Court to generate support. Much of this research has been conceptual, with only a small number of studies utilizing data on public attitudes toward the Court. One of the more recent and concerted efforts to determine the predictors of aggregate levels of support for the Supreme Court was conducted by Gregory Caldeira (1986; see also Kessel, 1966; Dolbeare and Hammond, 1968; Murphy and Tanenhaus, 1968; Tanenhaus and Murphy, 1981; and Handberg, 1984). Caldeira concludes that while people, due to lack of knowledge and attention, "base judgments on the vaguest and crudest of ideological frameworks," the public "appears to respond to events on the political landscape and to actions taken by the Supreme Court" (1986: 1223).

Finally, less work has been done on public support for the U.S. Congress. Indeed, we know more about the intricacies and correlates of public support for the Iowa state legislature than

we do about the U.S. Congress (see Patterson, Hedlund, and Boynton, 1975). However, early work by Davidson, Koveneck, and O'Leary (1968), Davidson and Parker (1972), and Parker (1977), and later work by Patterson and Caldeira (1990) all point generally to the same conclusion: support for Congress varies from year to year and seems to be at least partially a function of public attitudes toward the president, scandals, the economy, and perceived presidential-congressional relations (see especially Patterson and Caldeira, 1990: 42).

We argue in this paper that to gain an appreciation of public attitudes toward the institutions, we must distinguish among the three branches of government and between the people in the institutions and the institutions themselves. Research in political psychology provides evidence that people have developed, to varying degrees, attitude structures that allow them to make distinct evaluations among various political stimuli (see, e.g., Conover and Feldman, 1984; Erber and Lau, 1990; Hamill, Lodge, and Blake, 1985; Lau, 1989; Lau and Sears, 1986). We therefore hypothesize, first, that people can and do make a distinction between the institutions and the people in government, consistent with Easton's distinction between support for the regime and support for authorities, and that this distinction raises important implications for understanding public dissatisfaction.

Second, we hypothesize that the correlates of public support vary depending on the referent of people's attitudes. We

consider three types of variables: demographic variables such as age, gender, and education; attitudinal variables such as party identification and political efficacy; and levels of political awareness and involvement. For example, the people who inhabit Congress are demarcated along party lines whereas the institution of Congress is not inherently partisan by nature. We therefore expect party identification and ideology to be related to evaluations of the membership of Congress but not the institution of Congress. Determining the type of respondent who is more likely to approve of Congress as an institution and as a collection of individuals will permit a more sophisticated understanding of public attitudes toward Congress.

Finally, any discussion of public dissatisfaction naturally leads to talk of reforms designed to lessen this dissatisfaction. We hypothesize that support for reforms, specifically term limitations, is the result of demographic and attitudinal variables affecting evaluations of the membership and institution of Congress which then affects support for reforms. We therefore create a path model to explain public support for term limitations.

Data

Aside from the theoretical limitations of past research, the paucity of data on institutional support severely constrains what can be studied. Most prior research has relied upon data that are simply not adequate to support careful analyses of variations

in support, with the exception of support for sitting presidents. For the most part, conclusions about public support for Congress and the Supreme Court are based on time series analyses of a question that was asked usually just once a year. The survey questions generating the data are also often inadequate, what with the unknown effects of wording changes, the superficiality of questions, and the lack of relevant supplemental questions and soundings.

To remedy these data problems, we conducted during the summer of 1992 two major data collection efforts. The first was a telephone survey administered to a national sample of approximately 1400 adults in the United States.[1] The second component of our data collection efforts involved a series of eight focus group sessions conducted in four different parts of the country: Nebraska, Minnesota, Texas and New York. Each session consisted of about 10 participants and lasted approximately two hours. The group setting gave people the opportunity to respond and react to each other, which realistically mimics most political discussions. Moreover, the less-structured and more personal setting allowed people to discuss in great detail their opinions and concerns.

The richness of the information derived from the focus

---

[1] When interviewers reached a household, they asked to speak to the person in the household who was at least 18 years old and who had celebrated the most recent birthday (see Salmon and Nichols 1983). The interviews lasted about 30 minutes, were conducted between July and October 1992, and had a 57% response rate.

groups combined with the rigor of the data gathered from the national survey provide, we believe, a perfect mixture of depth and breadth in information on the important topic of institutional support. In the following section, we analyze these data in tests of our hypotheses.

PUBLIC EVALUATIONS AND INSTITUTIONAL SUPPORT

In this section, we test three hypotheses. First, as they accord support, do people make a distinction among institutions and between institutions and their members? Second, what leads people to differ from one another in their assessments of the various institutional referents? Finally, what explains people's support for term limits, the major current congressional reform proposal? We address each question in turn.

Evaluations of the Institutions and Their Members

There is no question that in the early 1990s, people were very upset with government, and that Congress was the lightning rod for most of these feelings. But saying, for example, that the public "hates" Congress is not particularly informative. To a greater extent than most institutions, Congress is a complex entity. It is difficult to know what aspect of Congress people think of when they report negative feelings toward it. Thus, one of our major goals is to determine the particular features of American politics that generate various (and usually negative) public reactions.

Richard F. Fenno, Jr. (1975) called attention to an important situation that is now a part of most discussions of public attitudes toward Congress: namely, many Americans have negative views of Congress at the same time as they profess positive views of their own member of Congress. Why so many citizens possess this unusual combination of views came to be known as Fenno's paradox. One of Fenno's answers to this paradox is that "we apply different standards of judgment, those that we apply to the individual being less demanding than those we apply to the institution" (1975: 278; see also, Cook, 1979; Parker and Davidson, 1979). Fenno's point is an important one and has quite rightly been influential.

Still, we wish to suggest that Fenno's point captures only a part of the overall story. Contrary to appearances, the key distinction is not really between the member and the institution; rather it is between all members and the institution itself.

We asked people about their approval of members of Congress as a collectivity. We then repeated the question with regard to the justices on the Supreme Court and then George Bush. In separate questions we also ascertained respondents' approval of the <u>institutions</u> of government, not the people in government.[2] Our analysis shows that the distinct questions for members and for the institutions themselves produced startlingly different results. These results are presented in Table 1. Perhaps the

---

[2] See Appendix 1 for the exact wording of these questions and response options.

most striking figure in this collection of marginals is the low approval level for members of Congress as a group. Less than one-fourth of the respondents approve or strongly approve of members of Congress. Approval of George Bush at the time of the survey was 45.8 percent and approval of current justices on the Supreme Court was a whopping 72.9 percent. Compared to members of the Court and "members" of the Presidency, the public does not like members of Congress.[3]

[Table 1 about here]

When the focus shifts to the institutions and not the members of the institutions, the consequences are remarkable. A focus on the institution produces strongly positive feelings across the board. About 95 percent of the public approves of the Supreme Court and the Presidency as institutions, regardless of who is in office, and, most notably, 88 percent of the public even approves of Congress as an institution. Nineteen percent of the respondents even claimed to <u>strongly</u> approve of Congress as an institution.

It is clear that a dropoff is registered for all three bodies as attention is directed away from the institution and toward the individual members--but the dropoff for Congress is of incredible magnitude. The Court witnesses the smallest drop, only 21.5 percentage points. Approval of the Presidency is nearly 50 points higher than approval of George Bush. And

---

[3] They do, however, tend to like their own member, as Fenno found. According to our survey results, 67 percent of the respondents approved of their own member.

approval of Congress is nearly 64 points higher than approval of the members of Congress. People do not hate Congress. Rather, they overwhelmingly approve of the institution even as they do not approve of the performance of the people in Congress, excepting their own member.

Who Approves and Who Disapproves?

Determining the type of respondent who is more likely than others to approve of Congress either as an institution or as a collection of individual members will permit a more sophisticated understanding of institutional support. We focus here on three types of variables that may be related to evaluations of Congress: demographic characteristics, political attitudes, and political involvement.

First, people with certain demographic characteristics, such as age, sex, education level and so on, may be predisposed to evaluate the institution or the membership more positively or negatively. For example, older people might be more favorably disposed toward the institution of Congress because they are more thoroughly socialized into supporting the political system. Women and minorities have historically suffered discrimination and this history could lead to greater alienation from Congress in light of its central role in structuring the social system that included discriminatory acts. And the higher people's income, the more supportive they might be since they would appear to have benefitted from the system of which Congress is an

integral part.

The relationship between education and institutional support is more difficult to predict. Researchers seem to assume that educated citizens are more likely to understand, if not fully appreciate, the messy nature of the legislative process. The less educated, in contrast, would tend to be put off by the open disagreements, the procedural wranglings, and the painfully deliberate pace of that process. Research findings, however, typically refute these expectations: education is either unrelated or negatively related to support for Congress (see, e.g., Ripley et al., 1992; Davidson, Koveneck, and O'Leary, 1968).

We also examine the relationship among certain political attitudes and evaluations of Congress. Attitudes that orient people in the political world might be related to how people perceive Congress and its membership. We consider three such attitudes: external political efficacy, party identification, and ideology. First, people who have a strong sense of external efficacy, believing the government is responsive to them, are likely to evaluate Congress more positively. The inefficacious, on the other hand, will likely evaluate Congress more negatively since they perceive government, of which Congress is a part, as unresponsive. Efficacy should therefore be related to both institutional and membership support. Second, party identification and ideology will likely be related to evaluations of the membership of Congress, but not institutional support.

The membership of Congress has been dominated by the Democratic party for the last several decades. It would be surprising if Republicans and conservatives were not more negative than Democrats and liberals about the membership of Congress. The institution of Congress, however, is not inherently partisan and therefore should not be evaluated differently by partisan or ideological groups.

The third and final cluster of independent variables involves political attention and involvement. It is likely that the more people are involved in politics--by being interested, keeping in touch with what is happening in politics through the media, discussing politics with friends and family, and voting--the more they will feel they have a stake in the system. Involvement should therefore be related to approval of Congress as an institution. This same involvement and awareness, however, may be negatively related to approval of the membership of Congress since these people are potentially more aware of negative events, such as scandals, relating to the members.

We expect that the education, income, and interest/involvement variables we utilize will be positively related to evaluations of Congress the institution, since these variables involve basic attachments to and appreciation of the political system. They may be negatively related, however, with evaluations of members of Congress. Just as baseball fans who have played the game at some level may be the most demanding and critical observers of players but among the most loyal supporters

of the game itself, political "fans" who are involved and knowledgeable may be demanding and critical of politicians even as they are supportive of political institutions.

We provide a preliminary test of these expectations by examining the simple bivariate correlations between the variables described and evaluations of the institution and the membership of Congress. The most astounding finding in Table 2 is that the correlates of approval for Congress as an institution (column 2) are so different from the correlates of approval for the members of Congress (column 1). As our theorizing indicated, in several instances a variable was more strongly related to members than to the institution, or vice versa. On the whole, the number of times in which correlations switch directions is noteworthy. Many variables lead respondents to be more supportive of the institution at the same time they lead respondents to be less supportive of members, or to have the opposite effect.

[Table 2 about here]

To be more specific, of the 13 explanatory variables in the table, 10 of them have opposite signs for members as they do for the institution. Only external efficacy is consistently and significantly related to approval of both the institution and its members. Age does not seem to be correlated with approval of either members or the institution, despite our expectation that with age would come more approval. Women and racial minorities, surprisingly, are more approving of the members of Congress but not much different from men or whites when it comes to approving

of the institution.

The findings in relation to education and income are quite suggestive. When considering approval of the institution, education and income are both strongly and positively related to approval. The more education and income a person has, the more likely that person is to approve of Congress as an institution. But the same certainly cannot be said when the focus shifts to approval of the membership of Congress. Here we find that additional income actually diminishes approval. Our measure of education also has a negative sign, but this may be occurring by chance. At the least we can say that there is no evidence that increasing education makes people more approving of the members of Congress as a collectivity.

Party identification and ideology, as we expected, are clearly related to views of the membership. Republicans and conservatives are the least likely to approve of the members and Democrats and liberals the most likely to approve. But these partisan and ideological predispositions matter little when people pass judgment on Congress as an institution.

Finally, a fascinating pattern emerges for the cluster of variables we refer to as political attention and involvement. Though our two media-oriented variables are not strongly related to evaluations of Congress, people who are interested in politics, who discuss politics, and who vote are much more likely to approve of Congress as an institution than are the less involved. At the same time, these same politically interested

and active people are actually less likely to approve of the members of Congress.

Support for Term Limitations

To determine how these variables fit together in a multivariate analysis to explain support for Congress, we used path analysis. In addition, we incorporate into the model support for proposals to limit the number of terms members can serve in Congress. Given the prominence of term limits on the reform agenda of recent years, we wanted to determine the kinds of people who favor term limits. Fifteen states have adopted term limit language of varying sorts. Forty-two percent of Representatives in the House (181 members) is currently limited in the amount of time they can remain, unless the courts declare that such limitations may not be imposed without a constitutional amendment. Term limits are with us for now and may spread further in the 1994 elections. Who is behind this movement? What kind of people are most excited by term limits ideas?

Previous studies have attempted to identify groups in society most supportive of term limits but have not met with a great deal of success. John H. Fund quotes the political director of CBS News as saying that he had "never seen an issue on which there was so little demographic variation" (1992: 225). Rick Farmer notes conflicting findings in surveys on even as elementary a matter as whether partisanship is related to support for term limits (1993: 9). We attempt to provide some answers to

the puzzling question of what explains term limit support.

In our path model, the demographic variables are exogenous and are directly related to the attitudinal and involvement variables. We then expect that the attitudinal variables will be strongly related to approval of the membership of Congress since, as we explained above, the membership is by its very nature partisan and ideological and perceptions of government responsiveness are obviously related to evaluations of the membership of Congress. We expect, on the other hand, that the involvement variables will be most strongly related to approval of the institution of Congress since people who have a greater stake in the system are likely to be most supportive of the institutional structure. Finally, we expect that these demographic, attitudinal, and involvement variables will primarily affect support for term limitations indirectly through membership and institutional approval. That is, people who disapprove of the members of Congress or the institution itself will be significantly more supportive of term limitations than those who approve of either referent.

We took several steps to complete the path analysis. First, we standardized the variables to range from 0 to 1. Second, in order to make the presentation as clear as possible, we report in Figure 1 only the significant relationships among variables. We also refrained from drawing in the significant relationships among the demographic characteristics and the attitudinal and involvement variables (see Appendix 2 for these relationships).

The results of the path analysis are reported in Figure 1. Looking first at the significant correlates of approval, it is clear that in general our expectations are supported. Party identification and efficacy are strongly related to membership approval, and ideology is marginally significant, controlling the effects of demographic characteristics and involvement. Republicans and conservatives are generally less approving and the efficacious more approving of the members. More surprisingly, one involvement variable, discussion, is also related to membership approval: the more people discuss politics with friends and family, the less approving they are of the membership of Congress. Congress would benefit from people not talking about politics. Finally, two demographic variables are directly related to membership approval. Women are significantly more approving than men and the poor are significantly more approving than the wealthy, even controlling attitudinal effects. More on this shortly.

[Figure 1 about here]

What explains approval of the institution of Congress? We find, as expected, that people who approve of the institution of Congress tend to be more highly educated, more efficacious, and more interested in politics than people who disapprove of the institution. Thus, people who have a greater stake in the system and are more involved in politics are more approving of the institution of Congress. A surprising finding is that there are not more involvement variables related to institutional support.

Turning to support for term limits, our preliminary results are sometimes surprising for what does not explain support. Education and efficacy are not directly related to term limits support. Similarly, people displaying more interest in politics, people who vote, and people who discuss politics are not more or less supportive of term limits than the uninvolved. So it seems the factors that usually mitigate support for a reform (education, efficacy, and political involvement and interest) are not directly able to diminish support for term limits as they often do for other reforms. This is an important finding.

What directly affects term limit support? First, two variables, sex and party identification, are directly related to reform support. As expected, Republicans, other things being equal, are significantly more likely to support term limits, but so are women. To our knowledge, the gender gap on term limits has not been discovered in previous research.[4] We believe the persistent support of women and Republicans for term limits is attributable to a perception that the membership of Congress is compositionally unrepresentative. Certain elements of society are believed to be frozen out of the body by virtue of an illicit subculture that has been able to perpetuate its dominance. This subculture is built around Democratic men. Thus, one motivation for supporting term limits is to alter patterns of entry into Congress.

---

[4] Some media polls show a slight gap on the issue between men and women, but nothing much is ever made of it.

Second, the extent to which people approve of the members of Congress and of Congress as an institution is strongly and significantly related to term limits support. People who disapprove of the members are much more likely to support a movement to kick members out of office, which of course makes sense. These people think the members are doing a bad job in office, so it makes sense to institute a reform that will limit their stay in office. Term limits give people the chance to elect a new batch of people more regularly, and it is hoped the new batch will do a better job. It is important as well to keep in mind the variables that have an indirect effect on membership approval. People who approve of members are liberal, identified with the Democratic party, efficacious, less likely to discuss politics, women, and the poor. These people are also more likely to oppose term limits through their disapproval of the members (with the exception of women). Conservatives, Republicans, the inefficacious, those who discuss politics, men, and the wealthy disapprove of the membership of Congress and are subsequently more supportive of term limits.

The relationship between institutional approval and term limits is based on a quite different set of variables. People who approve of the institution of Congress are significantly more likely to oppose term limits. Who tends to approve of the institution? The highly educated, interested, and efficacious approve of the institution, and are therefore less supportive of term limits. The less educated, the disinterested and the

inefficacious disapprove of the institution and subsequently support term limits.

CONCLUSION

People do not approve of Congress, but this disapproval is not as indiscriminate as is usually implied. Instead, public views of Congress as an institution and Congress as a collection of politicians could hardly be more different. Three out of every four American adults do not approve of the members of Congress but only one out of ten does not approve of the institution of Congress.

Perhaps more importantly, the correlates of approval for the institution and for the membership are also as different as night and day. Congress as an institution is most strongly supported by the people we would expect--those who feel highly attached to and part of the political system, who are well-educated, and who are interested in politics. The membership, on the other hand, is most strongly supported by women and the poor, by liberals and Democrats, and by people who do not discuss politics. Many of the variables expected to boost approval of members of Congress do not (a sense of political efficacy is the major exception). Education, for example, if anything, is negatively related to approval of the congressional membership.

What this means is that increased approval of members of Congress will not automatically accompany increases in the educational levels or living standards of American adults. A

more interested, involved, active, educated, and affluent public is not necessarily a public that is fonder of the congressional membership. These correlates of public attitudes toward the membership are crucial because, in the larger work of which this paper is a part, we demonstrate that when the public gives its views of "Congress" it almost always divulges attitudes toward the membership. For most people, by default, Congress is its members. Attitudes about the institution of Congress lie deeper and must be tapped with special efforts. Nearly all attitudes toward Congress discussed in an ordinary fashion are tantamount to attitudes toward the membership.

Taken together, these findings indicate that attitudes toward Congress--at least the kind that lead to investigations of "why Americans hate politics" and the like--are unlikely to be improved by educating the public, by improving economic conditions, or by inducing the public to be more involved with the political system. Those who are most upset with the membership of Congress and who are most supportive of term limits, it would seem, will only be persuaded if they are convinced of the congressional system's overall efficacy and its openness to women and Republicans and if they see Congress more in institutional terms than in terms of a collection of individual and unavoidably flawed members. The public support bequeathed to the Supreme Court by virtue of its being perceived more in institutional than in membership terms provides it with valuable cover. The Congress is not so lucky. Its very public,

very open, and very visible systemic venue and rules of procedure invite the public to see it as a collection of overly partisan, bickering, self-serving, political hacks.

All this leads us to concur, at least in part, with the theory (discussed earlier as Theory 1) holding that much of the unrest with the political system and especially with Congress is endemic to the role we ask Congress to play, although it is undoubtedly true that the unfortunate misdeeds of a number of members unnecessarily fan the flames of this unrest. Congress is not only an enemy of the public right now, it is an enemy because it is so public. If we value a separation of powers system (the public enthusiastically does) and if we value the role of a strong legislature in such a system, we must devote more attention to the care and feeding of such a legislature. Its viability should not be taken for granted in a pervasively sour and cynical climate. Moreover, it is not the case that, even if we could magically increase public political education and awareness, attitudes toward Congress would improve. To know Congress is not to love it, unless people can be made to think more often of Congress as an institution rather than merely the sum of its members.

Appendix 1

Survey Question Wordings and Response Options

Feelings Thermometer Ratings:

1. I'd like to get your feelings toward some groups of people in the U.S. government. I'll read the name of a group and I'd like you to rate it using something we call the feeling thermometer. Ratings between 50 and 100 degrees mean that you feel favorable and warm toward that group. Ratings between 0 and 50 degrees mean that you don't feel favorable toward the group and that you don't care too much for that group. You would rate the group at the 50 degree mark if you don't feel particularly warm or cold toward the group.

   a. Using the feeling thermometer, how would you rate the justices currently serving on the U.S. Supreme Court?

   b. How would you rate the current president, George Bush?

   c. How would you rate the current members of Congress?

2. Now, I've asked you to rate some people in government, but sometimes when we talk about the parts of the government in Washington, like the Supreme Court, the presidency and the Congress, we don't mean the people currently serving in office, we mean the institutions themselves, no matter who's in office. These institutions have their own buildings, historical traditions, and purposes laid out in the Constitution. I'd like to know how warm or cold you feel toward these institutions, not the people currently in office.

   a. Using the feeling thermometer, how would you rate the U.S. Supreme Court?

   b. How would you rate the Presidency?

   c. How would you rate the U.S. Congress as an institution?

Approval Ratings:

3. I have a few more questions about the institutions of the government in Washington--that is, the Presidency, the Supreme Court, and Congress. In general, do you strongly approve, approve, disapprove, or strongly disapprove of...

   a. the institution of the Presidency, no matter who is in office?

   b. What about the Supreme Court, no matter who the justices are?

c. What about the U.S. Congress, no matter who is in office?

4. Again, thinking about people in government, please tell me if you strongly approve, approve, disapprove, or strongly disapprove of the way the people are handling their jobs.

a. How do you feel about the way the nine justices on the Supreme Court have been handling their job?

b. What about President George Bush?

c. What about the 535 members of Congress?

d. What about your own Representative in the U.S. House of Representatives?

Term Limits:

5. Some people have suggested that we need to reform some aspects of government. Others think we ought to leave things the way they are. I am going to read you some proposed reforms. Please tell me whether you favor or oppose each reform. If you aren't sure, just say you don't know. If you want the reform explained, please let me know.

a. Limiting the number of terms someone can serve in Congress.

b. Would you say you strongly favor or not very strongly favor term limitations?

Political Attitudes:

6. **Ideology:** We hear a lot of talk these days about liberals and conservatives. Do you consider yourself liberal, slightly liberal, moderate, slightly conservative or conservative?

7. **Party identification:** Generally speaking, do you usually think of yourself as a Democrat, a Republican, an Independent, or something else?

a. [If Democrat or Republican] Would you consider yourself a strong Democrat/Republican or not a very strong Democrat/Republican?

b. [If Independent or other] Do you think of yourself as closer to the Republican or Democratic party?

8. **External efficacy:** [Response options: Agree or Disagree]

   a. People like me don't have any say about what the government does.

   b. I don't think public officials care much about what people like me think.

Political Involvement and Awareness:

9. **Discuss politics:** How many days in the past week did you talk about politics with your family or friends?

10. **Interest:** How interested are you in politics and national affairs? Are you very interested, somewhat interested, slightly interested, or not at all interested?

11. **Vote:** [Response options: Yes, did vote/thinks so or No, didn't vote/doesn't think so]

   a. In 1988 George Bush ran on the Republican ticket against Michael Dukakis for the Democrats. Do you remember for sure whether or not you voted in that election?

   b. In 1990 elections were held for the U.S. House of Representatives. Do you remember for sure whether or not you voted in that election?

12. **Media attention:**

   a. How many days in the past week did you watch the news on TV?

   b. How many days in the past week did you read a daily newspaper?

13. **TV news:** I'd like to ask where you usually get most of your news about what's going on in the world today--is it from the newspapers, radio, television, magazines, or talking with others? [Respondents answering "television" were coded 1, all others coded 0.]

TABLE 1

CONTRASTING SUPPORT FOR THE MEMBERS OF INSTITUTIONS AND FOR THE INSTITUTIONS THEMSELVES

	Percent Approve	Mean Feeling Thermometer
Members of Congress	24.2%	42.6
Institution of Congress	87.8%	65.7
Members of the Supreme Court	72.9%	54.3
Institution of the Supreme Court	94.4%	69.2
Specific President (Bush)	45.8%	47.6
Institution of the Presidency	95.5%	72.2

Feeling thermometer range is 0 (coolest) to 100 (warmest)

N varies but is about 1400 for each response

TABLE 2
